Going on our theory and the principle we have been insisting on for a great many years, it is our contention that the railroad companies buy the coal for 65 per cent, leaving as the resulting rate for transportation 35 per cent to tidewater, less whatever the expense of the commission, which would probably bring it down to about 30 per cent. Now I say that while the railroad companies are apparently willing to buy the coal for 65 per cent, they have not got to that point where they are willing to say to an absolutely independent operator, We will transport your coal for 35 per cent.

Q. (By Mr. C. J. HARRIS.) It ought to be about 30 per cent?—A. It ought to be about 30 per cent to be on a parity.

Q. (By Mr. RIPLEY.) Suppose we set aside from the total output that which is directly mined from the ancillary companies; then we take all independent operators who sell to the railroads at 65 per cent, agreeing to sell on that basis until all the coal in the ground is out; how many firms will be left free to do as they please? What proportion of the output do those thus left produce?—A. Very small percentage.

Q. Less than 5 per cent?—A. I presume it might probably stand between 5 and 10 per cent.

Q. In other words, if these contracts now under consideration are signed, less than 5 per cent of the total output will be free of railroad control?—A. Well, it might be 5; I would possibly be a little safer to say between 5 and 10.

Q. Then, if the roads agree among themselves, that insures a perfect control of the prices so long as that agreement among the railroads exists?—A. And that is a very important qualification, so long as they can agree among themselves.

Q. Will you state hypothetically what might lead to disagreement?—A. Many things. Railroad officials are very human; troubles in one place beget troubles in another.

Q. When you make statements including the roads, do you include the Pennsylvania Railroad? What has been its attitude in the past?—A. Years ago it carried all the anthracite coal that was offered. In fact, all the collieries working along that line of road worked practically full time. But that is going back, I should say, ten or fifteen years ago.

Q. In other words, at that time there was no restriction imposed as to the output?—A. Not so far as the Pennsylvania Railroad is concerned.

Q. So far as the Pennsylvania Railroad is concerned?—A. That was a very disturbing factor.

Q. Has that policy changed to your knowledge at the present time?—A. I think it has.

Q. Is the Pennsylvania Railroad substantially in the agreement?—A. Now you are asking me questions that it would be impossible for me to answer. You can verify all this by getting the reports of the mine inspectors of the Pennsylvania district, and you can see there how much time has been worked by the collieries along these various roads.

Q. (By Mr. KENNEDY.) I want to ask you whether, if 10 per cent of the coal if sold at less than the price fixed by those who control 90 per cent, would fix the market price? We were so informed yesterday. We were told that even 5 per cent being free and independent would fix the market price of coal.—A. What! Do I understand that 5 per cent taken out of a total of 45,000,000 tons, that 5 per cent, namely, 2,250,000 tons, would fix the price?

Q. Yes; I want to ask whether in your opinion that is true or not? Suppose you controlled 5 per cent of that 50,000,000 tons, and you chose to fix a price lower than the 65 per cent controlled by the railroad coal roads, would you fix the market price and bring them down to your figure?—A. Carrying that thought out, to make the matter very plain, let us suppose that the anthracite consumed in New York City is, say, 3,000,000 tons a year, and, if I could supply 300,000 tons of it, I could make the price on the remaining.

Mr. CONGER: That is the theory expounded to us yesterday, and we want your opinion on it.—A. How did it commend itself to you?

Q. (By Mr. C. J. HARRIS.) We understand from you that it would be an absurd proposition, from your experience?—A. I should say so; yes.

Q. (By Mr. KENNEDY.) I was informed yesterday evening that a gentleman named Luther, in the coal trade—I presume you know him.—A. The general manager of the Philadelphia and Reading Company?

Q. I do not know what position he holds.—A. There is a gentleman with them by that name—the general manager.

Q. That he recently disposed of an option to a gentleman in New York on large tracts of anthracite coal in Virginia, and this gentleman said there was 100,000 acres there of anthracite coal. I would like to know whether the people in the coal

trade know anything of the existence of such deposits in Virginia or not?—A. They would like to know of them. No; I do not know of any anthracite coal anywhere else except in the State of Pennsylvania. They have down in Virginia a very remarkable formation of natural coke, but it is not anthracite coal. We made an investigation there some years ago. We were sure there was some anthracite coal, and we had an investigation made.

Q. How many miners do you employ?—A. When running at full capacity, we employ from 1,000 to 1,100 men.

Q. Do you work your miners about the same number of days in a year that the miners in the collieries of the railroad companies are worked?—A. The railroads complain that we have been working more days.

Q. We have heard the complaint that the independent miners are working a less number of days by far?—A. That has not been our experience, so far as we are concerned, simply because I insisted upon our right to mine.

Q. Your miners were engaged in the strike?—A. Yes.

Q. Do you think their demands of last fall were unjust?—A. No, sir.

Q. Do you believe in arbitration?—A. Absolutely.

Q. Do you believe that if one side or the other in a strike of that kind, where the public is largely concerned, becomes stiff-necked and holds out, and great injury is liable to result to the public, there should be some force to settle the differences?—A. Under those conditions arbitration should be compulsory, where the interests are so great and the damage that can be done is so great—I mean the damage to the public.

Q. You believe then that the public is a very large party to a controversy of this kind and that its interests should be considered?—A. I do not know how we could get along without the public.

Q. (By Mr. J. C. HARRIS.) How are you going to compel miners to work if they don't want to work?—A. I admit there is the difficulty.

Q. Would you imprison them?—A. Or, put the question the other way, put the operators in prison?

Q. Then how are you going to have compulsory arbitration without imprisonment?—A. Would it not be possible for these trades unions to be incorporated? Wouldn't it be possible to make contracts with them in regard to men, the same, as I understand, is being done in other countries? Would not that be one effective way, the only reasonable way, of reaching the situation?

Q. Is compulsory arbitration practicable according to our present laws and conditions, in your experience?—A. I have not had any experience in regard to it; but it seems to me, following out the suggestion there, that where we have a deadlock which involves so much in the matter of loss and damage and inconvenience to the community, some means should be devised whereby it could be settled.

Q. (By Mr. KENNEDY.) Has your experience been that the employees are the ones generally that come forward with a proposition to arbitrate, and that the other side hold out as a rule?—A. In the anthracite strike, as you well remember, the hesitation was very largely on the part of the employers; there was a willingness on the part of the employees to arbitrate.

Q. If you still see a difficulty in the way of what is called compulsory arbitration, do you believe that the interests of the public are so overwhelming and overshadowing all others that the Government should provide some way against losses to the public on account of great controversies of this kind?—A. Just how far the Government could go in a matter of that kind, of course it is not for me to say, and I would not hazard any opinion; but looking at the question from the standpoint of the employer on one side and the employee on the other, and the grave issues that might be involved, there should be some way devised by which differences can be adjusted. One reason why the companies hesitate, as I understand, about making contracts with the miners, is they say that the miners are utterly and absolutely irresponsible. If there was an incorporation—

Q. (By Mr. C. J. HARRIS.) Do the miners not object to incorporation as trades unions?—A. I don't know, I am sure, as to that.

Q. You never knew one to be incorporated, did you?—A. It is done on the other side, is it not?

Q. I mean in this country.—A. That I don't know.

Q. Have you anything to volunteer further?—A. No; I have not.

Q. (By Mr. RIPLEY.) Can you state anything respecting the proportion of the undeveloped or unworked coal lands in the anthracite territory at this time?—A. No; I am not competent to pass upon that question without making a more careful study of the situation.

Q. Is it not a common opinion that a large proportion of the southern field is as yet undeveloped?—A. You mean by that term the Schuylkill region?

Q. The southern regions.—A. Yes; and it was that lack of development that brought the troubles to the Reading.

Q. In what way?—A. That a hundred thousand acres of coal property involved a debt, carrying a very heavy interest account.

Q. Does that debt still remain?—A. That I do not know. I presume it does.

Q. The Philadelphia and Reading, in its reports, shows a very large debt, does it not?—A. Yes.

Q. Is not the cost of carrying that debt included in the expenses of the company?—A. I presume so.

Q. Does not, then, the cost of carrying this undeveloped land for the next 50 years come on the price to the present consumer in a degree?—A. There will be an effort, I presume, to get it out of the consumer. They have not been very successful up to the present time, I will admit.

Q. Has the reorganization cut down the debt?—A. I could not answer that question. You will have to depend upon the company's reports for that information.

Q. (By Mr. CONGER.) Would that item of interest on the investment covering undeveloped coal land be much of an item in the price of coal?—A. Very large. If I remember correctly the Reading company invested about \$50,000,000 in coal property, and if I also carry the fact correctly the interest at that time upon the debt that was created was 7 per cent which represented in interest an annual charge of \$3,500,000.

Q. (By Mr. J. C. HARRIS.) For carrying coal property?—A. For the carrying of coal property.

Q. (By Mr. RIPLEY.) Does not that debt remain substantially as it did at that time? That is to say, has the reorganization ever cut down that debt?—A. I presume not.

Q. (By Mr. CONGER.) Has it cut down the interest?—A. I presume it has. Undoubtedly. But, getting back to your question, you can see how that in that case that charge becomes a very important factor.

Q. How many million tons does the Reading produce in a year?—A. They produced last year 9,388,000 tons; but when that property was bought I presume that road at that time did not produce more than 6,000,000 or 7,000,000; so that you can readily see that the item of interest was a very important one. Take for instance, this recent acquisition of the Pennsylvania Coal Company; now, when you put the interest upon that it runs up to an item of about 50 cents a ton.

Q. (By Mr. J. C. HARRIS.) That is, on the investment?—A. As relating to the annual tonnage; it amounted to about 50 cents a ton.

Q. (By Mr. RIPLEY.) Is there any large proportion of that coal land of the Pennsylvania Coal Company not yet developed? Are they carrying a supply for future years?—A. They have a supply for future years, but it seems to me you have to be very careful when you use the expression "developed." There might be a very wasteful development. For instance, take a situation we have, mining in Luzerne County, Pa. Now, there are 3 or 4 or 5 operations there. It would be better for everybody, better for the public, if that work had been done by one operation.

Q. (By Mr. KENNEDY.) That would be an argument in favor of combination?—A. There are arguments in favor of combination. There are arguments in favor of power, but it is the abuse of power that is objected to.

Q. (By Mr. CONGER.) I have one point I think we would better bring out before we close, and that is in regard to the possible regulation of freight rates. You testified a few moments ago that the railroads, while they had expressed willingness to contract with the operators to give them 65 per cent of the tide-water price for their coal, had not offered to give a freight rate to independent operators of 35 per cent.—A. That is bound to come, because we will simply enforce it.

Q. You think you will be able to get it?—A. That has been our record in the past.

Q. I was going to ask you whether you had any suggestions to offer as to Governmental regulation of freight rates?—A. So far as our experience is concerned it has been a matter of profound regret to us that that the interstate commerce law did not give speedy and proper relief. That was the original intent, you will remember, of the law. The way it stands to-day, as I remember, under the law a decree of the commission is simply prima facie evidence, and then you may begin all over again. You may take that decree into the courts and it becomes simply a part of the evidence.

Q. It has been advocated by some that Congress should pass an act which would make the decisions of the Interstate Commerce Commission operative while pending appeal by either party. Would you favor such an amendment?—A. I would; yes.

Q. Are you familiar with the provisions of the so-called Cullom bill before Congress?—A. Yes.

Q. Do you favor those provisions, as a general thing?—A. I do.

Q. And you think, in the the interest of the public, Congress should enact the provisions of that bill into law?—A. I do; yes. If we could have had the relief which was expected under the Interstate Commerce Commission the time that Coxé Brothers & Co. brought the suit in 1889 there would have been a great change in this entire anthracite situation.

Q. (By Mr. RIPLEY.) Would it perhaps have stopped this tendency toward the absorption of the independent operators?—A. Yes; certainly. Coxé Brothers made their appeal. There was a concern of great influence and wealth; they went before the commission; they made a strong case, and yet it did not amount to anything.

Q. (By Mr. CONGER.) Why did it not amount to anything?—A. The commission had no power.

Q. Simply because the decision of the commission was not operative: is that it?—A. That is all. They waited a long time for it, and when they got it it was not operative.

NEW YORK CITY, February 19, 1901.

TESTIMONY OF MR. HENRY S. FLEMING.

Secretary-treasurer Anthracite Coal Operators' Association.

The special sub-commission met at 10.30 a. m., Mr. C. J. Harris presiding. At 3.40 p. m. Mr. Henry S. Fleming was introduced as a witness, and being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Will you give us your name, your address, and your official title?—A. Henry S. Fleming, 26 Cortlandt street, New York City. I am secretary-treasurer of the Anthracite Coal Operators' Association.

Q. Will you tell us something about the independent operators' association, who compose it, and what proportion of coal they produce—any items of that kind that would be of interest to the commission?—A. The association is made up of various individual operators—that is, smaller companies, the individuals owning the mines sometimes in their own right, and sometimes leasing from the landowners. We produced, up to this year, about 31 per cent of the entire anthracite output. This year I think it will be in the neighborhood of 29 or 29½ per cent.

Q. About how many members are there in your association?—A. That I really could not say. I do not remember.

Q. What are the duties of your association?—A. That question is very difficult to answer. The association was organized for the general benefit of its various members—to do anything that it could to further their interests. The idea at the time it was organized was that a small operator was not in position to argue his case against a large corporation, where a combination of a great many operators would be.

Q. Is it part of your duties to obtain reasonable rates for the transportation of coal?—A. There has been an effort made in that direction—a constant effort.

Q. What is the railroad rate at the present time to tide water?—A. That I really could not tell you.

Q. Do most of your members ship and sell their own coal, or do they sell it to the railroads for a proportion of the tide-water price?—A. None of the coal is sold to the railroads, but many of the members sell their coal to large companies, the stock of which, I understand, is practically controlled by the railroad companies. It is entirely separate—it is an entirely separate organization.

Q. That is what I meant. Do you sell to the coal companies that are supposed to be connected with the railroads?—A. The majority of the tonnage is taken by them.

Q. That is, the largest coal companies are really owned by the railroad companies themselves; or there is a community of interest, is there not, between them and the railroads?—A. I can only say, I suppose so. That is a question of the stock books. The stock transfers are the only things that will show that.

Q. You said that the independent operators had dropped from 34 per cent to 29 per cent this year. Will you tell us the cause of that falling off?—A. Quite a number have sold.

Q. (By Mr. CONGER.) Sold to whom?—A. To the various companies. Some of the largest companies have been increasing their holdings.

Q. The railroads?—A. Not directly, in any case.

Q. (By Mr. C. J. HARRIS.) We do not mean, when we say the railroad com-

panies; I think we would better say the companies which have been testified to as being controlled by the railroads. That is what we mean.—A. Yes; with that understood I should say, yes. I could not, of course, testify as to the control of these companies. That is something I do not know anything about.

Q. To what points is the coal shipped—the anthracite coal produced by these companies?—A. It really goes all over the country. The market extends south to New Orleans and west to Duluth, and to all points east of those cities.

Q. In what directions, if any, do you have most of the trouble with freight rates?—A. That would be a very difficult question to answer. Under the contracts there is no question of freight rates. The people who have sold their coal under contract have nothing whatever to do with the rate. On the relatively small proportion sold on their own account, naturally, there is complaint of the rate in every direction.

Q. Do your people have any complaints in regard to furnishing cars for other facilities?—A. That, I think is exactly as in any large industry. There are times when cars are scarce; and while we appreciate that it is impossible to furnish all that are needed, we find it a very wise plan to insist on getting them, though I am not sure it amounts to very much.

Q. Would you say they treat the companies in which they had an indirect interest better than they treat your independent companies?—A. Oh, no; not at all. I think the distribution of cars has been exceedingly fair all through. I would be very apt to hear any complaint in that direction.

Q. Are there any complaints in regard to terminal charges?—A. No; I do not remember of hearing of any complaint on that ground at all.

Q. What did I understand you to say in regard to the proportion of coal contracted to the larger companies as compared with what your independent operators ship and sell directly?—A. That I really could not answer. The larger proportion, I should say, is contracted.

Q. I understood you to say the larger proportion is sold to the larger companies?—A. Yes. In many cases, if I may explain, a company will contract to sell the greater part of its output. Anything it produces over and above the quantity contracted it may send to market on its own account. That is done sometimes.

Q. (By Mr. KENNEDY.) Did you not just now say that cars are furnished freely, that there is no trouble on account of cars?—A. When they can, the railroads furnish them. I think we all recognize that there are times when they can not give the cars.

Q. You heard the testimony of Mr. Brooks at Washington, did you not?—A. Yes.

Q. His complaint was that there was a great deal of trouble.—A. During the time grain is moving it is very difficult to get cars back. In many instances they have sent coal in box cars. I think that is a local matter. It is hardly a matter of any importance. The local agents may send in box cars to collieries whose chutes were not suited for them.

Q. Is the situation better now than it was at the time Mr. Brooks made the statement?—A. I should say, yes; decidedly. The railroads have all added to their rolling stock and to their motive power.

Q. He seemed to think it was because they were being discriminated against by the railroads.—A. I do not think so, because that is a contingency that happens in almost everything. I had the same trouble when I was in the iron business. Those are local matters; they are not broad.

Q. (By Mr. C. J. HARRIS.) What is the contract price generally made with the larger coal companies by the independent operators?

The WITNESS. The yearly contracts made a great many years ago gave the operators 40 and 45 per cent of the price at which coal sold at tide; and at the same time, I believe there were some contracts that were based on the amount paid to labor. The varying price of labor made a difference in the price that the operators received for their coal. Just how that was arranged I do not know. That was a matter of some 25 years ago. It was a regular scale contract. After that the rate was advanced to, I think, 55 per cent.

Q. We understand to-day it is 60.—A. Then it was made 60 per cent and was 60 from 1892 up to 1898—6 years.

Q. What is the contract that is to be made now?—A. The contracts are based on 65 per cent of the tide-water price.

Q. For how long a time is that contract to be made?—A. That, I think, depends on each individual company. It is a contract that is not made between the railroads, but between each coal company and each individual operator who chooses to sell.

Q. Is it not made for the whole product of the mine?—A. I think it is in some cases, and not in others. An operator whose lease terminates can not make such

an agreement. If the lease of any part of the ground terminates before the time by which all of the coal can be removed he can not contract for all the coal in the ground, so that each individual contract has to be drawn with that allowance.

Q. (By Mr. KENNEDY.) Have you seen these contracts?—A. I have simply seen the first form. It has been modified and worked over, and the last form I have not seen at all.

Q. You are familiar with all the terms of the contract, are you?—A. I really could not say I am. It has been in the hands of a special committee and has not come under my scrutiny at all.

Q. Could you send us a copy of it?—A. I really could not promise to do that. I could ask for it.

Q. You would only have to ask members of your association?—A. I should have to ask the executive committee.

Q. What percentage of the members of your organization have entered into that new contract with the companies?—A. That question I could not answer.

Q. Are they accepting it very generally?—A. They are; the majority of them are contracting on that basis. I might say they find it very much more to their advantage to do that, and avoid the necessity of having an office of their own to dispose of the coal. If they have an office of their own it is a very simple commercial proposition—they must have an office here and a representative in a dozen other places, involving large expense, while they may not be sending coal to those places.

Q. (By Mr. CONGER.) Do those contracts usually restrict the production of the mine?—A. Oh, no; never.

Q. Is the mine operator at liberty to produce as much coal as he has a mind to under that contract, and can he get cars to take as much as he will mine, regardless of the quantity?—A. The coal company agrees to take as much as it requires.

Q. Ah! As much as it requires?—A. I do not remember the clause that covers that ground, but the coal company certainly could not agree to take an amount of coal that it could not dispose of.

Q. What I was getting at was the fact as to how the production—the amount of production—is fixed.—A. Well, the coal company will take all the coal it can handle, and there comes in the point I made a little while ago—that the operators, when they ship over and above the amount contracted for, can sell the surplus on their own account.

Q. The operators can?—A. That has been the case always.

Q. If they dispose of their selling agencies they are not in position to market to great advantage, are they?—A. There are the various commission houses. There are in New York probably 18 or 20 large commission houses handling coal, both soft and hard.

Q. You testified a little while ago that the distribution of cars is, in your opinion, satisfactory to the operators at the present time. Naturally it would devolve upon the railroads to supply plenty of cars. Would they not, under this contract, have the first interest in that direction?—A. Most decidedly.

Q. Has that been the remedy for the evil?—A. I think the tendency, so far as I can see, is for the railroad companies to give the operators preference in the number of cars over their own collieries—that is, over the collieries operated by the companies supposed to be under railroad control. I notice that in taking the figures of the mine inspectors showing the number of days worked by various collieries, as a general thing, what we call the railroad collieries operate a less number of days than the individual collieries.

Q. (By Mr. KENNEDY.) Again that is directly a contradiction of Mr. Brooks's testimony.—A. That is what I say. It is purely a local matter. It is a matter that affects one colliery and may not affect another. That sort of thing may last at one colliery for a few days or a week. Shortage of cars is a local matter—a temporary matter.

Q. (By Mr. CONGER.) Are you an operator yourself?—A. No; I have not any interest in mines—that is, in hard coal.

Q. Have you any soft coal?—A. Yes; I am interested in several soft-coal mines.

Q. Do you consider that hard and soft coal are competitors?—A. Most emphatically. Thirty-five per cent of our output is in direct competition with bituminous coal. It is a competition that is steadily increasing.

Q. Have the independent operators any grievances at the present time? Are they satisfied with present conditions?—A. While they have taken in these contracts, I have not heard any complaints. The contracts are apparently satisfactory. Of course I think everybody would like more, but it has been doubtful whether it can be obtained.

Q. They are getting what they consider their fair share?—A. If fairly carried out, it really is; I think everybody considers it a very fair share. The arrangement puts the division on a very fair basis. Out of the difference between what the company

pays and what it receives, it has got to pay the freight rate, which is an arbitrary rate. These companies also have to pay their selling expenses and for the support of the various agencies.

Q. The present consumption of anthracite coal is about how much per annum?—A. Last year it was 47,000,000 tons, I think.

Q. Would the total capacity of these collieries be much greater than that consumption if they were run full time?—A. Not unless we had another class of men; the men won't work more time.

Q. Will not work more time?—A. No. They worked all the time in 1899; I think we were then just about as near our productive power as we can get.

Q. It has been testified to here in the last day or two that at present coal is being produced at the rate of 5,000,000 tons a month.—A. Yes; it is. But you could not do so much all the year round. To produce 5,000,000 tons a month you have to increase your dead work very rapidly, and that is slower work. You could not do it; you would not have space for it.

Q. Do you think every producer is putting out as much coal as he can at the present time?—A. No; I think there are some collieries that could put out more if they would press hard, but it would not be an advisable thing to do. Hasty mining is dangerous.

Q. Do you think the mines are being run at practically their full capacity—say two-thirds of the capacity at the present time?—A. I would say that to-day the mines are at full capacity, decidedly. The record of production is only 5,125,000 tons, I think, in a month.

Q. What I was getting at is whether there is any agreement or arrangement by which production is restricted among the operators?—A. No; there is nothing of the kind at all. There are times when the market simply does not take coal, and you have no place to store it. It is like any other large commodity. If you keep on running a factory you produce a certain amount of goods that you can not find a sale for; and the coal trade is in the same condition. During the summer months the market requires very little coal, and the mines operate until they have everything filled just as full as they can. They cover the current demand, and fill every available storage for the consumption in winter.

Q. (By Mr. C. J. HARRIS.) Is dead work done in the summer to some extent?—A. To some extent, yes; it is absolutely necessary to do that, so as to provide for extended mining in the winter; otherwise you could not operate.

Q. (By Mr. CONGER.) How is the price of coal fixed?—A. It is not fixed. Each company has its own price. The price varies according to the reputation the coal has, and according to the grade and quality.

Q. Does not coal of the same quality sell for about the same price in the same market now?—A. No; I should say the variation in the market would be between 70 and 80 cents a ton.

Q. In coal of the same grade?—A. Different kinds of coal.

Q. Same quality and grade?—A. Yes, I would be willing to say that is true practically of the same quality and grade. There is a difference in the reputation that a coal has. Some people prefer a free burning coal, and some prefer a slow burning coal.

Q. Can you mention any two names or kinds of coal between the prices of which there is such a wide divergence as 70 cents a ton at the present time?—A. Oh, yes. I should say that in any of the free-burning coals of the Upper Lackawanna region, as compared with the coals of the Lykens Valley district, you get a variation of more than that sum. Those are two extreme coals. They are both specialties.

Q. Do you refer to the New York price?—A. New York, yes; I am quoting f. o. b. New York.

Q. As I understand you, these two coals you have named are practically of the same quality?—A. No; they are different in quality. You can not get any two coals of the same quality. There are coals that have a reputation. The actual heating power of the one is practically the same as that of the other. I would say they are practically of the same quality. As to market value, they are entirely different in character, and consequently they have a different market value. Lykens Valley coal is a very choice coal to some people; other people would not use it under any consideration.

Q. (By Mr. RIPLEY.) Was there not formerly some sort of agreement or definite price put on each kind of coal?—A. I think there has been nothing of that kind since Mr. McLeod's time.

Q. That was customary, however, for a great many years, was it not?—A. No; that lasted only about 3 months, and that was not with all kinds of coal. That was only with the production of four or five companies.

Q. You mean to say, then, that in the market of New York to-day there is not a certain price for each grade of grate, stove, or nut coal? You mean to say there

is not a regular quotation for each one of those kinds of coal?—A. For an average all through?

Q. In general?—A. No; decidedly not.

Q. There is not?—A. No; there is not. One company will issue a circular for its coal, and you will find in that circular a series of variations all the year through. The circulars issued by the other companies are each for their own variety of coal.

Q. These collieries must overlap, do they not, so that two collieries or two companies will be producing practically the same quality of coal? That is, there is more than one company in the Lykens Valley district?—A. No; the Lykens coal is practically all brought up by the Lykens Valley Coal Company. The vein is touched by other companies.

Q. But the prices of that coal differ as between the different companies?—A. If all got out Lykens Valley coal they would all get the highest market price on that coal.

Q. In other words, there would be a practical agreement on that quality of coal?—A. No; I should not call it an agreement. I would rather put it this way. The people who were getting this class of coal would get just as much money for it as they get in the market.

Q. Did not the sales agents meet up to 2 years ago?—A. That I do not know.

Q. Were there not meetings of the sales agents representing all these companies?—A. That I do not know.

Q. There were meetings up to a comparatively recent date, were there not?—A. That I could not tell you.

Q. They were testified to very fully in 1892.—A. That was before my time.

Q. You have no knowledge, then, of meetings of sales agents within 5 years?—A. Absolutely none since I have been in the trade.

Q. You have never seen published reports?—A. I have seen numerous reports and statements.

Q. You have never seen anything to confirm them?—A. Absolutely nothing.

Q. (By Mr. KENNEDY.) Are soft-coal dealers members of your association?—A. No.

Q. Is there an association in New York of soft-coal men?—A. None that I know of.

Q. How is that coal handled here; does it come in as the property of individuals or the railroads?—A. It comes in as the property of individuals. Some of the very large soft-coal companies follow the same plan as the big anthracite companies do; that is, they buy up the product of the various small companies around them and ship it to New York as their product.

Q. Do you know anything about the difference of cost of shipping soft coal and hard coal—the charge per ton per mile by railroads?—A. No; I really could not say anything definite on that point. That is a matter of figures from the books of the company.

Q. You are interested in soft coal, are you not?—A. Yes.

Q. Shipping it?—A. Yes; I am interested in Tennessee and West Virginia mines.

Q. To what points do you ship that coal?—A. The West Virginia coal goes to Newport News and some of it West; the Tennessee to Chattanooga.

Q. Have you ever figured out the cost per ton per mile of shipping your soft coal?—A. Some years ago, in West Virginia, but that was an exceptional year. I think the cost was something in the neighborhood of three-tenths of a mill per ton per mile.

Q. You consider that very reasonable?—A. Yes; that was particularly reasonable.

Q. Was it more so than they are charging for shipping the hard coal in this region now?—A. Very much less; but the price there has advanced very materially since that time. That was really a losing price. The roads could not afford to operate on that basis.

Q. You know nothing about the charges of shipping soft coal to this market?—A. No; I do not; I am not in that business at all.

Q. Have heard of no complaints about the great disparity between the two?—A. Oh, naturally I have heard complaints. I think all anthracite people have complained that the soft coal gets into the market for less money than the anthracite does.

Q. Do you know of any reason why it should be brought in cheaper?—A. Yes; there is really a very good reason. Soft coal comes in train loads, and it is all the same. You can carry it out to the end of the dock and dump it into the boat and ship it. Anthracite comes in different sizes and is of different qualities; all have to be kept apart. Probably 5 cars will be of one kind. Those will have to be loaded into a barge. The others will have to be held, and you have got to hold the barges there under demurrage till you get enough of that grade to fill them up.

So it does make a very great difference in the cost. The coal must be put on storage piles, awaiting sufficient amount to fill a particular order or must be held in cars at the cost of demurrage on the cars. Of course, that does not pay. It means also interest on the value of the coal, as well as the breakage on the coal, which amounts to a big item. Soft coal is shipped direct. It goes right from the mine down into the barge. It is an infinitely easier article to handle.

Q. What is the rate per ton per mile of shipping hard coal to tide water?—A. The present rate? I could not answer. I would simply be giving a guess, and that would be, I think, very unsatisfactory. It varies on the different roads and according to different mileages.

Q. What has it been in a recent period?—A. Well, in the period which I compared with the rate then prevailing on the Chesapeake and Ohio, it was about nine-tenths of a mill; but that is not a fair comparison, you remember, because that nine-tenths includes all the selling charges, and this demurrage at tide, and the delays. It is very expensive.

Q. (By Mr. C. J. HARRIS.) Have you any estimate of the amount of anthracite coal in sight at present; how long it would last at the present rate of production?—A. None except that made by Griffith some years ago, and published in the Bond Record.

Q. Do you remember about what that was; how many years' supply he estimated there is ahead?—A. No, I really do not.

Q. Sixty or an hundred?—A. I really could not say offhand. My recollection is that the estimate of one hundred years was for all regions. That supply was estimated for some two hundred and fifty or three hundred years for the Reading Company alone; something of that kind. That is simply a guess. Really I do not remember.

Q. The Reading Company is the largest holder of coal lands of any of the railroads, is it not?—A. Oh, yes, by a great deal. I am speaking simply of the Reading Company as being the largest of all.

Q. (By Mr. KENNEDY.) What profit has the seller of coal now, on the ton?—A. What is his commission, you mean?

Q. Yes; or what is the profit? Can you give us the cost of bringing a ton of coal to New York—mining cost, and the transportation cost, and any other items of cost, if there be any, and the selling price of it?—A. No; I really could not do that. The figures vary so much in each case. They vary with every mine; with every part of the mine.

Q. Can you give an instance?—A. I could not give even a single case. That is a matter that does not come under my department at all.

Q. Do you know anybody that could do that?—A. That would have to be done by the individual operators, by each company. The figures vary in each case. They vary with the distance the mines are from tide, and they vary with business, the amount of track the operators own. Some of them have a few miles of track running from their breaker out to the railroad, and on that they get a certain mileage. And they vary with the vein they are mining in, and the length of time they have mined in the vein, and the local conditions for the vein. I do not think it would be possible to ever arrive at even a moderately accurate estimate. I took that thing under consideration a long time ago, and found it impossible to arrive at satisfactory conclusions.

Q. Can you give us any information about the export trade in anthracite coal, and also in bituminous coal?—A. In anthracite coal there has been practically no export to Europe. Some small quantities have gone over, I think more as samples than anything else. I do not suppose the total amount of anthracite export to Europe would be more than 10 or 15 tons. The Bureau of Statistics gives the figures of anthracite export, including the coal going to Canada. The Canadian market is a very large one for anthracite.

Q. Do you know anything about the exportation of the soft coal?—A. Yes; there is quite a great deal of it going abroad.

Q. You are in that trade yourself?—A. Yes, but we are not exporting any. I went over to Europe a couple of times just on that matter to find out what market there is, both for soft coal and hard coal.

Q. What do you think of it?—A. I think the market there is a very big one, especially in the southern part. I do not think we can touch the northern part for a great many years.

Q. Are you going exclusively into southern Europe?—A. Yes; I think the shipments this year will amount to close on to a million tons.

Q. Is that a great improvement?—A. There was practically nothing before. I really do not remember the exact figures. I did see them, too.

Q. (By Mr. C. J. HARRIS.) Where does the coal go from mostly?—A. Phila-

delphia and Newport News. I think a little has gone from New York—very little. New York is not so good a shipping point as those.

Q. West Virginia coal mostly?—A. West Virginia and Pennsylvania. The coal has been received very favorably on the other side, but our method of mining is so different from theirs and also the shipping, that it is going to take a little more effort to establish the market, and get firmly fixed in it than it would here.

Q. Whence have these southern countries of Europe formerly obtained their coal supply?—A. From England principally, and small quantities from Belgium and Germany. Spain produces practically no coal, Italy none; they have to import all they use.

Q. What did you say of the price of anthracite coal at present? What is it here in New York? What is it, delivered on the other side, on the Jersey side?—A. That would be a very difficult question to answer.

Q. What is the New York price of anthracite coal at present?—A. That would be beyond me to answer; it would depend altogether on the kind of coal you are going to buy.

Q. We have had an average price given us here?—A. Yes, but an average price would not apply to every coal. You probably could not buy a ton of coal on that basis.

Q. I think we have had an average price of \$1.25 or \$1.75.—A. I should not like to answer that question, because it would be simply a guess, and I do not think you would get a first-class coal on that basis.

Q. How much higher is anthracite coal at present than it was at the same time last year, if any?—A. I should say about 30 or 35 cents a ton. I do not know about that. [After looking at paper.] Yes, I think that is a very fair estimate. I have here a statement showing the averages are made up from the selling contracts prepared by me for the association. Each company turns over to the company from which it buys coal an exhibit of the average price at the end of each month. Those statements were sent to me, and I put all of them together.

Q. To what do you attribute the higher price at the present time when compared with the corresponding twelve months ago?—A. I think it is very largely due to the strike. It made coal extremely scarce.

Q. Do you have an idea that the prices will drop back to their old position?—A. Oh, I think so, beyond any doubt. You see anthracite coal in this market, in fact in all the markets, is meeting with a very strong competition from bituminous coal, and a very injurious result from the use of gas as fuel. Gas and steam are replacing it in the large office buildings and in houses for domestic use. The consumption of anthracite is unquestionably falling off.

Q. Suppose the price of anthracite coal should be unnaturally advanced; would there be any check for such advance?—A. There would be almost an immediate check from the increased consumption of gas—gas and bituminous coal for steam-making purposes.

Q. (By Mr. CONGER.) Is it not a fact that the price of anthracite coal has already been so advanced as to greatly encourage the use of gas and other fuels?—A. I would not put it in that way; no. If you will look over those figures you will see the price of anthracite has been comparatively regular from 1897 to 1900. Taking the average of any size—except, possibly, the steam sizes—I do not think you will find an average advance of more than 15 cents.

Q. (By Mr. C. J. HARRIS.) Can you give us the maximum price of the domestic coals for 1897, 1898, and 1899?—A. Those prices are not fixed that way. There is a general average of chestnut and larger.

Q. (By Mr. CONGER.) Are those prices from 1897 higher than they were previous to that?—A. No; they run just about the same. I have no general figures of this kind for previous years. I have the figures of some of the companies and some individuals who sold here. They run very close all the way through. They are much lower, I might say, than they were back in the latter part of the seventies and in the eighties.

Q. Everything else was lower?—A. Everything else was lower; yes.

Q. The independent coal operators have no grievances now of which they may complain?—A. I do not know of anything that I feel at liberty to complain about.

Q. (By Mr. C. J. HARRIS.) With the present new contracts that are offered to the independent operators will there be any large percentage of independent operators in the anthracite coal business in a short time?—A. In what way? I do not quite understand.

Q. If the independent operators tie up their properties on this 65 per cent contract, then that property, that product, is handled by the larger coal companies, and I understand you to say that the tendency is for the independent operators to go into this arrangement—to sign these contracts. In view of this outlook is it

not probable that there will be very little independent production in a short time?—A. What we call an independent operator is a man who owns and mines, irrespective of the way that he sells.

Q. The degree of independence—that is what I was trying to get at.—A. You mean independent shippers. If you put it that way, I think there will be comparatively few. I believe most of them will find the contract rather more to their advantage than the other method of selling.

Q. Has there been any corresponding reduction in freight rates offered the independent producer?—A. Oh, yes; that same proportion carries all through. You mean to the independent shipper?

Q. Yes, the independent shipper.—A. Yes.

Q. (By Mr. CONGER.) You are quite certain of that?—A. That is what I am told. I am simply giving my general information on that point. I think that is the general understanding among the shippers.

Q. Mr. Haddock testified this morning that he did not so understand it.—A. Mr. Haddock never had a contract.

Q. That is probably true, because it would harmonize with his testimony, which was to the effect that he had not as an independent shipper as yet been given a freight rate equivalent to 35 per cent of the selling price.—A. I should be very much amazed if he has, because those contracts have not gone into effect.

Q. Ought he not have it now if the present rate is 40 per cent?—A. The rate is not 40. That is not the way it should be calculated.

Q. (By Mr. KENNEDY.) You say you know of no cause of complaint on the part of the independent operators that you are at liberty to state. Do you mean by that you know of no complaint whatever?—A. No; I mean I am not authorized to make any complaint.

Q. Do you mean by that you know of no cause for complaint?—A. I think I would rather not answer that question.

Q. Are you familiar with labor conditions in the anthracite region?—A. Yes; fairly so.

Q. Do you think the miners were just in their demands last fall?—A. No, I do not.

Q. You do not?—A. I think part of the demands were possibly just, but the general demand, I think, was unfair.

Q. Are you in favor of arbitration of labor disputes?—A. Very strongly, when both sides can be equally responsible.

Q. Do you recognize that there were more than two parties interested in that strike last fall? Do you recognize the public as a party at interest in a trouble of that kind?—A. I think necessarily.

Q. Well, have you any opinion as to whether there should be any means of compulsory settlement of troubles of that magnitude when they affect all the people?—A. I think it would be very desirable if that same compulsion could apply equally to both operator and laborer; but while you could very easily apply compulsion to the operator, whose money is in his property, it would be very difficult to apply it to the laborer. The laborer has no interest; he has only to pack his trunk and household goods and leave.

Q. In that case the laborers were asking for arbitration from the very beginning, were they not?—A. There was nothing said about arbitration in the beginning; not in the beginning of the labor dispute.

Q. Are you sure that Mr. Mitchell did not submit a proposition for arbitration?—A. At the first meeting; but that was after the thing had gotten fairly under way, and the matter had been taken up locally first by the various unions and various lodges.

Q. (By Mr. RIPLEY.) You say, Mr. Fleming, that the individual operators have no complaint to make?—A. I say I am not authorized to make any complaint.

Q. You have said that there is a tendency toward decrease in the proportionate output of the independent operators during the last few years, have you not?—A. No; I referred to the difference between last year and this. Prior to this year there had been no material decrease.

Q. Has not a very considerable purchase of coal land been made by the coal companies within the last 2 years, beginning with the purchase by the New York, Ontario and Western, and other companies?—A. I think that was covered in a previous question; yes.

Q. (By Mr. KENNEDY.) Have you anything to volunteer?—A. No; I think you have covered the ground very thoroughly.

(Testimony closed.)

NEW YORK CITY, February 21, 1901.

TESTIMONY OF MR. ALFRED WALTER,

President Lehigh Valley Railroad Company.

The Special Subcommittee met at 1030 a. m., Mr. C. J. Harris presiding. At 1.42 p. m. Mr. Alfred Walter was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Will you give us your name and your occupation and address?—A. Alfred Walter, president of the Lehigh Valley Railroad; my residence is in South Bethlehem, Pa.

Q. We would like to question you to some extent in regard to the anthracite coal situation. Will you tell us what proportion of the anthracite coal output your railroad carries, or the companies connected with your line?—A. We transport something over 15½ per cent of the product.

Q. Has your proportion been increasing, or has there been any variation in that percentage for the last 10 or 15 years?—A. The percentage that we are hauling now is, according to my recollection, about that of the last 3 or 4 years.

Q. Is the coal output on your line produced by companies auxiliary to the railroad company or by independent operators?—A. It is produced by both.

Q. Do your auxiliary companies buy the output of the independent producers for the most part?—A. In part we do, and in part we do not.

Q. What is the percentage basis on which you buy and handle what you do buy?—A. At the present time we pay our operators from whom we buy coal 60 per cent of the selling price at tide water.

Q. That has been the evidence of most of the witnesses, but there has been mentioned a different proposition at the present time which would be more favorable to the independent operators—that is, a larger percentage to them. Have you made any of those contracts yet?—A. We have not concluded the arrangement. The matter is now under discussion.

Q. Is there probability that the operators will receive a still higher percentage than they now get?—A. It looks that way; yes.

Q. What do you say of the production and sale of anthracite coal; is it increasing from year to year, or does it stand about the same in tonnage?—A. In tonnage I think the statistics would show that it varies from year to year, but probably over a period of years it increases somewhat.

Q. Is there an economic limit to the price at which you can sell your anthracite coal? Could the price be advanced indefinitely, or, the minute the price of coal became what the people called exorbitant or considerably increased over what it now is, would there be a resort to the use of other articles for fuel?—A. Oh, unquestionably; it has done so already.

Q. What would you say of the price of coal to-day; is it a high, or a low, or a fair price?—A. I should say it is an equitable price. We hear of no complaints from anybody.

Q. Is the price of coal higher than it was at the same time a year ago, and if so, how much?—A. You are speaking now of the price to the consumer? You know there is a very great difference between the fluctuations of the wholesale price and the price to the consumer. The price of coal to the consumer does not vary very much. I could not give you exactly the difference. It is not much over 25 cents, if that.

Q. Is the margin between the wholesaler and the consumer—that is, the margin of profit—a fair and proper and equitable one, would you say, or could it be handled more economically by large companies?—A. I am not thoroughly advised on that subject, except in a very general way. It of course depends on the facilities that the people have for handling it. Many years ago, perhaps twenty years ago, coal was handled at all points in a very primitive way. I think, within my memory, when a boat load of coal came to the dealer's yard it was unloaded by a bucket and a mule. At that time the business was done on a small scale through a great many dealers, and the amount of money invested by any particular dealer in plant, etc., was very small. The tendency of the last few years has been to concentrate the handling of coal in fewer hands, and those people have invested much more money in labor-saving devices, have carried larger stocks of coal, and the presumption is that they save by so doing. It works out on the same line as all other business of a similar character.

Q. Is the cost of mining coal the same now that it was ten or fifteen years ago?—A. Oh, no. When I first became familiar with anthracite mining some twenty odd years ago, the great bulk or very large proportion of the mining was done at

what was called above water level; that is, the lands were developed by putting in drift or a tunnel, and the coal that was worked out was above that level. The result was that as water accumulated the mine drained itself, and at that time mining was a much more profitable undertaking than it is at the present time. Not only that, but it was like all occupations of that kind in that it was gone into by a number of individuals. The plant required was comparatively small. The amount of money spent at that time for a coal breaker probably did not run very much over \$40,000 or \$35,000, and a large part of the coal that was mined went to waste. Now those workings above water level have not existed for some years, and in order to obtain the tonnage it is necessary to go below the surface in a vertical way. That means that you run up against innumerable difficulties, increasing the cost in every direction. Not only that, but in order to get any return at all on the investment it is necessary to have much larger investments. For instance, the Lehigh Valley Coal Company is just completing one colliery operation that is going to cost us over \$500,000. The same tonnage was taken out twenty years ago by a number of operations that perhaps cost us \$25,000 or \$30,000 apiece.

Q. Why is it there have not been inventions of machinery in anthracite coal mining to cheapen the cost, or have there been any?—A. Oh, a great many. There has been a vast improvement in that respect.

Q. Do you use the electrical coal machines?—A. Yes; there are a number of devices of that kind.

Q. They work in anthracite the same as in soft coal, do they not?—A. The devices are different. Of course, the method of conducting anthracite mining is quite different from that of conducting the mining of bituminous coal; but the general idea that labor-saving machines have been invented and are used is true.

Q. But still that fact has not, I understand you to say, lowered the price of mining coal per ton?—A. Oh, no; because the other items of expense have increased in very much greater proportion.

Q. What do you say of the general community of interest which has been developed on the part of the various coal railroads in the last few months or the last year? Is coal mining and handling coming more and more into fewer hands?—A. I do not think it is coming, necessarily, into fewer hands; I do not see any evidence of that.

Q. Well, what would be the end and aim of such combination in an economic way—and the results?—A. I take it that the competitive conditions under which we have done a great deal of our work in years gone by, have developed so many conditions that they render difficult the reasonable and businesslike discussion of the intricate questions involved. It is desirable that when they are discussed they should be discussed under conditions that will enable this to be done without any particular interest feeling that it is jeopardizing its business interests.

Q. Would there be any savings arising from such a combination that would be likely to benefit the consumer as well as the people interested in the combinations?—A. Generally speaking, I think that any arrangement that can be brought about to benefit the producer is bound to benefit the consumer.

Q. You see the map of the coal fields [referring to map]. Do you mean that in such a combination the markets nearest to the coal field would be supplied from that coal field, saving, perhaps, in transportation of freight?—A. Not necessarily.

Q. That would not cut very much figure in the matter?—A. Not very much; not necessarily. You must remember that the anthracite coal from one region is entirely different from the anthracite coal from another region. In other words, anthracite coals are not all alike; they are not one substance, nor can they be used for one purpose. People who have been in the habit of burning anthracite coal from one region do not like to burn it from another. Take a very cold country; the people there like to burn a very hard coal. Take a warm section of the country; they like to burn a softer coal. There are some sections of the country, particularly down East, down in New England, where they pay a very high price for a certain class of coal, and do so because it is cheap for them to do it. I know it was the case some years ago in the manufacturing districts of Massachusetts, where the operators came home for their dinners in the middle of the day, that they would buy a small quantity of red ash coal, which will kindle with a match almost; and when burned up will burn itself up entirely, there being very little ash left; they got the full benefit of it. And I suppose they buy it still. They did formerly. They could afford to pay for that coal, whereas harder coal coming from a different vein could not be used for their purposes at all.

Q. (By Mr. KENNEDY.) What proportion of the coal product that goes over your road is that of independent operators and shippers?—A. Generally speaking about 60 per cent.

Q. Is that higher than the percentage carried over other roads?—A. Higher than most of them, yes. I think it is the highest of any.

Q. You mean 60 per cent of the coal that goes over your road is shipped by independent—by individual operators?—A. Yes.

Q. Do they get cars as freely, and are they supplied as cheerfully as they are given to your own people?—A. Oh, quite so; generally more freely.

Q. There is no complaint on that score, is there?—A. I think not.

Q. Is it not the policy of your road gradually to get absolute control of the product of your region?—A. No.

Q. Would there be any advantage to your company in having the mining and shipping and selling of the product?—A. None, excepting to conserve the general interest. Of course the operator, like everybody else, only asks what he thinks is his fair share of the business; and as the ability of the whole region to produce is very largely in excess of the ability of the market to take, the individual operator very often thinks that he should have the opportunity of shipping when, in order to conserve the general situation and make a reasonable and equitable division, it would be unwise for him to do so; that is, unwise for other people situated the same as himself, to have him do so.

Q. Is there any restraint in any way upon his shipping to the full capacity of his collieries?—A. No; if he does it, he does it of his own free will and accord.

Q. You ship about 15 per cent of the anthracite product?—A. Yes; something over 15 per cent.

Q. Is there any allotment to you of what your line shall carry of the anthracite?—A. No; we endeavor to conform to our proportion of the tonnage which can be shipped in any one month.

Q. Can you say what the maximum production of your field might be, as compared with what you are shipping now?—A. We are shipping now our maximum.

Q. You are shipping your maximum?—A. Yes; I think all fields are.

Q. (By Mr. RIPLEY.) Would that be true of the Philadelphia and Reading fields?—A. I think so. I can not speak for them, but that is my impression.

Q. You mean the maximum of collieries that are in existence, not the maximum amount of coal that is in the ground?—A. No; I mean the maximum of the ability to produce.

Q. (By Mr. KENNEDY.) Have the independents any large tracts in reserve that are not operated?—A. I think not.

Q. (By Mr. C. J. HARRIS.) Do the independents own or lease for the most part?—A. Both; I should say, perhaps, they lease more than they own.

Q. (By Mr. KENNEDY.) You said something about a 65 per cent contract. I would like to ask you if it is provided in that contract that those who sign it shall forever after be debarred from shipping during the life of the other collieries?—A. I do not understand your question.

Q. Is it provided in that contract that those who sign it, the independent operators, shall give the entire product of their collieries to the company, sell it to the company? Is the 65 per cent contract for the whole of their production?—A. Yes. I want to be a little careful in answering that question. I think there are a great many limitations and stipulations in connection with that.

Q. (By Mr. RIPLEY.) Practically it is for the life of the property.—A. Practically, yes; still, as I say, with certain limitations.

Q. (By Mr. KENNEDY.) I should like to have you tell us more about your understanding of this phrase which has become so common now, "community of interest," and how far the principle behind it has progressed among the coaler roads.—A. Of course, I can only speak of my own experience. I have no definite information in regard to others, and I do not know that I can state it any differently from the way in which I have stated it.

Q. Can you say whether gentlemen who are in the directorates of other railroads are also in yours?—A. Yes.

Q. And would they have a voice in bringing about a uniform policy in all the coaler railroads or most of them?—A. I do not think that; no. The idea of some people being interested in different properties is not at all an agreement. The presumption is that if a gentleman is interested in more than one property he will, when he considers a question in connection with any one property, take it up with a view to that property.

Q. Is there any tendency toward a consolidation of all these coaler properties?—A. Not that I know of.

Q. Is it possible, the way events are going, for an absolute control of them to be had by a few men?—A. I should think not. In the first place, you must take a practical view of that question. The affairs of these different companies are very complicated and very extended, and the difficulty now that we have in getting the results that economically are required involves the most careful consideration of all the questions that come up, and I think that gentlemen would hesitate to go beyond the point of transacting the affairs that are brought before them. We have all we can do to look after the interests of our individual property,

Q. (By Mr. RIPLEY.) For instance, what proportion of your total traffic in tonnage is coal and what general tonnage?—A. About one-half is coal.

Q. The percentage varies as between the different coal roads, I suppose?—A. Oh, yes; it is different on the different roads.

Q. Can you give us any statement of the approximate percentages—how it is on other roads? Is your percentage of coal tonnage higher than—A. (Interrupting.) As compared with other merchandise?

Q. Yes.—A. I would not care to answer. I have a very vague idea on that point.

Q. The large percentage of your tonnage is coal, and an equal proportion of other freight would make it very difficult to administer the property solely in the interest of the coal without jeopardizing the other interests, would it not? The fact that your business is of this dual nature would make it difficult to carry out a definite line of policy for coal without affecting the other branch of the business, that is to say, it is not exclusively a coal road?—A. No; you are quite right about that.

Q. So that, for instance, a director in that company, while wishing, perhaps because of being a director in another coal road, to influence the Lehigh Valley's course in the interest of the other road, would be obliged to consider the effect on the general traffic of that same road?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Were these so-called coal roads built originally for the coal traffic exclusively? Do you know about that?—A. You mean at their inception?

Q. Yes.—A. Some of them were and some were not.

Q. What I wanted to get at is this: Has their business outside of hauling coal become very much more important than it was when they first started?—A. Oh, yes.

Q. Is it growing?—A. Yes.

Q. Cities and towns and districts settle up, and the tonnage other than coal becomes a more important item every year; is that it?—A. Yes.

Q. (By Mr. KENNEDY.) I would like to ask you something about the labor condition in the anthracite region. Do you believe that the demands of the miners made last September were just?—A. I hesitate in answering, because in a business transaction I hardly know what you mean by the word "just." They made their demands and they were acceded to.

Q. (By Mr. RIPLEY.) The strike has not seriously embarrassed the companies, to your general knowledge?—A. Not up to the present time; no.

Q. (By Mr. KENNEDY.) I would like to ask you if the public is paying any more for coal as a result of that labor trouble of last year?—A. Oh, yes.

Q. One gentleman testified the other day that the labor men had done what the railroad presidents had not been able to do in the past; that is, they had reduced the amount of coal produced, restricted it, adding that it was a good thing for the railroads, a good thing for the independent operators, and a good thing for the miners. He did not say about the public. I would like to ask you if you think it was a good thing for the railroads, a good thing for the miners, and a good thing for the consumers?—A. In so far as it resulted in concessions to miners and in exhausting stocks which had accumulated.

Q. (By Mr. C. J. HARRIS.) It allowed a higher price to be made, did it?—A. It resulted in a higher price being made.

Q. (By Mr. KENNEDY.) In a way that statement was correct then, that it was beneficial to the railroads and to the producers?—A. For the time being.

Q. Is it beneficial to the public?—A. That depends entirely. I do not know what the public view of it is.

Q. Could you not put yourself in the place of the public?—A. No.

Q. Are you in favor of arbitration of these disputes between capital and labor?—A. That is rather a large question to answer in a few words. I believe that we should endeavor to get along with a minimum amount of friction with the people we employ and do all we can to prevent any trouble.

Q. Do you recognize that labor, in a great industry like that, should have a voice in fixing the wages, the hours of labor, and the conditions under which the laborers work?—A. I believe that labor should be in a position where it can discuss and endeavor to reach conclusions with the employer as to what it shall do for what it gets.

Q. Do you think labor can do that better in an organized capacity of, say 140,000 men, than—A. (Interrupting.) I think so—yes.

Q. You think organization is a good thing?—A. As a general proposition, yes.

Q. Do you recognize the public as a third party in interest to a controversy like that of last fall—the coal interests being one party, the mine workers another, and the public a third party?—A. I think that the employer, so far as he has obligations to the public, should recognize them.

Q. Would you recognize the public, the public being consumers of this coal? They are cut off from the article which they want, delayed in their business, and inconvenienced in their homes, and if the controversy continues, the price goes up. Under those circumstances would you recognize the public as a third party—a very large third party—to a controversy of that kind, and that each should have some voice, the influence of which should prevail in a controversy like that?—A. That is a very broad question to answer. I do not know that I am prepared to express myself very fully on it. It is very much of the nature of a one-sided proposition. If the price of coal goes down we have to stand the loss. The public does not take us into consideration very much. If an arrangement could be brought about whereby, when we are at a disadvantage we would be taken care of, it might be advisable under such conditions that in the other stage of the case we would have to be regardful of the public, too.

Q. You would not be in favor, in the public interest, of a legal force to bring troubles of that kind to an end before they go so far as to disastrously affect the public?—A. That depends very much upon conditions. I am not prepared to express myself on that decidedly.

Q. (By Mr. RIPLEY.) I want to ask you if you are aware of a proposition to build an independent line to tide water along the line of the old Delaware and Hudson Canal within the last year?—A. All I know about that is what I have read in the newspapers.

Q. What would have been the effect of putting in another independent line? Would it have been to make more friction between the roads?—A. I think that is reasonably to be supposed. We have had considerable experience in matters of that kind.

Q. Did you formerly ship any of the Pennsylvania Coal Company's coal?—A. No. Q. So that the acquisition of that property by the Erie would not affect you in any degree?—A. No.

Q. Can you say anything about the relative proportion of your output of anthracite from the northern and the southern territory? Is the coal of the southern fields more expensive to mine, or are those fields worked as cheaply as others?—A. When you speak of "southern," what do you mean?

Q. I mean the middle, western, and Schuylkill.—A. Of course the geological formation and characteristics of the different regions vary very much. The Schuylkill and what is known as the Mahanoy are more expensive to operate than others, and as time goes on the expense will increase.

Q. Is that not also true of other coal beds in the whole southern territory, that they are more expensive to mine than the northern?—A. Very much indeed.

Q. Is a larger proportion according to the area of output at the present time in the northern field? That is to say, is the Wyoming field more likely to be exhausted under present conditions than is the southern and middle western field as a whole? Is the northern field being more extensively worked?—A. I should say it is.

Q. I am simply trying to get at the description of the general situation. You have spoken of your percentage of the annual output as being about 15. There is no form of agreement as to that?—A. No, no.

Q. Are there any roads which have in the past held out against such a general allotment?—A. I think not.

Q. Has the Pennsylvania Railroad always been in entire harmony with other companies?—A. In a sense.

Q. But in a sense also not?—A. No; I think not. Of course, I do not know. I would prefer not to discuss the Pennsylvania's policy. I do not know what that is, but we have not found—I do not think they are peculiar in any way.

Q. The statement has been made by witnesses here, that in the past the Pennsylvania Railroad has been rather a "free lance," implying that it held itself aloof from any obligation to conform to any other operations or to conform to any agreement as to the output, and I want to ask you whether that is true in your judgment?—A. The reason I smile is this, that my experience in the last 10 or 15 years has been such—difficulties have been so great, controversies have been so great, and as far as the use of the lance is concerned, it has been so universal—that I do not think the term "free lance" applies to any particular person or company.

Q. Suppose you next year should turn out 20 per cent of the annual output—we will say of an output of 50,000,000 tons. Suppose you were to increase your output to 10,000,000 tons, would there be any complaint on the part of the other companies? Judging by experience of the past, are you quite free to extend your output?—A. If we are prepared to take the consequences.

Q. Those consequences would be what?—A. Disastrous to me.

Q. In the line of—A. General competition; general disturbance.

Q. I see. But so far as the direction that the company goes, that action might

be taken if your directors chose to do so?—A. Oh, yes; there is nothing to prevent them; in fact, it has been done repeatedly.

Q. Within recent years?—A. Yes; within the last 12 or 18 months.

Q. So recent as that?—A. Yes; oh, yes. We are producing freely, and the market is taking all we can produce, and we are not under strain.

Q. Have you ever heard a complaint on the part of the Philadelphia and Reading road that it should be entitled to a larger allotment?—A. Yes; I have; from every other road, too. I have not heard it from the Reading particularly.

Q. The Reading, however, controls more coal lands than other roads, and the map would seem to indicate that its proportion of coal fields is greater as compared with the others than its proportion of the total output. Has that proportion been larger in past years?—A. Yes; I think so.

Q. Considerably so?—A. I think so; yes.

Q. (By Mr. KENNEDY.) If all are perfectly free to mine to their full capacity why should there be any complaint from any of them in regard to allotment? Why should there be any complaint; why not go ahead and increase their output?—A. That would mean self-destruction.

Q. I should like to ask you if there is any competition; and how you follow it; on what basis?—A. In communities where bituminous coal is used, and under conditions where bituminous coal can be used and also the finest sizes of anthracite coal, the prices which obtain are affected by the prices at which bituminous coal is sold.

Q. What proportion of the anthracite output would that be, 35 per cent?—A. Yes; quite that or more. The proportion is constantly increasing, too. Of the total tonnage produced, the percentage of the fine coal is increasing with great rapidity.

(Testimony closed 2.28 p. m.)

NEW YORK CITY, February 21, 1901.

TESTIMONY OF MR. E. B. THOMAS,

President of the Erie Railroad Company.

The special subcommission met at the Chamber of Commerce building at 1.42 p. m., Mr. C. J. Harris presiding. At 2.29 p. m. Mr. E. B. Thomas, president of the Erie Railroad Company, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Mr. Thomas, will you give us your name and address, also stating your official position?—A. E. B. Thomas; 21 Cortlandt street; I am president of the Erie Railroad.

Q. How long have you been president of or connected with the Erie Railroad?—A. I have been connected with the Erie for thirteen years in different capacities; but have been engaged in the transportation business for over thirty years.

Q. Could you tell us what proportion of the Erie Railroad's traffic is in anthracite coal?—A. Yes; I will tell you from our last report, which I brought along because that will give it a little more accurately than I could from memory. Our total coal transport, coal and coke, was about 12,000,000 tons out of a total of 27,000,000 tons.

Q. Not quite one-half?—A. A little less than one-half—that is, hard coal, bituminous coal, and coke.

Q. Yes. Your bituminous coal comes from the Pennsylvania field?—A. From the Pennsylvania and Ohio fields.

Q. (By Mr. KENNEDY.) From the Hocking Valley?—A. We transport a certain amount of Hocking Valley coal in competing for transportation from Marion to Chicago, and possibly some little locally at junction points on our line. We are large carriers of Pittsburg coal, completing the transport of the Pittsburg and Lake Erie from Youngstown to Cleveland. We also distribute that coal locally on our lines, and we produce from our own mines of the bituminous coal for supply for market purposes about 1,600,000 tons. I speak in round numbers.

Q. (By Mr. C. J. HARRIS.) About how large an anthracite-coal tonnage do you carry?—A. About 6,000,000 tons. For the year ending June 30, 1900, our anthracite coal transported was 6,000,000 tons. For the calendar year of 1900 it was 5,200,000 tons.

Q. How much of this anthracite coal is mined by your own company; in a general way, what proportion?—A. We purchased 900,000 tons and we mined about 700,000 tons from our own mines. I will give you the distribution of the 5,200,000 tons of the last calendar year: For the Delaware and Hudson, 1,100,000 tons; for the Pennsylvania Coal Company, 1,900,000 tons; and for the Erie, 1,750,000. Now,

for all other producers and other railroads we transported 450,000 tons. That includes individual operators and coal coming to us at junction points.

Q. Do you handle this anthracite coal mostly by purchase?—A. Yes.

Q. And do the selling yourselves?—A. Do the selling ourselves.

Q. What is the percentage allowed the operator?—A. The operator has 60 per cent of the tide-water price. He has that net without any expense of selling or handling, and takes no commercial risks.

Q. We have had a great deal of testimony about a new contract that is being made, giving 65 per cent to the mine owners. Are your roads doing the same thing?—A. We are doing the same thing with our operators, and it is expected that arrangement will be consummated.

Q. (By Mr. KENNEDY.) Have any such contracts been signed?—A. On the part of the operators, yes. I have some on my desk that I have not as yet signed. I have no reason to doubt the arrangement will be completed.

Q. Would you furnish the commission a copy of that contract omitting the names?—A. I would not like to answer that question at the moment. If you leave that open I will answer before I leave the city. If the contracts go into effect, I have no hesitation whatever in saying I will do so.¹

Q. If any contract goes into effect?—A. Yes.

Q. Well, most all of them will have to go into that contract before any—?—A. (Interrupting.) No; we do not make that a condition. We do think, however, we would be entitled to the acceptance of it by the bulk of them.

Q. Does that contract provide that those who sign it shall dispose of the entire product of the mines during the life of the mine to the Erie Company?—A. No; the Erie Company does not make any of the contracts. Some coal companies in the interest of the Erie will make a contract to purchase of the miner the amount of coal he may have in the ground.

Q. (By Mr. RIPLEY.) That is, for the life of the property?—A. Yes; for the life of the property.

Q. (By Mr. KENNEDY.) So after he signs that contract he can not be an independent shipper of the coal from the mines covered by the contract?—A. No; from that particular mine he could not.

Q. (By Professor RIPLEY.) You have said that the contracts at the present time provide for 60 per cent of tide-water prices?—A. Yes; prepared sizes.

Q. Do you in conformity with that arrangement transport the coal of the independent operators who ship, for 40 per cent?—A. We never have declined to do so. The rates on anthracite coal vary from \$1.15 to \$1.40 a ton.

Q. The rates of freight would presumably be somewhat in advance of 40 per cent, would they not, to the person who ships individually?—A. An advance over 40 per cent? I do not think so. Certainly the rates to the individual operator would not be any higher than now.

Q. In other words, the individual operators would get the same rate to tide water that the person who signs a permanent contract would get?—A. I would not like to answer that question, because that is a question that has not been decided—what the rate will be on a 35 per cent rate. Under the 40 per cent rate, as they now stand, the rates are from \$1.15 to \$1.40 a ton.

Q. What determines?—A. The \$1.40 rate is on the prepared sizes and the other on reduced sizes.

Q. About what proportion of the price would that be; would it be in excess of 40 per cent?—A. About 40 per cent.

Q. So that it would make little difference substantially to the operator whether he has a contract with you for shipping at 60 per cent of the tide-water price or whether he has his coal carried by your company for him at his own risk, he selling at tide water?—A. That would be a very difficult question to answer because it has not been decided exactly what the rate will be on the 35 per cent basis.

Q. The complaint has been made before the commission that the individual operator who attempts to ship or sell for himself is charged somewhat in excess of that price. I want to ask you if that information conforms to any practice that you know of?—A. So far as I am aware—and I get in very close contact and touch—I do not know a single dissatisfied operator or shipper in all the anthracite region on the line of our road, nor do I know of any controversies between them. The most amicable and pleasant relations have existed during the entire time I have been connected with the road. It is the fashion in this country, if a man fails in business, either from want of capital, his own inability, or the unfortunate enterprise in which he is engaged, to charge his failure to the railroads rather than by any possibility to his want of industry or application or ability.

¹ Mr. Thomas later submitted a copy of the contract, stating that it had been adopted on the Erie, but that he could not speak for the other railroads. It was identical with that on page 556 of this volume.

be taken if your directors chose to do so?—A. Oh, yes; there is nothing to prevent them; in fact, it has been done repeatedly.

Q. Within recent years?—A. Yes; within the last 12 or 18 months.

Q. So recent as that?—A. Yes; oh, yes. We are producing freely, and the market is taking all we can produce, and we are not under strain.

Q. Have you ever heard a complaint on the part of the Philadelphia and Reading road that it should be entitled to a larger allotment?—A. Yes; I have; from every other road, too. I have not heard it from the Reading particularly.

Q. The Reading, however, controls more coal lands than other roads, and the map would seem to indicate that its proportion of coal fields is greater as compared with the others than its proportion of the total output. Has that proportion been larger in past years?—A. Yes; I think so.

Q. Considerably so?—A. I think so; yes.

Q. (By Mr. KENNEDY.) If all are perfectly free to mine to their full capacity why should there be any complaint from any of them in regard to allotment? Why should there be any complaint; why not go ahead and increase their output?—A. That would mean self-destruction.

Q. I should like to ask you if there is any competition; and how you follow it; on what basis?—A. In communities where bituminous coal is used, and under conditions where bituminous coal can be used and also the finest sizes of anthracite coal, the prices which obtain are affected by the prices at which bituminous coal is sold.

Q. What proportion of the anthracite output would that be, 35 per cent?—A. Yes; quite that or more. The proportion is constantly increasing, too. Of the total tonnage produced, the percentage of the fine coal is increasing with great rapidity.

(Testimony closed 2.28 p. m.)

NEW YORK CITY, February 21, 1901.

TESTIMONY OF MR. E. B. THOMAS,

President of the Erie Railroad Company.

The special subcommission met at the Chamber of Commerce building at 1.42 p. m., Mr. C. J. Harris presiding. At 2.29 p. m. Mr. E. B. Thomas, president of the Erie Railroad Company, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. C. J. HARRIS.) Mr. Thomas, will you give us your name and address, also stating your official position?—A. E. B. Thomas; 21 Cortlandt street; I am president of the Erie Railroad.

Q. How long have you been president of or connected with the Erie Railroad?—A. I have been connected with the Erie for thirteen years in different capacities; but have been engaged in the transportation business for over thirty years.

Q. Could you tell us what proportion of the Erie Railroad's traffic is in anthracite coal?—A. Yes; I will tell you from our last report, which I brought along because that will give it a little more accurately than I could from memory. Our total coal transport, coal and coke, was about 12,000,000 tons out of a total of 27,000,000 tons.

Q. Not quite one-half?—A. A little less than one-half—that is, hard coal, bituminous coal, and coke.

Q. Yes. Your bituminous coal comes from the Pennsylvania field?—A. From the Pennsylvania and Ohio fields.

Q. (By Mr. KENNEDY.) From the Hocking Valley?—A. We transport a certain amount of Hocking Valley coal in competing for transportation from Marion to Chicago, and possibly some little locally at junction points on our line. We are large carriers of Pittsburg coal, completing the transport of the Pittsburg and Lake Erie from Youngstown to Cleveland. We also distribute that coal locally on our lines, and we produce from our own mines of the bituminous coal for supply for market purposes about 1,000,000 tons. I speak in round numbers.

Q. (By Mr. C. J. HARRIS.) About how large an anthracite-coal tonnage do you carry?—A. About 6,000,000 tons. For the year ending June 30, 1900, our anthracite coal transported was 6,000,000 tons. For the calendar year of 1900 it was 5,200,000 tons.

Q. How much of this anthracite coal is mined by your own company; in a general way, what proportion?—A. We purchased 900,000 tons and we mined about 700,000 tons from our own mines. I will give you the distribution of the 5,200,000 tons of the last calendar year: For the Delaware and Hudson, 1,100,000 tons; for the Pennsylvania Coal Company, 1,900,000 tons; and for the Erie, 1,750,000. Now,

for all other producers and other railroads we transported 450,000 tons. That includes individual operators and coal coming to us at junction points.

Q. Do you handle this anthracite coal mostly by purchase?—A. Yes.

Q. And do the selling yourselves?—A. Do the selling ourselves.

Q. What is the percentage allowed the operator?—A. The operator has 60 per cent of the tide-water price. He has that net without any expense of selling or handling, and takes no commercial risks.

Q. We have had a great deal of testimony about a new contract that is being made, giving 65 per cent to the mine owners. Are your roads doing the same thing?—A. We are doing the same thing with our operators, and it is expected that arrangement will be consummated.

Q. (By Mr. KENNEDY.) Have any such contracts been signed?—A. On the part of the operators, yes. I have some on my desk that I have not as yet signed. I have no reason to doubt the arrangement will be completed.

Q. Would you furnish the commission a copy of that contract omitting the names?—A. I would not like to answer that question at the moment. If you leave that open I will answer before I leave the city. If the contracts go into effect, I have no hesitation whatever in saying I will do so.¹

Q. If any contract goes into effect?—A. Yes.

Q. Well, most all of them will have to go into that contract before any?—A. (Interrupting.) No; we do not make that a condition. We do think, however, we would be entitled to the acceptance of it by the bulk of them.

Q. Does that contract provide that those who sign it shall dispose of the entire product of the mines during the life of the mine to the Erie Company?—A. No; the Erie Company does not make any of the contracts. Some coal companies in the interest of the Erie will make a contract to purchase of the miner the amount of coal he may have in the ground.

Q. (By Mr. RIPLEY.) That is, for the life of the property?—A. Yes; for the life of the property.

Q. (By Mr. KENNEDY.) So after he signs that contract he can not be an independent shipper of the coal from the mines covered by the contract?—A. No; from that particular mine he could not.

Q. (By Professor RIPLEY.) You have said that the contracts at the present time provide for 60 per cent of tide-water prices?—A. Yes; prepared sizes.

Q. Do you in conformity with that arrangement transport the coal of the independent operators who ship, for 40 per cent?—A. We never have declined to do so. The rates on anthracite coal vary from \$1.15 to \$1.40 a ton.

Q. The rates of freight would presumably be somewhat in advance of 40 per cent, would they not, to the person who ships individually?—A. An advance over 40 per cent? I do not think so. Certainly the rates to the individual operator would not be any higher than now.

Q. In other words, the individual operators would get the same rate to tide water that the person who signs a permanent contract would get?—A. I would not like to answer that question, because that is a question that has not been decided—what the rate will be on a 35 per cent rate. Under the 40 per cent rate, as they now stand, the rates are from \$1.15 to \$1.40 a ton.

Q. What determines?—A. The \$1.40 rate is on the prepared sizes and the other on reduced sizes.

Q. About what proportion of the price would that be; would it be in excess of 40 per cent?—A. About 40 per cent.

Q. So that it would make little difference substantially to the operator whether he has a contract with you for shipping at 60 per cent of the tide-water price or whether he has his coal carried by your company for him at his own risk, he selling at tide water?—A. That would be a very difficult question to answer because it has not been decided exactly what the rate will be on the 35 per cent basis.

Q. The complaint has been made before the commission that the individual operator who attempts to ship or sell for himself is charged somewhat in excess of that price. I want to ask you if that information conforms to any practice that you know of?—A. So far as I am aware—and I get in very close contact and touch—I do not know a single dissatisfied operator or shipper in all the anthracite region on the line of our road, nor do I know of any controversies between them. The most amicable and pleasant relations have existed during the entire time I have been connected with the road. It is the fashion in this country, if a man fails in business, either from want of capital, his own inability, or the unfortunate enterprise in which he is engaged, to charge his failure to the railroads rather than by any possibility to his want of industry or application or ability.

¹ Mr. Thomas later submitted a copy of the contract, stating that it had been adopted on the Erie, but that he could not speak for the other railroads. It was identical with that on page 506 of this volume.

Q. You have implied that the railroads would be justified in charging somewhat more for the transportation of individual operators' coal in getting that coal to tide water than they would charge if they had purchased the entire output of that mine; will you state what reason you have for that position?—A. Because the coal which they purchase is purchased under an arrangement which gives them a stability of business; the other is irregular. An operator may want cars to-day, he may not want them to-morrow; we may be prepared to furnish them to-day, and for one day they may be idle. There is no uniformity of transportation, which is a very essential element in the cost, and I believe that would justify a higher rate under those conditions. If we directed absolutely the output of the mine, we would know to-day whether that mine is going to work to-morrow and to what extent, and we could supply that transportation with regularity.

Q. (By Mr. C. J. HARRIS.) Your road would be able to rely on that amount of traffic always, whatever competition might come in?—A. Yes.

Q. What is the economic purpose of this combination or community of interest in the coal-operating roads that has gone to the front in the last six months? What is there to be said in favor of it?—A. I do not know of any combination, and perhaps this is as good a time and opportunity as will be presented to get clearly before you the fact that there is none. I know of no coal combination whatever. The nearest we ever came to one was in 1896, when the several anthracite-carrying roads entered into an agreement limiting the amount of transportation of anthracite coal, and agreeing upon a specific percentage which each of them would carry. That agreement was to continue, and did continue, for one year. It expired by limitation and has never been renewed. There is to-day no moral obligation on any railroad not to transport or mine all the coal it can dispose of. I am at perfect liberty on the part of the Erie road to mine all the coal I can, furnish transportation or bring it down here, and if I can sell it at a profit, to do so; or, if I prefer, throw it in the North River, which, if I could not dispose of it, I would have to do.

Q. (By Mr. KENNEDY.) If there were any combination or coal trust, as it is sometimes called in the public press, you would know of its existence?—A. Considering the amount we transport, I think I would have to be invited to be such a party to make it a real good strong success. I want to be perfectly frank and distinct in my disclaimer in that respect. Now, as to community of interest, we do consult together. It is impossible to conduct the commercial affairs of this country without consultation. There are no agreements, express or implied. We are at liberty to, and we do, mine and market as much anthracite coal as we can profitably find an outlet for.

Q. (By Mr. RIPLEY.) You feel that if you increased your proportion that would be an invitation to all other roads to do the same thing, and there would be an excess of production?—A. These markets are fairly well divided up as a result of long years of experience between the several coal producers and transporters. I could go, for instance, into the territory of some other road that has hitherto supplied the coal, and I could reduce the price of coal there and thereby add to my own transportation and market for a while. In a little while, however, the same thing would occur in our territory, the result of which would be that I would have succeeded in permanently lowering the price without any benefit to myself. Now, that is all there is of community of interest. The greatest danger that the public have to apprehend is from unrestricted and unrestrained competition. The great danger to the public in railroad rates is not that railroad rates may be too high; not that by combination among railroads we may so put up rates as to cripple commerce. The danger is from too low rates and favoritism, the former being the most important factor in breeding the latter. What this country commercially wants, and what I think the people want, if they thoroughly understand the question, is stability of rates—uniformity of rates; that A shall pay as much as B, and B shall pay as much as C; that favoritism shall be stopped. I know of no more pernicious factor in bringing about favoritism than unrestrained and unrestricted competition.

Q. Is there a tendency toward equitable freight rates at the present time? No favoritism; no rebates?—A. Rates as they exist to-day are not perfect, by any means, but they are more stable and more uniform than I have ever known them to be in my experience.

Q. What is the cause of that—the good times or the better understanding among the railroad managers?—A. Both.

Q. Which is the larger factor?—A. That would be very difficult to say. There have been a great many changes in the personnel among railroad men in the last few years, and, naturally, the transportation business, like every other, is one in which the element of personal equation can not be entirely overlooked. I think there is a feeling of more confidence on the part of each of us, and at the same time among us a disposition to bring about a better state of affairs. The railroads

of this country have shown their ability to transport a ton of freight 100 miles, or 1 mile, more cheaply than in any other country in the world.

Q. (By Mr. KENNEDY.) Why are they able to do that?—A. For a great many reasons. This is a new country, with opportunities for creating business and increasing our tonnage. We have stimulated development in every possible manner and in every possible way. No doubt the element of competition has done a great deal toward that. We have built a cheaper class of roads than other countries, and while our capitalization seems large it is very small compared with that of foreign roads. The capitalization of English roads runs as high as \$350,000 a mile, and it has been not unpopular to cry at the Erie road because it had a bonded debt of \$70,000 a mile—a property which could not be reproduced to-day for the bonded debt and a very large sum in addition.

Q. (By Mr. RIPLEY.) If you included the value of the terminals?—A. We have included the value of the terminals.

Q. But excluding the value of terminals it might be— A. I am not so sure about that, because I doubt very much the estimates of what can be done, compared with what is actually accomplished. For instance, the Lehigh Valley road several years ago used our tracks from Elmira to Buffalo for their own terminal at Buffalo. They were dissatisfied with the arrangements, and upon the expiration of the contract they gave us notice that they desired to build their own line. We made every effort to keep them, but they presented statements as to how cheaply they could build the road and how satisfactory the result would be to them, and they went off and built the road. I think to-day they would be glad to be back.

Q. The country is paying interest on two parallel roads instead of one?—A. Exactly. The best example of that is the Nickel Plate and the West Shore. They were parallel and competing lines, built against two railroads that can transport freight probably more cheaply than any other in the world. How much better would the country have been conserved had the money invested in those two roads been applied to the improvements upon existing lines, the cheapening of transportation, and the giving of better service to the public.

Q. Would not that same reasoning apply to the paralleling of the Lehigh Valley and the Central of New Jersey as they appear on that map [referring to map]?—A. Precisely. Either one of them were competent to do all the business through that territory.

Q. (By Mr. KENNEDY.) What benefit would the public have if there were but one of those roads, as you see it now?—A. I never have known of an instance where we succeeded in reducing the cost of transportation that in the end the public did not receive the benefit of it.

Q. (By Mr. C. J. HARRIS.) If one road could secure the whole tonnage and traffic of the two roads they would be able to make some reduction in charges perhaps on account of that increased business?—A. They certainly could.

Q. Some 20 or 25 per cent, perhaps?—A. I would not like to state the amount.

Q. Well, it would be some percentage of reduction?—A. They certainly could do that, and had legislation been directed to preventing the building of the competing lines which were unnecessary and to the restriction of the capital issues upon which profits should have been paid to the existing lines, then the legislation would have been in the line of affording a better solution to this problem than it has thus far done.

Q. Do you think that without this competition the then existing railroad would have reduced traffic charges?—A. As I say, I have never known an instance where we succeeded in reducing the cost of transportation that ultimately the benefit of that did not go to the public. It is a very narrow question and very difficult to answer as to whether, without any competition whatever, a reduction would have been made. That is going into the field of theory to too great an extent, but you must bear in mind that America is competing with the world. The price at which we ship a car of grain from Chicago to New York is not fixed by the railroad. It is fixed on the Bourse of France, by the markets of England and the Continent, and it is in competition with the Argentine Republic, with India, Russia, and all other producing countries. It costs so much, or at least the producer is willing to sell it at the point of production for so much; it is worth so much at foreign markets: shall America step in and take that or leave it?

Q. (By Mr. KENNEDY.) It is largely the railroads that must decide whether the American farmer gets the foreign market for his grain?—A. To some extent. Now, being forced to carry that export trade in competition with the world, it would have been an impossibility for them to so advance rates as to cripple seriously or produce any injustice toward shippers. That is my answer to your question as to whether if it had not been for this competition we would have reduced the rates.

Q. Does not the shipment of grain by the Mississippi River and the Gulf have an

influence?—A. It has a very great influence; likewise shipment on the lakes to Buffalo and on the canal from there to the St. Lawrence River and the Canadian line.

Q. (By Mr. RIPLEY.) The statement has been made in the past that the Erie Railroad has been rather prominent in providing low rates of freight as in competition with some of the trunk lines. That condition prevailed through some years in the past, did it not?—A. Well, I would not like to say that I was any more virtuous than my competitors.

Q. I did not put it on the ground of virtue. You got a larger volume of tonnage, did you not? Supposing you did offer lower rates, you got a larger proportion of tonnage thereby?—A. Yes. I never heard of the Erie Railroad offering a rate that it was not forced to by a competitor, or promptly met by it.

Q. And that rate even for a road like yours, which lies well inside of our territory, is undoubtedly affected by competition of roads that lie in Canada?—A. The competition of the Canadian roads is a very important factor in the rates of the American roads.

Q. Even as far south as the territory through which you operate?—A. Even as far south as New Orleans.

Q. Can you explain, by example, what you mean by the latter statement?—A. Because it goes right back to a statement I have made in regard to this foreign export business. If a man can export his shipment via Montreal at a lower rate, if that rate is not met by the roads via Galveston and New Orleans, then they must forego the business. Likewise, if it is not met by the roads through the interior they must forego it. It makes no difference, materially, to the exporter whether that property passes through Montreal, Portland, Boston, New York, Philadelphia, Galveston, or New Orleans.

Q. Would it not be an advantage to the roads in American territory if that competition with the Canadian roads ceased to exist?—A. If they were brought under the same laws and regulations as we are I do not know whether there would be any more propriety in eliminating them from the field than in eliminating us, but as long as they are free from restriction we are compelled to observe their competition.

Q. I want to ask about the growth of the Erie system. What is the present relation of the New York, Susquehanna and Western and the Erie Railroad?—A. The capital stock of the New York, Susquehanna and Western is owned by the Erie Railroad.

Q. The entire stock?—A. Substantially. It was taken through an exchange of stocks.

Q. Is that the same relation that exists at the present time between the Erie Railroad and the short road of the Erie and Wyoming Valley, which has recently been acquired?—A. The Erie and Wyoming Valley road is the road that belonged to the Pennsylvania Coal Company, and extended from Hawley to Scranton, in the anthracite region. They also own the road from Hawley to Lackawaxen, the latter being under lease to us—the Erie Railroad.

Q. The purchase, then, of the Pennsylvania Coal Company carried with it the purchase of that road?—A. Of the Erie and Wyoming Valley; yes.

Q. The purchase of the Pennsylvania Coal Company will very considerably affect your proportion of the total tonnage, will it not?—A. It simply preserves to us the tonnage we have enjoyed since the existence of the two properties, 38 years.

Q. They have always shipped over your line?—A. They have.

Q. It, however, gives you a permanent guaranty of stability of traffic in this way?—A. It does, and that was one of the greatest—one of the controlling features in the purchase. If the relations that have existed in the past between the Pennsylvania Coal Company and the Erie road could have been guaranteed there would have been no object whatever to us in the purchase of the Pennsylvania Coal Company, because we were carrying all their traffic. At times we thought we did not get a fair division of the rate, but that was a matter of bargain and sale.

Q. Was not that the same division of the rate that was accepted by the other dealers?—A. No; it was the division of the transportation of the two railroads that I have referred to.

Q. But there was perhaps friction in that respect owing to the fact that that company owned that railroad?—A. That was a factor in it.

Q. Is the price of these properties—the price paid by the railroad—a matter of public record?—A. It is.

Q. Will you then state that price to us?—A. The price was \$32,000,000, in 4 per cent collateral trust bonds, and \$5,000,000 in preferred stock.

Q. That represents a purchase of the company at what market figure, as compared with its value during recent years?—A. I do not know of any public value that has been placed on the Erie and Wyoming Valley. It was a company of very small capitalization.

Q. I refer to the Pennsylvania Coal Company.—A. The Pennsylvania Coal Company only had a capitalization of \$5,000,000. It was one of the oldest companies in the field, and, as I say, business relations have existed between the two companies since its formation, over 38 years ago. Unfortunately, the Erie Railroad in its coal business just reached the edge of the promised land. In other words, we went to Carbondale with our Jefferson branch, connecting with the Susquehanna on the west, and we went to Lackawaxen, and afterwards to Hawley. We did not reach the absolute point at which this property was produced, with the resulting effect that we were subjected to large laterals from the roads which did reach and control them.

Q. In other words, they took an undue proportion of the through rate?—A. We always thought they did; probably they thought otherwise. At all events they got it. Now, the incentive for the purchase by the Erie Railroad of the Pennsylvania Coal Company was the continuance to its lines of a transportation which it has enjoyed for a great many years and the insuring its own fuel supply by absolutely controlling the source and putting its own cars by its own power under its own breakers. We consume on our road 2,200,000 tons of coal every year in the conduct of our business, of which 350,000 tons is anthracite.

Q. What proportion of that anthracite production from your field and tributary fields goes to New England and the West, respectively, and to tide water?—A. I can not state that proportion exactly. The Pennsylvania Coal Company and the Delaware and Hudson ship each about a million tons. I think we pull about three million tons to tide water ourselves. As to what becomes of that, after it goes to tide water, how much is consumed here, and how much goes to Sound points and around Cape Cod and to New England points. I have not figures at my command to show.

Q. But practically, so far as you are concerned, all New England tonnage goes by water?—A. No; we dispose of some New England tonnage by Fishkill and Newburg.

Q. Will you explain as to whether there are compound rates in force between the coal field and New England?—A. I do not know what a compound rate is.

Q. The statement has been made before this commission that one rate was charged to the Hudson River, and that then another rate was charged from thereon. In other words, that the through rate to Boston.—A. (Interrupting.) Was the sum of those two rates?

Q. Was the same as those two rates; yes. Is that practice in force via the Harlem River?—A. I do not know; we do not handle any coal that way.

Q. By the Hudson River?—A. Yes; I think that is the way the rates are made.

Q. Will you state what practical reason exists in business for making double rates?—A. The ability of the New Haven road to exact a rate.

Q. But at Fishkill you connect with other New England roads?—A. No; we connect with the old New York and New England, which is now a part of the New York and New Haven system.

Q. The coal does not come through on a through bill of lading?—A. No; I think not. I think the rates are through rates; I think the coal is billed through, but the division is agreed upon. I think it gives the New Haven road a very much larger proportion per ton per mile than the road west of the river gets.

Q. In other words, the road in New England territory gets a larger proportion than the mileage seems to imply?—A. Yes; that is, it is not pro rated per ton mile over the two roads.

Q. Why is the New Haven road able to exact this—because it monopolizes a certain territory?—A. Largely.

Q. Would that not be an indication of the possible danger in granting a monopoly of territory to a road or a set or combination of roads? Would it not indicate that they could, in a measure, set an arbitrary rate?—A. No; because, on the other hand, they are exposed to the competition of the water. They are also exposed to the competition of the Fitchburg, Delaware and Hudson and the Boston and Maine from the northern ports, and also from the competition of bituminous coal from Virginia fields.

Q. Still does not that leave, within a definite territory, each of the roads a certain traffic which it can absolutely control?—A. Possibly.

Q. That is, all points in New England are certainly in competition?—A. No.

Q. There are many points on the Boston and Maine and New York, New Haven and Hartford territory which are entirely controlled by the road in whose territory they lie?—A. Yes.

Q. The point I am getting at is simply this: To ask you whether, if a monopoly of traffic in a given region has to be given to the roads, insuring them stability of traffic and with the desired result of stability in rates, there ought not to be some regulative power to determine when these rates are just and reasonable; that is, whether monopoly does not, with all its advantages, from one point of view, imply

some regulative power on the other?—A. Possibly; yes; but a manager who undertakes to work on that line of policy would soon ruin his business by absolutely drying up his source of supply, and would put his territory at such a disadvantage with the remaining portion of the country that neither the manufacturer nor the transporter could exist, and he would be forced to recognize that competition, even though he disregarded all moral and other obligations.

Q. That would be true certainly if you were speaking of a long term of years. Might it not be possible, however, for a certain board of directors and administration to come in and milk that territory for speculative purposes while they maintained control of that road?—A. Yes; but my experience is that speculators can milk more quickly through Wall street than through any such method as that. What they want is the dollar, and they want it quick. They may ultimately get out through some such channel as that. The latter is too tortuous, too lengthy, and too dangerous a channel to pilot the speculation through safely.

Q. And yet have there not been samples of squeezing of territory in a way to be not certainly in the permanent interest of the property, but which has occurred by reason of temporary control?—A. I do not recall any instances of that kind, and in my experience I never knew an appeal made by a majority of manufacturers or by communities in which the attention of managers was called to their condition, the impossibility of their meeting other competition fairly, of sustaining themselves, that was not promptly and fairly and liberally met. It is to the interest of every railroad manager to develop and sustain to the greatest extent the business along his line. We run trains on which we carry people that do not at times pay us the cost of their transportation. Why? Because we want to develop that country; we want to induce people to go there and manufacturers to settle there; and the difference between having a thickly settled community along your line and having a wilderness is success or failure.

Q. Does the purchase of the New Jersey Central by the Philadelphia and Reading road in any way affect the proportion of your tonnage, the volume or the character of it, as far as you are concerned?—A. Not a particle.

Q. In other words, the allotment of tonnage—of coal tonnage—is so firmly established that the consolidation of two or three roads will not affect it?—A. Excuse the interruption; there is no allotage of tonnage. But the tonnage that honestly belongs to each road and is marketed by it is so thoroughly established and well fixed, being the result of years of working, whether that is controlled by one or two companies cuts no figure whatever.

Q. (By Mr. KENNEDY.) Did not some of those roads complain at times that they did not have their proper allotment, that their allotment should be increased, etc.?—A. There is no allotment, and there has not been since 1897. I am very particular in making that point, because of charges made in respect to combinations. I never knew anybody to think that he got enough, and, naturally, the railroad managers are made up of the same clay as the balance of the world.

Q. They complained, some of them, that they did not ship their proper proportion of the entire production?—A. I think the Erie road doesn't get enough, either in tonnage or money.

Q. If you think not, you may increase your production, if you have facilities to do so?—A. Yes; and I can't make any money by doing so, but by increasing production and extending my markets I am pulling down the price on all my business. I would think about it a little while before being very aggressive on that line.

Q. The railroad men are thinking more wisely and intelligently?—A. By experience.

Q. The effect would be to pull down prices?—A. Certainly; yes. Suppose I am transporting, and I legitimately place 100 tons which I am marketing. Now, I can go over in some other man's field and I could make my transportation 110 tons, but by doing that I pull down my 100 tons, for which I am getting a fair price, to the level at which I am carrying that 110 tons. It is not good commercial policy.

Q. But the public gets cheaper coal?—A. For the moment, yes; in the end, no.

Q. Do you dispose of your product at tide water at practically the same level as the other coal roads dispose of theirs?—A. The prices vary slightly. I think we get about the same prices as the others. There are shades of difference in the coal, and there are tastes in the buyers. Some people give more for one particular coal from some particular mine than they will give for coal from another mine. For instance, the Lehigh has a more extended reputation than the Lackawanna coal, and can demand a little higher price in the markets.

Q. Is there any sort of connection in determining what the price shall be in New York or tide water?—A. No; I can not say there is any. There are consultations in regard to it. The Reading is the largest producer. That company sometimes fixes the price, and we generally follow.

Q. (By Mr. C. J. HARRIS.) Is there a market price for coal every day about the same as for wheat?—A. The price does not vary to that extent.

Q. (By Mr. KENNEDY.) The Reading fixes the price, you say?—A. Not invariably. Some of the larger companies lead off in their prices, and the rest follow.

Q. (By Mr. RIPLEY.) Does not the Reading Railroad control a larger proportion of the undeveloped coal lands than any of the other coal companies?—A. I so understand.

Q. Is not the cost of carrying their interest charges on these undeveloped coal lands put upon the earning power of the corporation?—A. That may have been the case originally, but the Reading has been through bankruptcy so many times since it acquired that land that I think it would be difficult for it to obtain that increase. At all events, the Reading can secure no more for transportation than the rest of us.

Q. You would say, then, these successive reorganizations practically cut out any excess of capitalization due to the purchase and retention of those coal lands?—A. If I were the security holder, I should think so. Of course, all that is speculative—guesswork—as to whether that has or has not been done.

Q. (By Mr. C. J. HARRIS.) What is there to prevent an abnormal price being charged for coal, provided that this community of interest, if there is any such—provided the whole anthracite supply should be controlled by a few hands? It has been stated here by certain witnesses that the anthracite deposits are a natural monopoly, being limited in extent and no others being discovered. What are the circumstances or the reasons that would prevent a very high and, we might say, unreasonable price for anthracite coal being charged?—A. There are a great many reasons. First, anthracite coal is not a necessity, absolutely; to a very great extent it is a luxury. Because of its cleanliness and the more economic and better manner in which it can be handled it is better adapted for furnace and house use and such purposes as those. But the competition of anthracite with bituminous coal is one that is continually growing. If you will trace the history of the anthracite industry you will find that the increase has been in latter years not in the prepared sizes, but what was formerly known as the refuse. The great increase has been from the small sizes—from washeries—the washings of the old culm banks. There is where the increase in the production, if any, has been. There has been very little increase in the prepared sizes. In this city, take the building of apartment houses. One of these large apartment houses will probably accommodate as many people as a dozen houses used to accommodate, all of which did use broken sizes. Now these apartment houses use anthracite mixed with bituminous or bituminous altogether. The best that can be said of the anthracite industry is that for several years it has been stationary. It is not a growing industry. It only grows with the increase of houses. While that is quite an increase, it is more than offset by the competition it has met with in the increase in the use of coke, gas, oil, and in other ways.

Q. (By Mr. KENNEDY.) The consumption of bituminous coal goes on in a greater increasing ratio than the consumption of anthracite?—A. Oh, enormously so. The anthracite industry has a capacity of production in this country of about 60,000,000 tons a year. That can be increased undoubtedly by additional development, but the country can only take and dispose of about 45,000,000 tons a year. Now, there are 15,000,000 tons of ability to produce in excess of our market. What are you going to do with it? Throw it in the North River or restrict it to what the country demands and what you can market at a fairly reasonable price?

Q. (By Mr. C. J. HARRIS.) What is the probable length in years' duration of the anthracite coal supply of the United States? Have you any estimate?—A. Oh, I should think that 10 or 50 years will see the substantial extinction of many of the anthracite fields. The Reading, I understand, say that they have enough to last about 100 years. I do not know how that is, but 50 to 60 years in the Lackawanna Valley will see pretty large inroads, and the mining is constantly increasing in cost. The expense of producing it is increasing with the depth of the mines and the difficulties of water and gas. Now, the largest production we have had of anthracite coal in this country was in 1899, when we produced 47,000,000 tons. Last year, 1900, we only produced 45,000,000 tons. That falling off was due to a two-months' strike.

Q. Forty-seven million?—A. Forty-seven million.

Q. Some one stated it was 60,000,000.—A. Whoever stated it was 60,000,000 was in error. There is an ability to produce 60,000,000, and there has been an abnormal production of anthracite coal since last November. That is due to the fact that in September and October the mines were absolutely idle and no coal was produced on account of the strike. That exhausted stocks around the country, and it naturally followed that January and December, usually quite dull months, have had an abnormal demand made on them to replenish exhausted stocks.

Q. I may be wrong; but I think a witness said at that time the production was going on at the rate of 60,000,000 tons.—A. Yes; the January production was a little over 5,000,000 tons, which would be at the rate of a little over 60,000,000 tons, but the anthracite mines have never been able to work much over 235 days in the year.

Q. (By Mr. RIPLEY.) What difficulty is there in producing uniformly throughout the year and storing all the excessive production during the spring and summer for the 4 months?—A. To some extent that is being attempted; that is also to quite an extent a little bit of a problem.

Q. Will you specify further in respect to that?—A. The demand in the summer months is for coal to be transported to the West, Chicago, and up-lake ports, which must go forward during the season of navigation. Now, to stock at tide water is a very expensive proceeding—to get right at tide water, where you can transfer from your stock piles to your boats, is a matter of considerable expense; the re-handling of that coal, the wastage and breakage of it, all add to its cost. Another thing: Very large stocks of coal are always a menace to the market.

Q. It is rather dangerous, then, for a company to be loaded up?—A. It is dangerous; it is expensive. You take a stock of 500,000 tons of coal. The expense of producing that, of piling it up; expense of rehandling, wastage, form a very considerable item of the cost of that product, which could be more cheaply produced and disposed of from day to day.

Q. (By Mr. C. J. HARRIS.) I suppose anthracite coal would not deteriorate in 6 months, would it?—A. Not in 6 months; but there is a certain amount of deterioration, and no customer will pay as much for coal that has been exposed for a long while as for freshly mined coal.

Q. (By Mr. RIPLEY.) It gets dull?—A. Gets dull in appearance; and the appearance of the coal is a factor in the sale of it. The anthracite industry in early years was a very profitable industry. Naturally it proceeded on very wasteful lines. There was nothing to call for any economical study of the problem or its development upon these lines, and many of the breakers there to day are antiquated. And the transportation of anthracite coal, as it has been in the past and is to-day, is the most extravagant transportation that I have ever known of. For instance, we have mines on one side of the Lackawanna Valley up on the hill and we haul coal down into the valley and up the hill on the other side going to tide water. We have mines on the opposite in which we drop that coal into the valley and haul it up on the other side to go West. But these things, through our recent acquisition of control of the Erie and Wyoming Valley, the Pennsylvania Coal Company, we shall to quite an extent eliminate; and there is a great deal more of such work that could be done to advantage. As the markets develop the necessity for these economies, the more intelligently will we be forced to study them and apply them; but when anthracite coal sold for \$6 at tide water there was so much money in it that there was no inducement for a man to apply economical measures.

Q. (By Mr. C. J. HARRIS.) Would you say that the profits accruing to the coal roads from the handling of the anthracite trade were unreasonably large?—A. I do not think so. I do not think they have been large compared with the profits that the individual operators have made. I can recollect individual operators who were carrying their dinners in their pails when I came on the Erie Railroad thirteen years ago who are living at the Waldorf-Astoria now. I really do not believe they are subjects of charity.

Q. (By Mr. RIPLEY.) They have sold out to the railroads?—A. Not all of them—very few of them. Some of them that have not sold out are living there and running their automobiles.

Q. (By Mr. C. J. HARRIS.) What is the price of coal, wholesale, here in New York?—A. I did not charge my mind with that. It is a matter of detail I should not like to answer, because I should want to speak accurately on that. I do not think there would have been any advance—in fact, I know there would have been no advance in the price of anthracite coal in New York this winter if it had not been for the advanced price that was paid to labor last fall.

Q. (By Mr. KENNEDY.) Are you in favor of applying the principle of arbitration to disputes between capital and labor of the magnitude of that in the anthracite region last summer?—A. No; I hardly think the time has arrived in this country when that can be done with justice to either party. I do not think we are yet educated up to the point where we can safely commit ourselves to that course of procedure. I am in favor of negotiation, always.

Q. You recognize that there were three parties at interest in the controversy last fall?—A. Yes.

Q. The employers of labor, the laborers—the miners—and the public?—A. There were.

Q. Are not the public quite as much a party at interest as any of the others?—

A. Yes; but no more so; are they? Now, let me answer that by reciting a little condition there. The anthracite country had not had a strike in twenty years. Labor was well paid—fairly well paid; the great difficulty was not with the rate that was paid, but with the fact that laborers could not secure sufficiently steady work; that there was not enough days work in the year to afford to them as large a compensation as the miners in the bituminous region. Professional agitators took advantage of that circumstance and came down into a country where all was peace and quietness, where there had been no strike in twenty years, and where there was really no cause for their benevolent services, and stirred up all this agitation and organization with the resulting effects. They had a perfect right to do what they did; I am not questioning that at all, I am only reciting facts. The conditions existing between many of the miners and the employers there—individual operators—partook largely of the nature of personal relations. A great deal had been done for them in the way of contributions, donations, hospitals, charitable work.

Q. Do you understand that practically the great majority of the miners in that region are now in the United Mine Workers' organization?—A. I understand they are.

Q. Do you believe that a professional agitator who had not really the interest of the men at heart could come to a region like that and find only 10,000 organized and bring in 140,000 practically?—A. I think he could.

Q. I want to ask you if you do not believe, the public being such a large party at interest, suffering as everybody did and as it was threatened that all would suffer a great deal more, that there should be some compelling legal force to bring about a settlement of troubles of that magnitude?—A. It certainly would be very desirable if there was some method by which that could be done with justice to all parties.

Q. Do you believe in compulsory arbitration, so called?—A. Based on the experience of New Zealand, I am not prepared to say that I do.

Q. Why do railroads give lower rates for exports, for carrying grain or other articles for export than they do for domestic purposes?—A. Because of the competition of the world we are meeting.

Q. I want to ask you if you consider it an injustice to the American miller and the American manufacturer of grain products that the grain is carried at so much lower rate for export than their products are carried to the seaport?—A. I am not willing to admit that that is done to so large an extent as to admit of any discrimination against them; but I believe that by increasing the volume of our business by reason of that slightly lower rate for export, we are enabled to give a lower rate to the miller than if we did not carry it.

Q. The millers claim that it is in the interest of the foreign miller and foreign manufacturer that the grain, instead of the grain products, is able to get so much cheaper rates.—A. Yes; I have heard that claim made, but I have never seen it substantiated yet. It is certainly to our interest to have the grain ground in this country. We would rather have the mills on our own line than in Edinboro.

Q. You think the millers have no just ground of complaint on that score?—A. I do not think they have a legitimate ground of complaint. Grain is much more cheaply handled than grain products. It loads itself and is handled by machinery. Grain products have to be handled—have to have storehouses provided for them, and do not load as much per car, are more subject to damage. There is every reason why grain products should pay a higher rate than the grain itself.

Q. Let us consider this condition: Suppose a shipper of grain products will load a car to its marked capacity and will take care of it at the terminals himself, will he receive as low a rate for transporting those products as the man who ships the grain?—A. No; I think the grain products bring a higher rate. Grain products have a different classification from the grain itself. They have been put into a class by themselves.

Q. (By Mr. C. J. HARRIS.) Are you familiar with the workings of the interstate-commerce law? Have you any changes to suggest in it?—A. I have failed to observe where the interstate-commerce law has been of any benefit to the country at large or to the railroads. The Congress in its wisdom saw fit to create an interstate-commerce commission as the result of the labors of a commission extending over quite a long period, taking an enormous quantity of testimony. The commission got into power, and like all such commissions, wants more power. They have been industriously seeking for many years the power to make rates.

Q. (By Mr. KENNEDY.) Or revise rates, which?—A. One is the same as the other, because if you revise a rate you say what it shall be, and saying what it shall be is absolutely the making of it.

Q. (By Mr. RIPLEY.) That is to say, changing one item.—A. (Interrupting.) It changes the relationship and compels the other to observe it. Now, if I wanted to make money, I would rather have a position on the Interstate Commerce Com-

mission, with the power to make rates for this country, than to have free license to loot the United States Treasury.

Q. Why so?—A. Because it would be infinitely more profitable, and safer.

Q. Supposing you wish to abuse that power?—A. Yes, certainly. I say, if I wanted to make money.

Q. Nevertheless a justice of the United States Supreme Court might make a very great deal of money?—A. He might.

Q. You grant that character is a great protection?—A. Exactly; but I say, putting the power of making rates in the hands of any 5 men in a country whose industries are so diversified as the industries are here, is too great a power to lodge in any body, unless its members are appointed for life; but, as you say, the element of character enters into it. It is not a safe thing to put into the hands of political parties; and the present law demands that the present body, the Interstate Commerce Commission, shall be composed of only a certain number of each political party. In other words, it is a political question.

Q. (By Mr. KENNEDY.) Has the commission any power or authority that the railroads are bound to respect?—A. Yes; the recommendations of the commission, in almost all respects, in many respects, have been followed.

Q. Has accomplished great good, has it, for the transportation interests of the country?—A. I do not think it has.

Q. Has it accomplished anything?—A. I would not want to go to the extent of saying it has accomplished nothing. I do not think the interstate-commerce law has been a success.

Q. The powers the commission was supposed to have have been emasculated by court decisions, have they not?—A. On the contrary, I think it has all the power the original law intended it to have.

Q. You make that statement after having read the debates in Congress?—A. Yes; I do not think Congress ever intended that the commission should have power to make rates.

Q. Does the Interstate Commerce Commission serve any good purpose at the present time?—A. Yes; I think it does to a certain extent. It affords an opportunity for people who feel that they are aggrieved to have their grievances investigated; and if they have a real grievance I believe that as a rule it is remedied.

Q. (By Mr. RIPLEY.) In other words, it secures publicity for grievances?—A. I think you have expressed it exactly. The intelligent force of public opinion is, after all, what makes law in this country, and what enforces law.

Q. In your judgment that is sufficient guarantee for its existence, without adding to its power?—A. I think so.

Q. If it has secured that, is it not well worth the existence of the body?—A. Yes; possibly.

Q. (By Mr. KENNEDY.) Have you any opinion to express on the subject of pooling, or is that now a thing of the past?—A. I think the railroads of this country ought to have the power, like all other commercial organizations, to make legal agreements among themselves.

Q. But the decision of the Supreme Court of the United States —A. (Interrupting.) It has declared we have none.

Q. Therefore, what results—combinations and community-of-interest arrangements, etc.?—A. There are no combinations. Naturally, that has had a great deal to do with what is generally called community of interest.

Q. There are no combinations, you say?—A. I do not know of any.

Q. Have there not been great combinations in the Southern system?—A. There have been. A great many roads have been consolidated and brought under one management and one ownership.

Q. Do you call it consolidation, then?—A. There have been more consolidations, I think, than there would have been but for the laws prohibiting pooling and prohibiting agreements.

Q. Have not these understandings or community of interest arrangements between the railroads done away with the question of pooling to a very large extent? Are the railroads reaching out for that power any more?—A. There is no effort being made by the railroads in favor of any legislation that I know of; at least we are not a party to any. I think that railroads would like, and I think they ought to have, power to make legal agreements between themselves. I think those agreements could be very properly made subject to the approval of some commission, and I do not believe the railroads should be allowed to make agreements that would be oppressive to the public or disastrous to commerce.

Q. (By Mr. C. J. HARRIS.) Would the self-interest of the railroads be a check to that course of procedure?—A. I think it would. I do not know of anything that is any more vulnerable to public opinion than a corporation.

Q. (By Mr. RIPLEY.) Has that been as true in the West as in the East?—A. I do not know so much about the West. They have not had as severe competitive conditions as we have had. The Western country is more sparsely settled; there are fewer people there.

Q. (By Mr. C. J. HARRIS.) Does the effect of consolidation, as it has gone on in this country so far, lessen or increase the traffic of the road?—A. So far, it has lessened it. Take the case of the Erie road, formerly made up of three separate and distinct corporations between New York and Chicago. They are now one corporation substantially so far as relates to the officers, organization, and everything—one corporation. The expense of maintaining two has been eliminated, and I have never known of an instance where we have reduced the cost that the public did not get the benefit.

Q. (By Mr. RIPLEY.) Speaking of consolidation, will you mention any other economies that might be incidental thereto?—A. Out of organization?

Q. Through the consolidation of a number of roads, other economies than those of administration—organization?—A. Yes; there are a great many economies.

Q. In other words, will it have the effect to reduce materially the ton-mileage rate?—A. I think ultimately it will. But the greatest danger we have is not through excessive rates, but from rates that are too low. Now we expend about 51 per cent for labor—a little more than that—for instance. I can tell you exactly what that is. Of our operating expenses last year \$15,000,000 of our operating expenses—54 per cent—was paid to the employees—distributed among about 30,000 people.

Q. What bearing does that fact have on this question, namely, the economy of operating through consolidation?—A. You take the case of the Lehigh and the Lackawanna paralleling themselves for 100 miles. If that passenger business can be done by an interchange of tickets good on both roads the public is better served. There would not be as many trains running as there are now, but there would be ample trains for the service. In other words, there would not be two running at the same hour when one would amply serve the purpose.

Q. Would there be the same competition in providing facilities? For instance, it is commonly stated in the West that the facilities for passenger travel over such roads as the Rock Island are materially better by reason of the strenuous competition between those roads for passenger traffic. They provide reclining chairs and everything of that sort. Is not the providing of facilities fully as important as the rate either for passengers or freight?—A. Yes; I think competition will always exist. Take it between New York and Chicago. There will always be competition between those points. If one road fails to provide somewhere approaching the facilities and accommodations of the other, it will begin to lose travel, and the minute it does that it will be forced to furnish the accommodations. You can not eliminate competition without you put all the railroads of this country under one management, and that is impossible.

Q. How does the value of the stock, preferred or common, compare with the value of the bonds of the Erie system?—A. There are forty-three millions of preferred stock, sixteen millions of second, and a hundred of common.

Q. That is materially less per mile than any of the foreign companies?—A. Yes.

Q. What is your practice in making improvements out of the operating expenses? Does it differ from the custom abroad?—A. The English have capitalized pretty much all the expenditures upon what was called improvements. In this country the practice has not obtained to anywhere approaching the extent it has abroad. For instance, the Lake Shore road has the same capitalization, stock and bonds, that it had 25 years ago, and yet the road has been improved to probably as great and probably greater extent than any other road in the country.

Q. Would that same statement be true of the Erie road?—A. No; not entirely.

Q. It has increased the volume of its securities?—A. In respect to some classes, yes, and in respect to others, no. The Erie road has been through several bankruptcies in which the securities have been reduced in volume and the rates of interest also.

Q. Have they been reduced in volume?—A. Yes; reduced in volume at times.

Q. The statement is made of many reorganizations in this country that while they reduce the fixed charges, they nevertheless increase the stock?—A. What difference does it make, if they do not pay any dividend?

Q. Does not that last series give control of the road in its operation?—A. Yes, it does; as a rule, yes.

Q. Then, does not the existence of a large amount of securities thrown upon the market in this way offer a premium for their acquisition for speculative purposes?—A. I suppose it might be so construed, but not actually perceptible. I have

never known that to cut much figure. The company with a small capitalization is much more exposed to being seized for speculative purposes, as you illustrated awhile ago, than a road with a large capitalization.

Q. Would that not be an argument in favor of restriction of capitalization?—A. I should think it would.

Q. Do you know any other examples of roads in this country whose capitalization is, perhaps, not excessive, from the point of view of earnings, but nevertheless is large compared with the cost of duplication?—A. I could not answer that question.

Q. The point I wish to come to is this: Whether any power, either in State or Federal hands, for prevention of excessive issue of securities, might not be advisable, both in the interest of the public and of the investor?—A. Much more desirable than legislation looking to what they shall charge for commercial work—much more desirable than to undertake to regulate the rates that shall be charged.

Q. In other words, you would favor the regulation of the financial details of the business, leaving the railroads free to perform the commercial side of it as they please?—A. Yes; if you are bound to control by legislation, control by capitalization; restrict the capitalization to actualities, as you express it, but do not hamper the roads in their commercial operations. In other words, if it is necessary for them to carry a part of their product at a very low price in order to make tonnage, which would serve to reduce the cost on the balance of their business, permit them to do it; do not hamper them, but simply undertake to control your corporations rather through their financial machinery.

Q. A proposition has been suggested to this commission for the prevention of, perhaps, at times, fraudulent overissue of capital stock through supervision of interstate roads by the Interstate Commerce Commission. Would you favor an extension of powers in that direction rather than an extension of their power to regulate rates?—A. I should, most decidedly.

Q. You believe it would conduce to the interests both of the railroads and the public?—A. Yes.

Q. Can you suggest anything further in this line?—A. No; I do not know that I can. This is a new country. We have a great many problems to work out here yet; among other things the problem of government. The surplus wealth of this country is largely invested in transportation enterprises. You can not touch that disastrously, unfairly, or unfavorably without affecting the whole country at large more seriously than by any other possible means. Probably 85 per cent of our surplus wealth is invested in railroads, and there are the owners of the securities and the army of the employees to be considered. On the Erie line we have 30,000 employees. That is a larger army than George Washington ever commanded. Whenever you touch that industry by legislation unfavorably, unfairly, it must ultimately be reflected on the country itself and on the success and prosperity of it. The country has shown its ability and its capacity to carry freight cheaper than any other country. Why not let those forces that have demonstrated that capacity work out their own solution instead of hampering them so much with investigation, legislation, and all that line of procedure?

Q. (By Mr. KENNEDY.) What you just said suggests the question to me: How do freight charges at the present compare with those of 20 years ago or with those of any other period you choose to speak about?—A. Why, they are not in sight at all.

Q. Let us have something on that line.—A. Our rate last year was 5.59 mills per ton mile, average rate. The rates of Erie road 20 years ago were probably over a cent a ton per mile—probably a cent and a quarter—and yet our volume of business was so large that a difference of 8 cents a ton would be a difference of \$1,000,000.

Q. (By Mr. RIPLEY.) Has a reduction corresponding to this one taken place in local freight rates? You have spoken of the reduction of average freight rates.—A. Oh, yes; the local rates have been reduced.

Q. Have they been reduced in proportion?—A. (Interrupting.) To the through rates? I do not think they have. Everything is competitive. If a rate is not competitive by reason of another railroad, it is competitive by reason of commercial conditions, and railroads can no more escape commercial conditions than can the grocer around the corner.

(Testimony closed.)

WASHINGTON, D. C., March 16, 1901.

TESTIMONY OF MR. ARCHIBALD A. McLEOD,*Former President of the Reading Railroad.*

The Commission met at 2.42 p. m., Mr. Clarke, presiding. At that time Mr. Archibald A. McLeod appeared as a witness, and, having duly affirmed, testified as follows:

Q. (By Mr. CLARKE.) Please give your name and address.—A. Archibald A. McLeod: New York, 149 Broadway.

Q. What is your official relation or what has it been to railroads?—A. I have been president of several railroads—the Reading, the Boston and Maine, and the New York and New England, and others, and I at one time leased the Jersey Central and the Lehigh Valley railroads.

Q. Are you now connected with any railroad company?—A. Not as president.

Q. The Commission will be pleased to have you proceed in your own way to give such information as you may have concerning the transportation problem and its relations, as you understand it, to other industries.—A. I presume you mean with reference to anthracite coal.

Q. If you choose to specialize it we shall be pleased to have you.—A. I have not given my attention so much to the transportation of bituminous coal. To a considerable degree my experience has been more in the mining and transportation of anthracite. I do not know just exactly what information you wish.

Q. We would like to be informed if you please as to the relation of the railroads to the coal production and coal transportation.

Mr. KENNEDY. And the distribution.

Mr. CLARKE. Yes, the distribution—the marketing.

The WITNESS. The mining and the distribution are conducted by the coal companies with the exception of cases in which individuals are engaged in the same business. Each one of these transporting companies has stocks in coal mining companies, and these companies are paying freights to the railroad companies for carrying the coal for those mining companies. That is the way the business is done, I believe, in every case. The accounts are kept separately. The coal companies are charged the same freight rates that they charge individuals where individuals mine and transport over these transportation companies' lines. The books are kept separately, and there is perfect accounting, just as though the coal company was owned by some interest other than the transportation company. That is the method.

Q. Is it a fact that the stock of the coal companies is in most cases owned, or at least the majority of it, by the railroad companies?—A. I believe that to be a fact. I know it is in some cases.

Q. Is that the case in regard to the Reading?—A. Yes.

Q. Practically, therefore, the railroad companies can and do control the coal companies?—A. In this case they do.

Q. (By Mr. KENNEDY.) Mr. Chairman, I would like to ask Mr. McLeod if he has seen this paper of topics suggested for statements on the anthracite coal industry, and to ask him if he could not take that paper and take up the topics and discuss them in his own way?—A. I will see. Take the railroad rates for instance. The railroad rates on anthracite coal are made exactly as the railroads make rates on other merchandise. The coal freight agents get together and make rates on coal just as the merchandise freight agents get together and make rates on merchandise. It is the same method exactly. There have been no changes in recent years that I know anything about. I think that has been the rule ever since these transportation and mining companies have been in existence. So far as I know, it is. The rates to New England are just like other rates. Sometimes they make water rates in connection with rail rates, and in different seasons of the year they are higher. It depends very many times upon the scarcity of vessels. Sometimes it is very difficult to get bottoms to transport coal to New England from the terminal points, Philadelphia or New York, and rates go up. At other seasons, when bottoms are plenty, they are lower. So that just what they are now, of course I do not know. They vary according to the season, supply and demand, and so on.

Q. (By Mr. RIPLEY.) What proportion goes by rail?—A. A very small proportion. I will give you the distribution of anthracite coal: The States of Pennsylvania, New York, and New Jersey consume about 70 per cent of the entire product; the New England States take 11 per cent, and that is very largely taken by water. A very small proportion of it goes by rail.

Q. (By Mr. CLARKE.) It has to go by rail some distance, I suppose?—A. It has to go down to tide water at Philadelphia or New York. The Reading takes most of its coal, if it is destined to New England points, to Philadelphia, because it has large shipping docks there, and it goes down through the Delaware River. It has shipping docks also at Port Reading, from which it delivers large quantities of coal to New England and to New York City. The other companies take their coal to New York because, with the exception of the Pennsylvania Railroad, their lines do not reach Philadelphia. Then the West takes about 12 per cent of the production, and the South about 4 per cent, and Canada takes about 3 per cent. Practically, 1,500,000 tons go to Canada.

Q. Is the consumption in the West increasing?—A. Very rapidly.

Q. Faster than in any other section?—A. Yes. The consumption in the West has been increasing very rapidly for a good many years.

Q. (By Mr. RIPLEY.) Is the demand from the West for a particular variety of coal?—A. Yes; although most of the sizes go there. The stove and chestnut sizes are very much sought after in the West, particularly the chestnut, for domestic purposes—cooking and heating.

Q. (By Mr. FARQUHAR.) Has the encouragement of consumption in the West come through lower freight rates on the lakes?—A. No; I do not think lower rates have had anything to do with it. The West is growing rapidly, and as the people accumulate more money they buy this luxury. Seventy-two per cent of the entire production of anthracite is a luxury now. There is very little of it used for steam, and not over 28 per cent of it is sold in competition with bituminous coal for making steam. The other 72 per cent is now almost wholly used for domestic purposes.

Q. (By Mr. KENNEDY.) The president of one of the coal roads told us in New York that 35 per cent of the anthracite is sold in competition with bituminous coal.—A. Well, I do not think so. I think I can prove what I say by statistics (examining papers). Here is the average of all sizes produced from all regions, and of this 71.72 per cent are above and the lower sizes. Those are the actual figures, so that there are 28.28 per cent that comes in competition with bituminous coal.

Q. (By Mr. FARQUHAR.) Do you care to have that paper of yours used as an exhibit in your testimony?—A. No. I simply give you the facts in round figures; the balance is a matter of detail.

Q. (By Mr. RIPLEY.) Has there not been a change in the proportion of prepared sizes to other sizes?—A. Yes.

Q. In recent years, and for what reason?—A. Well, the reason is that they have found ways by which they could use these smaller sizes. Years ago they were thrown away—thrown into the dumps. Recently the dumps have been worked over and all this coal has been taken out and marketed. In 1872 there was only 5.92 per cent of these small sizes; in 1873, 6.60 per cent; in 1874, there was 6.45 per cent. It then comes on down until we come to 1877 and we have 11 per cent, then in 1878 it was 10 per cent. Then when we come to 1888 we have 19 per cent, and in 1896 (that is my latest statistics) we have 28.28 per cent, showing how the use of the smaller sizes in proportion to the other sizes has grown.

Q. Might not that proportion have increased to 35 per cent, as stated in New York, by the present time?—A. That may be true. I am reminded by your question that my statistics are incomplete and cover only the years up to and including 1896. That is as late as I am familiar with the subject. I will make the correction. It may be 35 per cent now; I could not say that it is not; but my percentages of 71.72 and 28.28 are absolutely correct up to the date given. It will probably go on in about that ratio until the maximum is reached.

Q. (By Mr. CLARKE.) Has there been any increase in the exportation to Canada?—A. Yes; that is increasing all the time, but slowly. The greatest increase in comparison to the tonnage taken is in the West and that, as I say, results from the good times in the West. The people of that section of the country have had good crops for a good many years, and as the farmers become more able to provide themselves with luxuries, they take more anthracite coal. That is found to be the case all over the country.

Relation of independent operators to the railroad: I presume you have had all that from the gentlemen who have been before you. I myself changed their relations to the transportation companies in 1892, and the arrangement I made with them is practically in existence now. At that time I made contracts with almost all the individual operators in the anthracite region, which were designed to make a fair division between the miner and the transporter, and they were so fair that they are in existence now.

Q. (By Mr. RIPLEY.) What was the proportion?—A. Sixty per cent of the tide-water price.

Q. (By Mr. KENNEDY.) Did you make any provision as to marketing the entire output of their mines?—A. No; in fact that was not necessary. What they wanted from me, and what was agreed to, was a fair division between producer and transporter, and it is in existence to-day, except that now they are agitating the question whether they shall get 65 per cent. That is the only change.

Q. (By Mr. CLARKE.) The independent coal producers do not pay freight to the railroad company, but receive from the railroad company a percentage of the amount received for the product at tide water; is that it?—A. You may put it in that way and then you may put it in another way. For instance, the coal is taken under that agreement to divide according to those percentages. The coal is sold by the coal company, not by the transportation company, because they do not do that kind of business. The coal company takes their coal, disposes of it at tide water, and then they get 60 per cent of the average price at tide water for their share and the 40 per cent goes to the coal company for the purpose of paying the transportation to the railroad company transporting the coal to market.

Q. That is to say, the coal company, allied with the railroad company and owned by the railroad company, takes the coal of the independent operator and allows him a percentage?—A. Yes.

Q. (By Mr. RIPLEY.) Have you seen any of these recent contracts, or do you know anything further respecting them?—A. I know only what some of the individual operators have told me. They are all my friends. They have said to me that there is practically no difference except a proposed increase of 5 per cent. I do not believe that the proposed new contract has been closed; they are agitating the subject now as to whether they can secure the increase. Outside of that I think the contracts are to be practically of the same nature.

Q. Is there not a difference in this respect between these new contracts projected and those which were in effect, namely, that the new ones are for the entire life of the mine—to last until all the coal is taken out of the ground?—A. I believe that is true. I do not know of my own knowledge.

Q. But the contracts initiated under your management were not of that perpetual nature?—A. No. Mine were made for 7 or 8 years, and they were continued after that because they were considered to be satisfactory by both parties.

Q. What can you state as to the relative proportion of the independent operators along the different lines of railroad?—A. The total shipments in 1900 were 47,000,000 tons, of which individual operators mined, in round number, 16,000,000 tons, or about 33 per cent.

Q. But do not some of the railroads procure their tonnage to a greater degree from independent operators than others?—A. Yes; the tonnage of the Lehigh Valley is very largely from individual operators, more than any other. The Reading mines nearly all its own coal.

Q. There are very few independent operators on the line of the Reading?—A. Very few. The Lehigh Valley mines only—or it did last year—2,922,000 tons out of 7,675,000 tons.

Q. Approximately two-thirds is from independent operators?—A. Yes.

Q. What is the proportion of the Reading, or will you make a statement from the table you have respecting the proportion of the different railroads?—A. The Reading, out of 9,084,000 tons, mined 7,605,000 tons.

Q. What is the proportion of independent operators on some of the roads that have recently entered the territory, such as the New York, Ontario and Western? Is it small?—A. Yes. They mine 1,086,000 tons and the individual operators mined 906,000 tons.

Q. Will you give the proportions of the Central Railroad of New Jersey?—A. They mined 4,133,000 tons and the individual operators mined 1,670,000.

Q. (By Mr. KENNEDY.) I would like to ask you whether there is an allotment made to that railroad in any way, and whether this amount is under or exceeds the allotment?—A. No; the allotment question has been eliminated so far as my knowledge goes. You probably know what the percentages are to each of those interests.

Mr. RIPLEY. Yes; we have those data.

A. I do not know of any pressure that has been brought to bear on any of the individual operators. I think they are all pretty well satisfied. I do not know of any discontent that exists to-day on the part of individual operators anywhere.

Q. Can you say how this allotment is arranged?—A. That is ancient history. These percentages have been in existence from, I guess, about the time I was born. They have not been changed except as one interest would get a little more tonnage than another by some change in ownership of roads or something of that kind. I do not think they have been changed in a good many years. I know when I first entered the anthracite business about 17 years ago the percentages were in exist-

ence, and there has been no change since that time except that I increased the Reading's percentage by business methods.

Q. Was there not a time when the Reading's percentage was nearly one-third?—A. It was nearly one-third about 1870.

Q. What is the percentage at the present time?—A. Twenty-one per cent.

Q. To what degree has there been a decrease in the proportion?—A. Let me tell you how that occurred. It was under Mr. Gowan's management of the Reading, and because he did not keep pace with the increase in consumption in the market. His percentage went down because he failed to mine and market his percentage of the increase in the consumption; therefore, his competitors' percentages went up. In other words, when he acquired all these coal lands, he was mining and transporting about 6,000,000 tons of coal per annum, and that was about 33½ per cent of the entire output at that time. When I went into the Reading 15 years later, the tonnage of the Reading did not amount to over 6,500,000 tons, while in the meantime the entire tonnage had more than doubled. It was taken away from him because he simply did not hold on to his proportion. That is the reason the Reading's percentage was reduced.

Q. Well, could not the Reading very easily supply one-third of the consumption at the present time with the coal properties it owns?—A. No; it would take it some years to develop the collieries up to that capacity. You must bear in mind that there are certain months in the year that it is impossible to dispose of anthracite coal except to dealers who have storage places to deposit it. The consumer waits—the average consumer waits—until the cold months of the year to order his coal, and except for these dealers who provide storage places to take the coal from the mining companies during the months of April, May, June, July, and August, when the demand of September, October, November, and December comes on there would not be enough coal to go around, and people could not get it; consequently the companies, in order to have coal at certain distribution points in the country, have to mine it during the summer months and sell at concessions to get those dealers to take and store it and hold it until the consumers come into the market for it. The proportion of consumers who will buy their coal in the warm months when they do not need it, and put it away in advance, is very small. That has got to be done through dealers who have places to store coal and await the pleasure of the consumers.

Q. Did you have to fight the other coalers to increase the Reading percentage?—A. No.

Q. Did not you have to reduce the percentages of any of those roads?—A. Well, I would be taking a little more than my proportion of the increase.

Q. (By Mr. RIPLEY.) Has there not been a feeling for a great many years on the part of the Reading management that it was not getting its due proportion of coal output?—A. There may have been, but it was the management's own fault. They simply stood still, and the other companies, with their increased facilities, were ready to take the coal that was offering all the time, and supplied the increased demand. There are many interested in Reading throughout the country who do not know how the Reading's percentage was reduced. They say it was reduced, but it was not; its tonnage stood about stationary, and its percentage, therefore, fell off. When the entire tonnage was 18,000,000 tons per annum, about 1870, Reading had 33½ per cent of it; when it increased to 36,000,000 tons, and Reading failed to get its proportion of the increase, its percentage was reduced, although Reading had the same tonnage practically.

Q. (By Mr. KENNEDY.) Do you know of any claim that the Reading has not its proper percentage at the present time?—A. There is none that I know of.

Q. Or a claim of that kind on the part of any of the other coal roads?—A. I do not know of any. Of course, you understand, I am not in their counsel now.

Q. (By Mr. RIPLEY.) Is there not a disposition on the part of the railroad companies to provide greater storage facilities for dull seasons of the year? Are they not building large storage bins?—A. Yes; I built two for the Reading near the mines where, during the dull months of spring and summer, I could mine and store 300,000 tons of coal, and which could be shipped in October when the people wanted it.

Q. Prior to that time it was customary to store only on wheel?—A. No; they had storage places at different points throughout the country. For instance, at Perth Amboy the Lehigh Valley had large places where they could store two or three hundred thousand tons of coal. The Reading had another large depot at Port Richmond, where they could store a large amount of coal. Then they had pockets along the New England coast, where they could take the coal in vessels and store it in the pockets until the demand came from the people.

Q. Do those increased storage facilities tend to steady the price between seasons

of the year?—A. Well, no; it does not do that so much as it helps the companies to keep their collieries running and keep their men on hand to get coal to the point of distribution so it will be there in the fall of the year when the demand is made. Otherwise it would be impossible for the collieries to mine or the roads to transport enough coal to meet the demands of September, October, November, December, and so on. That is the object in doing that. Otherwise you see the collieries could not be kept running during those 8 months, and when the demand came, if it came all at once, the possible supply would not meet it.

Q. Is there any restriction upon the output, so far as you know, of any individual operators placed by the railroads?—A. Not that I know of. I think that is a great bugaboo. I do not think there is any restriction put upon the mining and transportation of coal when they can get rid of it. You could not give it away, sometimes. For instance, the market, we will say, will take 50,000,000 tons of coal. You could scarcely give away 3,000,000 more tons—the people would not want it. It is just like any other commodity.

Q. If anthracite coal were \$2 or \$1.50 cheaper a ton than at the present time, would not that decrease in price increase the demand for it?—A. You would not have the coal; you would bankrupt everybody in the business: there would be nobody mining it.

Q. But the increased supply could be utilized, could it not?—A. How are you going to use it when there is nobody going to mine coal unless he makes money out of it? If the coal was selling at that price nobody would be mining anthracite coal, because it costs \$1.90 a ton to put anthracite coal in the cars, without adding anything for transportation.

Q. Have you any statement respecting the cost and the elements of cost at the mine month?—A. I have.

Q. (By Mr. KENNEDY.) Before you go further with that: You say it costs \$1.90 to put anthracite in the car at the mouth of the mine. What is the transportation cost to tide water for a ton of this same coal that costs a dollar and ninety?—A. That is varied. I do not know just what they are charging now.

Q. Give an instance.—A. I suppose the average freight rate to-day is about \$1.50 a ton. I know positively that on the coal coming from one colliery the average freight rate on it was only \$1.36.

Q. (By Mr. RIPLEY.) To tide water?—A. Yes; that is about 7 mills per ton per mile.

Q. What would be the rate through to Boston on that basis, approximately?—A. That can be ascertained by a mathematical calculation. I would have to figure that out. You can do that by taking the number of miles.

Q. Is it on a mileage basis?—A. No; but you take the mileage as a basis and you can tell just what it would cost. Now, what do you want: the cost of coal?

Mr. FARQUHAR. The idea was this: You made the statement that the cost of putting a ton of coal on the car at the mouth of the mine was \$1.90, and \$1.36 in a special case on freight, making \$3.26. What is the selling price at tide water of that coal?

The WITNESS. The average price at tide water for coal for the last 20 years has been \$3.48 per ton; the highest has been \$3.96 and the lowest \$3.48.

Q. That would make a working margin of 22 cents up to 50 cents; 22 cents up to 50 cents for handling?—A. Yes; but there is nothing included there for the cost of coal in the ground.

Q. (By Mr. RIPLEY.) Do you include in that calculation, also, the interest charge upon the investment—that is, the investment in reserve coal lands?—A. I include in the \$1.90 a ton the interest on the investment in coal lands, that is all; nothing for the coal but the interest on the value of those lands.

Q. Is that interest charge heavy on some railroads?—A. Somebody has got to own the land.

Q. I do not object, you understand; I am simply trying to bring out the point that there is a large investment on many acres.—A. I am talking now of the average. I do not take any one company in figuring on the average, so that does not make any difference. We all know that the Reading has a large quantity of land that she has no use for now, but that does not make any difference in this statement, because I take the average of the whole region.

Q. Can you give your opinion as to how much reserve coal land the Reading has?—A. The Reading has 150 years of coal supply.

Q. How does that compare with the reserve of the other companies?—A. None of them, of course, compares with the Reading. There are some of the smaller ones that are almost exhausted. I would not like to make that statement here, because it might interfere with the values of some of those properties if taken seriously, but we all know that there are a good many of those properties that are

nearly exhausted. That is, in 10 years 10 per cent, and in 40 years 75 per cent of the collieries in the Wyoming region will be exhausted.

Q. At the present rate of output?—A. Yes.

Q. Don't lose sight of this question as to the cost of a ton of coal matter.—A. The average cost per ton on cars, including all charges for improvements, depreciation, land exhaustion, taxes, and insurance, I figure at \$1.59. Then the average cost for a ton of coal on cars, including the interest on the value of coal lands, brings it up to \$1.90. That is the average on coals; some cost a great deal more, some cost less.

Q. (By Mr. KENNEDY.) Is that a printed report?—A. No; this is a private report.

Q. No public document?—A. No.

Q. Of any railroad?—A. No. That [pointing to a book beside him] is a public document, with State information; it contains all the mining laws; that you could get if you wish it.

Q. (By Mr. RIPLEY.) The cost of carrying these reserved lands is at present borne by the price of coal and the consumer, is it not?—A. No.

Q. What pays the interest on the debt of the Philadelphia and Reading road?—A. The Philadelphia and Reading Company has a general business as well as a coal business. The coal business would not maintain the Reading road, nor would its other business maintain it. It must have all the business it can handle, and yet it has one hundred and twelve millions of capital that is not earning anything now. There are, altogether three hundred and eighty-two millions of capital of the so-called anthracite roads that is not earning a cent of interest or dividends.

Q. Does that all represent actual investment?—A. It represents actual investment or interest on actual investment. Some of these stocks have been increased from time to time by adding the interest that was unpaid, the unpaid coupons, and so on, and in the case of the Reading there are one hundred and twelve millions that don't receive any interest, and twenty-eight millions more that has just begun to receive interest. The Lehigh Valley has \$40,441,000 on which no dividends are paid. The Erie has \$172,000,000 on which no dividends are paid. The New York, Ontario and Western has \$58,113,000, making a total of \$382,554,000 that don't earn a cent.

Q. Are not many of those securities represented by bonds issued 30 or 30 years ago for the purchase of these coal lands?—A. I can't speak so much for others. In the case of the Reading—referring to the period of 1870 to 1876—the Reading invested in actual cash about seventy-five millions in coal lands.

Q. What has paid the interest on that seventy-five millions since that time?—A. Their net earnings went as far as they could, and when they did not have any earnings the interest went unpaid.

Q. Has not the fact that it has been struggling along under this heavy debt been one reason for the financial difficulty of that railroad during the period—we will say—from 1875 to 1890?—A. That is true.

Q. Could it not have put coal profitably upon the market at a cheaper price if it had not been burdened with the interest charge for this heavy debt?—A. It has been putting coal on the market as cheap as it did before it had any debt, and for less money.

Q. (By Mr. CLARKE.) Could it not put coal on the market cheaper still, but for that debt?—A. No; because it has one hundred and twelve millions that don't pay any interest.

Q. (By Mr. KENNEDY.) Put it this way. Suppose the Reading had not secured a monopoly of all those lands and held them undeveloped, is it not probable that other interests would have taken hold of them and developed them, and have brought about a competition that would very materially decrease the price of coal?—A. I do not think so, because they have not been making money in mining coal; nobody has made much money on coal except a few individuals who might happen to have a colliery located very favorably, having a good vein of the right size in which to mine, without any slate or other substances which would interfere with the cheap mining of the coal. A few of those could make money, but, in my opinion, the people on an average are getting cheaper coal to-day than though this coal had been mined by individuals, just for the reason that I stated a little while ago, that it requires a large amount of capital and a large, thorough organization to mine this coal from poor veins, as well as the best ones, and distribute it to the places where it is needed by the public at an average cost which places it within the reach of all the people. If it were not for the large aggregation of capital and thorough organization the people would not be able to get it at a reasonable price. It is not like bituminous coal. Bituminous coal is taken the

year round. Anthracite now is a luxury. We know that it is, because they have no anthracite coal on the Pacific coast, and they get along without it. If this coal should advance above a certain price it could not be sold at all; people would not take it, because, as I said before, about 72 per cent of it is a luxury.

Q. (By Mr. RIPLEY.) Could not a larger percentage of it be used for manufacturing purposes by reducing it to steam sizes?—A. No.

Q. In the cities, where, for instance, they have ordinances against smoke nuisances.—A. No; take the city of New York, for instance. There is a city that has in existence those ordinances. It can get all the pea, buckwheat, and rice coal it needs. Still the New York people will use bituminous coal. Bituminous will make more steam than anthracite coal.

Q. Even of the smallest sizes?—A. Yes. There is one thing about this anthracite business that a good many people do not understand. As we have shown here, it costs double to produce this coal that it does to produce bituminous coal, and when you sell 28 per cent of it at a loss of \$1 a ton you have to add such loss to the price of the other sizes in order to get cost for the whole product, and before you can make any money on the 72 per cent the loss on the 28 per cent must be added to it. They must sell the 28 per cent in competition with bituminous coal, as I say. On that 28 per cent they lose a large amount of money, and if a larger percentage of the small sizes were produced the cost of the domestic sizes would be greater to the consumer.

Q. What are the average wages of coal-mine operatives?—A. I figure them the year round. They do not work every day in the year, as you probably know, and I estimate they earn about \$10 a month to the man. The average number of boys employed is probably 12 per cent of the whole number of employees, and they get about half that wages. Just to show you the difference in the cost of producing anthracite and bituminous coal, I cite the fact that it requires 145,000 men to produce 47,000,000 tons of anthracite coal, and 91,000 men to produce 73,000,000 tons of bituminous coal in the State of Pennsylvania. That statement at once shows you the great difference in the cost of producing the two coals. These statistics are public property, gathered by the State, and there can not be any question about their accuracy.

Q. (By Mr. KENNEDY.) Is there any foreign trade in the anthracite business?—There is practically no foreign trade except with Canada. It is not possible. I had that subject thoroughly investigated to see whether it was possible to create an export trade to Europe for anthracite coal, and I found it absolutely impossible. The cost price of anthracite coal with freight added would be prohibitory. There is no back lading for coal-carrying vessels, and this is something that must be taken into account when considering the question of exporting coal. The only export coal that we have been able to dispose of has been to Canada, and, of course, the trade there is natural, because Canada has no anthracite coal. They can't get it anywhere else, and we can deliver it to them at reasonable prices.

Q. (By Mr. RIPLEY.) The Philadelphia and Reading Company could have produced more coal than it does with its facilities if operated to its full capacity the year around, could it not?—A. Certainly; if it could dispose of it.

Q. Did the existence of such a surplus have anything to do with the entrance of the Philadelphia and Reading into the New England territory in 1892?—A. No; my object in that move was to increase the Reading's tonnage without getting into such a row with my neighbors that the whole structure would go to pieces. There has been a well-recognized rule among those companies for years that where the transporting company owns the rails the tonnage distributed on those rails should be considered as belonging to that line; therefore, they would not precipitate a war that would be ruinous. My object in going into New England was to get, in that way, and under a well-recognized rule of the distribution of tonnage, an advantage that I could not get in any other way. The Boston and Maine and the New York and New England handle about 3,500,000 tons on their rails. That is the tonnage I intended to get for the Reading Railroad without a fight. If I could have carried out my plans I should have secured that large tonnage to the Reading, and the other lines would have had to give it up. It was a legitimate vantage I was securing for the Reading road.

Q. Which would have increased the tonnage very considerably?—A. Very largely; and would have enabled the Reading management to pay dividends on all its securities.

Q. Without increasing the price of coal in New England?—A. Yes; without increasing the price. And another thing I intended to do was to eliminate very largely the middlemen. The amount of money between what the companies get for this coal and what it costs to the consumer when it is put into his cellar is simply outrageous. It is there that the greatest reform could be made in this business, and that is what I intended to do, and I have no doubt it will be done

some day. I intended to erect large pocket depots in certain places in the city of New York and other cities where a man with a cart could go and get coal for the people; there would be nothing between the producer and the consumer but the man, the horse, and cart, because the coal would be shot right into a cart. Instead of putting it into yards and reloading it at unnecessary expense, I would have simply a cart and horse between the producer and consumer, and the amount of money that could be saved would be enormous. For instance, it costs me to put coal into my cellar in New York a dollar and a half a ton more than I know that the man who delivers it to me pays to the coal company for it. Now, that extra expense is simply absurd, and there is where the greatest reform could be made. It is so all over the country. You may go into any small town anywhere in the country and you will find twice as many dealers there as necessary to supply the residents with coal. In Philadelphia, along Ninth street, you will find coal dealers almost on every lot, where one good large supply station would do that business just as well as all those dealers and eliminate an expense of at least a dollar a ton. If a man has a yard, we all know very well there must be three, four, five, or ten thousand dollars' expense connected with that yard in some way or other, which could just as well be saved provided large stations, such as I have spoken of, were established the coal put in pockets, and screened as it went out in a cart. Then instead of \$1.50 a ton, it would cost about 30, 40, or 50 cents at the most for delivery to the consumer.

Q. (By Mr. CLARKE.) Why could not the railroad companies and coal companies bring about that reorganization of business?—A. That was my intention. I think it could be done.

Q. (By Mr. FARQUHAR.) Is there an opposition among these coal dealers maintained, so that they are kept in business—in finding customers and distributors; is there opposition?—A. Yes.

Q. Is there sufficient opposition to keep that business up among local coal dealers?—A. Oh, yes. Of course, in some places they have retailers' associations, but I find in buying my coal in New York there is considerable opposition and competition between them. I have taken particular pains, as you may naturally understand, to see whether one would sell at a lower price than the other, and when my coal was put in this last summer I telephoned to a coal man and got a certain price, and telephoned to another man to quote prices, and the latter sold it to me at 25 cents less per ton.

Q. Does that shading come out of the retail dealer and sales agent?—A. I think it came out of me. I do not think I got full weight. [Laughter.] In fact, I had that thing investigated myself in various places, and I caught I do not remember how many sending around short weights.

Q. (By Mr. KENNEDY.) If the citizens of Washington pay \$8.50 and \$6.75 a ton for coal, how much would there be saved if this arrangement of yours you speak about were put into effect—just the man and cart between the producer and consumer?—A. I think 75 cents a ton could be saved.

Q. That is the profit there is in it to the retailer?—A. Yes. There is no question that that saving could be accomplished. A couple of large pocket stations in this town would supply the whole city. One on each road would supply the city conveniently.

Q. Seventy-five cents a ton would be very little, considering the investment a man had in his business, would it not?—A. That depends. It depends on how much he could do. The trouble is so many go into the business that they must have a large percentage in order to live, and there is where I think the business is conducted on wrong principles. I think the people who control the coal ought to control the distribution of it in the cities.

Q. (By Mr. FARQUHAR.) The entire cost of present distribution, then, to consumers, you would say, is just an extra cost put on to consumers—what it costs to run every yard and pay the salaries of the men in the yard, and delivery teams, that is placed on the consumer's coal?—A. Yes; of course it is. You can see that these companies are selling their coal at low prices in New York by those figures I give you, which are absolutely correct. I vouch for the correctness of them. I will tell you why: Those figures are the result of certain contracts under which settlements were made where the money passed from one man to the other, and there is no better way of getting at a true result than that, because each man is bound to see that he gets what is due him. There can be no question about those figures.

Q. (By Mr. RIPLEY.) Would this plan of yours be more feasible if the railroads more fully harmonized their interests by consolidation than at the present time?—A. They can't carry it into effect in any other way than by harmonizing their interests. My idea was to benefit the consumer as well as the corporations I represented, by bringing every interest, so far as possible, into one harmonious

organization, thereby saving a large amount of money that is now thrown away in the manner I have just described to you.

Q. But an essential feature in that plan meant the consolidation of the railroads.—A. Not necessarily. What I was striving to do was to control the sales of coal; then to establish reasonable and uniform prices based upon cost of production, and transportation according to mileage to points of distribution: to do away with near-by high prices and far-away low prices, and the excessive and unwarranted commissions and profits to middlemen, which for many years have worked a great injustice to both the consumer and the producer.

Q. (By Mr. TOMPKINS.) In that connection, what would prevent the railroad company owning the transportation facilities and owning the coal mines, if they desired to utilize their facilities for the best profit, putting the price of coal to a point where it would cost the consumer a great deal more, and where the only beneficiary would be the railroad company and the coal-mining company? What would be the protection against that?—A. The people would not take the coal; they could not sell it.

Q. They would be compelled to take it?—A. No; the people are not compelled to have anthracite coal.

Q. You are speaking only of anthracite coal?—A. That is all. You can't sell anthracite coal above a reasonable price. The moment you get to such a price you have got to stop. The price will take care of itself, just as sure as you live.

Q. (By Mr. RIPLEY.) An independent coal operator in New York testified before our subcommittee that the price of coal at the present time is very near the upper limit for maximum sales. Have you any opinion respecting that statement?—A. I do not agree with him. You can get more for anthracite coal, and ought to get more for it to day.

Q. More than the present price at tide water?—A. Yes; anthracite coal ought to be sold so that everybody could make a reasonable profit out of it at an average of \$4 a ton.

Q. (By Mr. FARQUHAR.) Four dollars?—A. Yes.

Q. (By Mr. RIPLEY.) What is the price this year at tide water?—A. That I can not give you now, because it is too soon to get average figures. For the year 1899 it was \$3.92.

Q. That was the average price for a long term of years?—A. No; it was the average price for 1899. I took the average for 20 years just to show you how evenly the price has been running.

Q. (By Mr. KENNEDY.) Didn't you say the retail price is as high as could be maintained and permit the doing of business on a large scale?

Mr. RIPLEY. The highest price consistent with maximum demand?

The WITNESS. Yes; but if you eliminate the middlemen you do not increase the price of coal to the consumer, but you make a good deal more money.

Q. If by reason of these economies of which you have spoken the cost of putting the coal at tide water were reduced by 75 cents or \$1 a ton, would not the public be entitled to some proportion of that saving?—A. Certainly. My intention was to give the public half of it, and the other half would have made the companies which I represented pay dividends. That was my object.

Q. (By Mr. CLARKE.) Why should these anthracite coal companies sell coal in competition with bituminous at a loss?—A. Because there is no use for the small sizes except in competition with bituminous coal; they could not give it away. It must be taken by people who use it for making steam.

Q. Why is it not better to let it remain in the ground than to take it out and sell it at a loss?—A. Because you can not get the large sizes without the smaller ones, and if you did not sell them at whatever they are worth in the market in competition with bituminous coal, you would be so much worse off. The process of making anthracite coal is this: Here is a vein, we will say 8 feet in thickness. That coal is all mined out in the first place as you mine bituminous coal. You take the "run of the mine," and it is put in the breaker and crushed in order to get the different domestic sizes, and then it is run over screens, and as it passes through the troughs there are little boys sitting there and picking the slate out. The whole 50,000,000 tons that was produced last year passed under the eyes of those boys; they see it all and pick out the slate as it goes by. When it passes over the screen the very finest of it goes through first. Then it passes over another sized mesh, then another size, and so on, and when it gets down to the bottom you have the largest sizes of the coal; but all sizes are made through one process, and therefore it costs just the same to make one as to make many. So this coal you have to sell, whether it be culm, pea, buckwheat, or stove—the latter the highest price—costs just the same at the mine, and while some of the sizes will bring \$2.25, other sizes may bring only 50 cents. The culm is the very smallest. Then you come to the rice, then the buckwheat, then the pea, just according to the size of

the screen, and as all those sizes must be made in order to get what we call the domestic sizes or higher-priced sizes, it is obvious that a producer must sell his whole production of the small sizes at whatever price they will bring in the market in competition with bituminous coal or suffer a total loss on say 80 per cent of his mine production.

Q. These are the steam sizes that compete with bituminous?—A. Yes.

Q. (By Mr. FARQUHAR.) Does not the culm become competitive for domestic purposes by the use of fans?—A. It can't be used for domestic purposes because it is so fine that it will run through the grate; nor can they use it in a locomotive as the exhaust would drive out such a large proportion of it. They have not yet been able to devise any way of using the small sizes except for steam purposes.

Q. In recent years, how far has fuel gas and illuminating gas, used in the kitchens of the country, competed with anthracite coal?—A. That is a very difficult question to answer. It can only be answered in this way: If it had not been for these other fuels coming into the market in competition with anthracite coal, instead of mining and transporting 50,000,000 tons, as they now do, they would be mining and transporting 75,000,000 or 100,000,000 tons. It has prevented the growth in the use of anthracite coal that otherwise they would have had.

Q. (By Mr. RIPLEY.) Has this substitution not, however, resulted in the conservation of the reserve supply for future years?—A. Of course. Twenty-five million tons you could have mined and sold is not mined or sold; it is still in the ground.

Q. (By Mr. FARQUHAR.) That does not help the present generation?—A. No. But it is a fact, and, besides, you know, there is always more coal found when you come to dig it out than was ever estimated when it was in the ground. Experience has taught us that. I believe there is coal enough for 200 years instead of 150.

Q. In the Reading lands?—A. No; in the entire region.

Q. How will the reserves of other companies compare with those of the Reading?—A. The Reading owns about one-third of the whole.

Q. (By Mr. RIPLEY.) There will come a time, unless the ownership changes, when the Reading will own the entire anthracite coal in the ground of the country?—A. I do not know what warrants you in thinking that.

Q. I ask you the question—your judgment on it—that is all.—A. I do not see any indication of that result at present.

Q. (By Mr. KENNEDY.) Have the other companies reserves that will last as long as those of the Reading company?—A. Not all of them.

Q. Have any of them?—A. I could mention a company that has 25 years' reserve. That is the lowest. From that it will run up close to the Reading. I know there are other companies that have a very large reserve.

Q. (By Mr. RIPLEY.) Are you acquainted with the estimate made by William Griffiths in the Bond Record of years ago respecting the anthracite coal supply?—A. I have read that, but I have forgotten. I estimate we have 15,000,000,000 tons of anthracite coal in this region.

Q. (By Mr. KENNEDY.) You said a while ago that 75 per cent of the reserves in the Wyoming Valley would be exhausted in 10 years.—A. No; not quite that—10 per cent in 10 years and 75 per cent in 40 years.

Q. They have reserve lands?—A. Oh, yes. The life of a colliery is about 30 years. Then they must open up new collieries, and that, of course, is a great expense, for which a sinking fund should be established, and which is not now done except by a few companies. Remember, you have to have a new colliery, a new plant every 30 years, and there are a great many millions now invested in them.

Q. (By Mr. RIPLEY.) Are the most easily or the least easily worked portions of the territory now being developed?—A. The veins nearest the surface are being worked out first. You know there is a good deal of chance in sinking shafts. You may strike a vein in one locality, in perfect place where it has not been disturbed at all, and a few hundred feet away you may run into a break, and that holds good all over the region. It is only by experience, by putting down shafts that one can tell whether those veins are in place or whether they have been squeezed out, as they are in some places. For instance, I have opened collieries on some tracts of land and got one first-class colliery that would produce cheap coal, and the other one would be good for nothing and the expenditure wasted. That is another thing that must be taken into consideration in estimating the cost of coal. There is a good deal of hazard in sinking these shafts until developments have gone sufficiently far to demonstrate just where the vein is in place.

Q. The belts of the Schuylkill region, however, are really more difficult to work than in the Wyoming, are they not?—A. It costs 20 cents a ton more to produce in the Schuylkill than in the Wyoming region.

Q. And from Schuylkill a large part of the future supply of the country will have to come?—A. Yes.

Q. As a consequence, then, we have to expect in the future a greater expense of mining than at present?—A. Naturally; as you go deeper the expense will increase. You know something about the formation, don't you, of the coal veins? We have, for instance, 16 veins in some places, with a certain amount of rock between them, and the lowest one or those may be down 3,000 feet in some localities. Naturally, as the veins near the surface are worked out and you have to go deeper and work much deeper veins, it will cost more to produce coal, and in a great many places the deeper you go down the more water you encounter. For instance the last year I worked the Reading mines, we pumped two tons and a half of water for every ton of coal we raised.

Q. (By Mr. RIPLEY). Are you aware of any tendency toward consolidation of the different railroads which serve the anthracite coal territory?—A. No, no; I am not aware of any.

Q. I refer to the leasing or the purchase of one road by another?—A. No; I do not know of any. All I know is what I see in the public prints, that one company has purchased the stock of another, and so on. That you know as well as I. I have no inside information of anything in contemplation.

Q. (By Mr. KENNEDY.) Do you know anything about the community-of-interest plans?—A. No; not except in a general way. That is all on the surface. I think everybody knows about that, pretty well. One company may buy the stock of another, and I must say, I think it is a good thing. I think it will produce better results for the people.

Q. The community-of-interest arrangement?—A. I do believe in it. I believe when you get stable rates and reasonable rates the country will be more prosperous. I believe that there is nothing that will produce greater prosperity than equal, reasonable, stable railroad rates.

Q. (By Mr. TOMPKINS.) That suggestion applies to all railroad rates?—A. Yes.

Q. Then we come to the original question: What would prevent those in control of the situation from taxing the people for the benefit of the combined interests?—A. The people. You can't get any combination of capital that is big enough in this country to rob the people; it can't be done. The man doesn't live, and could not live, that would attempt it, in my judgment. That question will take care of itself.

Q. (By Mr. KENNEDY.) They are not attempting it, you think?—A. No; I do not believe there is any such intention on the part of any men, and I know them pretty well. I know what my own methods were in trying to accomplish the same thing, and I do not believe there is any man engaged in it to-day that is not engaged in the work of self-preservation. I do not believe otherwise. I have no interest in saying so. I am a free and independent citizen, but I believe that, and I think I understand the situation pretty well.

You ask for a division of this tonnage. The following table gives the figures:

	Per cent.
Pennsylvania and Reading.....	21
Lehigh Valley.....	15.65
Delaware, Lackawanna and Western.....	12.57
Central Railroad of New Jersey.....	11.48
Pennsylvania Railroad.....	11.32
Erie Railroad.....	11.51
Delaware and Hudson.....	9.55
Delaware, Susquehanna and Schuylkill.....	4.26
Ontario and Western.....	2.86

Q. (By Mr. CLARKE.) Has the New York Central recently acquired interest in the anthracite regions?—A. Not that I know of. I do not believe that the New York Central as a corporation has any interest in the anthracite region. I understand that some of the stockholders own stock in some of the anthracite roads. I do not know.

Q. It has been stated within a few months that the New York Central owns certain contracts, certain short pieces of road, and that it was about to build a connecting link between them and the coal fields?—A. Does not that report refer to the bituminous fields?

Q. (By Mr. RIPLEY.) Does it not refer to the Erie and Wyoming Valley, perhaps, which was an independent road of the Pennsylvania Coal Company?—A. Well, the Erie has got that.

¹ The Erie has recently taken in and added to its tonnage so as to give it 11.51 per cent.

Q. (By Mr. KENNEDY.) Do you refer to the report of control of the Delaware and Hudson?—A. If they have control of it, I don't know it.

Q. (By Mr. KENNEDY.) Is it true that the Reading fixes the price of coal and that other companies follow the lead of that company?—A. That I can not tell you, because I do not know what their policy is now.

Q. Can you say whether that was true in the past?—A. I believe that when I was president of the Reading I had considerable influence with other people; yes. That is what I was there for.

Q. (By Mr. RIPLEY.) Are you aware of the purchase of the Central Railroad of New Jersey by the Reading?—A. Not except from the public prints.

Q. I mean by the public press. Would not a combination that increased the tonnage of the Reading directly give that company a still more important voice in fixing the price?—A. No; it does not increase their tonnage at all.

Q. Not the direct tonnage, but the tonnage controlled by the two roads; it adds the proportion formerly carried by the Central Railroad of New Jersey to that formerly carried by the Reading, does it not?—A. No. How does it do that? They all go on; they each have their coal; they each have their coal companies; transporting it does not change their movement at all.

Q. Would it not be an advantage in the case of having two parallel lines that each carry coal under one management?—A. That is impossible; it never will be done; it can not be done; it is out of the question.

Q. Do you know of any legal bar to the actual consolidation of these roads?—A. Yes.

Q. Where is it found?—A. I think the laws of New Jersey now prevent the combining and consolidation of railroads.

Q. Will you state what was the cause of the receivership of the Reading Railroad? Was it the leases of 1892?—A. Actual lack of capital to carry out its own plans.

Q. Was not there also a constitutional provision prohibiting such a lease?—A. Yes; the State brought suit to cancel the lease.

Q. What was the outcome of that suit?—A. The suit was discontinued because the Reading went into the receiver's hands; the parties on both sides thought it was not to their advantage to continue the suit, and it was discontinued.

Q. Did not Chancellor McGill render a decision at that time?—A. If my recollection serves me right, I do not think he did; I think the suit was discontinued before he rendered any decision, if my memory serves me right. I do not think he did.

Q. A constitutional provision prohibiting the lease of the Lehigh Valley or of the Central of New Jersey to a Pennsylvania corporation would not operate against an actual purchase?—A. No.

Q. So that a purchaser at the present time would not be prevented from making his purchase by the legal obstacles which stood in the way of consolidation in 1892?—A. Oh, of course not. I know of no way that you can prevent a man from buying property if he has the money to pay for it.

Q. Are you aware of the terms, as printed in the public press, under which the Pennsylvania Coal Company was transferred to the Erie Railroad?—A. All I know about it is what I saw in the public press.

Q. Have you formed any judgment as to the financial expediency of such a purchase?—A. I think it is wise.

Q. For the Erie Railroad?—A. Yes.

Q. And for what reason?—A. Because it secures to that road a tonnage that might otherwise get away from it; I think it was a good move.

Q. Have you any judgment as to the price paid for the securities of the Pennsylvania Coal Company so far as that price was mentioned in the public press? Was it high compared with the financial position and possibilities of the company?—A. No; I think it is worth the price. You must remember that anthracite coal is getting more valuable with every ton that is taken out. You can never replace it again. The Pennsylvania company has a large tonnage left unmined, and that tonnage is now secured to the Erie road. There has been no money in mining; they want the transportation of the coal.

Q. The transportation of that coal, then, is profitable to the road?—A. Reasonably so only.

Q. It would seem that if they assume so great financial responsibility there must be considerable profit?—A. The Erie will pay off all that debt through the sinking fund of 10 cents per ton, as they have provided, and it will be wiped out, and without any burden to the Erie.

Q. That 10 cents will be put on the price which will be charged for the coal at tide water, will it not?—A. Not necessarily. It will be sold in competition with all the other coal and at the same price.

Q. It will simply reduce the profits on coal for somebody?—A. Yes; it will be that much less than for some other company which has not been conservative enough to provide a sinking fund, as all should do. And, as all must sell at the same price, the one that does not put that 10 cents in to liquidate debts of the same nature will meet with a day of reckoning which I do not wish to contemplate.

Q. The debt provided for by the sinking fund will be extinguished when the coal is exhausted?—A. Yes.

Q. Is that a common practice with the other roads to your knowledge?—A. It is receiving more consideration now, because people are seeing that they must do that to liquidate the debts for large sums of money which have been invested in coal lands.

Q. The foundation of such sinking funds is going to still further increase the cost of putting the coal upon the market as years go on, is it not?—A. I suppose that will be taken into consideration, just as you take into consideration the increased amount paid to the miners or the increased cost of taking coal out of deeper mines and so on; that is perfectly natural.

Q. (By Mr. KENNEDY.) Now, how many times has the Reading been in the hands of receivers, Mr. McLeod?—A. Four times, I think.

Q. Can you state what the causes were that forced the receiverships in each of those cases?—A. It increased its debt too largely in financing the coal lands with bonds; it could not earn the interest on the bonds and had to go to the wall.

Q. In any case, was it the result of ruinous competition, so called?—A. Yes; it sold coal below cost; away below cost. It sold coal before the Reading receiverships as low as \$2.48 a ton at tide water.

Q. (By Mr. LITCHMAN.) What was the effect upon the volume of stock and bonds of the reorganization of the Reading Railroad after the receivership of 1893?—A. The debt was increased somewhat.

Q. Was not the cause of that receivership the excessive capitalization and issue of bonds incurred in financing the coal operations?—A. No; the cause of that receivership was a lack of capital. For instance, when I leased the Lehigh Valley and the Jersey Central and took over their coal operations and the individual operators as well, I found that I had \$13,000,000 invested in coal and in carrying the customers of the companies. The Reading did not have that much capital, and I had to borrow \$8,000,000 of that \$13,000,000. Then the panic of 1893 came on. I had arranged to fund that \$8,000,000 of floating debt by selling securities, etc., giving me a working capital of \$17,500,000, but the parties who were to furnish the money had six months in which to do it, and on account of that panic coming on before I could get the money, there was nothing in the world for me to do except to put the Reading in the hands of the receivers to save its securities. That is the reason I did it.

Q. Was it not necessary at that time to purchase outright large amounts of coal produced by independent operators?—A. It was not necessary. I did it. I made all those contracts, and that coal was purchased under those contracts, which proved to be a good thing because it has stood ever since.

Q. Would these independent operators not have interrupted the Philadelphia and Reading Railroad at this time had you not purchased their coal?—A. No; I never had any trouble with the individual operators. The individual operators were all willing to follow me always. I made that arrangement with them, and they considered it fair. There were some on the line of the Lehigh Valley that had contracts outstanding then at 55 cents. I canceled them voluntarily, gave them all 60, and brought them all in under one general plan.

Q. Have you ever shipped any coal for the firm of Cox Brothers?—A. Yes; I made a contract with Cox Brothers and built a road in to get their coal.

Q. Was the Philadelphia and Reading Railroad involved in the well-known case of Cox Brothers v. The Lehigh Valley before the Interstate Commerce Commission?—A. No; not at all.

Q. There was complaint at that time, was there not, on the part of the independent operators, that they charged an undue amount for the carriage of their coal?—A. I only know by what I saw in the press that Cox Brothers had a suit pending with the Lehigh Valley.

Q. Was not the price charged for transportation by the Lehigh Valley practically the same that was charged by all the other roads?—A. I think so. I think the roads all charge the same rate.

Q. Was not that case of Cox Brothers v. The Lehigh Valley practically, then, a statement of the attitude of the independent operators toward all the anthracite coal movers?—A. No; I do not think it was. An individual might have a grievance that some other individual would not have.

Q. Assuming that its grievance, however, was purely a financial one, not personal, would that still not be true?—A. One individual might not be satisfied

with what another individual would be satisfied with. I do not know what the Coxe Brothers claimed; I never saw what their claim was; I never read it. Now, Coxe Brothers may have sought to get something that was not fair—I do not know about that—but I believe, so far as my knowledge goes, the individual operators were always fairly dealt with, because I dealt with them myself, and I know I dealt with them fairly.

Q. At the time of entrance into New England territory was the controlling interest in the stock of the Boston and Maine actually purchased?—A. No.

Q. Will you make any statement respecting the character of that control?—A. That was largely through personal influence.

Q. It was not, then, by actual purchase?—A. I purchased enough of the stock to give me what we call a standing with the rest of the stockholders of the property, and by that I persuaded them to make me president of the road, but I could not control the company by actual vote—nothing like it.

Q. Is not that situation typical of the situation of many other roads in the country, namely, that the actual control of far less than a majority of the capital stock gives virtual control of the policy of the company?—A. That depends largely upon the standing and influence of the party who holds a large interest; that is, the personnel enters very largely in an arrangement of that kind, as you can readily understand. An objectionable party certainly, as you know, can not buy a small interest in a road and control it.

Q. But parties in good financial standing might by getting absolute control of 30 per cent of the stock of a railroad dictate its policy in many instances, owing to the apathy of the remaining faction of the stockholders?—A. If they dictated a policy that was in the interest of the majority of the stockholders, I imagine they would get along all right; but if it was not, I do not think they would stay there very long.

Q. (By Mr. KENNEDY.) I would like to ask you, Mr. McLeod, what effect the strike of 1900 had upon the price of coal?—A. It had a tendency to advance it, and did advance it. I will give you another instance. We had a strike the latter part of 1887 and the first part of 1888, when the price of coal went up immediately; I will show you how the average price went up. For instance, in 1887 the average price was \$3.67; but as the result of that strike from the last day of the month, 1887, running into 1888, the average price for the whole year of 1888 was \$3.86.

Q. I would like to ask you whether, in your belief, the strike of 1900 was one that was welcomed by the railroads as a good thing in their interest?—A. No; I think they did all they could to prevent it.

Q. One gentleman said in New York on that line that Mitchell and the Mine Workers' Union did what the coal roads and coal producers had never been able to do; that they brought about a complete stoppage of work, and the owners were thereby enabled to work off their surplus stocks at increased figures, and therefore that the strike was a good thing for the railroads, a good thing for the independent operators, and a good thing for the miners.—A. That has been the practical result. But I know personally, because I know all those men at the head of these properties, that they did not want a strike; they did all they could to avert it. The very fact that they granted the miners' demands shows that they did not want any strike.

Q. Did political influence have much effect in settling that strike?—A. Oh, that I know nothing about.

Q. (By Mr. CLARKE.) Who made the money when the price advanced?—A. The miners, I think. That is the way it looks to me up to this time. I do not think coal has gone up enough to let them out yet.

Q. How about the middlemen?—A. The middlemen always get about the same. Their commissions are about the same, no matter what coal costs or what price it brings.

Q. Did not the middlemen advance the price before there was any advance in the price at the seaboard?—A. They may have done so. Probably they took advantage of the situation to ask an advance on some coal they had on hand—naturally.

Q. I would like to inquire now, although it may possibly be a little out of the connection, how the coal is mined by the coal companies—whether by employing men or by contracting the work?—A. By both methods. Usually in the mine there are some of the miners who work on a contract. They get so much a yard for cutting coal and they employ their own help. Then, a great many work by the day, and I can give you the average that those men make on the surface and under ground. The average wage for above-ground foremen, for instance—you know there are foremen above ground and foremen under ground—is \$2.71 a day, and the average for mechanics above ground is \$1.92. The average for laborers above ground, \$1.29; boys under 16, 62 cents. Below ground foremen get \$3.05; miners, \$2.40; laborers, \$1.63; boys under 16, 89 cents a day.

Q. Does that mean steady employment during the year?—A. No; the average is about 200 days a year.

Q. (By Mr. KENNEDY.) I was going to suggest that Mr. McLeod should put in his testimony a very great deal of material that he has that may not be brought out by our questions.—A. I would be glad to do so, because I feel that the more this subject is talked about and ventilated, the better it will be for everybody. For instance, a committee of the legislature of New York was appointed to investigate the subject when I leased those properties, and there was a great hue and cry that I was trying to make a combination to increase the price of the necessities of life, and all that, and I said: "Gentlemen, I wish to go before you and tell you everything I know. I would like to bring our books and show you what we have been doing, because I believe that the more that is known about these things and about this business, the more our methods will appeal to your sense of justice and fairness." And I think so now; and while I am not directly interested in the business at this moment, I have not changed my mind a bit. I think that the more this subject is brought to the attention of people like yourselves, who are interested in making laws for the protection of everybody, which means fairness to man and man, the better it would be for the people and for the corporations too. Of course, all that I think and believe is in the direction, as you understand, of just what is being done, because I believe that the close control of these corporations will produce better results to the people and better to themselves than if they were allowed to run down by ruinous competition until finally the people will have to pay more money for coal. I say that because, as I have said here before, you can only mine and you can only distribute anthracite coal to the consumer within a short period of the year—not over 6 months. There are 6 months that you can scarcely give it away. You might, approaching the season when they want to consume it, but after, in the spring months, you can not do anything with it; and the only way that you can mine and handle and distribute in the interest of the people is to have it done by the great corporations. Corporations having large capital, who can mine and produce cheap coal and give it to the consumer when he wants it, and you can not do it in any other way. You can readily see now if this coal was not mined in May, June, July, and August, and if those mines were idle all those months how it would be. The interest on the investment in the plants and on everything is accumulating all the time, your fixed charges are going on, and the investment would have to be doubled if the companies had to mine and move the coal during the months when consumers will take it. Then no individual would be capable of conducting the business in the way in which it must be conducted. It must be done by a large aggregation of capital and thorough organization on a large scale. Bituminous coal mining is very different. Bituminous coal is taken the year round in about equal proportions. But anthracite is a commodity that is manufactured, practically—put through these breakers and all this process—and it is only needed within certain times of the year. And I tell you if it is not done in this way it will cost the consumer very much more money than it is costing now, and sometimes, unless done in this way, consumers would not be able to get it at all. You can not mine and move coal as fast as it would be needed during those months of the year when everybody wants it.

Q. Last fall, as we understand, the mine workers had only about 12,000 men of that anthracite region in their organization. We now understand that they have upward of 80 per cent of the men organized, and that they are moving in the direction of getting recognition for their union; that is, that they shall confer and arrange a scale of prices and fix conditions for every succeeding year, as is done in the bituminous regions. I would like to ask you what is your opinion as to the wisdom of the managers of the railroads and coal carriers and operators meeting them on this question of arranging a scale of prices every year for them?—A. I can best answer that question by stating what I did. When I was in a position of authority and had strikes on my hands—I have had some of the largest strikes that we have had in this country—my policy was never to raise the issue as to whether a man belonged to a labor organization or not. He would come and see me; if he was respectable and respectful when he was in my presence I did not care who he was; and I found that that way of treating with men was the very best. That is a practical answer to your question. I believe that the best way to deal with men is to look them square in the face and talk to them and try to arrive at something that is reasonable and fair without resorting to force on either side. I believe in that policy, and I believe it can always be pursued.

Q. Do you not believe that the men can get better results for themselves by going to the corporation in an aggregate capacity and conferring with them in that way?—A. I do. I certainly think that men make a mistake when they delegate their power to some other party. I think that men would always get what is fair in the end if they would be frank and go to their own people. I do not believe

there is an employer in the country—if there is I am very sorry—that will not meet with his men, no matter whether they belong to a labor organization or not. Men have the right to organize, in my judgment, just as well in the capacity of labor as they have in any other. I do not believe in discriminating.

Q. I would like to ask your opinion about the present emergency which seems to be upon the people in the anthracite coal business. The men are organized, over 80 per cent of them; they want the companies to meet their representatives in conference and fix the price and fix other conditions, more for recognition of the union than anything else. If that does not mean an increase in the wages, which we understand it does not at the present time, but just a recognition of the union as it is recognized in the bituminous fields, do you think it is the part of wisdom for the mine operators to hold out against giving this recognition that they desire and thus bring about a cessation of work and perhaps a higher price for coal?—A. Their action one way or the other means nothing. It is mere words, because when they advanced the wages of the men they gave them all the recognition that they needed. As you say yourself, there were only 20 per cent of them in the organization before that and now there are 80 per cent in it. There is a substantial recognition. Now, no matter whether they meet them or not, those men are in the organization; they are there, and it is a mere matter of words which do not change the facts at all as I view it. And it does seem to me that there ought to be some way when you have got a great body, an army of 145,000 or 150,000 men, of meeting them, so long as they are respectful. It does seem to me so. Of course, if meeting them means that they are going on demanding, and are not satisfied with obtaining reasonable concessions, then it becomes a question of business policy. One concession, I am sorry to say, often means to men of that kind another demand. They lose their heads and they think they can get anything they ask for, and they are so likely to go on and crowd the employer to the wall. In other words, they will simply make the employer say, "I will not do anything; you may strike if you wish." That is the danger.

Q. They are human, and the employers and capitalists of the country are human too; and you think there is also danger of the combined capital of the country going on and crowding more and more because it has the power to do it?—A. No; I do not.

Q. Do you think the capitalists will be more reasonable than the men who work for their daily bread will be?—A. Why, you have an instance right here. One company has been buying into another recently, and the very first time the miners asked an advance they got it; and they are more likely to get it under those conditions than they are under the other. The individual operator could not have afforded to give them that advance without the corporations had backed it up, and they are more likely, in my judgment, to get better wages as a result of the harmonizing influences which are going on.

(Testimony closed.)

Whereupon, at 4.50 p. m., the commission took a recess until Monday, March 18, at 10.30 a. m.

WASHINGTON, D. C., April 2, 1901.

TESTIMONY OF MR. IRVING A. STEARNS,

President, Coxe Bros. & Co., Incorporated.

The commission met at 2.45 p. m., Mr. Phillips presiding. At that time Mr. Irving A. Stearns was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. PHILLIPS.) Will you state your full name and address and your business position?—A. My name is Irving A. Stearns. I am president of the Coxe Bros. & Co., Incorporated. Our main office is at Drifton, Pa., but I spend most of my time at 143 Liberty street, New York, and my residence is at Wilkes-barre, Pa.

Q. Have you any official relation to other corporations engaged in the coal-mining industry or transportation?—A. I am president of the Delaware, Susquehanna and Schuylkill Railroad Company, which is owned by the same parties that own Coxe Bros. & Co.

Q. Will you describe the location of these enterprises?—A. The mines of Coxe Bros. & Co. are located in what is known as the Lehigh region. They are scattered over considerable territory. [Indicating on chart.] Everything as shown here in purple evidently belongs to Coxe Bros. & Co.; but as to the location, as shown by this map, I can not designate each colliery.

Q. Will you describe the location of the Delaware, Susquehanna and Schuylkill Railroad in general, its length and its principal connections?—A. It connects with the Pennsylvania Railroad at what is known as Gum Run Junction and extends to Hazleton, to Drifton, and to Beaver Meadow and Onelda, connecting all the collieries of Coxe Bros. & Co., Incorporated; and it also connects with the Pennsylvania Railroad, the Lehigh Valley Railroad, the Philadelphia and Reading, and the Central Railroad of New Jersey.

Q. Before proceeding to take up in detail the different topics, have you any general statement which you are prepared to submit respecting the state of the anthracite coal industry, or any movements in progress?—A. No.

Q. In what way are the rates upon anthracite coal made up at the present time?—A. That is a question that does not come to me at all, as all of our coal that goes to tide water is shipped over the Lehigh Valley Railroad on our own cars, in our own trains, and with our own crews. All our western and line coal is shipped over the Pennsylvania Railroad to line points, except what we ship by lake, which goes to Buffalo, over the Pennsylvania all the way now, though it formerly went over the Pennsylvania to Emporium. We have nothing whatever to do with making rates.

Q. Are there any individual operators who ship over your line?—A. No. We purchase coal from Mr. C. Pardee, at his breaker, and of course that goes over our lines, but it goes as our own coal.

Q. Have you knowledge of the system under which coal is generally shipped by the individual operators, or the relations which exist between independent operators and the railroads?—A. For several years past the great majority have sold their coal to the railroad companies on a percentage basis; that is, 60 per cent of the tide water price to the operator, and the railroad company received the other 40 per cent. the railroad company guaranteeing the sales and paying all of the expenses of them.

Q. So that the system under which coal was formerly shipped by Coxe Bros. & Co. prior to the construction of the Delaware, Susquehanna and Schuylkill Railroad was on that basis?—A. No; I think not. I do not think they ever shipped under that special contract. I do not speak from knowledge, but only from hearsay. They had some traffic arrangements with the Reading Railroad Company.

Q. Will you describe the causes which led to the construction of the Delaware, Susquehanna and Schuylkill Railroad by the firm of Coxe Bros. & Co.?—A. I am not in a position to state them definitely, as I have only been in their employ for 3 years, and the only two men who could probably answer that question are Eckley B. Coxe and E. B. Ely, who are dead. But I have understood the object in building this railroad was to connect all their collieries, so they could deliver their coal to any of the different roads with which they connect, and which I mentioned—the Pennsylvania, the Lehigh Valley, the Reading, and the Central Railroad of New Jersey.

Q. Coxe Brothers is a firm?—A. It was a firm up to December 31, 1895. Since then it has been a corporation.

Q. Is the corporation independent of any particular line of railroads in making its shipments?—A. Except to tide water. We have a trackage contract with the Lehigh Valley Railroad by which, as I stated before, we run our own cars, our own trains, and our own crews to tide water.

Q. Are there any other firms or corporations which have similar relations to the railroads, to your knowledge?—A. No; not that I know of. I am sure there are not.

Q. Are you aware of any proposition made to the independent operators for an increased proportion of the tide-water price?—A. Yes; they have made an offer, I think of 65 per cent for their coal, 35 per cent to go to the railroad company for freight. This result was arrived at, I think, by a committee of individual operators and a committee representing the railroad companies. They had sessions lasting over several weeks, and that is the result of the conference. That is the proposition made by the railroad companies to the individual operators on the different lines.

Q. Was such proposition uniformly offered by all the railroads in this territory?—A. I understand it was.

Q. Substantially identical in all companies?—A. Yes.

Q. Have you any knowledge as to the reception given to this proposition by the individual operators?—A. Only by hearsay. I have been informed that some of the individual shippers on the line of the Pennsylvania Railroad have signed these contracts. I have also been informed that none of the operators on the lines of the Lehigh Valley, Jersey Central, and other railroads had signed them up to 10 days or 2 weeks ago, which was the last I heard.

Q. (By Mr. PHILLIPS.) How much per ton or car is this price which they get, of 65 per cent and 35 per cent?—A. It is 65 per cent of the tide water price per ton.

Q. What is the price?—A. That varies. They take each month by itself. The take the average price received for the coal at tide water on prepared sizes.
 Q. And fix the price of freight accordingly?—A. Yes. If coal were selling at \$4 per ton at tide water, the operator would receive 65 per cent of \$4 and the railroad company would take the other 35 per cent for freight. Then on the smaller sizes there is a different rate. I am speaking from memory now, but I think it is 50 per cent for pea and 40 per cent for the smaller, although I am not positive, as we are not interested in these contracts and it is only hearsay.

Q. (By Mr. RIPLEY.) For the sake of the record, will you describe the distinction between the prepared and small sizes?—A. A prepared coal includes all sizes from chestnut up to broken. Small sizes include everything from pea down to what we call barley coal. I think I can give you the meshes, if you want to know the different sized meshes over which they are made.

Q. (By Mr. C. J. HARRIS.) When you say the freight charge is 40 per cent, you mean over the selling commissions and all, do you not?—A. The railroad company pays the operator 65 per cent, and the 35 per cent goes for freight, selling expenses, and all the rest. That is what the railroad gets.

Q. (By Mr. PHILLIPS.) The railroad does the selling?—A. Yes.

Q. (By Mr. RIPLEY.) The railroad assumes the actual title to the coal at the breaker?—A. Yes.

Q. And the individual operator from that time forth ceases to have an interest in the coal, otherwise than in the price which the railroad company receives at tide water?—A. He has no responsibility. He has nothing to do with selling the coal. The railroad company pays the 60 per cent, or the 65 per cent, whatever the percentage may be, of the tide-water price for the month.

Q. Who fixes the price to the consumer?—A. The different companies.

Q. Will you state the distance by the shorter and also by the more roundabout routes, in general figures, from the coal centers to tide water?—A. I have not looked that question up, and do not think I can give the information. I know the distance we ship is 125 miles—from the junction with the Lehigh Valley road to Perth Amboy. It is more than that, of course, from the Lackawanna region and some others.

Q. (By Mr. C. J. HARRIS.) Is there to be an equitable difference in the rate, according to the distance they haul the coal? Suppose your mine is 100 miles nearer than some other anthracite mine, do you get the same percentage? Do you get 65 per cent of the price of the coal at tide water and the man 100 miles farther on the same price that you get?—A. That condition does not exist in the anthracite region. When I speak of the 125 miles we haul that coal, down to the junction, I do not include the haul from the collieries. We haul it part way over our own road.

Q. (By Mr. PHILLIPS.) What would be the probable distance from these coal centers to tide water?—A. The difference in the Wyoming region is very slight; not very much difference. From the Schuylkill region they ship largely to Philadelphia.

Q. (By Mr. KENNEDY.) What object have the railroad companies in view in offering this 65 per cent of the tide-water price to the independent operators of the coal region?—A. That, I think, had better be answered by some of the officers of the railroad companies who are interested in those contracts. We are not.

Q. Do you not know by hearsay and by general knowledge what the object is?—A. I could only give you what my opinion would be. It would be that it is done in order to control or consolidate the business and prevent competition and the cutting of prices.

Q. They also insist upon having a clause in the contract that they shall have the entire output of the collieries that come in under that agreement?—A. I can not say about that. Not having any personal interest in these contracts I have not given them the attention that I otherwise would.

Q. (By Mr. RIPLEY.) Do you know what the life of these contracts was to be—for a limited term of years or in perpetuity?—A. The 60 per cent contracts were for a limited term. Most of them expired 2 years ago. The proposed contracts are in perpetuity, I think, with the exception of those of the Pennsylvania Railroad.

Q. Would this not mean, then, from the date of signing such a contract, that the individual operator so signing would cease to be independent? Would not his output be dictated to him by the railroad company?—A. Not necessarily his output, but the price would be fixed.

Q. He would be obliged to accept the price fixed by the railroad at tide water, either directly or in cooperation with other railroads?—A. Not the price fixed by them, but the price received by them. It is settled on the prices received the month previous; the actual average price received.

Q. How do the numbers of individual collieries at the present time compare with the number in existence 10 years ago? Is there a tendency toward their disappearance?—A. Quite a large number have been purchased by the different companies in the last two years. They are decreasing.

Q. Will you state some of the causes which have induced that absorption?—A. I think that generally the individual operator finds he can make more money selling out than by continuing in the business.

Q. Has there been complaint among the individual operators that the rates charged for the transportation of their coal were excessive as compared with the rates on bituminous coal?—A. At times.

Q. How do those rates compare in general?—A. They have been higher; but how much I can not say.

Q. Very considerably higher?—A. Yes. I understand there has been an increase in the bituminous freights, but what it is I do not know.

Q. Were not the proceedings instituted by Coxé Brothers & Co. before the Interstate Commerce Commission made because of complaint that the rates were unjustly higher on hard coal?—A. So I understand.

Q. From your knowledge of the cost of mining and transporting, is there justification for such a discrimination against hard coal as in favor of soft? Does it cost more to transport the one than the other?—A. The cost of transportation, I should say, would not be in excess; but this difference prevails to a certain extent. The cars loaded with anthracite coal as a rule almost always return empty. I think they have a return load more in bituminous coal than anthracite, but I do not like to express an opinion on the bituminous business, because I do not know anything about it.

Q. You have been formerly connected with other companies?—A. I was connected with the Pennsylvania Railroad for 12 years as manager of their coal companies.

Q. (By Mr. PHILLIPS.) Was that company managed for the benefit of all the stockholders of the Pennsylvania Railroad?—A. Yes.

Q. They owned the mines and transported the coal, and the profits were divided—A. (Interrupting.) Among the stockholders.

Q. They have a right under their charter to do that business, have they?—A. I can not say that. Most of the coal properties owned and controlled by the Pennsylvania Railroad Company came to them by the purchase of other lines of railway. For instance, the property at Shamokin came through the acquisition of the Northern Central, or the Shamokin and Pottsville, which is a division of the Northern Central, and which owns certain properties in the Shamokin region.

Q. Then all these transactions at the seaboard are made for the benefit of the stockholders, and all the profit from the coal goes to the stockholders of the various roads, as I understand it?—A. I suppose so. I had nothing to do with that. They were entirely independent, so far as the organization was concerned. The Susquehanna was entirely independent, and so was the Mineral Railroad and Mining Company.

Q. These properties were taken over by the Pennsylvania Railroad and the profits were divided, as per understanding, between the stockholders?—A. Whatever the profits were went to the stockholders of the coal company.

Q. Not of the Pennsylvania Railroad?—A. Oh, no; no.

Q. (By Mr. RIPLEY.) Was not at least a controlling interest in the stock of these companies owned directly by the Pennsylvania Railroad?—A. Yes; I think all the stock of the Susquehanna was owned by the Pennsylvania; also of the Lykens Valley and of the Summit branch and of the Mineral Railroad and Mining Company. Speaking from memory, I think they owned a controlling interest in all these companies, and all the stock of the Susquehanna Coal Company.

Q. As a rule is not most of the stock of these mining companies that operate in connection with railroads owned by the railroads?—A. Yes; so I understand.

Q. They are simply subsidiary companies for the transaction of certain kinds of business?—A. As I understand it.

Q. Are the accounts of the two companies kept entirely distinct?—A. Yes. I am speaking now of the accounts of the Pennsylvania Railroad. They were kept entirely distinct.

Q. Are the coal companies of the Pennsylvania Railroad charged exactly the same for the transportation of coal that the individual producers pay?—A. No.

Q. Was there any discrimination?—A. On the contrary, they did not give them the benefit of the 60 per cent rate. They charge them the same rate as any operator shipping over the line. They pay the full rate the same as anybody else.

Q. Do you recollect what that rate was?—A. That would vary from time to time.

Q. There was no advantage, then, to the Pennsylvania Railroad or to the coal company from the connection between the two?—A. Not the slightest.

Q. Were the accounts kept so distinct that the cost of mining to the mining company could be estimated?—A. They were kept absolutely separate from the Pennsylvania Railroad Company accounts.

Q. Is that the practice, to the best of your knowledge, of most of the railroads?—A. As far as I know, the coal company accounts and the railroad company accounts are entirely separate and distinct.

Q. It would be possible for a railroad company to favor its own coal company as against individual operators if it so chose to do; that is, it would be possible for a railroad to transport coal from its own companies at less rate than it charged individual operators who had no financial interest with them, would it not?—A. Well, I do not know whether they are legally allowed to do that or not.

Q. What remedy would exist in case such discrimination was shown?—A. If I were a shipper over a line of road, and I knew the management were charging somebody else less than they charged me, I would try to see if I could find some way to stop it.

Q. (By Mr. LITCHMAN.) There would really be no difference if they owned all the companies?—A. It would simply be taking out of one pocket and putting it in another.

Q. (By Mr. PHILLIPS.) Have you heard any complaints of these individual operators of discrimination in favor of these companies?—A. I never heard of any. I never heard any complaints of that kind.

Q. (By Mr. RIPLEY.) Have you known of instances in which money has been loaned or advances made to individual operators for the development of properties?—A. I have heard that such loans have been made. I can not speak from personal knowledge, however.

Q. Would not such loans, if made, tend to render the acquisition by purchase of those properties simpler by the railroads than if the collieries of the independent operators were in fact entirely independent?—A. I do not see why it should, unless the loan was so great that the individual operator never had any chance to get out of debt, like a mortgage on the property.

Q. Mortgages of less amount, however, placed on these individual collieries have been held by the railroads, have they not?—A. I can not say that.

Q. You have known of instances?—A. I have heard that certain companies had advanced money to the operator for certain improvements, but I speak without personal knowledge.

Q. In what part of the anthracite coal region are most of the individual operators located, or where were they located?—A. In the Wyoming, the Lackawanna, and the Lehigh regions, and some in the Schuylkill region—fewer in the Schuylkill.

Q. Fewer in the South than in the North?—A. Yes.

Q. Can you give us any information as to the percentage of coal mined in this field which is produced by individual operators at the present time?—A. No; I could not. It has changed so rapidly in the last few years.

Q. How much was it three or four years ago, in round numbers? Was it 10 per cent?—A. That I do not know. I think it was more than that.

Q. It has substantially decreased in the last few years by reason of absorption and purchase by the railroad companies?—A. Yes.

Q. Has this tendency to absorption been the result of distress among individual operators, or has it rather been attempted by purchase at substantial remunerations? Has it been more profitable to sell out by reason of fair or very good prices offered for the properties, or have the individual operators been forced to sell out through the power which the railroads were able to exercise?—A. I do not think they have been forced to sell out, but that they did so because they could realize a very good profit and get a very good price.

Q. Do the laws of Pennsylvania prohibit a railroad from operating as a coal mining company?—A. I do not know. I think they do.

Q. You maintain two independent corporations, one of which mines and the other transports?—A. Yes.

Q. Are there any other companies, so far as you know, that mine directly themselves?—A. I do not know of any. Now, I can not say about the Delaware, Lackawanna and Western; they formerly had another company under which they operated, but how it is now I can not say.

Q. On what lines are the larger operators or individual operators, or were they a few years ago?—A. I would say the Lehigh Valley.

As to the laws of Pennsylvania, understand I do not know whether the company can operate coal mines or not. We have two separate organizations.

Q. In what manner is settlement generally made with the independent operators; do you know? Are they paid at the time the coal is delivered at tide water or do they receive payment at the time they deliver the coal at the breaker?—A. As soon as the prices for the month are determined they are paid; generally early in the month following. For April coal they would be paid as early in May as the aver-

age price was determined. I do not know whether the contracts specify a certain time or not.

Q. Do you know whether those contracts of which you have spoken as recently submitted to the individual operators and signed by some on the line of the Pennsylvania permit a certain amount to be mined each year, or is the quantity limited?—A. I can not say.

Q. You have not seen the contract?—A. I had a copy furnished me with the terms paid.

Q. What are those terms?—A. Sixty-five per cent for prepared sizes, and, my recollection is, it is 50 per cent for pea and 40 per cent for buckwheat. It was some time ago that I saw the contract, and it was not the final proof.

Q. You have said that in your own case you have a long-time trackage arrangement with the Lehigh Valley Railroad.—A. I think it has about 7 years to run.

Q. Does it permit the coal mined by Coxé Bros. & Co. to be transported at cheaper rates to the seaboard than you could have obtained as independent operators not controlling a railroad?—A. I can not answer that question, for the reason the present arrangement involved a very large expenditure of money in purchasing equipment, such as cars and engines; and the depreciation, of course, on that plant is quite material. Then we have the selling expenses to pay, which an operator shipping under a contract with a railroad company does not have to pay. We have to take the chances of all bad debts, which an individual operator does not have to do. So, taking the cost of the equipment, the depreciation of the plant, the cost of selling, and the bad debts, I would not like to say whether we get any the better of it or not.

Q. You enjoy the benefit of joint rates, do you not?—A. Oh, no; we pay so much per ton per mile; no joint rate about it.

Q. Would you be willing to say that the ownership of a line of railroad does not give you an advantage in the price paid for transportation to the seaboard?—A. I could not say that because of the conditions I have mentioned. I have never made any calculation on it. I know, of course, that our depreciation is very large on the plant; there is a question of new cars coming up very shortly.

Q. What proportion of your coal goes west and what east, respectively?—A. I can give it to you exactly, if you would like to know. [Referring to table.] Coxé Bros. & Co. in the year 1900 shipped 1,032,577 tons. They sold at the mines 29,077 tons. They used for the company's use, steam, etc., 191,838 tons, making a total of 1,246,592 tons. We purchased from Mr. C. Pardee 529,021 tons, making a total shipped from the mines, including the Pardee purchases, 1,561,593 tons. Of the amount shipped the figures will not check up with what I have given already because we had a certain amount in storage at Roan. We shipped to Perth Amboy 1,071,357 tons, and to line points east 119,209 tons. We shipped to Buffalo for lake shipment 199,870 tons, and west by rail 160,446 tons; total, 1,580,882 tons.

Q. (By Mr. KENNEDY.) That is what percentage of the entire output of the region?—A. It is about 3½ per cent.

Q. Is there entire freedom on the part of individual operators, so far as you know, to produce more or less, as the case may be, according to their own disposition, or are they allowed to produce a certain amount and held to that allotment?—

A. I can speak for ourselves on that point. My instructions have always been to mine all the coal that we could sell without sacrifice—without cutting prices. That is the principle we are working on.

Q. Is there not, however, between the different railroads concerned what is known as an annual allotment?—A. Several years ago there was. The presidents of the different railroads got together and agreed on a percentage that each company should ship, but I do not think that any attention has been paid to that for some time. Everybody ships all he desires to ship. Any company can ship all the coal it can, and fill the cars all up, and do anything it likes.

Q. As a matter of fact, has not the proportion each year remained about constant?—A. Yes, naturally; for the reason that allotment was based upon the respective outputs of the companies, and they would necessarily follow very close to those figures.

Q. Will you give the name and address of the official who prepares and publishes these official statements of allotment?—A. There is no statement of allotment made.

Q. Of the tonnage shipped?—A. I can not give you his address. His name is W. W. Ruley, of Philadelphia.

Q. He, however, stands in no official relation to any of the railroad companies, as far as you know?—A. Not as I understand; no.

Q. Has Coxé Bros. & Co.'s proportion held in the last 5 or 10 years or has it increased?—A. I think it has been about stationary for the last 3 or 4 years.

Q. Has the proportion been stationary for the most of the other railroad companies; referring, for example, to the table published in the New York Financial and Commercial Chronicle?—A. I could not give you those figures. That is a matter easily determined from the statistics. In general I think it is about the same.

Q. Has there been complaint on the part of the Reading Railroad that its allotment was too small, considering its facilities?—A. Not to my knowledge.

Q. The Reading Railroad is, however, the most important producer, is it not?—A. It is the largest producer: yes.

Q. So far as you know, you have never heard a complaint on the part of the Reading Railroad that it deserved a larger proportion?—A. It does not follow that they have not made that complaint.

Q. Do the sales agents or the presidents of the different roads meet at any time officially or unofficially, so far as you know, to determine what amounts shall be allotted to each road?—A. Not to my knowledge.

Q. Do they meet in conference to consider the question of production each season?—A. Not to my knowledge. It will be 4 years in August since I became president of Coxe Bros. & Co., and I have not been called to such a conference and I have never heard of a conference to fix such allotment.

Q. Were such conferences held regularly 4 or 5 years ago?—A. I was not in a position to know.

Q. You have no knowledge of meetings of the sales agents?—A. I do not think they have regular meetings, but they do meet occasionally, probably twice a year, or something like that. I do not think they ever lay down fixed or positive prices. I think their meetings are more for discussion as to about what price they should receive.

Q. There is, however, an agreement as to what a fair price under the conditions of each season should be, is there not?—A. I think so. We do not attend these meetings.

Q. Suppose to-morrow, or next week, or next month, the Reading Railroad, or the Lehigh Valley, or the Pennsylvania Railroad, or your own road, should double your output by some means, what would be the result?—A. It could not sell the coal.

Q. Could you not sell it by shading the price somewhat?—A. I do not think it would be possible.

Q. Could not that be done in the fall of the year, when the demand for coal is somewhat greater?—A. To do that would demoralize the whole coal trade, and the producer so selling would have to stop mining, because the price received would be less than the coal had cost, and you can not do business on that basis very long.

Q. Have you ever heard the complaint or statement that the coal was mined at a loss by many of these coal companies owned by the railroads, but that the railroads were so enabled to mine at a loss because they made a profit in transporting the coal for themselves?—A. I have heard that statement.

Q. What is your judgment in respect to its soundness?—A. I am not in a position to know of the companies, excepting our own.

Q. Speaking of your own experience, would that be true?—A. No; I think we would make a small profit on the mining.

Q. It was testified before this commission some weeks ago that the cost of coal at the breaker was on an average \$1.71. What is the price at tide water, fixed on the 1st of April, as published in the papers; do you know?—A. I think the price is \$4 per ton for stove and nut.

Q. Have you received notice from the other companies or from any persons to the effect that this would be the price for this season?—A. I think the only company that sends out an Eastern circular is the Philadelphia and Reading. We receive a circular from that company announcing its prices. I read a newspaper article which stated, and I think it is correct, that the present circular and net prices f. o. b. the harbor were: Broken, \$4; egg, \$4.25; stove, \$4.50; chestnut, \$4.50. But it goes on further and says that these are the regular prices that have been prevailing, and that sales may be made with the following discounts or reductions from the price: April, 50 cents a ton off these prices; May, 40 cents off; June, 30 cents off; July, 20 cents off; August, 10 cents off, and September, the full circular price.

Q. (By Mr. KENNEDY.) You are speaking of the Philadelphia and Reading prices, are you not?—A. Yes. That is practically the price of all of them.

Q. You said the Philadelphia and Reading is the only company that gives out a circular?—A. I think it is the only one.

Q. It sends to the other companies?—A. Yes.

Q. The other companies follow the prices the Reading names in the circular?—A. Not necessarily. If we can get more we do so.

Q. Is it not the rule to follow the Philadelphia and Reading price list?—A. I think generally all do.

Q. The Reading people fix the price themselves?—A. I do not know whether they do it without consulting the other companies or not. I can not say that. They may agree or not, but as far as we are concerned we always sell our coal for all we can get for it, and usually get a little more than the circular price, especially on the Lehigh coals, which are a higher-grade coal.

Q. (By Mr. RIPLEY.) Repeating a question which I asked before, the effect of any one of these railroads exceeding what has been a customary proportion of the annual shipment would be to demoralize the trade, would it not?—A. I think it would; yes.

Q. What do you mean by demoralize?—A. Understand me: you stated the proposition, if the Philadelphia and Reading or Lehigh Valley should double the shipment. In that case somebody else would start in to get even with them, and the result would be the demoralization of the trade, and everything would go to pieces. That would keep up as long as they could stand it, and then they would have to stop.

Q. Such demoralizations in price have been frequent in the past, have they not?—A. Yes.

Q. Can you state when the last serious one took place?—A. I think it was about 3 years ago in the fall, when prices went to pieces pretty badly.

Q. As a whole, prices have been steadier the last few years, have they not?—A. Yes.

Q. Have they not been higher also than during the range of a number of years preceding?—A. No; I think not. They are not as high as they were along in the early nineties.

Q. They are higher at the present time, however, than they have been for any long time at once, are they not?—A. They have been higher since the strike, caused by the market being denuded of coal, and the old rule of supply and demand rather enhanced the price.

Q. What is your judgment as to the price of coal at the present time? Is it about as high as the trade will stand?—A. Do you mean before this reduction?

Q. Yes; through the last winter.—A. I think so.

Q. It would not be to the interest of the producers, then, to advance the price beyond that of the present time?—A. I do not think it would be, because that brings into competition other fuels. Anthracite coal is largely a luxury, except the small sizes for steam purposes.

Q. Will you speak of the nature of such competition in fuel as the anthracite coal is obliged to meet?—A. For steam and manufacturing purposes, of course, bituminous coal, for household consumption, gas stoves and gas ranges are coming in, and oil stoves; and in the large cities, in the apartment houses, where anthracite coal was formerly used, a good many are using bituminous coal now.

Q. Is not the demand for all kinds of anthracite coal increasing year by year, however?—A. Not very materially. I think the largest increase has been in the small sizes more than in the large sizes. It is only a few years since all of what are known as the small sizes were thrown away; in fact, prepared sizes were used for steam purposes at the mine, and egg and stove coal were burnt under the boilers. What is known now as pea, barley, buckwheat, and rice were thrown away; and I think the large increase in the consumption of anthracite coal for the last 10 or 15 years has been more due to the consumption of the small sizes than to an increase in the large sizes.

Q. Is there not, however, a definite relation between the amounts produced of these 2 sizes? Are not the small sizes simply a by-product, incidental to the mining of the other sizes?—A. Certainly they are; but at the same time the conditions of the market have changed the proportion of sizes mined. Twenty years ago, or less time than that even, where an operator could sell 10, 15, or 20 per cent of lump coal, he can not sell any to-day, and it has to be broken into smaller sizes; and when you break down coal you increase your percentage of small sizes. We are making practically no lump coal to-day, nothing above broken. That means breaking everything down, and it means a large increase in the percentage of small sizes.

Q. So you would say that the principal increase in the last 10 years has been in the small sizes?—A. Largely due to the increased consumption of small sizes.

Q. And that the competition of other kinds of fuel with the prepared sizes has prevented a great extension of the demand?—A. Yes.

Q. You have spoken of the percentage rates to tide water. In what way are the rates to Chicago and the West made up? Under what conditions do you ship your coal to the West?—A. I think we get rates in the spring. Whenever they make any change they send us a circular stating what the rates are, and we pay on the all-rail coal a certain fixed rate. There is a certain rate to Buffalo.

Q. Probably the regular published rates that are on file with the Interstate Commerce Commission?—A. Just the same.

Q. And to the best of your knowledge these are the regular rates paid by all individual operators alike?—A. Yes.

Q. Without discrimination or favor?—A. Yes.

Q. (By Mr. FARQUHAR.) You shipped about 200,000 tons to Buffalo last year. Was that for local consumption or did part of that go by lake?—A. It all went by lake.

Q. And you say you shipped 160,000 tons by all-rail for the West?—A. All-rail for the West and intermediate points.

Q. You use the transportation of the Pennsylvania road on the lake?—A. No; boats.

Q. Your own boats?—A. No. We charter from whomsoever we can get boats.

Q. You simply use the Pennsylvania railroad tonnage to Buffalo?—A. The Pennsylvania tonnage to Buffalo.

Q. Are your lake rates uniform at Buffalo?—A. They vary very much. They have varied from month to month since I have known of them. They have been as low as 20 cents from Buffalo to Chicago and as high as \$1.25.

Q. Have you had an advantage in taking wild or independent boats and not regular liners?—A. Oh, no.

Q. Are your selling rates the same as those of others—the Delaware and Hudson and the Lackawanna—in Buffalo?—A. We do not sell in Buffalo.

Q. No local market?—A. No.

Q. Are there any parties who buy from Coxe Brothers, Incorporated, and supply the city government and others with your coal?—A. I do not know of any. There may be, but I mean to say we do not do any retail business there, or anything but rail delivery. There are points in the vicinity of Buffalo where we ship by rail, and of course we supply them.

Q. Do you ship to Chicago?—A. We ship to Duluth, Chicago, and Milwaukee.

Q. Are the sales made through your own agents in those ports?—A. Entirely.

Q. Is it a common market and is the price common there?—A. Yes.

Q. So that you are just as well advantaged as the regular liners? You get as good a price as the Pennsylvania or the Lackawanna for coal in the Western ports?—A. I think so.

Q. Do you know of any other independent shippers who do that?—A. I do not think any of the independent operators ship their coal west.

Q. You get just as good rates to Buffalo as any other shippers?—A. We get the same rate.

Q. (By Mr. RIPLEY.) Have there not been at times, however, cutting of rates in favor of certain shippers?—A. Not since I have had anything to do with the rates; not to my knowledge.

Q. Was the Pennsylvania Railroad ever inconvenienced by discrimination forced upon it by its connections?—A. I could not answer that question, as I would not know anything about a matter of that kind.

Q. Is it possible to get at the cost of mining coal at the breaker?—A. [Laughing.] That is a very difficult question.

Q. Will you explain some of the difficulties?—A. Preparatory to coming down here I read over Mr. Coxe's testimony before a commission several years ago, and he said it was a question he had been trying to find out all his life, and had never succeeded. The local conditions will vary in every locality and in every mine, and in the seams of every mine. To-day a seam may be in good condition and everything going on smoothly, and to-morrow you may have an explosion of fire-damp that will cost considerable money; or you may have a fall of roof, or you may have a flood in your mine, and those conditions are in every locality, in every mine—in fact, you may say they are in the same seam of the same mine.

Q. (By Mr. RIPLEY.) Under those circumstances, then, would it be possible to operate a mine at a very close margin of profit on mining?—A. No, sir.

Q. The profits have got to be broad enough and large enough to cover contingencies?—A. They ought to be. There is another question that is seldom figured in the cost of mining—the cost of developing a property. An anthracite coal mine takes a very large amount of capital, and the depreciation of the plant is very seldom taken into account; the depreciation of your property, if you are a land owner, is very seldom taken into account. In other words, where a man at present is receiving a royalty on coal land and he spends that royalty he will be minus his property in time, and it is the same way in mining.

Q. Is the practice of setting aside a certain amount for depreciation, or for exhaustion of property, followed by any of the companies of which you have knowledge?—A. It was by the Susquehanna Coal Company; as to the others, I can't say.

Q. In other words, a company which does not set aside something out of the earnings each year will, at the exhaustion of the mine, find it is without capital?—A. Yes, sir.

Q. The wisest business policy then, following your argument, would be to set aside a stated amount for that purpose?—A. Yes.

Q. Does the competition of coke in New England territory, for example, threaten an embarrassment?—A. I have not heard anything about it.

Q. You are aware of the experiments made in the line of producing coke from Cape Breton coal?—A. Oh, yes.

Q. Is that regarded seriously as likely to affect the consumption of anthracite coal in that part of the United States?—A. I can only speak for ourselves. We have not so considered it.

Q. Do you ship any large amount into New England?—A. Yes; we ship considerable there; I can't say the amount, but we ship considerable.

Q. Do you sell it at the wharf in New England, or do you deliver it at interior points?—A. We sell it usually f. o. b. Perth Amboy; sometimes we sell it delivered to points reached by water transportation.

Q. If it is sold delivered in New England that arrangement includes all freight charges?—A. I do not think we ever sell the New England purchaser at delivered price. The purchaser has to take care of the freight rates. I do not think we ever go further than the water rates. Understand, I am not very familiar with the details of the sales department.

Q. You have no knowledge of freight rates which are charged to interior Boston points upon coal that goes by rail from Boston?—A. No, sir.

Q. Is the consumption of hard coal or soft coal increasing most rapidly; which?—A. I think the consumption of soft coal is increasing more rapidly.

Q. Soft coal, then, threatens to be the most serious rival in the future?—A. I think so.

Q. Is there any definite relation between the price of soft coal and hard coal? Do they move together in sympathy at all?—A. I think not.

Q. Is there to-day a certain relation between the prices of soft coal and hard coal which will compensate for the superior quality of hard coal as fuel for domestic purposes?—A. We have never considered the price of soft coal in fixing our prices at all.

Q. Do you know the difference of the heating power of a ton of soft coal and a ton of hard coal, if any?—A. It is usually considered that a ton of good George's Creek bituminous coal will make more steam than a ton of anthracite.

Q. Under a boiler or locomotive?—A. Under good conditions.

Q. (By Mr. LITCHMAN.) Is that due to quicker burning?—A. Because the hydrocarbons in bituminous coal have a much higher heating power than carbon.

Q. (By Mr. C. J. HARRIS.) There is some relation between the price of hard and soft coal, is there not? You said just now, as I understand, that there was not.—A. No; I said we did not take the price of bituminous coal into account in fixing the price of anthracite, speaking for ourselves.

Q. What I wanted to get at was this: You could not place an unlimited price per ton on your hard coal; you could not raise the price indefinitely higher than a certain limit without taking the risk of having soft coal used in its place, could you?—A. That is right; we could not.

Q. And do you not find, or do you, that when the price of anthracite coal becomes perhaps temporarily very high that there is a tendency to use bituminous?—A. To use bituminous coal, yes. What I meant to be understood as saying was that we did not figure any fixed price as between anthracite and bituminous. We know perfectly well if we advance prices on small sizes which come in competition with bituminous coal beyond certain prices, the bituminous coal will take the market.

Q. That would be true, of course, of steam coal more than of coal for domestic use?—A. Yes.

Q. Would not that same competition come in eventually in regard to domestic use?—A. Unquestionably; that is why I say that the price of anthracite coal can never be put to an excessively high point.

Q. (By Mr. PHILLIPS.) Do you know the difference between the heating power of a ton of coke and a ton of anthracite?—A. It is a question I have not had occasion to look up for a good many years.

Q. (By Mr. C. J. HARRIS.) What effect has the recent large combination of coal railroads, so called, had on independent producers?—A. In what way?

Q. Well, what I meant to say, would it eventually drive them out of the business entirely? Would it do away with the independent producer?—A. No; I do not think so.

Q. Would he be able to come in and compete, if they wished to freeze him out entirely?—A. I think so, for this reason: Any attempt to freeze out an individual operator would mean a reduction in the price of coal—the price of a very large volume of coal—which would hurt the large interest much more than it would

the small interest, and there would not be any object in doing that. The combination of capital, whether large or small, I do not think would be apt to throw away a large amount of money to squeeze out the small individual.

Q. (By Mr. RIPLEY.) Are there not other ways open to freeze out a small individual, viz, by discrimination against that individual in freight rates or in delay in getting cars or in lack of other facilities of that kind?—A. Well, with the 65 per cent contract I do not think that either device would have any effect.

Q. I understand that contract has not been signed. Did you not make that statement?—A. The last I heard it had not been signed. I have no definite knowledge.

Q. Has there not been complaint at times within your knowledge of a lack of cars and facilities in certain instances?—A. Yes.

Q. (By Mr. C. J. HARRIS.) Have you heard of any lack of cars or any other matter of that kind that has worked any special injustice of late years?—A. For the last three and a half years I have not come in contact with that phase of the problem, but while I was in the Pennsylvania Railroad Company I heard plenty of such complaints: and my experience with the Pennsylvania Railroad Company was that it took a great deal better care of the individual operators than it did of its own coal companies, and I used to protest very vigorously because they would send cars to individual operators, including Coxé Bros. & Co., when we could not get cars to run our own collieries.

Q. (By Mr. RIPLEY.) Was that the policy, however, pursued by many of the other large roads, the Reading, for instance, Lehigh Valley, etc.?—A. The Reading—I know nothing about their policy. I think, as far as I know, the Lehigh Valley tried to distribute cars as fairly as it was possible to do. There are times, of course, when no railroad companies have cars enough to go round to supply the demand. I think the policy of all the roads, as far as my knowledge extended, was to treat the individual operator as fairly as they treated their own collieries.

Q. There was, however, complaint sufficient in the case of Coxé Brothers to lead to an institution of proceedings?—A. That is going back further than I am familiar with. I am speaking of the last few years.

Q. The specific complaint of Coxé Brothers Company at that time was that a discrimination against hard coal was made, the rates being so much higher than upon soft coal?—A. Yes; but not any discrimination against furnishing cars is the point I was making.

Q. (By Mr. C. J. HARRIS.) What do you say of the price of coal now as compared with the price of coal at this time of last year and the year preceding? Is it much higher now?—A. It is about the same.

Q. Is it about the same?—A. Yes.

Q. (By Mr. PHILLIPS.) About what percentage of the anthracite coal fields is controlled now by this recent combination of interest?—A. That would be merely a guess on my part. I should say, roughly, possibly 80 per cent.

Q. (By Mr. RIPLEY.) It would be possible to compute that, would it not, from the table of shipments which is officially printed, if you knew which roads were controlled in that respect?—A. Yes; I could—

Q. (By Mr. PHILLIPS.) Is 80 per cent of any commodity like anthracite coal sufficient to give a monopoly of that commodity, in your judgment?—A. You mean in fixing the price?

Q. Yes.—A. No; I do not think so. I think I could take 20 per cent of anthracite coal and break the market any time.

Q. (Mr. LITCHMAN.) Suppose you could not get transportation to market.—A. Then of course I could not do it.

Q. (By Mr. PHILLIPS.) This combination is between the coal people, the owners, and the railroads, is it not? This recent combination embraces 80 per cent of coal and all the railroads, does it not, leading into the field?—A. It would embrace whatever coal the railroad companies controlled.

Q. But they are all working in the same interest; all the railroads are combined leading into the anthracite fields at the present time, are they not?—A. All except the Pennsylvania Railroad, the Ontario and Western, and the Delaware and Hudson.

Q. (By Mr. RIPLEY.) What do you mean by "combination," Mr. Stearns?—A. I did not use the word.

Q. I understood you to use the word.—A. No; I quoted the word. "Community of interest," I think it is called now.

Q. (By Mr. PHILLIPS.) The roads are at least working in harmony, and as a rule the directors of one own stock in each others' roads, do they not?—A. That is a question I know nothing personally about, except as you do—through the newspapers.

Q. Would it not be possible, even if they had equal transportation facilities, for

a large and wealthy concern to follow a person having 10 or 20 per cent of a commodity, to follow it into a given market and sell there at a lower price, and then follow it to another market, thus pursuing what we might call a "clubbing policy?" Is not that frequently done where persons have large control of a commodity, thus driving others out of the market?—A. I have never known it to be done in the anthracite coal business, and that is the only business I have ever been connected with, except engineering.

Q. (By Mr. FARQUHAR.) Do you think that you could force 20 per cent more anthracite on the people than you supply now?—A. No.

Q. Could you shove 10 per cent more upon them?—A. No.

Q. Suppose you made an exorbitant rate; suppose you owned 95 per cent of the output and made an exorbitant rate; would not bituminous coal come in and compete and knock the rate down?—A. It would knock the price of coal down.

Q. (By Mr. LITCHMAN.) What is the total product of anthracite coal?—A. About forty-five million and some thousand tons in 1900. The year before it was forty-seven million and some thousand tons.

Q. An increase, then, of 50 cents a ton would be a very handsome return, would it not, to controllers of that output?—A. It certainly would, if they could get it.

Q. (By Mr. RIPLEY.) It is about 50 cents a ton higher at tide water than it was before the strike.—A. Fifty cents on prepared sizes. I think on the average total output it would be about 30 cents.

Q. Thirty cents at tidewater on the total output?—A. Yes.

Q. Are there not certain peculiar circumstances in the coal industry which make it to the interest of the operator to increase his output? I refer to the fact of a dull season, when facilities must be all maintained for a full production in the fall. Will you explain whether that is so or not?—A. To a certain extent it is, for the reason, at this time of the year, for instance, when the demand is small, it requires so much space to stock anthracite coal and so much money that it is impracticable to regulate your year's supply by the output in the months when the trade is in a depressed condition, and in order to supply the demand in the fall and winter months, which is brisk, you have got necessarily to have your mines developed to a capacity much in excess of what would be needed if you could run uniformly through the year.

Q. (By Mr. RIPLEY.) There is, then, this powerful incentive which would tend to increase the capacity of each company?—A. Yes.

Q. What holds the company down to the constant proportion which has been maintained for a number of years, as I understood you to say, in the past?—A. Every company has certain collieries becoming gradually exhausted, and that circumstance, of course, takes off a part of the increased output made by new openings and additional capacity.

Q. I suppose, too, the available supply for future years varies very greatly as between the different railroad companies, does it not?—A. Oh, yes.

Q. Will you specify any of them which are supposed to have a vast reserve for the future?—A. The Reading is generally considered to have the largest amount.

Q. And which company after that, so far as your general knowledge of the trade goes?—A. I should say the Lehigh Valley. The Delaware, Lackawanna and Western have a large reserve also.

Q. How about the Jersey Central?—A. I am not so familiar with their lands in the Lehigh region. I do not know what proportion of those are undeveloped, but I think their Wyoming lands are pretty well developed. I do not think they have much virgin coal left.

Q. (By Mr. KENNEDY.) Have you made any estimate as to how long your mines will hold out?—A. No, sir; I have never made any.

Q. (By Mr. RIPLEY.) A consolidation now of the Reading, the Erie, the Lehigh Valley, and the others which you have named as having the greatest reserves would give such a combination a most important strategic position 50 years from now, if the remainder of the coal fields were exhausted, would it not?—A. Certainly it would. Understand, when I am speaking of the amount of unmined coal these companies have, it is not from actual knowledge, but general opinion.

Q. You are acquainted with all the official and geological reports, such as those made by Griffiths and others?—A. Yes.

Q. The general impression is as you state among scientific men?—A. I think so.

Q. Do you understand that the companies which have a vast supply in reserve for the future are paying interest charges upon that capital so invested out of earnings made at the present time?—A. I do not know; I can not answer that question.

Q. You are aware of the circumstances under which the fields of the Reading

Railroad were acquired, are you not?—A. No. That transaction occurred a good many years ago, and I was not interested in coal mining then, except as an engineer.

Q. (By Mr. PHILLIPS.) Would it be possible now for a new company to go into the anthracite field, if it could procure or had procured an eligible body of coal, and open that mine up and have the same facilities for transportation and opportunities at the market as those who are now engaged in it?—A. I think so, undoubtedly.

Q. It could have the same facilities that you have in mining your coal?—A. It could come in on the same basis as anybody else; I do not think there would be any discrimination whatever.

Q. Then it is your understanding that this recent combination is not to discriminate against others or independents or new operations in the field?—A. I think not.

Q. (By Mr. C. J. HARRIS.) Would it be possible to find any territory that an independent operator could get hold of now?—A. There is some. I understand there are some lands in Schuylkill County that are not owned by any of the companies, that are on the market. They come up every once in a while.

Q. The anthracite fields, however, have been pretty well exhausted?—A. Oh, yes; the desirable coal land is all owned by parties who are operating.

Q. It would be very improbable that any new anthracite coal fields would be discovered in Pennsylvania?—A. Yes.

Q. (By Mr. RIPLEY.) I quote the following statement from the New York Journal of Commerce of February, 1901:

"The Delaware and Hudson, so the independent operators were informed, could have its coal carried to tide water by the Erie Company for 60 cents per ton. The independent operators, then paying nearer one dollar sixty a ton for the service, not unreasonably failed to get the D. & H. as an ally to this plan."

According to that statement it would appear that the independents, perhaps, were paying \$1.60 a ton when the Delaware and Hudson Railroad were getting the service for 60 cents a ton. Have you seen in recent years or had knowledge of the existence of any such conditions or discriminations?—A. No.

Q. Would that be possible so far as you have any knowledge?—A. I would know nothing about any arrangement the Erie and the Delaware and Hudson would have.

Q. So serious a discrimination must, however, if it existed on any large scale, be a matter of common knowledge in the trade. You have no knowledge?—A. I have no knowledge whatever.

Q. You have never heard of any such?—A. No.

Q. Will you make a statement respecting the attempts within the last year to build independent lines to tide water, so that the independent operators might secure an outlet?—A. Within the last year? I think there was an independent line started three years ago.

Q. There have been other attempts and projects within the last year, have there not?—A. Yes. The first attempt was a line going from Scranton to tide water. The next was the line which followed the old Delaware and Hudson canal and terminated at Kingston, on the Hudson River, in connection with the Pennsylvania Coal Company.

Q. Were the franchises for these lines actually secured?—A. I do not know whether they were finally secured. They were in litigation on the charter for a long time as to certain rights of way, and whether they ever completed the litigation I do not know.

Q. What was the understood object of those attempts to construct more independent railways to tide water?—A. To get a lower rate of freight.

Q. In other words, the individual operators were sufficiently dissatisfied with the rates charged upon coal to be willing to agree to ship over a new line if it were built?—A. That is my understanding.

Q. Have any of these lines been built in part or entirely?—A. Not at all.

Q. And what prevented the consummation of the plans?—A. Bought out.

Q. Bought out by whom?—A. By the different community of interests, the different roads that are now considered as—

Q. (Interrupting.) Have you ever heard of the Temple Iron Company? And if so, will you make a statement respecting what you know of it, what it is, and for what purpose it was created?—A. The Temple Iron Company's collieries were formerly owned in part by Simpson & Watkins, who were individual operators.

Q. (By Mr. PHILLIPS.) You spoke of these roads having been bought out by the community of interest. Would not the existing roads necessarily have to charge more for freight if they paid large sums to prevent this advantage in order to recoup and get that money back?—A. No; not necessarily.

Q. Would it not take money from the stockholders that belongs to them? It has to come from some source.—A. The assumption is that they are making some profit on the operation of these collieries and the transporting of the coal. You see they purchased these collieries, and now they own the coal instead of buying it.

Q. Oh, I understood you to state that they bought out the men who were going to build this railroad.—A. No, no; they bought out the collieries.

Q. (By Mr. RIPLEY.) Was the Pennsylvania Coal Company one of those purchased at that time in order to prevent the construction of those lines?—A. The Pennsylvania Coal Company was purchased recently, and the assumption among the public is that it was purchased to prevent the building of the new line to Kingston.

Q. Was any other action taken, for instance, by the New York, Ontario and Western road to that same end?—A. Not to my knowledge; I do not know.

Q. Were not a large number of individual operators bought out by that company?—A. By the Pennsylvania Company?

Q. By the New York, Ontario and Western.—A. Yes; they bought several collieries, but they were entirely separate.

Q. They bought them out to eliminate the individual operator who was seeking an outlet?—A. As I understand it, the collieries purchased by the Ontario and Western were collieries which would have been shippers over the new road had it been built.

Q. In other words, the parties already interested in this territory were exceedingly desirous that no new independent lines to tide water should be constructed?—A. Yes; naturally so.

Q. And in order to prevent that effect the individual operators in that territory were bought out, and among those the Pennsylvania Coal Company?—A. Yes.

Q. Have you seen in the newspapers a statement concerning the price paid for the property of the Pennsylvania Coal Company?—A. Yes.

Q. Does it seem to you a fair price or an excessive one under the circumstances?—A. It is considered by the coal men who are familiar with that property that it was a very fair price, a reasonable price.

Q. (By Mr. PHILLIPS.) What was the sum paid?—A. It was about 32,000,000, or somewhere near that.

Q. (By Mr. RIPLEY.) There was, however, a quotation for the stock at a rate which would bring the total very much higher than that for a long time, was there not?—A. I have not seen any of that stock quoted on the market for a good many years. I did not know there was any of it for sale.

Q. What would be the effect upon the general harmony of interests throughout the coal region by the elimination of these individual operators, including the Pennsylvania Coal Company? Would it tend to strengthen the community of interest throughout the remainder of the field?—A. I should say that it would.

Q. In other words, has not the independent operation in that northern section of the Wyoming field been a source of considerable trouble to the other roads in maintaining a fixed price for the product?—A. That is the general impression.

Q. So that that obstacle being removed it would be easier for the remaining roads to come together and operate harmoniously?—A. Yes.

Q. (By Mr. LITCHMAN.) I have here a clipping from the New York Journal of Commerce which alleges certain facts. One is that the Morgan roads, so-called, absolutely control 63.17 per cent of the output of anthracite coal; that the non-Morgan roads control 36.83 per cent, and that the reason for the community of interest agreement is that these Morgan and non-Morgan interests have all been brought substantially under one control, and that they represent 96 per cent of their entire output of anthracite coal. That being the case, what is the opportunity for an independent operator to operate against 96 per cent of the production of coal?—A. That being the case we are the ones that are up against that proposition.

Q. Is not your company the Delaware, Susquehanna and Schuylkill Company?—A. Yes; that is our road.

Q. That is a Morgan road.—A. Not a bit of it, not a bit of it.

Q. Well, that would only eliminate 31 per cent more. That would make it 93 per cent.—A. Then there are the Ontario and Western, the Delaware and Hudson, and the Pennsylvania Railroads.

Q. The Ontario and Western is non-Morgan, but has recently been brought into the community of interest by virtue of the purchase of a controlling interest.—A. That is a newspaper report. I do not know anything about it.

Q. You own your transportation?—A. For only part of our coal.

Q. If the time comes when you find there is a shortage of cars for shipment to tide water then you will be apt to feel this competition, will you not?—A. I do not know.

Q. (By Mr. RIPLEY.) Is not that the reason why you built this road, 40 miles long, known as the Delaware, Susquehanna and Schuylkill, that you might obtain such transportation irrespective of any action?—A. The only person who could have answered that question is Mr. E. B. Cox. Mr. Cox stated, in some testimony at Harrisburg, that he built the road to connect his collieries, some of which were on one road and some on another, so that he could send his tonnage wherever he desired.

Q. (By Mr. LITCHMAN.) Has not the operation of that railroad, under the control of the Cox Brothers, been the means of obtaining the favorable terms upon which they operate their collieries at the present time?—A. They have no more favorable terms than any other roads, unless a trackage agreement to tide water can be so considered, and I do not know whether I consider that more favorable than the 65 per cent arrangement or not.

Q. (By Mr. RIPLEY.) Are you willing to submit that agreement?—A. As it is an agreement that affects only two interests, and not the public interest, I prefer not to do so.

Q. (By Mr. LITCHMAN.) This community of interest in the coal region is also the community of interest in transportation. Is it not, in that region?—A. The transporting companies control the coal companies.

Q. (By Mr. RIPLEY.) Is it not true that in the past the Reading Railroad has been the most uncertain factor in the situation as far as the maintenance of the regular output is concerned? Has that road not in general broken the customary allotment of shipments by increasing their output beyond that figure?—A. I do not know that it has.

Q. Would that not be true of 5 or 6 years ago?—A. I can not state without going over their shipments.

Q. You have no recollection to that effect?—A. No. Everybody complains about everybody else in the coal business the same as in any other business. They will damn the Reading one month and some other company the next, and so on. That has been the way.

Q. The incentive, however, on the part of the Reading to increase the output owing to improvements of that company is perfectly clear, is it not?—A. The more any company can increase its output and sell its coal the cheaper it can operate its mines as a rule.

Q. But in case of that company there is a large proportion of coal land lying idle which is eating itself up with interest charged, is there not?—A. Doubtless that is true.

Q. (By Mr. LITCHMAN.) Do your records of shipment show the prices of coal at tide water for, say, covering a period of 10 years?—A. Yes; I have the record.

Q. Could you furnish a statement showing that range of prices?—A. Yes.

Q. I want to show whether there has been any marked variation, and whether that variation has been affected by dull times and good times, and perhaps by these combinations that have taken place within that 10 years, and I take it that the operations of your company are of sufficient volume to make testimony on that point desirable.

Mr. Stearns thereupon submitted the following tables of prices:

[Coxe Bros. & Co., Incorporated.—Average f. o. b. tide prices received during years shown for coal mined by Coxe Bros. & Co., the Cross Creek Coal Company, and Coxe Bros. & Co., Incorporated.]

Q. (By Mr. PHILLIPS.) What effect, if any, has this recent combination had upon the distribution of coal in the great cities, such as Philadelphia and New York? Are there the same number of persons engaged in the marketing of this coal as there was before, or does this combination expect to handle the coal itself and retail it?—A. I do not think it has made any change as yet, but about plans I know nothing whatever.

Q. Or whether they are going to distribute it from certain depots in the cities?—A. I have seen statements to that effect, but I know nothing whatever about it.

Q. (By Mr. RIPLEY.) Coming to the question of labor and wages, how many men do you employ?—A. About 3,700, or a few over of men and boys.

Q. Were your men concerned in the strike last fall?—A. Yes.

Q. Have you any statement to make respecting their attitude or behavior during that time?—A. Our men did not strike except at one colliery. The strike commenced on September 17. I think only 54 of our men went out the first day of the strike, and they continued to work until intimidation was commenced, and they were threatened, called scabs and everything else, and every influence known to labor organizations and that class of people was used to intimidate them and keep them away from work. They continued to work until October 11, when, as a result of rioting, they killed one of our watchmen, shot another one in the face, wounded several others, and we concluded to stop, and posted the following notice:

"NOTICE.

"After nearly 1 month's struggle with intimidation, raiding, etc., and the lack of adequate protection from the proper authorities, and with the feeling that this company has reached a point where it is unable to properly protect its employees, notice is hereby given that all mining operations, from this date, will be suspended until further notice, to avoid loss of life.

"COXE BROTHERS & Co., Incorporated.

"DRIFTON, PA., October 11, 1900."

Q. (By Mr. RIPLEY.) It was not then a strike of the operatives in that case, so much as concessions to prevent difficulties?—A. Yes. We had to protect those

that did go to work, and we were running about half our capacity when we stopped, but during the early part of the strike the men came out nearly full-handed.

Q. What were the wages of the different classes of employees in your mines, distinguishing the miners, common laborers, and boys?—A. There are probably 60 or 70 different classifications. It would be impossible for me to give them.

Q. Can you make any specification at all?—A. No.

Q. Will you make a statement respecting the average wages?—A. For the month of August, before our men quit, the last month we worked, the average earnings in the mines, including those of the boys, were between \$13 and \$14 net, after making all deductions.

Q. What proportion of your operatives are boys?—A. I should say in the mines one-half are miners, possibly. We don't have the small boys we have outside in the breakers, and I think no one under 14 is allowed to work in the mines. We speak of the driver as a boy and the doorkeeper as a boy. About one half are miners, and the other half are laborers, door boys, drivers, runners, and timbermen, and everything of that kind.

Q. That average, then, is compounded by the wages paid to a great number of boys for these various kinds of work, and also the common day laborers as well as the miners?—A. Yes; it is the total pay roll divided by the total number employed.

Q. Will you say that rate per month was typical throughout the year?—A. No; because in August we worked more days than in some other months in the year.

Q. That showing was better than could have been made in any other month in the year?—A. Not necessarily better than any other month.

Q. As good as any month in the year?—A. Here is a statement of the number of days worked in every month of the year:

[The Cross Creek Company—Coxe Bros. & Co., incorporated after March 31, 1900.]

Hours worked in 1900.

The WITNESS. This statement shows the number of days worked in each one of our collieries. I want to say in this connection that the Beaver Meadow Colliery was idle entirely through the month of May and a good part of June, for the reason that we were building a new breaker, and we had to disconnect the tracks to do that work; consequently they worked much less time during the whole year.

Q. (By Mr. PHILLIPS.) Speaking of the strike, were or were not the men justified in making a demand for better conditions last year when that strike was instituted? Were or were not their claims just?—A. Some of their claims were just.

Q. Were all of them engaged in mining or were only a certain percentage of them miners?—A. Only a certain percentage. They made a good many claims, but possibly it would be well to explain the system on which wages were fixed in the Lehigh region.

Q. Yes.—A. In 1875 the operators agreed upon what they called the basis wages. That is, the price of each class of labor was fixed at a certain price when coal sold at tide water at \$5 per ton. For every 10 cents advance or decline in that price the wages advanced or declined 1 per cent. The price of powder and the prices of other supplies were fixed in order to determine the price to be paid per car. The rates of freight at the time and the price of coal at tide water had gone down to

so low a point that their wages, if they had adhered strictly to the basis, would have been very low, and they never did fall down to the bottom of the basis; but, owing to the fact that the rate of freight was \$2.50 a ton, in order to put wages on the same basis as they were when this contract was made, the price per ton of coal at tide water was taken, the rate of freight paid at the present time deducted, which gave the price per ton at the mines, and then \$2.50 was added for the freight, which was the same rate as paid in 1875, when this contract was made. Upon that the wages were based for each month. There had been, I think, an advance of 6 per cent through the summer on account of the price of coal going up. Then they demanded that the basis be abolished; that their wages should not be made to go up and down with the prices of coal. They also demanded an advance, and I do not know what all. There was a 10 per cent advance granted then, and the price of powder, which had been \$2.75, was reduced to \$1.50, and they went to work.

Q. Would those concessions have been granted had they not struck?—A. I think they would. I know a reduction in the price of powder would have been granted.

Q. Didn't the operators try to reduce the price of powder and have the wages remain as a basis of settlement later?—A. I do not think the offer was ever made. There was a very strong sentiment in favor of reducing the price of powder.

Q. Do you think they would have gotten these conditions without the strike, or not?—A. They would undoubtedly have gotten a reduction in the price of powder; there is no doubt of that.

Q. But not an advance in wages, perhaps?—A. That might have been a question, but I think there would have been an advance.

Q. Do you think now that the wage is too high, or is it not reasonable?—A. As long as we can keep the price of coal to cover that advance; but when we can't we are going to lose money.

Q. (By Mr. RIPLEY.) Is not the price of coal, however, more in excess of the price of coal before the strike than the present wages are in excess of past wages?—A. Yes; but you must remember the conditions which existed just after the strike were very different from what they are going to be now for the next 6 months. When the strike ended we met a market depleted with coal. There was no coal in the market, and winter came on; but now the market is full of coal, and we can't realize those prices, and the prices are back now to where they were before the strike.

Q. Has not there always been a reduction of about 50 cents a ton the 1st of April?—A. Usually; yes.

Q. Is there, then, this year any abatement of the rule? In other words, have you done anything more this April than to go back to the figure that prevailed for April before the strike—than you do each spring to go back to the fall prices?—A. No; the price is always lower in the spring months, for the reason that it is desirable to induce customers who can afford to do so to lay in their winter supply of coal at lower prices, and thus keep the mines at work; or, in other words, keep our collieries in operation. It is impossible to work our collieries full time and sell coal that the people don't have any use for, but simply have to store away until winter comes and they can use it, without making concessions in prices.

Q. But, allowing for the season, you are still at as high a level as in previous years—as you were immediately following the low prices.—A. No; I think the price is about the same as a year ago.

Q. (By Mr. PHILLIPS.) Can not coal be mined and shipped much more cheaply now than it was 10 years ago?—A. No.

Q. Have not the improvements in mining methods, in machinery, and in the cars and handling of the coal, the facilities for handling larger cars, and better tracks had a tendency to make a great cheapening of the price?—A. That is a cheapening of transportation. I am speaking of mining. The cost of mining has not decreased, but on the contrary has increased every year and will continue to increase. Our mines become deeper, more expensive to ventilate, and we have more water to pump, and the cost of mining will continue to increase.

Q. The cost of transportation has been decreasing, and will likely still continue to decrease?—A. I will not prophesy; but it has been decreasing.

Q. (By Mr. C. J. HARRIS.) Some coal mines would be more valuable now than they were 10 years ago if you took into consideration that you had to pay interest and taxes on those lands for 10 years. Is that factor figured in the price of coal at all?—A. That was what I was speaking of a short time ago—whether in endeavoring to arrive at the cost of mining a ton of coal depended on whether you took all those things into account or not.

Q. (By Mr. RIPLEY.) They ought to be included, ought they not?—A. Somebody has to pay for them.

Q. Has not the price of coal got to pay the interest and carrying charge upon

all the money invested in reserve coal lands?—A. It ought to, as a business proposition, get the money out of it that has been put in.

Q. Does it not, necessarily, if those companies are to remain solvent?—A. If they get their money back they have got to get it that way; certainly.

Q. Was that not the reason for the financial difficulty which the Reading Railroad was involved in some years ago?—A. I would not like to answer that question. I do not know.

Q. (By Mr. PHILLIPS.) Returning again to the proposition regarding the investment, do you think it is essential to the good of the community at large that persons should buy up a very large amount of coal or iron or anything else and charge the community interest against that investment? Would not the community be better served if they were held in smaller holdings and mined as the community needed the commodity? Should the community, in other words, be taxed for carrying a very large body of anthracite coal or bituminous coal by any large corporation?—A. I do not think that question has ever come into the cost of mining or selling coal at all. I do not think any companies ever figured on that. They are too glad to get out what their actual cost in labor and material is, with a small profit over it, and their royalty.

Q. (By Mr. LITCHMAN.) Can you tell us something about the nationality of the operatives in the coal regions?—A. Of the miners or the employees?

Q. Yes.—A. Yes; we have 20 different nationalities working for us. We have 1 Jew and 1 Spaniard and 1 Frenchman. The majority of our employees who are employed on the railroad are Americans.

Q. Are not the employees of foreign extraction about three-quarters of the entire number?—A. A good many of those that are rated Americans, you know, are American born from foreign parents.

Q. Then that would make the percentage still larger?—A. Well, they are rated American; they are American born.

Q. You have given a total of 3,350, and of those you classify as American 999?—A. Yes.

Q. That would be a little more than two-thirds actually of foreign birth, and a portion of that 999 are of foreign extraction, but of American birth, you say?—A. Yes.

Q. (By Mr. A. L. HARRIS.) It was stated by the press a few months ago, on what was said to be good authority, that some 9 railroads control about all the anthracite coal in the State of Pennsylvania. Is that true?—A. Yes.

Q. It was stated in the same connection by the same party that it cost three times as much to transport the anthracite coal per mile as it costs to transport the bituminous coal. Is that true?—A. I should think that estimate was excessive; that would be my opinion. You have doubtless had a good many gentlemen before you who are much more capable of testifying on that point than I am.

Q. There is an excess, then, in the transportation of anthracite over bituminous, is there?—A. Yes.

Q. On what ground is that justified?—A. I should say, first, that bituminous coal does not have to be classified in all the various sizes, of which I think there are 8 in anthracite. We have got to classify that coal into sizes in cars, and we can not send a car of stove and a car of pea, and mix the cars all up. It is classified into sizes, so that when it reaches tide water or destination it can be unloaded directly into the boats without rehandling cars containing other sizes. Bituminous coal does not have to be classified. And then again, the anthracite coal cars almost invariably return empty. They have a load only one way; whereas bituminous cars—a great many of them—return loaded; they are used for iron ore and for various other purposes. In our cars, for instance, we never have a load back except some scrap, or something of that kind from a wreck; nothing that amounts to anything. They are loaded one way and empty the other.

Q. In your opinion, does the coal transportation get a fair and liberal rate?—A. Yes; I think so.

Q. (By Mr. LITCHMAN.) I want to find out whether the proportion of foreign operatives in the region generally would be the same as that stated by you as applying to your own employees, so far as your judgment goes?—A. That, of course, would be impossible to say; but I would not think the ratio would vary very much.

Q. How long have you been familiar with the nationality of the employees in the region?—A. I have been connected with mining now for 16 years, and I have been engaged as a mining engineer since 1869.

Q. Have you noticed a change in the personnel of the miners in that region?—
A. Very decidedly.

Q. Can you give us a little information on that point in a general way, showing the change from one nationality to another?—A. In old times, 20 years ago or thereabouts, all of our miners were Welsh, Irish, Germans, very few Americans, few English. There were a good many Cornish men, but they were mostly employed in rockwork; and we had no Hungarians, Polanders, Austrians, and men of those nationalities. Now the younger generations have come along of the Welsh and the Irish, and they have not gone into the mines. The parents have been ambitious to give them a little better education than they had, as every parent is, regardless of nationality: to put them in a little better condition; to give them a little better chance, and the result is that very few of the young Irish and the young Welsh and the young Germans are found in the mines, and these foreign classes have come in and taken their place to a very great extent; and it is not a very desirable change.

Q. Is it not true that this foreign element has been brought in by reason of strikes among the original miners and the sons of the original miners?—A. No; I do not think there have ever been any men imported into the anthracite coal field.

Q. We have it in testimony that the first firm to import foreign labor was that of Cox & Brothers.—A. I have heard that statement. I have looked it up, and I find there is not one word of truth in it, absolutely none. There is a little peculiarity about it. A Hungarian comes to Drifton, and he goes to work, and he does very well, very much better than he ever dreamed of doing in the old country, and he immediately writes to his friends, and they come straight to Drifton. There was another colliery up on the Pennsylvania road above Shamokin, Hickory Ridge, and they came there in droves. They did not know any other place in America but Hickory Ridge. That is the way they come, in schools and droves. I mean that is the way they started, because now they have friends scattered everywhere all over both bituminous and anthracite regions.

Q. It is substantially true that the older miners have been very largely supplanted by the Hungarian and Polish miners?—A. Very largely so; very largely so. I think we have a larger percentage of the old miners than any other collieries in that region, for the reason that we have given them better conditions. We have better houses. For years we had a hospital where they were attended carefully, free of charge, until the State built a hospital at Hazleton, when ours was abandoned. They have had exceptionally good treatment in many respects.

Q. (By Mr. KENNEDY.) I would like to ask whether these Poles and Hungarians show a disposition to become American citizens and to remain in this country?—A. Not very largely. Both political parties look after getting them naturalized, when it comes near election time, a little too close for the public good; but even if they do get naturalized, when a strike occurs they will go back. Last fall they went home in droves, saying they would come back when the strike was over. They get enough money to make them independent over there.

Q. From the point of view of making them citizens, they are not as desirable as those who come from the British Isles?—A. I think the Polanders make good citizens. Some of the young Polanders are very bright fellows, and some of the other nationalities will doubtless make good citizens.

Q. (By Mr. RIPLEY.) You mention Polanders; are they not Polish Jews?—A. No; I mean regular Polanders.

Q. (By Mr. PHILLIPS.) Is there some additional statement that you would like to make?—A. About the only statement I wish to add in reference to the anthracite coal trade is, that the production is a good deal in excess of the market. That is a condition that has existed for a good many years past. We have a capacity of say 60,000,000 tons, and a market for 45,000,000 tons now. That has been one of the difficulties in maintaining uniform market conditions.

(Testimony closed.)

WASHINGTON, D. C., April 16, 1901.

TESTIMONY OF MR. JOSEPH S. HARRIS,

Former president Reading Company.

The commission met at 2.50 p. m., Vice-Chairman Phillips presiding. At that time Mr. Joseph S. Harris, former president Reading Company, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your full name, address, and occupation?—

A. Joseph S. Harris, Reading Terminal, Philadelphia. As to my occupation, I am at present not in business.

Q. How long were you president of the Reading Company?—A. Nearly 8 years.

Q. And what was the nature of your occupation and your profession before that time?—A. I am an engineer.

Q. And your official position recently?—A. I was president of the Lehigh Coal and Navigation Company for 11 years. I was also receiver of the Central Railroad of New Jersey during that time and afterwards vice-president of the Central Railroad of New Jersey.

Q. Will you state the relation at present existing between the Reading Company and the various operating companies through which it acts.—A. The Philadelphia and Reading Coal and Iron Company owns a large body of anthracite lands; the Philadelphia and Reading Railway Company owns, leases, and controls a large mileage of railroad; the Reading Company owns the stock of these roads—the stock of the railroad company, and the stock of the Coal and Iron company.

Q. The Reading Company, then, is a finance corporation primarily?—A. I do not know that you could accurately call it that.

Q. (Interrupting.) I will ask the question in another way. Is the volume of bonds and stocks issued by the Reading Company equal in amount to the aggregate bonds and stocks of the other two companies you have mentioned?—A. No. The chief obligation of the Reading Company is the general mortgage. That is secured by the properties it holds in these other companies. These other companies have a large volume of obligations of their own.

Q. Independent of the Reading Company?—A. Yes. You see the Philadelphia and Reading Railway Company is the successor of the Philadelphia and Reading Railroad Company, which had a large volume of securities of various grades. The Coal and Iron company was also a corporation that existed long before the reorganization of 1896 and had its own obligations. The Reading Company in its present form has only existed since 1896, and the general mortgage, which is the chief security issued by the Reading Company, took up the old general mortgage, which was based on the property of the Railroad Company, and of the Coal and Iron company. That is its chief obligation, and there was, as I say, a large volume of obligations of the subsidiary companies. The Atlantic City Railroad, the Central Railroad of New Jersey, and many others of them, the East Pennsylvania Railroad, for instance, have their own obligations.

Q. Is the aggregate volume of stock and bonds of the Reading Company equal to the aggregate amount of the stock and bonds of the companies of which it is composed?—A. No.

Q. Is it larger or smaller?—A. I suppose the stock and bonds are each larger.

Q. Can you give a rough indication of the amount?—A. No; because I have really no idea what the volume of the bonds of the subsidiary companies is.

Q. Can you state the relation between the bonds and stocks of the Reading Company constituted in 1896 and of the bonds and stocks of the railroad company which it superseded, in round numbers?—A. No; I could not tell you at all.

Q. That will appear from the annual reports?—A. Yes; it will appear from the annual reports. I could not even make an approximate answer.

Q. (By Mr. FARQUHAR.) How much greater was the second general mortgage of the Reading Company than the first general mortgage that was taken out?—A. I do not really know; I do not remember. I do not remember how great the general mortgage before was. There are many questions which the commission may ask me as to figures which I shall not be able to answer, because I am careful about what I say about such matters, and do not attempt to hold them in my memory, always having them to refer to when in my office.

Q. (By Mr. RIPLEY.) Are the stocks and the bonds of the Philadelphia and Reading Railroad Company still in existence?—A. No.

Q. What is the approximate value of the stock and the bonds of the Reading Company?—A. The Reading Company has \$28,000,000 of first preferred stock, \$42,000,000 of second preferred stock, and \$70,000,000 of common stock.

Q. Are there not in addition a certain amount of general mortgage bonds?—A. Yes.

Q. Do you recall the figures?—A. That figure is changing; there is at present somewhere about \$63,000,000. Under the plan of reorganization, additional general mortgage bonds can be issued until \$20,000,000 are issued, to come out at the maximum amount of \$1,500,000 a year. My impression is that when the maximum amount is issued there will be \$135,000,000, but this includes a number of bonds or prior liens which have not matured.

Q. Adding up the totals which you have stated, I find the figure to be approximately \$250,000,000 of stock and bonds?—A. Yes.

Q. How would that compare with the volume of stock and bonds of the companies superseded by the Reading Company?—A. I do not really know what the stock and bonds of those companies amounted to.

Q. It was considerably in excess of that figure, was it not?—A. I should suppose so, yes; I do not remember what it was.

Q. In excess by an amount perhaps as large as \$50,000,000 of stocks and bonds?—A. I do not know whether it is or not. The matter is all accessible in the company's reports. The bonds I should say were about \$30,000,000 in excess, but as to the stock I do not know. I came into the Reading originally as one of the receivers, and it was placed in the receiver's hands before I became president, so that many of those details of the old company did not impress themselves on my mind particularly, as I did not make the plan of the reorganization.

Q. Will you state the causes which led to the reorganization of 1896?—A. It was the setting of the Reading companies on their feet again after bankruptcy.

Q. What was the cause of bankruptcy?—A. They did not have money enough to pay their debts.

Q. Can you describe a little more in detail?—A. It seems to me that is actually what the trouble was. They did not have money enough to pay their interest. They went into bankruptcy. They were placed in the receiver's hands on a suit of one of their creditors.

Q. Do I understand you to say that after the reorganization which followed the volume of the indebtedness, stock, and bonds was increased?—A. Yes.

Q. That would seem to require an explanation?—A. The explanation is a very simple one. You can not put a company into bankruptcy because it does not pay dividends on the stock, but you may if it does not pay interest on its bonds.

Q. The change, then, which principally took place in 1896, was a change in the volume of the company's charges?—A. Yes.

Q. And will you state the object of that, or what the relation of the decrease of the volume of the company's charges was, and the increase in the amount of stock. The point I would like to bring out before the commission is this—what the effect of the reorganization of 1896 was upon the volume of securities, and what the capitalization upon it was, the earnings that are now made and were made?—A. I can not answer that question except vaguely. You see you are asking me to testify in regard to a great many questions upon which my testimony would not be worth anything at all unless it was accurate. I can only say that the effect in connection with that reorganization was to lessen the fixed charges, and it did start after the reorganization at less fixed charges than it had before, but as to how much less I would be simply guessing. The figures are not in my memory at all. I think I should fairly say, perhaps, that my labors have been mainly in relation to the business of the company, and the finances were taken care of by the bankers who undertook the reorganization. If I had planned the reorganization I probably should have the figures more definitely in my mind.

Q. Complaint is made that the rates for transportation of hard coal are unduly high as compared with rates upon soft coal and other commodities. Will you state what relation, if any, exists in practice between capitalization and the rates charged? In other words, does the increase in the volume of securities, which, as you have said, took place in 1896, necessarily involve upon the public higher rates for the transportation of the product?—A. Directly there is no connection. The rates are made on the commodities by the freight agents, and the main thing that actuates them in making rates is the rates of their competitors.

Q. Are there any competitors in the case of the anthracite coal-carrying roads at the present time, or do they in general work in harmony?—A. They are working in substantial harmony, but not in exact harmony. For instance, in the case of the Pennsylvania Railroad, its relation to its competitors in the anthracite coal business does not differ, so far as I know, from the relation to its competitors in the merchandise business.

Q. Is that true of other railroads, however, such as the New York, Ontario and Western?—A. I should say yes, with the New York, Ontario and Western. The New York, Ontario and Western is one of the more lately formed roads, and never has worked in particular harmony with the other interests.

Q. Will you make a statement respecting the general proportions of the total output controlled by the different roads? What is the proportion of the Philadelphia and Reading Company of the total tonnage; the share of the output that it ships?—A. It ships about 20 per cent of the total.

Q. Do you include in that the shipments over the Central Railroad of New Jersey?—A. No.

Q. That is about how much more?—A. That, I think, is about 12 per cent.

Q. Those two roads, however, are now one and the same for all practical pur-

poses, are they not?—A. The Reading Company owns the majority of the stock of the Central Railroad.

Q. The policy of that road, then, may be dictated by the Philadelphia and Reading Company?—A. Yes.

Q. But would a small proportion of the annual shipment be able to disturb the rate situation?—A. Yes. It would disturb it in this way, doubtless: A very small proportion might be ignored, but a considerable proportion, if it were sold in Boston, for instance, at a much lower rate than the other parties were selling, would of course affect the previous rate.

Q. A statement has been publicly made in the press and also before this commission that somewhat over 90 per cent of the anthracite coal tonnage shipped is controlled practically by a combination of interests, either absolute ownership or community of interest, and that a small proportion, perhaps from 6 to 7 per cent, is not so controlled. Would that 6 or 7 per cent be able to disturb the price of coal or the rates charged?—A. I do not know that the statement is accurate. The Pennsylvania Railroad certainly, with about 12 per cent, would have to be considered an outsider. I should think the Delaware and Hudson would, with about as much coal; New York, Ontario and Western with about 4 per cent; the Coxe interests, with about 4 per cent, are not in any way closely affiliated with the others; Coxe's is an entirely independent ownership.

Q. Are you aware of any desire on the part of the railroad companies to harmonize their interests in this way?—A. Undoubtedly.

Q. Will you state what certain advantages and disadvantages would follow from such a policy?—A. I think your question is a little too large. Be a little more definite.

Q. Will there be any economy in operation incident upon such a consolidation or harmony of interest? Can coal be mined more cheaply and put upon the market more cheaply at a saving to the consumer, if this consolidation takes place or this harmony of interest is attained?—A. I suppose so, yes. I suppose, for one thing, the cost of marketing it might be very much decreased.

Q. Would that follow unless common agencies for distribution at terminal points were constituted?—A. That would be one way of doing it. The way in which an economy would be made would be by the elimination of a great number of middlemen—men who are interested as commission merchants. It would probably eliminate the commission merchant to a great extent, and put the business in the hands of direct agents of the several companies. That would make a noticeable economy.

Q. Would that not make it necessary that those agents should act as a unit?—A. Not necessarily. They never have so acted. They are just like the freight agents of the country. Their interest is to act together, but they don't do so.

Q. Great difficulty has been experienced in the past, has there not, from cut-throat competition of one coal road with another?—A. Yes; competition has gone in many cases beyond the point where it was wise or to anybody's interest—either the interest of the producer or the consumer, or the carrier—as it has in the general freight business of the country.

Q. Are there any factors, however, peculiar to the anthracite coal industry which would make such a combination or consolidation of interests more desirable from the point of view of operation than in the case of general railroad business?—A. It does not occur to me at the moment how the anthracite business differs from any other interest in that respect.

Q. (By Mr. PHILLIPS.) Was or was not an effort put forth lately to control the anthracite output, both as to mining and shipping?—A. Control in what way? What do you mean by control?

Q. Such control that there would be no cut in freight rates.—A. I have to ask these questions because there is a very great amount of vague talk in the papers, and we will have to get down to closer lines before I can answer intelligently. I do not really know exactly what you have in your mind about control.

Q. The anthracite coal field is limited in extent?—A. Yes.

Q. And there are only certain railroads that run into that field?—A. Yes.

Q. Heretofore there has been a very considerable cut in freight rates. Now, by this harmony of interests have they advanced the rate?—A. There has not been a considerable cut in freight rates in any of the recent years. Freight rates have been very fairly maintained.

Q. Then what relation do present freight rates bear to the rates prior to this consolidation of roads?—A. Freight rates on the whole have gone down in the last 6 or 8 years. They are considerably lower to-day than they were 6 or 8 years ago.

Q. (By Mr. RIPLEY.) Are you speaking of the average rates, or are you speaking of the rates of hard coal transported by the Reading Company?—A. I am

speaking of the rates on hard coal. That is what we are talking about, I understand. The general rate on hard coal from the mines to tide water a few years ago for some years was about \$1.70. It is considerably lower now.

Q. Can you state the specific figure at the present time?—A. I should say probably \$1.30. It varies very much.

Q. (By Mr. LITCHMAN.) Why not get the price of coal at the mine and at tide water, showing relation the freight has to the price of coal.

Q. (By Mr. RIPLEY.) Will you make a statement respecting those points, the price of coal on the properties of the Reading Company at the mine mouth as charged to the railroad and at tide water at the present time?—A. The Coal and Iron Company does not sell its coal to the railroad company. It does not put its coal at the mine to the railroad company at any price. It delivers its coal to the railroad company for transportation, and sells the coal itself when it gets to destination.

Q. Do the other railroads stand in the same relation to the railroads which serve them as the individual operators do?—A. In some cases, yes; and in some cases, no. There are still in the Reading territory operators who mine their coal and put it aboard cars and sell it when it gets to destination themselves. They stand in relation to the railroad company just as the Coal and Iron Company does. There are other operators who sell their coal to the railroad company at the colliery.

Q. A greater proportion of them, however, sell at collieries to the railroads, do they not?—A. A greater proportion in the other regions do; yes. I do not really know whether the volume of coal that is transported by us for private operators is or is not greater than that of coal bought by us at the collieries from private operators.

Q. The amount produced by independent collieries in your territory is exceedingly small, is it not?—A. Not exceedingly small. I should say perhaps a million tons.

Q. Out of a total of how many?—A. Out of a total of 8,000,000 or 9,000,000 tons. In other words, practically one-eighth of your tonnage shipped is produced by independent collieries?—A. I should say so; perhaps more.

Q. Do I understand that you mean that the company has no interest in those collieries, no agreements, no financial relation?—A. In some cases absolutely none. In some cases they have some. For instance, I have in my mind a colliery in the Hecksherville district which started by leasing ground from private parties. When they got to the boundaries of that territory, they came to the Coal and Iron Company and asked for leave to run into our territory. They offered in return for that privilege that they would let the Coal and Iron Company run into their territory; so things became quite mixed up there. The limits of the mines and the way in which they are worked depend very largely on the geological conditions. That they should mine certain coal on our property and we some on their property was found to be economical for the general interests, both theirs and ours. That is the way they started originally. We had absolutely no interest whatever, and neither the Coal and Iron Company nor the railroad company had any interest originally in that coal except in the transportation to the tide. As time has gone on that relationship has changed some, and the Coal and Iron Company has some interest as it gets a royalty on the coal mined from its property.

Q. In the case of the properties of individual operators in your territory, what rate do you charge per ton for transportation to tide water?—A. There are several rates; one is the rate to Philadelphia tide and the other rate to New York tide.

Q. Will you make a statement in either or both cases?—A. I really can not tell what the figures are; I do not remember.

Q. Are these accessible?—A. Yes; they are published whenever there is a change in freight rates.

Q. Can you state approximately what the amount is?—A. Well, I should say to New York tide it is somewhere about \$1.30 a ton; to Philadelphia tide it is probably something less.

Q. Do I understand you to say that in the case of coal mined by the Philadelphia and Reading Coal and Iron Company that that coal is transported by the railway company as the property of the coal company?—A. Yes.

Q. Do you charge in accounting the same rate upon coal which is transported for that coal company as you charge the individual operators?—A. Also not.

Q. There is no discrimination whatever?—A. None whatever in any way, shape, or form; absolutely the same.

Q. Has that been the rule ever since the reorganization of the Reading Company in 1897?—A. Yes; and before. That has always been the rule.

Q. Complaint has been made at various times and voiced in the Anthracite Coal Operators' Association letter that discrimination against the individual operator and in favor of the coal companies is made.—A. That has not been true in regard to the Coal and Iron Company.

Q. Such discrimination does not exist in your company?—A. Absolutely not. I can not make that assertion too strong or too plain from the beginning. There is another thing that is sometimes charged, that the Reading railroad companies are absolutely free from. It is charged that there has been discrimination in the distribution of cars, that one party would get a larger proportion of cars than another one. In the Reading district the method of apportioning cars is this: There is a subordinate officer of the railroad company whose duty it is to visit every colliery and ascertain its productive capacity. He finds that one colliery can produce 50, another 40, and still another 30 cars daily. He goes to everybody shipping coal over the Reading lines and estimates the amount which each one can produce. The sum of these makes an aggregate and whatever cars there are to distribute are distributed on that basis. That has been done so accurately and so thoroughly in all past years that you can not find anybody, any private operator or official in the Reading division that would not tell you that has always been done equitably. So they have no reason to complain. I know something about the Reading's affairs for 30 years, and know that in many respects the Reading Company's record is above reproach. It is absolutely fair.

Q. Do I understand you by that to imply that if the individual operator was to try to increase his output the railroad company has no objection?—A. The plan works in this way: Suppose a man's colliery rating, as it is called, has been 50 cars a day. He goes to this colliery inspector and says, "I have done so and so; my capacity is about 60 cars a day." The man goes and examines his collieries, and if he finds it is so he is put down at 60 cars a day.

Q. And if that operator desired to increase his plant and to double his output he is perfectly free to do so?—A. Absolutely. Nobody has ever had anything to say to him about that at all.

Q. Is the Reading Company free at the present time in a similar way to increase the output as it pleases irrespective of the action of other roads?—A. Yes. Let me amplify that statement a little. No company ever criticises another as to what it does about its collieries. It can have fewer or more collieries as it pleases. Nobody says anything to me if I choose to double the output of the colliery. That is nobody's business.

Q. I find in Bradstreet's of 1895 a statement to the effect that a great deal of difficulty in the anthracite coal trade has been encountered by the constant desire of the Reading Company to increase its allotment. Are you aware of any such desire on the part of the company?—A. If it has such a desire it has not shown any indication of it. This should fairly be said: I think it is true that the Reading Company is the only one of the large companies that is entirely controlled about Philadelphia or has been in the past. It has no special representation in New York, and on the principle that the absent is in the wrong, a great many of the evils of the coal trade have been charged to the Philadelphia and Reading Coal and Iron Company. Now, the Philadelphia and Reading Coal and Iron Company has taken no measures that I know of to justify any such criticism as that at all; that is another idle story.

Q. It, however, has resources undeveloped greater than those of any other company?—A. It has greater resources than any other company; yes, but it is not correct to say that it alone has undeveloped resources. There are a number of the other companies that have undeveloped resources.

Q. It has, however, a proportionately larger undeveloped amount?—A. Yes.

Q. Would or would it not, then, be a strong temptation to that company, especially would it not have been in the past when it has been in financial straits, to increase its output, to take a reduction of prices, perhaps, in order to gain a market?—A. If there has been such a temptation it has been virtuous enough to resist it. The output of the Reading Company to-day is not proportionately larger than it was 20 years ago.

Q. What is the proportion at the present time?—A. About 20 per cent.

Q. Was it not larger 10 years ago than to-day?—A. No; not larger 10 years ago. It was larger many years ago, but 10 years ago it was about the same. It has not varied very much in 10 or 15 years. The proportion was larger many years ago because the Reading territory was developed earlier than the others. There was a time when it had half of all the output, and while it has gone on growing it has not grown as fast as the others. You see, there are several reasons for that. One of them was that the Reading in the old days practically only had access to the markets of the East, whereas the other companies had access to the markets of New York State and Western States. That is not now true as to Reading, but it was so for a good many years.

Q. (By Mr. KENNEDY.) I want to ask about what the market takes. I understand it takes about 50,000,000 tons a year.—A. It never has taken quite 50,000,000. I think the largest output was 46,500,000.

Q. I read a statement that it was 49,000,000 last year.—A. There are several

ways of making that up. Probably the statement you saw included the coal that was burned at the mines. I am quite sure that 46,500,000 was the output of 1895, and that was for some years the record year. It may have been a little more last year; I do not remember: but it has never reached 50,000,000 shipped from the mines.

Q. I want to ask if the Reading could not if it chose to work its coal lands to the full extent supply the entire output now?—A. By no means. The best proof that it could not is that we never have shipped, even in October, when all companies ship to the limit of their capacity, much more than a million tons in a month. A million tons a month would mean we could not ship over 10,000,000 in a year; so you see we would not have more than one-fifth of the output; that is the limit of our collieries.

Q. I am not speaking about collieries; I am speaking of reserve coal lands.—A. There is no telling what we could do there. We could ship more coal if we could go on and develop the whole of our region, but it costs to develop a first-class colliery now anywhere from \$300,000 to \$700,000.

Q. Don't you recognize that you have a certain percentage of the market and that you are not to exceed that percentage, so as not to encroach upon the supply that the other roads may take to the market?—A. Yes.

Q. (By Mr. FARQUHAR.) What is the policy of your company in respect to your reserve fields? Is it that instead of present developments there is an advantage in holding as against the ultimate market or a condition that may insure better prices for coal?—A. I think you might consider coal as analogous to anything else. For instance, copper. You may have a very large tract of copper lands. You might be asked why you did not make more output, and you would say that you had to be governed somewhat by the cost of developing and somewhat by the amount you could sell. If we were to attempt to add 50 per cent to our output, it would take us, I suppose, 8 or 10 years and possibly require the expenditure of \$5,000,000 to reach that point, and by doing so we would disturb the market, so that we would lose money on that advance. There are a great many conditions, as in all lines of business; you have to keep fitting your action to the condition of your business in coal as in other lines.

Q. Is the field for the consumption of your products circumscribed?—A. Yes; circumscribed by the price. We send some coal around the Great Lakes and to some distance beyond the Great Lakes, because lake transportation is very cheap; but I do not know what proportion of the whole output. The anthracite companies, I imagine, do not sell more than 5 per cent of coal to the Great Lakes of the country and cities tributary to them, because it is a fancy article there—a luxury.

Q. If the owners of the mines transported 10 per cent more in the market, would the price go down?—A. Yes.

Q. What is the competition in respect to natural gas, electricity, and bituminous coal? Are you circumscribed by them also?—A. Yes; by natural gas largely, by bituminous still more largely; by electricity I should say not much, because electricity is a product, you might say, of the second order. You have to burn coal to produce electricity.

Q. Your proposition as to the analogous condition of the mines, a copper mine and coal, is similar to conditions usually confronted in the West, that a man will produce, say, 2,000,000 year in and year out for a continuous time, making a dividend of 10, 12, 14, or 16 per cent, and the stockholders are satisfied with the profit. Would you say that in your output of coal the Reading is satisfied with its profit, with its division of the output?—A. Yes; as to the division of the output, that point has been reached after many years of conflict. We have been fighting over that question for 30 years. It is very curious that whether we have been working in reasonable harmony or absolutely out of harmony, the proportion we take amounts to about the same thing. It varies very little. Each company has certain natural advantages. The companies in one of the regions have a natural advantage over the others with respect to shipments to New York State. We, of course, have a natural advantage in Philadelphia. Nearly 25 years ago we got to a state that almost bankrupted everybody. The proportion each of us took did not differ materially. There was about the same proportion mined by each. Again we find that certain people like certain coals. The coals burn differently, and you can not change this preference any more than you can change the brand of flour they prefer to buy. One set of people like one brand of flour; another set of people another. It was true to a singular extent, that whether we were fighting or were not fighting, each company had pretty nearly the same proportion of output.

Q. (By Mr. RIPLEY.) Did that proportion hold pretty constantly during the war of rates and prices which followed the resignation of Mr. McLeod from the presidency in 1893?—A. Yes; pretty closely.

Q. So that allotment of the different roads, so called, remained pretty nearly constant, whether the price is high or low?—A. The amount of coal that the several companies transport amounts to about the same whether the rates are higher or lower. You will find that to be true by looking back over the statistics. I do not believe any company went at any time 2 per cent away from the amount that was ordinarily shipped.

Q. New companies are, however, coming into the field all the time, are they not; referring, for instance, to the New York, Ontario and Western?—A. Yes; but the New York, Ontario and Western has simply taken the output of some one else; it has not developed any new coal, to speak of. This is what has happened. Possibly the Delaware, Lackawanna and Western, and some other railroads, formerly mined some coal which the New York, Ontario and Western has now taken. They have opened no new fields; they simply bought collieries that had been shipping on some other road.

Q. Was there not some apprehension that the construction of an independent line to tide water within the last year—I refer to the Erie and Wyoming Valley—would disturb rates and prices?—A. Yes.

Q. The amount it could have shipped would have been proportionately small, would it not?—A. I suppose it could possibly have secured 7 per cent, or something of that sort—some three million tons.

Q. (By Mr. KENNEDY.) If your company were to operate upon the old lines of competition to get out as much as you can, and get as much of the market as you can, the price of coal would be cheaper to the consumer, would it not?—A. Probably; yes.

Q. (By Mr. RIPLEY.) Is not the price somewhat above the average this year—considerably above the average?—A. Somewhat above the average of prices for the preceding year.

Q. What is the price at the present time of, let us say, any of the standard prepared sizes of your coal?—A. I can not tell you. I think it is \$4 a ton in New York.

Q. Is not that about 50 cents a ton higher than it was last year?—A. No; I think it is the same price.

Q. Is it not higher than it was previous to the strike last fall?—A. I think not; I think it is the same price that it was this time last year. It is 50 cents lower than it was a month ago.

Q. Is that not, however, the usual reduction at this season of the year?—A. Yes. Q. The fair comparison would be, then, April of this year with April a year ago?—A. I think the price is the same.

Q. It has been testified before this commission that the price is appreciably higher. Of course that is a matter of public knowledge?—A. Absolutely; yes. I think the price is the same as it was this time last year. I think the price is the same as it was after the drop made in the spring.

Q. The point I would like to bring out is this: Would an increase in the price, supposing that it took place to the amount of 50 cents a ton, correspondingly increase the net receipts of the company? That is to say, is it financially to the advantage of these companies acting in harmony to put the prices up?—A. I should say not, and I should say that that is very generally understood by the companies. If the anthracite producers controlled the coal market of this country it would undoubtedly be to their advantage to have prices advanced, but it is bituminous coal that controls the coal market of the country, and we know perfectly well that by putting the price up we should limit the market. I do not understand there is any disposition to put the price above what it was during last winter.

Q. It has been as high as it is to-day a number of times in April in past years?—A. Yes; and higher.

Q. In your judgment would an increase of price above the present figure, however, operate disadvantageously to the companies?—A. Yes; and that is the general judgment of the companies, I understand. They do not think it would be wise to put the prices higher.

Q. (By Mr. PHILLIPS.) Still you admit if there were free competition and no combine, prices would be lower?—A. Prices would be lower, and we would all be in bankruptcy probably.

Q. (By Mr. RIPLEY.) Is the price made by joint action of all the railroad companies?—A. No.

Q. Who makes the price of coal to-day?—A. It is made by the general supply; and by conference among the selling agents of the coal companies.

Q. It has been testified by at least two witnesses in the coal industry that a circular letter is sent around each year by the Reading Company stating the price which it will make for that season, and that that price is acquiesced in by the other

companies?—A. The Reading Company does issue and always has issued a circular of prices at which it sells coal. Whether that price is acquiesced in or not by others is a matter entirely for the companies themselves to say. Sometimes it is and sometimes it is not.

Q. Do you mean to say that if it were not acquiesced in, that if other companies sold at 10 or 15 cents below the figure that you fix in your circular prices, you would still adhere to your prices?—A. That would be a matter for the exercise of judgment. In many cases we enjoy this difference because some of our coals sell more readily and in some places we have an advantage. I do not suppose there has ever been a year that we did not for a considerable time vary from the prices. Some companies' coal is not as readily salable.

Q. (By Mr. LITCHMAN.) Is that more true at competing points?—A. Yes; we have ourselves coals that sell at 75 cents or \$1 more than other of our coals, as you can see on any of our circulars.

Q. (By Mr. KENNEDY.) A president of one of the large coal roads testified that as a rule his company follows the prices fixed in this circular of yours. I would like to ask if it is not your understanding, as well as that of others, before you send the circular out, that they shall follow the prices you make?—A. No. If he testified he did it I have no doubt it is true. We make our price and send out the circular, but they frequently do not follow the price.

Q. As a rule do they not follow it?—A. They frequently do, but it is a matter entirely of their own volition. We do not do anything to make them do so. We fix a price at which we think we can sell our coal. Now, last year there were several cases where people did not follow our prices. They were not satisfied that that was the right price, and they did not do what we did.

Q. (By Mr. RIPLEY.) Has there been any absorption of any individual coal operators in the territory served by your company during the last year or two? Have purchases of collieries been made?—A. No.

Q. The map upon the wall, showing by colors the location of the different coal properties, was prepared by Mr. Griffiths from plans published in the Bond Record. Does it represent the situation at the present time? In other words, have any considerable changes taken place since 1895 and 1896 as to the ownership of coal properties?—A. Not in our region: no. We have bought little pieces of coal land, 50 to 100, 200 acres—little pieces outlying here and there—but I do not think there has been a single large purchase of coal land made in the last 8 years by the Reading Company.

Q. (By Mr. KENNEDY.) Mr. McLeod had bought about all there was in sight up to that time?—A. Mr. McLeod did not purchase any coal lands. They were all bought by Mr. Gowen.

Q. Mr. Gowen, I mean.

Q. (By Mr. RIPLEY.) There were quite a number of purchases made, too, by Mr. McLeod?—A. No, I think not.

Q. You think not?—A. I think not. I do not recall any purchases made by Mr. McLeod.

Q. (By Mr. LITCHMAN.) The claim has been made that the bankruptcy of the Reading Railroad was due to the fact that it had bought out a lot of coal lands in anticipation of future needs, and therefore loaded itself down beyond its capacity to carry. Have you anything to say on that point?—A. Yes; I should say that was a fair statement. Those purchases were made mostly from 1870 to 1875, I should say, by Mr. Gowen, and I think Mr. Gowen did push that policy too far.

Q. Was it the policy of the road to charge a certain portion of expense to those purchases to meet the cost of carriage?—A. I do not quite understand your question.

Q. It is charged that a certain portion of the expense of the road is due to the cost of investment in these unproductive lands bought in anticipation of future needs. Is there any such thing as that?—A. No; there is not.

Q. (By Mr. RIPLEY.) What pays the interest?—A. On the coal and iron company?

Q. No; on the new lands?—A. There are no interest charges specifically based on the new lands.

Q. As I understand Mr. Litchman's question, it is whether the expenditures for interest and for taxes, etc., are not a charge upon present earnings, and whether they do not help to fix the price of coal higher than it would otherwise be?—A. I think not. I am not sure that I yet quite understand your question. What the coal and iron company does is this: It mines its coal, puts it on cars, sells it when it gets to its destination, pays the railroad company the same rate that anybody else pays for carrying it, and out of its net earnings arising therefrom it pays its cost of mining and its interest. There is no mixing up of the finances of the two companies.

Q. But is not the expenditure made for those coal lands still an important fac-

tor in the total value of stocks and bonds out?—A. I think I can put that question possibly a little more plainly. If you ask me if the Reading Coal and Iron Company had not expended any money for coal lands whether it would have less interest charges, I should say, certainly.

Q. (By Mr. LITCHMAN.) Well, then, is it not true that an interest charge is paid for this land that was bought in anticipation of future use? Is it not true that that is a charge upon the Reading company at the present time?—A. Undoubtedly; the interest on the purchases is still a charge.

Q. And the taxes on this land that is held also are a charge?—A. Undoubtedly.

Q. Then if that charge were eliminated it would enable the Reading, on the same earning capacity, to pay a higher rate of dividend on the stock?—A. And similarly if it had not built its railroads, the railroads would not have cost anything and the company would have paid more on its stock. All railroads are built in anticipation of use, and to develop business.

Q. Is that a fair comparison with the purchase of the lands?—A. I should say that the purchases of the lands went further ahead of present needs than the building of the railroads. Those are matters which, of course, lie in individual judgment. Doubtless Mr. Gowen did what he thought was best for the interests of the company. In some respects he may have bought more coal lands than were necessary. I think, myself, that he did.

Q. Understand that these questions are not asked in criticism, but they are made because we thought you were in a position to give us information ex cathedra.—A. It can not be denied, of course; it is a perfectly patent thing that if fewer coal lands had been bought, or if they had been bought for a less price, there would to-day be a smaller interest charge. There is no question about that. Similarly the Reading company and every other company that I know of made mistakes in building railroads. They built railroads in some places which did not turn out to be the best places, and which you would call more expensive than they might have been.

Q. (By Mr. PHILLIPS.) Is that charge, then, taken from the stockholders for carrying this debt?—A. Yes; unquestionably. That is, there is a certain amount of net earnings of the railroad company and the coal and iron company, and these interest charges necessarily come out of that amount. There is therefore less to pay the stockholders than if that sum did not come out.

Q. (By Mr. RIPLEY.) The significance of this circumstance would be less, perhaps, if it were not for the fact that the charge is made by the coal companies that do not carry as large a reserve supply as does this one company?—A. There is nothing in that, absolutely nothing.

Q. (By Mr. LITCHMAN.) The significance is also greater when the claim is made that the bankruptcy of the Reading Railroad was caused by these lands?—A. That is unquestionably so.

Q. (By Mr. PHILLIPS.) Was the receivership caused by competition?—A. The two things came in. If there had not been so much competition there would have been more earnings and they might have been able to carry these loads. Of course, if you have half a dozen merchants doing business in town, the man who has loaded himself up with unwise investments is probably the one that will first go to ruin in time of competition. That comes in every business. The man who has no debts will last longer if his business is conducted wisely.

Q. (By Mr. RIPLEY.) Have you an estimate of the amount of lands that are owned by the Reading company, and how long the supply from those lands will last?—A. Yes; I have estimated it. I do not remember what it is. It has been published several times, but I do not recollect what the figures are.

Q. (By Mr. KENNEDY.) Two hundred years?—A. No; I should say not. I do not think the lands would hold out. I do not think at the present rate of production there will be very much left of the lands in a hundred years, and I think the output of anthracite has nearly reached its maximum. (Witness refers to map.) I doubt whether it ever reaches 60,000,000 tons a year, and the reason for that opinion is that about half the land in all this territory from Pittston east has reached its limit of production, and I doubt whether it will ever produce more coal in any year than it does now.

Q. (By Mr. LITCHMAN.) Is any exploration being made to ascertain whether there is coal deeper than the coal that is being developed now?—A. Yes; the mines have been very thoroughly explored there. A good many of these properties are now working out—you will see in that report of Mr. Griffiths. Mr. Griffiths states, in regard to some of the companies there, that they only have a few years' coal left.

Mr. RIPLEY. Nine years in one case.

The WITNESS. There is a very great amount of coal in this part of the region (indicating the western part).

Mr. LITCHMAN. In the western part of the field.

The WITNESS. And the reason of that is because it is deeper there. Here (indicating the eastern part) anybody could develop coal cheaply. Here (indicating another point on the map) in some cases they have to go down 2,000 or more feet.

Mr. RIPLEY. In speaking of the conditions will you not kindly name the sections by towns or districts?

The WITNESS. The district which will soonest be exhausted is the eastern end of the Wyoming coal field, which is sometimes called the Lackawanna coal field. The western end of the Wyoming coal field will last much longer. The group of small basins known as the Lehigh region has passed its maximum production, and will not produce nearly as much as the other fields. I doubt whether the Mahanoy and Shamokin region will ever produce more than it is producing now. There are lands in the western end of the region which are not fully developed, and there are lands in the eastern end of it which are very nearly exhausted. Some of our Reading collieries are exhausted, and some are approaching exhaustion. The Schuylkill region is the great reserve of coal. More than half of the coal in Pennsylvania is there.

Q. (By Mr. PHILLIPS.) You speak of mines being exhausted. Is that demonstrated by following the veins down to the bottom for the coal?—A. Yes.

Q. Where it does not exist?—A. Yes.

Q. What is about the depth of the anthracite vein from the top?—A. That differs very greatly. In some cases you will enter the anthracite at the surface of the ground. In some cases the basins will not be more than 100 or 200 feet deep; but about Pottsville, in the Schuylkill region, the bottom of the basin is supposed to be about 5,000 feet deep. It is sometimes charged, I think, that the Reading has not developed this region because it has been holding it back. The real reason is that this coal is deeper and it is more costly to mine, and therefore it could only be developed at a certain rate in comparison with the coals that were farther to the north—in the Wyoming region, for instance. In the Wyoming region the coal is very much less disturbed in its stratification and very much less interstreaked with slate. So marked is the difference in this respect that in some parts of the Schuylkill region it costs nearly as much to prepare the coal after you get it to the breaker as it does to get the Wyoming coal out and prepare it. In the property of the Lehigh Coal and Navigation Company there is coal which is called Lehigh coal, notwithstanding it is in the eastern end of the Schuylkill region. That brings in another matter: In that region the coal is hard at the extreme eastern end, and it grows softer and softer as it goes toward the western end, until you get the Lykens Valley coal. At the extreme western end we reach a spot which belongs to the Pennsylvania Railroad. And in some of our own collieries at the eastern end it is extremely hard. But in the Lehigh Coal and Navigation Company's mines I estimated, when I was in charge of them, that we had to raise to the surface about three tons of coal and about ten tons of water from an average depth of 600 feet, for every ton of coal we sent to market. I have seen a whole train load of mining cars come out of the Lehigh Coal and Navigation Company's mine, and you could stand and look into the cars and you would say there was nothing there but slate and dirty water. Nothing else was to be seen. It is because, for these reasons, coal is so much more costly to prepare in the Schuylkill region, that the development of that region has been retarded and the other regions have been gone into in advance of it. These drawbacks have had a disastrous effect upon some individuals. Since I have known the Schuylkill region there have been three sets of people, one from New York and one from Boston and one from Scranton, that have come into the Schuylkill region to buy up coal lands and make fortunes there, their theory being that the reason people could not make money mining in the Schuylkill region was because they were too dumb. But they have all gone home without their money. It is an entirely different proposition mining coal down there from what mining it in the Lehigh is. And it is proper to say that that is why the Reading company's task has been harder than that of some other companies. The cheap mining in the Wyoming region and by the Lehigh company has been mostly done, and that is the reason why the Reading company can hold its own better than it could formerly.

Q. (By Mr. RIPLEY.) In other words, the outlook is for a slightly increased cost in comparison with formerly?—A. Absolutely. I should say that coal costs, perhaps, from 75 cents to a dollar more to mine to-day than it did 20 or 30 years ago.

Q. (By Mr. LITCHMAN.) Before we pass from the element of cost, let me ask how much increase has there been in the cost of the labor of mining coal?—A. The cost of labor has varied very much at different times. Immediately after the civil war the cost of labor was very high. Twenty years ago the cost of labor was much lower than it is now. I mean to say the wages that were paid varied very greatly. I should say there had been a considerable increase in the cost of labor, and that partly for the reason that 20 years ago only the finest veins and the most

easily operated were mined. Now, a mined vein in some cases is not more than 2½ feet thick. There is a great deal more cost of labor in those thin veins than there is in the wide veins. For instance, in the Lehigh Coal and Navigation Company's mines sometimes we would put a shot into a mass of coal, and men would load out of that place for a couple of days without ever putting in any more powder, for that company has the thickest of all coal deposits. In the thin veins you have to be using powder all the time. The cream of the coal, as a general thing, has been mined.

Q. (By Mr. KENNEDY.) You say these conditions that you describe meant that there would be a gradual increase in the price of coal. Other gentlemen who have testified on this subject say that in view of the possible competition from bituminous coal they think that the price is now about as high as they can afford to put it?—A. Yes; so do I, as a rule.

Q. Then, there will not be this gradual increase?—A. We are speaking of two periods of time. One is the immediate future and the other is the distant future. There will necessarily be an increase in 20 or 30 years in the price of anthracite, or it can not be mined. Sometime ago—30 years ago, you could open a colliery, perhaps, for \$100,000. To-day some collieries will cost \$1,000,000 before they get in a position where the coal can be profitably worked. Instead of going down 200 or 300 feet, you have to go 1,500 feet. You have to put in an enormous pumping apparatus. You immensely increase the cost of maintaining your mine because of this enormous superincumbent weight which, when you take the coal out, is always tending to crush in.

Q. (By Mr. PHILLIPS.) Is there not still a large amount that can be reached very readily from the surface?—A. No; the surface mining has very largely been done. There is a small proportion relatively that remains. But the greater proportion of coal that can be readily reached from the surface has been taken.

Q. (By Mr. LITCHMAN.) As an engineer, do you consider it advisable to tunnel from a low level to reach the veins in mining?—A. That has been done in some instances. For instance, there is a considerable part in our Schuylkill region where the coal is below the level of the seas. Tunneling is possible to a limited extent, but as a rule it is not. About Pottsville the deepest part of the basin is 4,000 feet below the level of the sea. Did I make myself clear in reply to Mr. Kennedy's question? We were speaking of two things. In the immediate future, the price of anthracite is not likely to increase materially, but it is unquestionably true—I am willing to be a prophet to that extent—it is unquestionably true that the cost of coal, or the price at which coal is sold, is going to be increased in the distant future; or the anthracite coal mining has got to stop. I do not know of anything that is likely to work the other way. I do not know of anything that is likely to cheapen it. There may be something found or better methods of mining, of course. We are working at that problem all the time. It is the same proposition as in England. You know they will never have any cheap coal there again.

Q. (By Mr. RILEY.) You were president of the Philadelphia and Reading Railroad at the time of the purchase of the Central Railroad of New Jersey recently?—A. Yes.

Q. Will you make any statement about the terms of the purchase so far as operation and finances are concerned?—A. It has no bearing on the operation at all. It was simply a purchase of the majority of the stock.

Q. The statement has been made in one of the New York papers that this purchase may conduce to economy of operations, in that the Central Railroad of New Jersey may carry a good deal of the tonnage more directly to tide water than it could otherwise go over the Philadelphia and Reading road. Is that true?—A. The New Jersey Central and the Reading do naturally constitute one system. All business of the Reading that comes from the South or Southwest goes to New York markets over the New Jersey Central about 30 miles. We get a good deal of bituminous coal at Shippensburg, coming in from the Baltimore and Ohio fields lying down in the mountains of West Virginia. Now, that very largely goes over the Reading road to Allentown, and from there 90 miles over the New Jersey Central Railroad to New York. The business that comes from the Northwest—from Buffalo, for instance—comes to a considerable extent down over several of the systems of roads to Scranton, where the New Jersey Central road commences, and then down to Bethlehem over the New Jersey Central road, and from there to Philadelphia. So you will observe that the two systems supplement each other. The business is gathered at Philadelphia, whether from the ocean or otherwise, and this business and the products of the manufactories of Philadelphia going to the Northwest go over our road to Bethlehem, and then over the New Jersey Central to Scranton. In many directions, indeed, the two roads are supplementary. For thirty years our business has gone over the New Jersey Central lines in that way.

Q. The statement is made publicly that the next step proposed in an alleged

consolidation of these roads will be the absorption of the Lehigh Valley.—A. I have no reason to think that is true. So far as I know, it is not contemplated at all. That is simply a newspaper guess. Of course, anything is possible in matters of that kind, but it is not at all the present intention.

Q. Have there not been purchases, however, of considerable blocks of stock, for instance, such as those owned by the Packer estate?—A. Purchased by whom?

Q. By those interested in the Reading company.—A. Now, you are getting too deep for me. What they are doing in New York in the way of buying up stock I do not know.

Q. The amalgamation, however, of the Erie, the Reading, the Lehigh, and the Central of New Jersey would control more than half of the anthracite tonnage, would it not, and give a practical monopoly of the field?—A. No; not by any means a practical monopoly. The Reading has about 20 per cent, the Lehigh Valley about 16 per cent, the Central about 13, and the Erie about 9, I think. That would be about 57 per cent, roughly speaking.

Q. Have you included the Pennsylvania Coal Company, recently purchased?—A. Yes. I think, taking in all those, the Erie has about 9 per cent. It may be 11.

Q. Would there be a difficulty in the way of this consolidation owing to the independent action of the Pennsylvania Railroad Company? Has it in the past acted somewhat independently of the other roads?—A. Yes; quite so; quite independently.

Q. And so long as that railroad remained outside would it practically prevent a total monopoly of these coal-carrying roads?—A. Yes; and the Delaware and Hudson is quite as independent, as is also the railroad belonging to the Coxé interests. The New York, Ontario, and Western is also independent.

Q. It would not, however, be a serious matter for one of those railroads to purchase the collieries of the Delaware and Hudson and for that company to be absorbed as a part of the New York Central?—A. I do not know whether it could be done or not. It is wholly a matter of money. All things are possible, but I do not know of any movement in that direction.

Q. At what figure, do you know, was the purchase of the stock of the Central of New Jersey made in order to control the majority of this stock by the Reading?—A. It was purchased at 160.

Q. Was that considerably above the ruling rate of stock quotation?—A. Not very much. It had been, I think, 150 or over.

Q. Has it been so in recent years—that is, with the exception of the last year?—A. No.

Q. Has it not run very much lower than that during the 90's?—A. Yes; it has been very much lower. The Central Railroad, however, has been paying dividends, I think, of from 5 to 7 per cent for some years past, and it ran along at about the same rate, I think, as the Delaware and Hudson; possibly a little lower.

Q. Is 160 the price at which it is accepted in underwriting or under the mortgage bonds issued?—A. Of course, that price had to be taken.

Q. Had to be covered by the issue of securities?—A. Yes.

Q. And the total volume of capitalization of the combined companies, of course, is increased by that amount?—A. Yes; it is. The stock of the New Jersey Central has gone into the ownership of the Reading at that price.

Q. Has not the combined volume of new mortgage bonds issued by the Reading company exceeded, however, the value of the stock purchased with those bonds?—A. Those bonds were put on the market below par. To that extent it has.

Q. The point I wish to bring out is whether the effect of the consolidation under the terms of this purchase resulted in still further swelling the capitalization of these combined companies upon which they have got to earn dividends.—A. Perhaps this suggestion will throw some light on that point. The rate at which the Jersey Central is earning the dividend which it would pay out of its earnings would carry the cost of that stock to the Reading company; so that in that case, if that money had not been paid as dividends to the Reading it would have been paid as dividends to the individual owners. The purchase simply changes the personnel of the ownership. The Reading company becomes a stockholder instead of John Doe.

Q. Do you see any way in which the consolidation of these two roads might affect the Baltimore and Ohio or the Pennsylvania disadvantageously?—A. No.

Q. The Reading company is a competitor of those roads in the carriage of coal?—A. No; not at all a competitor with the Baltimore and Ohio. The Reading company furnishes in its territory a market for a very large freight of the Baltimore and Ohio. The Reading stands to the Baltimore and Ohio somewhat in the same position as the Jersey Central territorially stands to the Reading, as being an extension of its road. For instance, the Baltimore and Ohio uses the Reading from Philadelphia east and from Shippensburg east, and the Baltimore and Ohio and the Reading are strong allies on that account.

Q. The Baltimore and Ohio and the Pennsylvania are supposed to be owned in common, are they not? Does not the Pennsylvania control the Baltimore and Ohio?—A. Yes, I so understand.

Q. Do not all these things indicate that the several roads in the hard-coal territory are getting together, either by lease, original purchase, or harmony of action?—A. Yes.

Q. And, so far as you can see, that would not result disadvantageously to the public, but merely in economy in the operation of the roads themselves?—A. That is a very large question. My own belief is and has always been that no combination of that kind can be made so large as absolutely to govern the situation. The situation will govern the roads. None of these plans have ever worked out, and I do not believe they ever will.

Q. (By Mr. PHILLIPS.) They do for a time, do they not?—A. Perhaps so; yes. I believe that some advantages will occur through the cheapening of methods. I am speaking of the public now; but I do not believe the advantage will be wholly with the public. That is not what the people who are buying these things are doing it for, of course. I think we might fairly say that they are doing it to prevent the sacrifice of their own securities, to prevent ruinous competition, and my own belief is very strong, and it is a subject that I have thought about a good deal, that the public is not interested in ruinous competition. I do not believe the public is interested in having great industries and great masses of capital sacrificed. I think that all human affairs go on with a conflict between those two interests and neither of them is unselfish.

Q. (By Mr. LITCHMAN.) You consider the desire to prevent ruinous competition the reason for the acquisition of the New Jersey Central by the Reading?—A. I do not know that I am able to speak of the motives, and I do not know that I have a right to speak of the motives that led to that acquisition, for it was not primarily by the Reading. It was the action of the bankers who control the Reading. Just what their motives were I do not know. I think you gentlemen would be quite as able to infer what their motives were as I; but I think I can fairly say it was not advised by the management, but advised by the owners of the road.

Q. If it be true, as alleged, that the Reading controls the Jersey Central, and there is a community of interest between the Baltimore and Ohio and the Reading, and the Pennsylvania controls the Baltimore and Ohio—A. (Interrupting.) Now, let us pause as we go on there. What do you mean by the community of interest between the Reading and the Baltimore and Ohio? There is no more community of interest between the Reading and the Baltimore and Ohio than there is between any two roads that give business to each other—absolutely none. What the Reading does, for instance, is this: The Baltimore and Ohio hauls coal to Cherry Run, and we take it from there and haul it into our territory. The community of interest between those roads is this, that they are freight producers and we are freight consumers.

Q. I started by saying, "If, as alleged"—A. Why do you say, "If, as alleged?" You can allege anything.

Q. If the interests, as alleged, that are back of the Reading are also back of the others—A. (Interrupting.) You have got entirely out of my depth.

Q. If you know nothing about it, I will not ask the question.—A. No; I do not. My function has been to manage the Reading Railroad and do its work as cheaply and earn as much money for it as I could; but what is in the bankers' minds they never told me. That was not in my department at all. I was the operating officer.

Q. (By Mr. KENNEDY.) You said that the acquisition of the New Jersey Central was not primarily the action of the Reading Railroad, but that the bankers brought it about. Who are those bankers to whom we may go for information?—A. What I said was, that it was not the act on of the Reading Railroad, speaking of myself as the manager. The people who have represented the Reading Railroad to the world since the reorganization have been J. P. Morgan & Co.

Q. (By Mr. RIPLEY.) You have referred to a possible motive on the part of those bankers. Do you know what commissions were paid in that transaction, namely, the purchase of the majority of stock of the Jersey Central by the Reading Company?—A. I think all the information that the public have, and all that I have, is stated in the circular of those bankers. I do not remember the figures, but there was a bankers' circular issued in connection with the purchase.

Q. You have said in connection with that, have you not, however, that the new bonds, collateral trust bonds, issued upon the stock of the Central Railroad of New Jersey exceeded considerably in amount the amount of those stocks. Did I so understand your statement.—A. I did make the statement. I was thinking whether it was correct.

Q. What is the volume?—A. I was mistaken about that. The volume was not

greater. It was just about the same—the amount of stock and the amount of bonds that were issued. The amount of bonds issued was just about the same amount as the stock, at the figure I gave you.

Q. In order to make this a matter of record, what was the amount of stock of the Central Railroad of New Jersey actually purchased?—A. One hundred and forty-five thousand shares at an average cost of 160.

Q. Does the amount of new collateral trust bonds issued by the Reading Company exceed 145,000 shares at 160 a share?—A. No. If you will figure that out, you will find that 145,000 shares at 160 a share cost \$23,200,000. If I said differently, it was incorrect. The reason why I hesitate to speak about figures is because many of the figures I do not remember accurately. The figures at which the stock was bought I remember, but there are a good many figures I do not remember.

Q. The profit to the bankers, then, for financing that deal would come presumably out of the difference between the price at which they acquired that stock and the price at which they turned it over to the Reading Company, would it not? Do I make the question clear?—A. Yes; it is clear. No; I think the bankers absolutely turned over the stock at the price they paid for it.

Q. There must have been a commission of a considerable amount for financing such a deal?—A. Yes; but that is stated in that circular of the bankers.

Q. The point I wished to make is this, whether the commissions in the case of operations like this are made a part of the future capitalization of the company or of the volume of security?—A. Undoubtedly the commissions are taken care of in some way. That is the case in all financial transactions. If a company puts out bonds that are sold at 95, the commission or discount has got to be taken care of. Observe, as is very often the case, you may fund a 6 per cent bond into a 4 per cent bond, sell that 4 per cent bond at 95, if you please, to the bankers, and yet have a lower interest charge than you had before. The banker and everybody makes money there. The only person that does not make money is the man who has money to loan who gets a smaller return.

Q. (By Mr. FARQUHAR.) Do you know that the bankers who made the transfer of those bonds of the Jersey Central asked or obtained any more than the usual commission in Wall street?—A. No; I should say they did not.

Q. You never heard that they ever did?—A. I know that they did not. It was a reasonable commission. That commission, I ought to say, is stated in that circular which they issued to the stockholders. I do not remember accurately what it was, but it was a reasonable and ordinary commission.

Q. (By Mr. RIPLEY.) Does the question of rebates or discriminations or anything of that sort against individual operators amount to very much at the present time since the number of those operators has so far decreased?—A. So far as the Reading is concerned, there is absolutely nothing of that sort; absolutely nothing.

Q. Does it affect the price of coal, or does it not?—A. I do not quite catch the force of your question. How can it affect the price to the consumer if there is nothing of the kind? And I say in the most unhesitating, absolute way that the Reading Company has absolutely treated its individual operators as it has treated its coal and iron company.

Q. Do you know what is the status of those 65 per cent contracts offered to the individual operators at the present time? Were many of them accepted by the individual operators?—A. So far as I know, they have not been pronounced operative as yet. I think the majority, so far as my information goes, of the individual operators are satisfied with them. There are but few people that have held out, so far as we know, trying to drive the railroad companies into buying their collieries.

Q. A witness made the statement here some few days ago that these contracts were rejected by all but a few operators along the line of the Pennsylvania Railroad, and they refused to sign those because they involved a perpetual lease along the life of the property.—A. That witness is in a position to know very accurately, and it is a matter that is more closely under his ken than it is under mine. I would rather his testimony would stand, because he lives in Wilkesbarre, where the most of these private operators are, and he would know more about it than I do. In our region no such question has arisen.

Q. Unless some such contract is signed by all these remaining individual operators they will still have their product carried at the rates customary to all operators?—A. That I do not know. That no man can foresee. That is a question that is under negotiation.

Q. (By Mr. KENNEDY.) What is the attitude of the Reading and the Jersey Central as to the labor engaged in mining?—A. I can not tell you about the attitude of the Jersey Central. I am not the president of the Reading; nor of the Jersey Central since that has been taken over.

Q. You are not president of the Reading now.—A. No; I resigned a few days ago.

Q. What was the attitude of the Reading toward organized labor when you were president?—A. That is a large question. Please make it a little more specific.

Q. I want to ask you if that attitude was friendly. Do you believe organized labor has a right to a voice in fixing wages, hours of work, etc.?—A. I think it has absolutely. There are several Reading companies. The Reading Coal and Iron Company has been more than friendly to labor. There has been less friction than in any of the other coal companies. I can illustrate best in this way: Three or 4 years ago, at the request of persons who charged themselves with the interests of labor, the legislature of Pennsylvania appointed a commission of the senate and house to go all through the coal region. They must have spent 3 months there. When they came into the Reading region, as they did at Shamokin, which is the western end of the Mahanoy and Shamokin field, some of the persons who claimed to represent labor—and I suppose they did—met that commission and said to them if everybody treated their labor as the Reading Coal and Iron Company did, there would not be any labor question.

Q. Do you believe that labor has the same right to organize as capital has?—A. Yes; certainly.

Q. Do you believe labor should have a voice in fixing the wages for which it shall work and the hours in which it shall work?—A. Certainly.

Q. And you believe that that right should be recognized by employers?—A. Certainly. The laborers not only have the right, but the power, which is more important.

(Testimony closed.)

WASHINGTON, D. C., April 5, 1901.

TESTIMONY OF MR. B. H. GRISWOLD,

General Freight and Passenger Agent Western Maryland Railroad.

The commission met at 11.20 a. m., Mr. Farquhar presiding. At that time Mr. B. H. Griswold, general freight and passenger agent Western Maryland Railroad, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) You will give your name, address, and official position with the freight bureau to the commission.—A. B. H. Griswold; general freight and passenger agent Western Maryland Railroad; Baltimore. I understand I am summoned as chairman of the Baltimore freight committee.

Q. Have you any statement to make distinct from the examination?—A. I have not, further than to say that I was not aware of any intention to summon me until I received a notice Wednesday night a short time before leaving for Philadelphia, and I have had no intimation as to the object or the occasion of the summons.

Q. Would you state to the commission the composition of this freight bureau of Baltimore?—A. It is composed of representatives of lines either terminating at or passing through Baltimore, or which have representation in Baltimore. There are in the bureau some 14 individuals, some of whom represent 2 or 3 lines. I think each important railroad and steamboat line is represented.

Q. How long has it been in existence?—A. Since the 1st of January, 1898.

Q. Could you state to the commission what the causes were that brought it into existence?—A. It was brought about, I think, by some of the representatives of the larger railroad lines, like the Pennsylvania and the Southern lines, who had representatives in Baltimore, suggesting that it would be well to have their various representatives get closer together, with a view to securing uniformity of practice, for an interchange of views, for the purpose of keeping up with the situation generally, and for the purpose of discussing any questions that might come before it, as they might be brought to the attention of any of the members through shippers or through any railroad company or steamboat line. It does not meet regularly. The chairman can call the committee together at any time, and he must call a meeting on the request of 3 members. There has been no meeting for a month or so, there having been no special questions to consider.

Q. Are questions which come before your organization submitted to the roads afterwards, or have you any power of yourselves to make settlement?—A. If any question comes before the committee and is after discussion acted upon by a vote, the motion becomes effective if the vote is unanimous. If there is a single

negative vote it falls to the ground, and if a representative has not power to act he must state the fact and say that he must refer the matter to his traffic department before any action can be taken on his part. Sometimes matters are laid over until a letter vote is received from a member thus situated or until a subsequent meeting.

Q. Does your organization conserve the interests of Baltimore alone?—A. It is mostly interested in Baltimore.

Q. Do you know of any other like organization of the kind on the coast?—A. I think there are a number of local freight committees at various points in the interior and on the coast also. There is a Boston committee. I am not sure that there is one in Philadelphia, but I think there is an organization in New York; I am not sure, though.

Q. Have you the cooperation of the steamship lines with you in this board?—A. They are represented—that is, the coast lines. I do not mean the ocean lines.

Q. Does your body assume any authority on rates?—A. Only to a limited extent and when all the representatives have the proper authority from their traffic officials. There are a number of representatives in the association that have no authority, and they must obtain it from their traffic officials before they can act. There are a number of representatives who have authority to act for their own lines.

Q. In the case of differentials in which other ports like New York, Philadelphia, Newport, Norfolk, and others are interested, have you any authorization to meet with a joint commission or to take and consider terms of the differentials of the ports?—A. We would have no power to act as regards differentials. If the question was brought before the association and we felt it to be the interest of the lines and the community and Baltimore to take the matter up we would do so and place it in the proper course for consideration and discussion.

Q. (By Mr. RIPLEY.) I would like to ask about the differentials which Baltimore enjoys against other ports. Will you make a statement respecting the comparative Chicago and Atlantic coast port rates on wheat and other products?—A. Are you speaking now of all-rail rates?

Q. All rail, east bound; and also if you will designate between the rail and the water rates.—A. Am I to understand that your question refers to the effect of the present differential or to the reduced differential? You know there is a reduced differential.

Q. I would like to have you speak upon both if you will; that is, the origin and development of the system of differentials from Chicago and St. Louis to Eastern ports.—A. It is rather hard, without any previous consideration, to answer that question as I would like to have answered it if I looked it over afterwards. I think we all realize that in the early days of railroading each railroad was built without regard to any other, and to subservise some particular purpose. After a time those roads began to be connected together, and different lines formed associations to make through lines. These associations after awhile developed gradually a system of rate making from what was previously chaos as regards anything like through rates. The through rates originally were the sums of rates of the various roads over which traffic was carried, and after the roads began to get together to make through rates there necessarily was interference on the part of certain lines with other lines in competition, bringing about wars of rates. The competition was not confined to railroad lines, but embraced markets also. The result was that an understanding was arrived at, after these several railroad wars, to make certain rates to the seaboard and an agreement as regards differentials. Those differentials were arrived at in the first place, I imagine, by agreement and by compromise and by concessions on the part of some lines, and by meeting the demands for the control of the situation on the part of others, the shorter lines from the West to the nearest seaboard, of course, claiming the right to make a lower rate than the longer lines to more distant ports or to the same ports. In that way the differential as between New York, Philadelphia, and Baltimore was first established, and it developed finally into a system of making rates under which, so far as trunk-line business is concerned, Chicago and New York are taken as 100 per cent points, on which all rates are based.

Q. (By Mr. CLARKE.) Is the differential in favor of the shorter and more direct route, or in favor of the more roundabout route?—A. It is in favor of the shorter, more direct route, although it results in longer lines between the Western point and an Eastern point being obliged to make the same lower rate, and getting the benefit of the lower differential, which is fixed by the shorter line. What I mean is this: Suppose the Baltimore and Ohio Railroad from Chicago to Baltimore is 100 miles shorter than some other line, which may be the same distance from Chicago to New York as from Chicago to Baltimore. It results necessarily in the longer line from Chicago to Baltimore maintaining the same differential as the shorter line from Chicago to Baltimore.

Q. (By Mr. RIPLEY.) How many lines participate in this through traffic from Chicago and St. Louis to Baltimore? Does the Southern Railway participate at all in through business at the present time from the West?—A. I do not think the Southern Railway, the line through Washington, participates to a very large extent as far as the Western business is concerned. I am not in position to know the relative tonnage. It does participate to a certain extent in connection with our line, as far as its new acquisition is concerned, the Louisville, Evansville and St. Louis Consolidated, which is a line running from Louisville to St. Louis now owned by the Southern.

Q. Is freight hauled in competition with the Baltimore and Ohio, the Pennsylvania, and the New York Central from Chicago to the seaboard points via Cincinnati, or Louisville and the Southern Railroad on a long haul, then up through Washington to Baltimore or Philadelphia?—A. I do not think it is. If it is it must be to a limited extent. We have not seen it in our relations with other lines.

Q. The Chesapeake and Ohio, and the Norfolk and Western, however, participate in this Western business?—A. Yes.

Q. And they enjoy differentials?—A. No; not the all-rail lines. There is an all-rail line operated from East St. Louis, from the West generally, by the Southern Railway and the Louisville, Evansville, and St. Louis Consolidated through Louisville, and the Chesapeake and Ohio, the Norfolk and Western, the Western Maryland, the Philadelphia and Reading, and the Central of New Jersey to Baltimore, Philadelphia, New York and interior points, but it is not a differential line. That is, it maintains the differentials, the port differentials, but it has no differential as compared with the shorter lines like the Union, Empire, the Pennsylvania, and the other lines, and the Continental and Central States Despatch.

Q. What do you mean by those latter companies? They are not railroad companies?—A. No; they are not railroad companies. They are called cooperative lines. They are fast-freight lines.

Q. What is the relation between those fast-freight lines and the railroads?—A. They are simply lines within the railroad lines placed under direct control of a manager and his assistants, so that they can be operated as one line over 3 or 4 or more railroads.

Q. Are they represented by any independent issues of stock or bonds or by corporate existence?—A. No.

Q. They are merely trade names for a road?—A. That is all, for through movement, and their purpose is to secure through movement, through schedules, and give better service, enabling the lines to compete more efficiently for traffic.

Q. Do they assume any liability as a separate organization?—A. The liability is assumed by the railroads. The line, in the settlement of a claim for loss or damage, for example, would adjust it, but the railroads would reimburse the line, or the railroad where the damage occurred would do so.

Q. They maintain a separate fiscal officer—a treasurer—as a rule; the Union Line, for instance?—A. They have separate management in that way, but everything as regards the Union Line goes into the Pennsylvania Railroad, and I think their accounts are audited by the Pennsylvania Railroad in that case.

Q. May freight rates be made by these fast-freight companies without the knowledge or direct participation of the traffic officials of the railroad?—A. Power is sometimes given to the manager of the line to do so.

Q. So that in case he were to make a special rate to a shipper the railroad would not have information to that effect or control of it?—A. The railroad would have to participate in it, of course. The rate would have to be issued by the manager, and it would have to be carried out by the railroad, but he might make a rate under certain circumstances without first obtaining the direct authority of the line.

Q. If that were done, then, it would bind the company to the performance of the contracts, would it not?—A. Yes; I suppose it would, legally. I know in practice it is actually done. The rate would be protected upon acknowledgment made by the manager, but if it was objected to by any line the shipper would be notified at once.

Q. (By Mr. FARQUHAR.) Is there such a thing known in a case of this kind as a cooperative fiscal agent of one of these fast-freight lines making secret rates unknown to the general management of the road itself?—A. It might be possible, but the fact would develop when an adjustment of the accounts was reached; but it would be but temporary, unless, as might be the case, the attention of the traffic people was not especially called to it and it went through the auditing departments and the clerks' hands without the officers' attention being specially called to it. The rule is that the manager of the line can not make a rate on business originating on any line of railroad without that railroad company consenting to

his doing so. It is possible for the manager to make a rate with the concurrence of some one line, that line protecting the cut without the other roads being a party to it.

Q. (By Mr. RIPLEY.) The force of that cut, then, would fall upon the initial line shipping, or upon the fast freight line?—A. It would be borne entirely by the line making the cut. For instance, you have a fast freight line from Baltimore to a Western point, which operates over 5 roads, we will say. Now, the third road in that line might say to the manager, If you want to make a reduction in a through rate to secure certain business by this route as against any other, you are authorized, as far as we are concerned, to go to the extent of 2, 3, 4, or 5 cents a hundred pounds, but that road would have to make that deficit good; no other road would necessarily be a party to it.

Q. So that rates might be cut on a through line over the line of railroad without that particular railroad itself having made the cut?—A. Yes.

Q. Were any of these fast freight lines formerly separate in their corporate existence?—A. They were; yes. They originated under separate organizations.

Q. What was the general relation as to ownership by the railroads, so far as your knowledge extends?—A. I only know from being in the railroad business many years, and from hearsay. I have never had any actual personal knowledge. I know that in the old times of the fast freight lines their organizations were entirely distinct from the railroads as far as the ownership was concerned, and the ownership was to a great extent in the hands of the officers connected with the lines over which the fast freight lines operated; there was also some outside ownership.

Q. So far as you know, however, no such condition as that exists at the present time?—A. I do not know of any case.

Q. The fast freight lines are merely names for particular routes, but they have, however, a certain independence of action in the matter of rates such as has been described?—A. Yes, when authorized.

Q. (By Mr. LITCHMAN.) When authorized by whom?—A. By the railroad companies over which the fast freight line operates.

Q. (By Mr. RIPLEY.) Such cuts are usually authorized by the higher officials of the line, I suppose?—A. They would have to be; yes.

Q. That is to say, a local freight agent, or a freight agent in a particular city, would not have authority on his own part to make a special rate?—A. Sometimes a contracting freight agent or commercial freight agent at a local point is given some discretion in making rates, although there is very little of that now. There used to be a good deal of it, but if you asked me to name a case of that kind, I could not do it, because I don't know of one.

Q. Does the special cutting of rates appear to be less prevalent than some years ago?—A. Markedly so; decidedly.

Q. To what reason do you ascribe that change?—A. I think the attempt upon the part of the larger lines to bring about a better condition of affairs by agreeing to maintain rates and to cooperate in carrying out the requirements of the interstate-commerce act is the principal reason.

Q. What is the latest day at which the promiscuous cutting of rates from Baltimore west was practiced?—A. I think there was some cutting the last of last year in some merchandise business, but I do not think it was in connection with all-rail lines; at least we were not able to place it there.

Q. The rail and water lines are allowed to charge less than all-rail lines between St. Louis and Chicago and Atlantic ports?—A. Yes; there are differentials—

Q. (Interrupting.) Is there a rail and water line from Chicago to Baltimore, and one from St. Louis?—A. Yes; there is a rail and lake line during the lake season.

Q. To Baltimore?—Yes; there is the Anchor Line, that operates out over the Pennsylvania Railroad, and the Fairport Line, that works out over the Baltimore and Ohio to the lakes, and others.

Q. To what point?—A. To Chicago and Northwestern points during the lake season.

Q. But with an outlet at Baltimore?—A. Yes.

Q. Those routes would certainly be more circuitous than the trunk lines?—A. Yes.

Q. And yet they are allowed by these general agreements with the roads to charge somewhat less?—A. That is right; yes.

Q. What is the specific difference to-day on east-bound traffic between the rate from Chicago to New York and Chicago to Baltimore and Newport News?—A. You mean on the class rates?

Q. On grain?—A. I think the difference between New York and Baltimore on export grain is $1\frac{1}{2}$ cents.

Q. Is that arrangement on the percentage basis, or is it an absolute difference

per hundred pounds?—A. It is an absolute difference per hundred. All of those differentials applying to the seaboard are absolute differences, not percentage differences.

Q. What is the differential in favor of Newport News?—A. I do not recall it.

Q. Is it somewhat greater than that of Baltimore?—A. I think it is.

Q. That gives an advantage, then, to that port, in that respect, over Baltimore?—A. Yes.

Q. Has it had an appreciable effect upon the commerce of Baltimore?—A. I do not know. I think it has had some effect, and yet it is very hard to say, because we find that traffic to a point is influenced by so many conditions. As soon as the grain trade drops off at a port everybody in the grain trade and the railroads interested think that something has happened to draw the business somewhere else, and the next year, under the same condition of rates, etc., the business of that port may be greater than the business of the port that had the largest business the year before, relatively. So that I personally think that the idea that business is drawn from one port to another by the cutting of rates is very often erroneous and that it is due to conditions at the port itself. For example, we find in export business that a steamship line at one port will make some specially attractive rate to fill up, for the time is approaching when it will have a steamer to sail, which it doesn't want to send half loaded. It wants business, and will make a very attractive rate. The agents go to the railroad agents and say, "Can't you give us some business here? We will give you this rate." The agents at that port will wire to the Western agents and say, "Here is an ocean rate of so much." They get business in that way. They hustle around, and find that it is very attractive to the shippers, and they send a cargo to that port.

Q. At special rates?—A. Not necessarily at special rates. I am referring to the ocean rate, without reference to the inland rate at all.

Q. Would not there be a strong temptation for a railroad to offer a special lower rate over its own line in such a case, in order to induce that business?—A. Where there were two or three lines running to that port, and all had the same information, there would be a strong temptation to do so to secure that business.

Q. Is any community-of-interest plan going to be sufficient in force to prevent that condition?—A. The best plan, to my mind, for bringing about fair dealing among the roads is either a physical, if it were possible, which I doubt, division of the business, or pooling and dividing the earnings between the roads. Either plan would take away the incentive to cut a rate.

Q. (By Mr. LITCHMAN.) What would be the effect upon rates of the virtual control of the Baltimore and Ohio Railroad by the interests owning and controlling the Pennsylvania Railroad?—A. I do not think it would have any effect excepting to make the rates steadier, to maintain them, uniform them. I do not think it would have the effect of raising rates. I think the time has gone by when unreasonable rates can be charged, because the competition, from my experience, is not simply between railroads, it is a question of market and various other considerations. I think there are very few roads that even in their local territory have no competition.

Q. Would it not be the fact that if the same interests controlled both lines of railroad that this temptation which you have already spoken of—to cut rates—would disappear?—A. Yes. I thought you were referring to the rates themselves.

Q. No; I was referring to that point.—A. Yes.

Q. I understand you to say that the differential is in favor of the shortest distance?—A. What do you mean by "in favor?" We mean by "in favor" that it is a lower rate.

Q. I mean to say, is a lower rate given for the shortest distance?—A. I was speaking of the origin of these differentials. It does not follow now that the lower differential—and I tried to illustrate that—is necessarily by the short line.

Q. (By Mr. FARQUHAR.) When you made the differentials, was not there another great question that entered into consideration, namely, the facilities of your port in handling?—A. Yes.

Q. Did not Baltimore and Newport News make claims of that kind when that arrangement was made on differentials?—A. When the differential was first made I did not have any business in Newport News.

Q. Are not two features of your differentials now considered in making the differentials—the short line and the facilities of the port in handling?—A. That is true.

Q. Those are the only two features on which you make a differential?—A. You are going beyond me, because I am not connected with the trunk-line committee, or with a trunk-line road, nor am I a party to the making of those differentials.

Q. Does your differential in Baltimore cover your transfer charges?—A. It covers the delivery on board ship.

Q. (By Mr. LITCHMAN.) I am still befogged on this question. At the same rate from Chicago to the seacoast, would traffic preferably seek the shorter line?—A. Not necessarily. It would depend upon the facilities and the market.

Q. Assuming that the conditions are equal to the port of foreign exit?—A. Everything being exactly the same, markets and facilities, and everything of that kind, I should think the question of time would be a consideration, and that would necessarily be in favor of the short line.

Q. Why, then, in addition to that, is there a difference given to the lower rate for the shorter distance?—A. On the ground originally that the shorter line can operate more cheaply than the longer line.

Q. And that same reason exists at the present time?—A. As I said before, there are so many conditions now surrounding the transportation of freight that a great many of the original ideas have been entirely lost sight of. Take a local territory of our own, for instance, where we have a short line 87 miles to a given point. There is another line 104 miles to that point, and there is still another line that is 158 miles between those two points.

Q. (By Mr. RIPLEY.) What are those points?—A. I was speaking of lines between Baltimore and Hagerstown, Md. Our line from Baltimore to Hagerstown is 87 miles, that of the Baltimore and Ohio 104 miles, and that of the Pennsylvania Railroad is 158 miles. The rates by all 3 lines are exactly the same. Originally the rate would have been highest for the longest road.

Q. (By Mr. LITCHMAN.) That being the case, there is no inducement for a person to send by the longer route, I should think. Is that not true?—A. That is true to a certain extent. It depends upon the location of the shipper, the receiver, the terminal facilities, etc. A good many of those things come in outside of the question of the mere length of the line.

Q. Can you give any instance of a distance, say, of 120 miles between Baltimore and Hagerstown on the Pennsylvania road of the rate charged as compared with the rate charged Hagerstown?—A. I can not. I know that they have, as other lines have, a mileage tariff, which tariff is based upon distances, but that that is sometimes ignored. It has to be by the issue of class and commodity rates to meet the special conditions of the short line.

Q. In other words, when you strike a competing point the established tariff follows the conditions and not the schedules?—A. It is obliged to.

Q. And it might happen that for the shorter distance on their own line a shipper would pay a higher price than was paid to the terminal at Hagerstown?—A. No; that limits the rate to all intermediate points.

Q. That is what I asked, if you knew of any instance of a higher charge between the starting point and Hagerstown than the through rate?—A. I beg pardon. I misunderstood your question. I thought you asked if I knew of any charge on the Pennsylvania Railroad for a distance of 120 miles that was higher than our charge for 87 miles.

Q. No; I meant just the other way.—A. No; I do not know of any case where a higher charge is made to an intermediate point.

Q. (By Mr. RIPLEY.) Do you observe the long and short haul clause?—A. We do; we observe it not only in interstate business, but in intrastate business, because we find it is the only convenient way; we can't have two policies.

Q. You are aware of the existence in many parts of the South of a contrary practice?—A. Brought about by water competition?

Q. By water competition.—A. Yes.

Q. Are you aware of such violation of the long and short haul clause in any territory north of Virginia?—A. I am not.

Q. You said that you found it better practice for your road to observe that section?—A. Yes.

Q. Can you explain further what you mean?—A. It is a disadvantage to those located on the line of the road and it is a great inconvenience to the railroad company to have right in the same territory a different method of making rates for interstate business and intrastate business. We cross the State lines of Pennsylvania and West Virginia some 8 or 9 times; a good deal of our local business is interstate, and we feel that we would be going a good deal out of our way to have to adjust our mileage tariffs so as to make a higher rate to a point just within the State than to a point a mile beyond, just without the State. It would be a disadvantage to the community, and in that way a disadvantage to the railroad company, for I hold that the interests of the two are mutual, and that if we do anything that disadvantages any particular community or any set of shippers it redounds to the injury of the railroad, and not to the benefit of it in any way, shape, or form.

Q. Would you say that that assertion is universal in its application?—A. I think it is.

Q. Can you conceive of a case where it might be to the interest, temporarily we will say, of a railroad, or the particular manager of a railroad, to build up certain towns or sections at the expense of others?—A. I can conceive of its being to the interest of a railroad to build up a town, but not at the expense of others. We would be very glad at certain local points upon our road to offer inducements to large establishments to locate there. We would not pick out any particular place or particular town for them to locate in, but if a large concern came to us and said, "We want to put up a factory at this point; what will you do for us?" we would be very glad to aid them in every reasonable way.

Q. Would the conditions be the same, however, if that large establishment were a jobbing house—wholesale distributors of products—rather than a factory?—A. I do not think it would make much difference.

Q. Might it not be to the interest of that town to absorb and control the wholesale business of a large section, and might not the other towns be injured if special or peculiarly low rates were granted to that town?—A. We would not meet the case by granting special rates for their product. We might do this: We might say, "We will go to the expense of putting in a siding for you," or "We will make a special rate on your building material to erect your establishment," but it would be a direct discrimination, to my mind, if that establishment got rates not given to similar establishments on the line to other points. That we would not do. I do not know of any practice of that kind.

Q. Is that not the true effect of the basic point system of the Southern States, to build up certain towns at the expense of intermediate territory? Allowing that there is justification at the outset in the existence of water competition, is not that the effect of the system?—A. I am not familiar with the effects upon the Southern States of the policy pursued—of the present basis of rates.

Q. You referred to "commodity rates" a little while ago. What do you mean by commodity rates?—A. The rates on such articles as lumber, coal, iron, pig iron, articles of that kind that could not be handled or moved in large quantities under class rates.

Q. Have you ever heard of the inclusion of special commodities, of special products under the head of "commodities," which were not in bulk; that is to say, are commodity rates, so called, ever made a cover for granting lower classification on certain classes of goods?—A. For granting a lower rate, yes; they practically go in a lower classification.

Q. That is to say, commodities which might be classed as merchandise otherwise are taken out of the classified series and named as commodities?—A. Yes.

Q. So that the expression "commodity rate" does not necessarily apply to sending lumber or bricks, but it means any rate which is made special for that commodity?—A. Any rate that is made outside of the ordinary merchandise classification.

Q. Are such commodity rates on merchandise more frequently made now than they were? Is the practice common at all?—A. There are a great many commodity rates, but as compared with some years ago there has been a very great reduction; an immense number has been wiped out.

Q. To which classification is your road subject?—A. The official classification as a rule. The southern freight classification applies to some territory south.

Q. What are the differences between those two classifications in the main?—A. There are very considerable differences, and it would be hard to state off-hand what those differences are. I think myself as a rule the southern classification is higher than the official, although there are cases just the reverse; but I should suppose, taking it as a whole, that articles are classified a little higher.

Q. Is it more complex, more intricate, than the official, or the reverse?—A. I think it is more complicated.

Q. Can you assign any reason in the nature of the railroad business why this should necessarily be so?—A. There is a very decided advantage in a uniform classification.

Q. For the country at large?—A. For the country at large, very decided; but even with a uniform classification, on account of the varying character of the traffic, it would not work satisfactorily in all sections; and I take it, without having had anything to do with the making of the southern classification, that the reason it is adhered to is because they consider that it answers the purposes of the traffic to and from their section much better than the official classification would, although personally I would be very glad to see a uniform classification applicable everywhere.

Q. What is the general attitude of traffic officials, so far as you know, respecting the desirability of a uniform classification?—A. I think they would all agree that a uniform classification is desirable.

Q. Is there a noticeable tendency in that direction?—A. The official classifica-

tion, as you are aware, was the result of the endeavor to secure uniformity in classification.

Q. Are the official, the western, and the southern classifications becoming more uniform, or are they tending to draw apart?—A. I think that each is about holding its own. There may be a slight tendency to get together in some cases.

Q. Would there be any specific, any inherent difficulty from the railroad point of view in the application of a uniform classification for the entire country as regards the handling of traffic and making of rates? Will you suggest such objections as they exist?—A. I do not know of any objection. I think it would be a godsend to the railroads if we could have a uniform classification applicable everywhere. It is a very difficult matter to know what a rate is where two or three classifications apply, although this is not true to the same extent that it was some years ago when we used 10 or 15 different classifications.

Q. In making a rate from official territory into southern, which governs?—A. To certain southern territory the southern classification governs, and to territory which is governed by trunk-line conditions the official classification applies.

Q. To what territory do you refer?—A. For instance, via southern lines operating into East St. Louis or that territory the official classification applies. There are some exceptions: I am not sure exactly how they are limited. I only know that as far as the all-rail lines are concerned and in our own territory the official classification applies excepting to certain exclusively so-called southern territory.

Q. The classification, as now drawn up, is made without participation of shippers, is it not?—A. The shippers have a right to and do make their representations to the classification committee, either directly, or through some traffic official of some road that they are acquainted with and who knows the ground for their claims and who may be favorable to them, or otherwise.

Q. Would it be possible to favor certain interests in the preparation of such a classification?—A. It would be possible.

Q. Is such a practice known?—A. I do not know.

Q. In your experience, what would be the difficulty in allowing supervision over such classifications by the Interstate Commerce Commission?—A. The only difficulty that I could see would be that it would be similar to supervision over the work of experts by inexperienced persons.

Q. (By Mr. RIPLEY.) You admit, however, that it would be possible to make up a classification which should favor certain interests?—A. It would be; but those who prepare the classification represent so many varying interests that I think it would not be practicable to do it. It would be possible, of course, by an agreement on the part of all of those engaged in making up the classification to make the classification such that it would favor certain interests, but I do not think that is at all probable. I have never seen anything of it in our own tariffs or classification. I have seen things that we objected to.

Q. Do you have anything to do as a traffic official, or does the Baltimore freight bureau have anything to do, with classification?—A. No.

Q. Is your road represented upon the classification committee?—A. No.

Q. The preparation of such a schedule, then, is entirely independent of many roads in the country?—A. It is; but all of those roads, I suppose, judging from my own experience, have not only the right but are requested to make suggestions. Whenever there is a change proposed in the classification I always receive notice, with a request to make suggestions.

Q. Are such requests sent to shippers, so far as you know, or merchants' associations or others?—A. I do not know.

Q. Have you any knowledge as to whether they participate at all in making up the classifications, or is it entirely done by the railroads?—A. I understand that when the committee meets it considers all the suggestions that are made, not only from the railroads, but from shippers. Shippers do make suggestions. I have sent some suggestions as to changes myself that have been made through me by shippers.

Q. (By Mr. KENNEDY.) You are quite familiar with the different classifications, are you, Mr. Griswold?—A. I am more familiar with the official classification, as that is the one that we constantly use.

Q. I would like to ask you if there has been in the past year or so a very considerable increase, a practical increase, in the rates by changing articles from a lower to a higher classification?—A. There was a considerable change in classification, but afterwards a large proportion of those articles were embodied in a supplement to the classification, allowing a 15 and 20 per cent reduction from the advanced classification.

Q. Is it not true that rates have practically been increased considerably in the last year or two by changes in classifications?—A. I can not say that there has been, by a change in the classification, an increase all around. There have been some

increases in the particular respect of which you spoke just now: but, as a rule, outside of that I do not think there has been much advance in the classification.

Q. A gentleman who represented the business men of New York stated the other day that there had been a great many such changes, and he also said that an examination of the classification sheets will show that in many instances the profits of these great industrial combinations, or many of them, were not changed at all, instancing the International Paper Company; there had been no change made that affected them. But the changes were made, as a rule, against the small producers and manufacturers, and not against the great industrial combinations. Can you state from your familiarity with the classification sheet whether that is apparently so or not?—A. To properly reply to a question of that kind would require some examination particularly of the classification, with the object of ascertaining the correctness of that statement. I have not noticed anything of that kind that would affect especially the smaller shippers as against the large concerns. There have not been many changes in the paper rates, and my understanding of that particular case is that it is due more particularly to the fact that the Eastern lines maintain certain rates to Western points on paper shipments in carloads, and that the interior lines, the lines in New York, Pennsylvania, and Maryland, are so limited by reason of the rates that were made from the New England States that they could not make changes. In fact, we had at one time to make some reduction to meet the New England situation and put the shippers in our territory on as favorable a footing as we could in their competition with New England territory.

Q. (By Mr. FARQUHAR.) You can raise rates to shippers through classification without touching your tariff?—A. Yes.

Q. Within late years, since 1896, do you think that has been done?—A. I think there have been some advances in classification since 1896, but with the exception of the particular case that Mr. Kennedy spoke of I do not think it has been very general.

Q. (By Mr. KENNEDY.) I would like to have it explained how that could be done.—A. If an article in the classification placed in third class is taken and put in the second class, the change would have the effect of advancing the rate from that of the third to that of the second class.

Q. (By Mr. FARQUHAR.) You spoke of a supplemental schedule. Was not that supplemental schedule made to equalize the inequalities by raising the rates without changing the tariff?—A. The effect of the supplement to the classification was to reduce the rates in many cases, and thus remedy some of the inequalities of the classification.

Q. Without making an entire review of the whole schedule?—A. Yes.

Q. (By Mr. KENNEDY.) I want to ask if uniform classification is practicable?—A. It is very desirable. Whether it can be accomplished or not is a question that has bothered a good many railroad people and others, too, for years. There have been many attempts to bring it about, but I do not know whether it can be done or not.

Q. What are the principal obstacles in the way of uniform classification?—A. The varying conditions in different sections requiring different classifications on account of the volume of certain commodities and certain merchandise in one section, and the fact that one section may be a producer of certain classes of merchandise to a large extent. A railroad can afford to take a large business on a little lower basis than a road in another section that has a carload where, in the first section, we will say, the road may have a hundred carloads. The conditions are so varying.

Q. Those obstacles of that kind seem to be almost insurmountable, then?—A. As far as I can see, they are, up to this time. It is not so much, it seems to me, a reconciling of the railroads as it is a reconciling of the existing conditions in the different sections of the country.

Q. (By Mr. RIPLEY.) How is the rate on coal used by manufacturers to Baltimore fixed? Can you state what the rate on coal from, we will say, the West Virginia and Virginia fields is?—A. The rate is \$1.45 from the Cumberland and the West Virginia Central coal fields to Baltimore by the Baltimore and Ohio Railroad.

Q. Without distinction as to distance?—A. Yes.

Q. That is, from all places in that soft-coal field the rate is the same?—A. No; there is a territory beyond that section—I forget what it is called—from which the rates are higher and also the gas-coal field.

Q. Is that because there is a difference in the quality of the coal or because of the distance? How does the rate on coal from those fields to Baltimore and that from the same fields to Philadelphia compare?—A. I understand that they are the same. I would like to say that, while we are a carrier of that material as an intermediate line, the business in our case originates on the Baltimore and Ohio Rail-

road. I do not think I am as familiar with the conditions and the methods and provisions for the making of rates as I should be to answer those questions.

Q. But the rate is the same, whether it is to Philadelphia or to Baltimore?—A. Yes.

Q. Does not that occasion some complaint in Baltimore?—A. I think it does not. The matter was taken up by one of the papers, and as it dropped the subject I suppose it saw that if the contention and the methods as suggested were carried out logically it would work in some cases to the direct injury of Baltimore as against Philadelphia.

Q. In what way?—A. By reason of Philadelphia having its own coal fields, with some lines as short to Philadelphia and longer to Baltimore.

Q. In other words, Philadelphia enjoys the same rate as Baltimore does to the coal fields tributary to you because she has other fields from which draft might be made?—A. Yes, and the rate is the same. If I was representing the Baltimore and Ohio Railroad, I should say that the rate to Philadelphia was made the same as to Baltimore because of the fact that the rate from the Pennsylvania fields is the same to Philadelphia as the Baltimore and Ohio rate is to Baltimore, and that while it brings business to the Baltimore and Ohio Railroad to engage in the Philadelphia traffic it does not hurt Baltimore.

Q. In other words, if they raised the rate to Philadelphia, coal would come from other points?—A. If they raised the rate to Philadelphia, they would not haul any. The Pennsylvania would haul all the coal to Philadelphia.

Q. Have you any knowledge as to the relative proportion of soft-coal tonnage in Philadelphia from the two fields, the Pennsylvania and the Southern? Is the proportion increasing from the West Virginia and tributary coal fields?—A. I think it is, but I am merely judging from our own traffic in connection with it. I have no statistics at all. I am speaking merely from observation.

Q. You make a through rate from Baltimore to Northern ports—Boston, for instance—on coal?—A. I have nothing to do with that at all. I am not familiar with that question.

Q. Are through rates made to Northern ports by combined rail and water through Baltimore?—A. Yes.

Q. What is the principle of division that is usually accepted? Is there any rule?—A. I do not think there is any rule. I think, like all water freights, they vary as far as the water rates are concerned.

Q. It was testified before this commission a few days ago that Baltimore enjoys a distinct advantage below New York on west-bound traffic as well as east-bound. Is that so?—A. You are speaking about merchandise?

Q. About merchandise.—A. Yes.

Q. What is the differential in that case?—A. I think it is, first class 8 cents, and from that down to 3. I think it is 3 cents on sixth class.

Q. By which you mean if the rate on a certain commodity first class from New York is 50 cents to Chicago, the rate from Baltimore is 42?—A. Yes.

Q. In other words, you enjoy an 8 cent lower rate?—A. Yes.

Q. Does not this give Baltimore a distinct advantage in the importation of products from abroad?—A. I do not know that it does. As I said some little time ago, there are so many conditions surrounding transportation and traffic, merchandise business, and commerce outside of the actual freight rate that a low freight rate from a given point might not be attractive at all to a shipper as compared with a higher rate from some other point.

Q. Will you specify some of these conditions which might, for instance, make it not to the advantage of a shipper to go through Baltimore to Chicago when he could get a rate of 42 cents instead of 50?—A. Yes. The larger number of regular steamship lines plying between New York and foreign ports—and not only of regular lines, but of tramp steamers—where ocean rates might be made, and sometimes are made, lower than to Baltimore, which ocean rate in connection with the inland rate might be lower than the ocean rate via Baltimore in connection with the inland rate. For example, we will take Liverpool: Suppose, without any regard for actual figures or market figures, a steamship line made a rate of 20 cents from Liverpool to New York and of 30 cents from Liverpool to Baltimore on some Chicago business. The advantage in favor of New York, leaving out any other conditions, would be 2 cents a hundred pounds on first class.

Q. Ordinarily the rate is the same from Liverpool to Baltimore as from Liverpool to New York by water?—A. Generally about the same, although there are cases, especially where they are looking for business, where there are special rates.

Q. You spoke some time ago about reducing the differential. What did you mean?—A. I meant that the differential from Chicago was reduced now to 1½ cents on export grain, whereas it used to be 3 cents.

Q. It used to be 3 cents and was reduced to 1½?—A. Yes.

Q. To what extent do Baltimore merchants compete with New York merchants

in middle and southwestern territory? Are the rates so fashioned at all as to enable a large or considerable development in this direction?—A. I think Baltimore's principal business is in the southeastern territory.

Q. (By Mr. KENNEDY.) Are you familiar with the water rates down the coast?—A. Offhand I could not tell you the conditions, but of course we are governed by them.

Q. Is the rate by water from Baltimore down the coast to a coast place reached by one of these Southern railroads practically the same by water as by rail, or is there any great difference between them?—A. We find that the water-line rates are very much lower than ours.

Q. And the steamship lines are not controlled by the railroads that go into the same territory in the matter of rates?—A. No; I know that if the rail lines did control, in many cases the differentials would be done away with entirely, because the reason for those differentials no longer exists in our opinion from a railroad standpoint.

Q. But they do exist?—A. They do; but there are some exceptions as to their application.

Q. Can you say what the difference is between rail rates and water rates from Baltimore to a Southern coast town?—A. That is hard to state, because there are very large and very considerable differences. I forget how those differentials run.

Q. But you say from the railroad point of view there is no reason why there should be those differences in the rates?—A. That is, to common territory I think they should not exist. I know that other railroad traffic officials have said the same.

Q. Can you say why they should not be?—A. The reason why differentials between the water and rail lines, we will say, from Baltimore to certain Southern territory were allowed was because of insurance, and it is claimed, the disadvantage to the business in handling and the poorer time made. The water lines insure now and the shippers do not have any insurance to pay. They make just about as good time as the rail lines, and therefore we feel that there is really no difference in the service.

Q. You feel that there is no difference in the cost of the service; you mean to the different transportation lines, water and the rail?—A. I do not suppose there is much difference; there would be some. While I am not familiar with steamship and steamboat questions I know that the water lines have more handling at wharves than the rail lines, but, on the other hand, they have water transportation for a portion of the way, which is much cheaper than rail transportation.

Q. Are there any lines down the coast that are owned and controlled by the railroads that go into the Southern country?—A. I do not know of any from our section, from Baltimore.

Q. (By Mr. RIPLEY.) Is the Old Dominion Line entirely independent of the railroads?—A. I do not know; I never supposed or understood that it was actually controlled by any ownership of the railroads, although I do not know at all.

Q. Do you mean to say that the rates between Baltimore and Boston by rail and by rail and water are appreciably different at the present time?—A. I do not think that question came up before. It was the Southern points we were discussing.

Q. Would that same condition apply to Boston? Is there a differential allowed to steamship lines?—A. I think the rates of the Merchants and Miners' Line between Baltimore and Boston are lower than the all-rail rates between Baltimore and Boston. I am not sure about that. That is not in the direction of our traffic.

Q. Up and down the coast, then, either north or south, the steamship lines enjoy the privilege of charging lower rates?—A. Yes.

Q. Is there actual water competition, to your knowledge, at interior points on the Southern rivers which might have communication down those rivers by water with the ocean steamers along the coast?—A. At Memphis and points like that?

Q. At points like Memphis, or Macon, or Montgomery; I mean interior points.—A. At Memphis there is, decidedly. I think at all those points.

Q. Actual water competition—that is, steamers to ply up and down those rivers?—A. Oh, you mean via the rivers?

Q. I am referring to the rivers.—A. No; I do not know of any. I beg your pardon. I thought you were referring to the coast steamers to and from the Southern ports into the interior. I do not know of any competition of that kind.

Q. You know of no lines?—A. No; I do not know of any such river lines.

Q. Is not the justification for the lower rates given to many towns and cities based on the assumption that there is water competition from Northern ports?—A. I never knew of the rates being based upon such interior river competition. By water competition we have always understood the meaning to be the coast steamboat lines in connection with rail lines from the Southern ports.

Q. There is not supposed to be any actual active competition up those rivers,

making through water rates from Northern points to those interior cities?—A. I have never seen any from our territory.

Q. Does any cotton come north to Baltimore?—A. Yes.

Q. You mean for export?—A. The Baltimore and Ohio hauls cotton through Baltimore.

Q. Have you any knowledge of the rates charged on it?—A. No.

Q. Does any cotton go through Baltimore to New England points by rail?—A. I should think it would through the Baltimore and Ohio Railroad and the lines via Washington.

Q. Have you any knowledge of the difference between the Baltimore rates and the Norfolk rates? Is there any active competition in carrying cotton to New England through the lines which center at Pinners Point or Norfolk?—A. I will have to ask you a question: Do you mean by through Baltimore the same as through Pinners Point?

Q. Yes.—A. That is, that the cotton is brought to the seaboard by rail and thence via water to Boston?

Q. Yes.—A. There is, I think, much more brought through Pinners Point than through Baltimore. I do not think there is much via Baltimore.

Q. What is the difficulty in shipping through Baltimore?—A. I am not familiar with that. But there is only one regular steamship line from Baltimore to Boston, and that is the Merchants and Miners.

Q. They do not carry any cotton?—A. I do not think they do.

Q. What is the class of merchandise usually carried north?—A. It is very mixed, varied; but I am really not competent to answer those questions about the Merchants and Miners' Line and their business.

Q. The point I want to bring out is this: Whether the growth of Pinners Point and of Norfolk has affected in any way the commerce through the port of Baltimore?—A. I am not prepared to answer that question.

Q. (By Mr. KENNEDY.) I want to ask one question about Hagerstown. I believe you said there is one line that is 87 miles long from Hagerstown to Baltimore, and another 104, and another 158. I would like to ask you whether, if all three of those roads come practically under one management—I understand that two of them are now—what will be the effect, so far as Hagerstown and Baltimore traffic is concerned? Will it go over the one line?—A. I should say that is guessing a little. I do not know what the policy would be under those circumstances. In all probability I should think that the business would be taken by the shortest line; but, at the same time, each of those three lines have different locations in the city, and there is certain business that one line gets now as against the others that is simply due to location. It is more convenient for the shipper, because the time is about the same by all three; the longer line has to make good deal better time to make delivery.

Q. Is there too much railroad convenience between Baltimore and Hagerstown from a railroad point of view? We have heard a great deal about this extravagance of paralleling lines, etc. I would like to ask you whether, in your opinion, there is more railroad facility between Hagerstown and Baltimore than is necessary for the Hagerstown and Baltimore business?—A. Oh, yes. The whole business of that section could be handled by one railroad.

Q. Are they separate lines? They are not main lines at all, either the Baltimore and Ohio or the Pennsylvania, that you speak about?—A. No; the Baltimore and Ohio reaches Hagerstown through a branch line some 24 miles from the main line. The Western Maryland is a main direct line. The Pennsylvania is via the Northern Central division and the Cumberland Valley road.

Q. Would it be an object, in case all these three roads come under one management, to let one or more of the lines fall into disuse altogether, or any parts of one or more of those lines?—A. I do not see how they could. There is other business, much greater business, in various other sections entirely independent of the fact of these three lines running there, that would have to be conserved, and which would maintain the lines.

Q. (By Mr. RIPLEY.) You said sometime ago that the last time of which you had knowledge of rates being cut was at the close of last year. Is it not true that in the autumn, when a great deal of grain is moving east there is a strong incentive to cut rates in order to fill the empty cars west bound? Is not that—A. (Interrupting.) Well, theoretically there is. But I do not think that that cuts much figure when it comes to cutting rates. I think it is more due to the anxiety of the solicitors to secure business. I do not think they consider much the fact that the cars are going west empty.

Q. Have you heard of such a thing as a rebate sheet?—A. I do not know what is meant by a rebate sheet. I know what rebates are.

Q. Have you any protection against a shipper where you suppose he is mis-

classifying goods? Would it pay you ever to call for an investigation?—A. You mean similar to inspection?

Q. Yes; that is to say, are you not bound usually by the classification and specification which the shipper makes of the goods?—A. Yes. As a rule our agents and our receiving clerks are supposed to watch closely and see that the articles conform with the invoice furnished, but they can not know what the hidden contents of the cases are without examination, of course.

Q. If you were too particular about that would not the shipper be likely to send his goods by another road sometimes?—A. If one line has inspection and another has not, a shipper would be very likely to use the line that has no inspection.

Q. Have you an inspection bureau at Baltimore?—A. We have not. Nothing outside of our own agents.

Q. Does each line maintain its own inspection agents at Baltimore?—A. No; there is an inspection bureau in connection with the Baltimore and Ohio and the Pennsylvania railroads, but I think that has not been extended to any other lines out of Baltimore as yet.

Q. As a matter of fact, then, the shipper is put upon his own honor in classifying goods?—A. Yes.

Q. And by the shipper making misclassifications and by acquiescence in them by the railroad, rates might be practically cut, might they not?—A. They could be.

Q. Have you any knowledge of roads which are confessedly not too particular in that respect?—A. No; the lines with which we come in competition have their inspection, and our instructions to our own people are to inspect carefully.

Q. Would there be any advantage in subjecting such inspection to Government control in any way, and having inspectors, as they are appointed in the Western States, for grain and other traffic, to see that the classification corresponds exactly to the goods contained?—A. Under certain conditions, I think, at least it would save the railroads the expense of doing the inspecting.

Q. Would it not insure the equal treatment of all shippers, supposing the system worked honestly?—A. I think it would, and I think the present method of inspection insures equal treatment. The inspectors do not know who shippers are, and they are changed about from station to station.

Q. (By Mr. KENNEDY.) Have the jobbing merchants of Baltimore any just complaint that they are not equally favored with New York and Philadelphia merchants as far as railroad rates are concerned?—A. I do not think they have. That is a pretty broad question.

Q. (By Mr. LITCHMAN.) Is there any complaint that there is discrimination in favor of Baltimore at the expense of New York and other jobbing points?—A. I do not know of any. Periodically there are complaints on the part of Baltimore of discrimination in favor of some other points, and I see the same complaints periodically of other points regarding discriminations in favor of Baltimore. Sometimes the complaints come out in Philadelphia and sometimes in Baltimore.

Q. That is due more to temporary conditions rather than to permanent conditions?—A. I think so.

Q. (By Mr. RIPLEY.) What would be the effect if the New York Central and the Pennsylvania railroads should bring their rates down on east and west bound freight to the level of the Southern ports—Chicago rates?—A. I think the effect would be to injure Baltimore business very considerably.

Q. And correspondingly injure to the advantage of those other cities?—A. Yes.

Q. Would there be any remedy open to Baltimore?—A. I do not know of any excepting—I do not know of any remedy. I was going to say except that of bringing Baltimore up to the same financial basis and giving her the same facilities for doing business on a large scale and all those conditions that New York enjoys.

Q. Any attempt of that kind would be met by cutting rates on the Baltimore and Ohio and the other roads, would it not?—A. Yes.

Q. Suppose the Baltimore and Ohio is controlled entirely by the Pennsylvania Railroad, would it not be possible for the Pennsylvania Railroad to reduce its rates and to add the same to the present Chicago-Baltimore revenue and still not allow its rates to be cut under that figure, thereby injuring the city of Baltimore?—A. If all lines were under one control that would be possible, but if the Baltimore and Ohio and the Pennsylvania were under one control that would not necessarily follow, because there are other lines.

Q. No control of the Baltimore and Ohio by the Pennsylvania is feared by the city of Baltimore?—A. I have not heard of any expression of fear.

Q. (By Mr. KENNEDY.) Is there any fear that the practical control by one management or the consolidation of all the trunk lines will bring about an equality between New York, Philadelphia, and Baltimore?—A. I have not heard of any.

Q. Did you see a dispatch asserting this to be practicable?—A. A general consolidation?

Q. Yes.—A. No.

Q. Would there be any object whatever in bringing about a general consolidation with the center of influence in New York City?—A. I do not see that there would be. It would be similar to obtaining control or ownership of all the roads in the country and running those roads in the interest of one point, which would be against the interests of the railroads themselves.

Q. (By Mr. LITCHMAN.) Would not there grow up out of that consolidation what would virtually be a pooling of traffic?—A. There might by community of interest or by the consolidation of lines be brought about a condition that would result in absolute maintenance of rates, but I do not think it would bring about a uniformity of rates between all Eastern ports and Western points.

Q. Would it not bring about an adjustment of rates so that there would be no unfair discrimination as against one port compared with another?—A. That question of what are fair rates as between the different ports is one that has been gone over and studied and worked out by the various railroad lines in past years, resulting in the present system of rates. The discriminations, in my judgment, have not so much been due to tariff rates in the past as they have been to disregard of tariff rates at different points.

Q. Such a combination would eliminate substantially all competition, so far as the United States is concerned, would it not?—A. I do not see how it would.

Q. If all the lines running east were substantially under the control of one management in a community of interests, would not that consolidation eliminate competition?—A. I think the competition between railroads is merely a percentage of competition. There was a time when competition between two railroads or between two sections was due to the fact that there were two railroads. But in my experience, in our local territory where we have no other railroads, we feel competition, the influence of markets, inducements in the way of facilities and prices at various points, and we have to meet the competition of markets, if we are going to do business on the line, as much as we do the competition of other railroads.

Q. The cost of transportation enters very largely into the cost to the consumer?—A. It does.

Q. Is it not true that the so-called Vanderbilt system, the Pennsylvania system, and the Baltimore and Ohio system are substantially all of the lines concentrating at New York?—A. They control to a very great extent the situation, although there are other lines that are not controlled by them and that do affect the rate situation.

Q. It is asserted that the Baltimore and Ohio and the Pennsylvania are under one control and that that control is being managed in a community of interest with the Vanderbilt system. That being the case, is not the result the elimination of competition between those three systems?—A. Between those three systems to a certain extent, if the premise is correct; but it does not eliminate the competition of markets or of different sections of the country with one another.

Q. We are discussing now the question of transportation purely; other conditions, of course, affect all alike. Now, if that combination or agreement should eliminate competition so far as three systems are concerned, does it not carry with it the power to raise rates arbitrarily on those three systems against the shipper?—A. Theoretically it does, but I am speaking from a practical standpoint. I do not see how a railroad is to engage in traffic even if it is controlled by some other road unless it meets market and other conditions outside of railroad rates. Perhaps I can make clearer what I mean. If all the roads in our section were under one ownership and that ownership should say "Put your rates up 20 per cent in all this section," the result would be to shut out some of the roads belonging to this ownership from business—not only the one road, but all the roads in that ownership. Certainly that would be very short-sighted policy, and it seems to me it would be impracticable to attempt to ignore conditions outside of the removal of railroad competition.

Q. Would that answer apply to a general raise of 20 per cent on each of the three systems at the same time?—A. It would, supposing that those three systems are running to a given point and that there are other sections of the country that are not under this control.

Q. Those three systems control substantially the entire transportation, and that, it seems to me, would have a very marked effect upon the control of the business itself, would it not?—A. It would have its effect.

Q. It would have a controlling effect?—A. Yes, it would have a controlling effect; but unless the roads are going out of business and desire to shut off certain classes of business they can not put rates beyond a reasonable figure. I do not know whether I have expressed myself very clearly. Suppose the Baltimore and Ohio and the Pennsylvania Railroad were absolutely under one control as to the

territory through which they run. There are other lines running to other markets. If the Baltimore and Ohio and the Pennsylvania Railroad by agreement or control should put rates to an unreasonable figure to the markets to which they transport freight and which are open to their territory, they would certainly be turning a very large amount of profitable business over to lines running to other markets, unless you can go so far as to put all the railroads in the country under one control and an unreasonable advance made to one market is made also to all the markets in the country.

Q. Would that not be the logical sequence?—A. It might be theoretically, but I am speaking of the practical results.

Q. Has not this consolidation among the railroads been brought about under the plea that ruinous competition among the systems has reduced the rates below the proper compensating point?—A. I think it is more on the ground that rates have not been maintained, and with the view to securing a maintenance of existing rates and economy of management. In the case of the Baltimore and Ohio and the Pennsylvania, I do not see where the economy of management would come in, because they are operated entirely separately.

Q. Yet, even in the territory covered by those systems, there has been a competition of rates at times?—A. Yes.

Q. That would cease, necessarily, if they were under one control or community of ownership?—A. It would for the particular business and for the particular territory to their particular market.

Q. (By Mr. A. L. HARRIS.) Is the territory of the United States divided for classification purposes by the railroads?—A. There is no uniform division. In actual practice one classification will apply to one territory and another to another; but there is no rule as regards dividing territory.

Q. There is a Southern territory?—A. There is a Southern territory that takes the Southern classification; there is a Western and Middle States, and New England territory that takes the official classification; there is a different classification in the trans-Mississippi territory.

Q. I understood you to say that it is important that the classification be as permanent as possible.—A. No; I did not say "permanent;" I said "uniform," and I referred more especially to the character or the similarity of the different classifications. I do not think you could have a permanent classification because of the changes in conditions, although it would be very desirable, if it were practicable, to continue a classification.

Q. Is the country also mapped for freight rates?—A. There is a system, or a basis, rather, of rates in what is known as the trunk-line territory. As I said before, Chicago and New York are taken as a basis and the rate between them as 100 per cent. Rates to trunk-line points are based on New York and Chicago rates, if within or beyond trunk-line territory. For instance, the rate to Cincinnati is 87 per cent and to St. Louis 116 per cent, etc.

Q. Is it desirable to have steady rates, as far as possible?—A. It is.

Q. The rates are fixed, as a rule, by experts in freight rates, are they?—A. Yes.

Q. Are they subject to frequent changes?—A. No; the class rates are very steady. There has not been a variation in the class rates for a good many years.

Q. Do you believe it would be important, both for the producer and consumer as well as to the shipper, that rates should be steady?—A. Yes.

Q. Is that the case, as a rule, now with the railroads?—A. The present conditions are very steady, and rates have been maintained.

Q. Do railroads complain of each other in regard to cutting of rates?—A. Yes; at times.

Q. After railroads, large systems at least, have fixed rates, would it or would it not be possible for some body like the Interstate Commerce Commission to approve these rates and see that they are maintained?—A. As I said before, the rates are made by experts, and for the Interstate Commerce Commission to attempt to regulate them would be to submit them to an examination and approval by those who are not experts in that particular line of business.

Q. If the Interstate Commerce Commission were competent, then what?—A. It would be a most gigantic undertaking to supervise and examine the rates made by the railroads in this country. It would be a question not of millions, but of billions.

Q. (By Mr. KENNEDY.) Our attention was called the other day to a condition of affairs which I will illustrate to you in this way. A gentleman told us about rates being such on certain lines of merchandise that they could be sent to Chicago from New York and then reshipped from Chicago back to Connersville, Ind., for instance, 150 miles back into the territory through which they had gone and a little south, for considerable less than the merchants of the town of Connersville could have the goods shipped to them direct from Cincinnati, say. I will ask you

if you have knowledge that such a condition prevails to a considerable extent, and why it is, and whether you look upon it as a fault that should be corrected or not?—A. I would look upon a condition permitting such a practice as a fault, but whether it exists or not I do not know. I suspect it does in some cases, and I am trying to find out for myself. But let me see if I understand your question. The shipment brought from New York to Chicago and then back again to some interior point, is carried by the sum of these two rates at a less cost than the cost direct from New York to that point?

Q. Yes.—A. You mentioned Cincinnati and that threw me off. I suspect that condition does exist in some cases from some things I have seen, and I am trying to follow it up, but I do not think it is intentional. We all discover in the making of rates from time to time that in meeting certain conditions, we have overlooked cases that should have been met at the same time; and from what I have heard in that connection as regards that method of making the rate, I think it is a case of that kind. There may be more like it, but I do not know.

(Testimony closed.)

WASHINGTON, D. C., April 6, 1901.

TESTIMONY OF MR. T. M. R. TALCOTT,

Assistant to the president of the Seaboard Air Line.

The commission met at 2.07 p. m., pursuant to recess, Mr. Farquhar presiding. At that time Mr. T. M. R. Talcott, of Richmond, Va., assistant to the president of the Seaboard Air Line Railway, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. FARQUHAR.) Please give your full name, present position, and address.—A. T. M. R. Talcott; assistant to the president, Seaboard Air Line Railway; Richmond, Va.

Q. Will you please give to the commission your first experience in railroading and the offices you have held, so far as your recollection goes?—A. I commenced 47 years ago this month as an engineer on railroad construction, and I served in that capacity and also in connection with the transportation department up to 1861. From that time until April, 1865, I was in service in the Confederate army. After 1865 until 1890 I was connected, either as civil engineer or as superintendent or general manager or vice-president, with railroads in operation. The roads with which I was connected were the Richmond and Danville and the Mobile and Ohio during that period—those two systems. Since 1890 until the last 2 years I have not been connected with railroads, except when employed as a consulting engineer. For the last 2 years I have been with the Seaboard Air Line in my present position. I was for 1 year the commissioner of the Southern Railway and Steamship Association, which position I resigned to take the position of first vice-president of the Richmond and Danville Railway. I think that covers my experience.

Q. (By Mr. RIPLEY.) In the first place I wish you would make some statement respecting the effect of the enactment of the interstate-commerce act in 1887 upon the Southern Railway and Steamship Association. What was that association, what was it intended to do, and what was the effect of the enactment of the act upon it?—A. The Southern Railway and Steamship Association was composed of the Southern rail lines and the steamship lines between the North and South Atlantic ports. It did not take in the Gulf ports at all, but the Eastern cities—Boston, New York, Philadelphia, Baltimore, and Fall River—and it was for the purpose of preventing fluctuation in rates and rate cutting; that was the object of it. It was organized by Mr. Albert Fink, who had just left the Louisville and Nashville road, and at first the plan was to give the commissioner, Mr. Fink, full authority over the rates. He issued the rates and all were bound to observe them. Later it was found that it was important to have some better guaranty, and that was effected by means of pooling the business. The commissioner was authorized to make allotments to each line, and, if not satisfactory, there was appeal to a regular board of arbitration appointed by the association. Parties dissatisfied had a right to appeal to that and present arguments for a change. When allotments were established that way, either accepted as given by the commissioner or as determined by arbitration, the division was made on a tonnage basis, lines carrying an excess being given a very small compensation, made small so as not to give them any inducement to get an excess, and the balances were settled in cash. That was the basis of that pool which was in operation at the time the interstate-commerce law was passed which forbade pooling.

Q. (By Mr. FARQUHAR.) Was this in existence up to 1887?—A. And longer. But of course it had to be modified. Then a new agreement was made, and it was under the new agreement that I was for 1 year commissioner of the association. Of course the powers of the commissioner were largely reduced then, and the method of operation was for the commissioner to maintain close watch by means of having all the manifests of the competitive business sent to him. Copies of all manifests were sent to him as issued, and they were condensed in his office, so that he always had a record of the business done by each line, and his reports showed to the executive committee precisely how the business was being divided under the agreement at that time, which was merely to maintain rates.

Q. (By Mr. RIPLEY.) How many companies were in that agreement at that time—how many companies, approximately?—A. The Louisville and Nashville; the Nashville, Chattanooga and St. Louis; the Western Atlantic; the East Tennessee; Virginia and Georgia; the Norfolk and Western; the Richmond and Danville; the Atlantic Coast Line; the Seaboard and Roanoke; the Plant System; the Georgia Central; the Georgia Railroad; and 1 or 2 other rail lines. Then there were steamship lines, the Merchants and Miners', of Boston; the Old Dominion; the Clyde Line; and some subordinate Baltimore lines the names of which I do not recollect now, because they were frequently changing them. It took in practically all the steamship lines and rail lines that competed in the Southern territory as distinguished from the extreme Southwestern territory. The Mobile and Ohio and the Illinois Central were not in the association.

Q. Was the association successful in attaining its object prior to the enactment of the interstate-commerce act?—A. Very successful; and it was very satisfactory.

Q. What was the immediate effect of the passage of that act?—A. It relaxed the maintenance of rates from the very first, more or less. Perhaps I should say not from the very first. For a little while they went along very well as they had gone, but within a very short period of time to the time I came in as commissioner there was more or less disturbance of rates, which required frequent called meetings of the executive committee to consider them.

Q. So far as you know has an unsettled condition prevailed since that time?—A. Of my own knowledge I can not say, except for a year or two after that, or less than 2 years after I was commissioner, when I was representing the Richmond and Danville road in the association. That road I represented in the association at that time. The conditions continued about the same for 2 years. Subsequently, I know, from observation and reading the papers, that there were decisions of the courts which tended to weaken the strength of associations of that sort, but the exact effect upon them I do not know, because I have had no connection with them since.

Q. Can you make any statement respecting the present tendencies, the attempt to prevent rate cutting, and competition by other means? Is there any extensive rate cutting, so far as you know, in the territory served by your railroad?—A. No. So far as I know the rates are very well maintained at this time. There is business enough for all, and there is very little temptation to disturb rates. How it would be if it were otherwise I do not know.

Q. There would, then, be, so far as the maintenance of rates is concerned, no further advantage to follow the absorption of the few remaining independent lines in the South by the Southern Railway?—A. No, I can not see that there would be any advantage. Looking at it from my standpoint, I do not see any necessity for further absorption in the interest of the public.

Q. Has the competition at times been sharp between the Atlantic Coast Line and the Seaboard Air Line in the past?—A. No; I think not. I think the competition between the old Seaboard Air Line, before the enlargement of the system by taking in two other systems, and the Southern was quite bitter at one time, according to the reports in the papers and from what I heard from railroad acquaintances; but I never heard of any bitter contest or any rate wars between the Atlantic Coast Line and the Seaboard Air Line. They may have occurred, however, without my knowledge.

Q. Have rate wars been as frequent in the Southern territory as in the North, so far as your observation has extended?—A. I think not. During the time that I have had the opportunity to know they certainly have not been so frequent.

Q. Is there at the present time apparently any effective competition between the steamship lines and the railroads in the Southern territory?—A. To speak of the situation in that respect as of the present time would be difficult, because I have no immediate knowledge of the conditions of traffic. Up to within 10 years ago when I did have connection with traffic, there was more or less competition, some even from the West, or by means of the trunk lines and the coastwise steamships which controlled not only the rates at the South Atlantic ports for Western business, but also to some extent the inland rates.

Q. That is, those companies were interested in land companies in the south?—A. Oh, no. The trunk lines simply brought the western products to the ports, and they were then taken by the Atlantic coastwise steamships down to the south Atlantic ports. That fixed the through rate from Chicago, for instance, or other western points to Savannah and Charleston, by way of rail and water combination. Then Augusta was affected because there was a regular line of boats running up the Savannah River to that city.

Q. Do those lines still operate, so far as you know?—A. I do not know, because I have had no occasion to notice. They did up to the time that I severed my connection with the Richmond and Danville Railroad.

Q. Some years ago, then, there was effective competition up the rivers from the coast into the heart of this southern territory?—A. Yes; in the case particularly of the Savannah River.

Q. Steamers running frequently?—A. Yes.

Q. And transporting a considerable volume of business?—A. Yes; it was a competition that could not be ignored by the railroads; they had to make arrangements in order to protect rates, and they at one time subsidized the steamboats. The railroads in the Southern Railway and Steamship Association subsidized the boats on the Savannah River.

Q. What are the conditions of ownership of some of the steamship companies in the South now? For instance, the Old Dominion?—A. I can not say that the Old Dominion is now entirely owned by the railroads, because I do not know that fact; but I know that three principal lines or systems of railroads connect with it. They are the Southern, the Seaboard Air Line, and the Atlantic Coast Line, and all three of them are interested in the Old Dominion Steamship Company.

Q. So that the policy of the steamship lines is distinctly in harmony now with that of the railroads?—A. Of that particular steamship line that is true, and the lines from Baltimore are also controlled by the railways. There are two lines from Baltimore, Norfolk and Chesapeake Bay lines, of which one is controlled by the Southern and the other by the Seaboard Air Line, part and parcel of those lines, or of the two systems. I do not know of any other interest of the rail lines in steamship lines running to the Virginia ports or to Charleston. The Clyde lines are entirely independent. The Ocean Steamship Company, which runs to Savannah, has always been controlled by the Georgia Central—the old Georgia Central and Banking Company—and is, so far as I know, so controlled to-day.

Q. Can you make any statement relative to the position of some of the Southern ports—Mobile, for example? Has it physical advantages of location or of harbor, etc., which would be injured by the absorption of the Mobile and Ohio road by the Southern Railroad?—A. I was for 3 years on the Mobile and Ohio Railroad as general manager, from 1884, during which time, of course, I became very familiar with Mobile and studied the possibilities of the development of Mobile. We endeavored to build up there an export cotton business, but were not very successful. I thought that the tropical fruit business could be handled there probably better than at New Orleans, after the Mobile and Ohio was extended, during the time I was connected with it, to East St. Louis. Before that we could not do anything. We commenced making preparations for that business, and it has since been developed, but to what extent I do not know. I see by the annual reports that quite a large business has been built up there in tropical fruits which, I suppose, will stay there. I do not see any reason why that should be diverted. I do not think the Mobile and Ohio had any export cotton that amounts to much.

Q. Is there any particular reason why it should not be a cotton-exporting port?—A. Because of the difficulties of the port at that time. The water in Mobile Bay has been deepened only in a little, narrow, or a comparatively narrow channel. The Government is gradually extending the width, I believe. But there was difficulty in getting large vessels up. Only a certain class of large vessels could be brought there, and those were vessels that were arranged to use water ballast. They pumped the water out to lighten them for going down to the sea and took them outside of Fort Morgan, and then they pumped the water in and got them down to their bearings for seagoing. I did not think there was much prospect of building up Mobile for cotton export. Another class of business that I endeavored to develop whilst there was the coal business—export business in coal. And in order to see what could be done with that the company authorized the expenditure of some money and we sent coal down to be burned by the steamships plying in connection with the Panama Railroad—the Pacific Mail steamships—and got them to use it; but we found they got their Cardiff coal—English coal—very cheaply, and that they liked it; and whilst they said the Alabama coal was fair coal, they did not like it quite as much as they did the Cardiff. The price of the Cardiff coal was so low, owing to the fact that more or less of it was brought over in ballast, not paying freight, that we were not successful, and we lost money.

The venture did not pay, and it was dropped before I left there. Whether they ever tried it again or not I do not know; but I have understood that there has been some coal shipped to Cuba through Mobile. I do not see any reason why, if there is any demand for coal there, they should not ship the Alabama coal to Cuba over the Mobile and Ohio, because the Mobile and Ohio is a very low-grade road and ought to be able to haul coal cheaply if the volume of it is sufficient.

Q. (By Mr. CLARKE.) How long hauls do they have to make?—A. The haul through Alabama was something like 230 miles.

Q. (By Mr. FARQUHAR.) Was Pensacola a competing point with Mobile while you were trying to build up the coal business?—A. No; not in coal at that time, only in lumber.

Q. And has the lumber business developed in Mobile? Is it still the largest market on the Gulf?—A. I have not noticed it recently, but a few years ago, when I had access to information, it had continued to develop. I should have mentioned that one of the efforts we made in order to make freight was to develop the lumber trade, and in doing so we utilized the timber lands belonging to the Mobile and Ohio Company, acquired by land grant.

Q. Something has been said before the commission here about the competition of the Southern rivers. While you were connected with the Mobile and Ohio did you notice how much there was of competition in Arkansas or Alabama in these small independent boats and the effect they have on the rates?—A. One of the river boats could run as far up as Columbus, which was on a branch line (it is now on the Montgomery extension of the Mobile and Ohio), and also occasionally, I think, it used to come up as far as Aberdeen, which was the terminus of the Illinois Central line running into that territory; but it was only for a short time during the cotton season. Some seasons there was hardly water enough for them to come there at all. And I can not recollect that I ever paid much attention to that competition. Maybe the competition with the Illinois Central kept me so busy that I did not notice the boats. Now, as regards the Alabama River, at the time that I was on the Mobile and Ohio there was a regular line established, a line which the Mobile and Ohio recognized as a connection to Montgomery. It was established some months, perhaps a year, before I severed my connection with the Mobile and Ohio, and, so far as I can remember now, it was still in operation at that time, but what became of it afterwards I do not know.

Q. (By Professor RIPLEY.) Was the basing-point system of rate making in the Southern States in force at the time that you were directly connected with affairs there?—A. Not in the sense in which that word is used now. When the Green Line was opened from the West into the South in competition with the lines I have spoken of, through the south Atlantic ports in connection with the coastwise steamships and trunk lines, the basis adopted was to make all rates from the Ohio and Mississippi rivers to interior points the same; and that was on an understanding with the roads north of the river that they would make their rates the same to all river points, no matter by what lines. That was the principle that prevailed all through the life of the Southern Railway and Steamship Association up to the time that I severed my connection with it.

Q. Will you specify by way of illustration what you mean?—A. I mean this, that the rate from Chicago to Cairo, to Henderson, to Evansville, to Cincinnati, and to any other point on the Ohio or to Memphis would be the same; through those points, I should have said, the rate to Atlanta would be made by the combination of rates to those points from Chicago and from those points to Atlanta, and that the proportions were the same north of the river and south of the river, no matter what river point freight came through. Do I make myself clear?

Q. What was the basis of that division then?—A. It was not a pro rata division at all; it was an arbitrary division. In other words, the lines north of the river named the rates to the river, and the lines south of the river named the rates to each point south, and the combination of these two made the through rate. That was the basis of rates at that time.

Q. But there was not the element which you find in the present basing-point system whereby certain towns, by reason of their size or the existence of so called water competition, got peculiarly low rates and the rates to all the suburban places were made by adding a high local to that rate?—A. That was not exactly the basis of rates. Certain important distributing points, such as Atlanta and Augusta and Macon were afforded rates which had certain relations, either the same or a certain differential. As far as practicable the most important distributing points were given the same rate, so as to enable them to develop equally.

Q. The number of subordinate rates below those which have through rates was not great?—A. The rates were generally made from those distributing points by adding the local tariff of the road over which the freight went.

Q. It was the same principle which you have in the present basing-point system, but not developed to so extreme a degree?—A. The same general principle, yes. Subsequently, during my administration as commissioner, it became desirable to have uniform rates to what are known as the Georgia and Carolina points. I was coming to that as a modification of what I have stated before. And the commissioner made up and issued a tariff of rates from all points West to what are known as Georgia and Carolina points, taking in all the principal stations, which were to be the same, and agreed upon as the same, whether via the Western lines coming across the Ohio, by the Chesapeake and Ohio, coming through Richmond, or by any other route that could be made available, such as the Norfolk and Western, running down into Virginia, and then shipping south in connection with other lines. That was the basis that was adopted a few months before I dissolved my connection with the association, and it remains in effect: or at least so I have understood. I heard from our traffic manager the other day that these rates are practically in effect now, with some modifications.

Q. Are you aware that the long and short haul clause of the interstate-commerce act is inoperative in a large part of the Southern territory?—A. Yes; it always has been to some extent. For instance, the rates from Chicago to Atlanta are higher than the rates from Chicago to Savannah or Charleston, although the freight goes through Atlanta to reach those points.

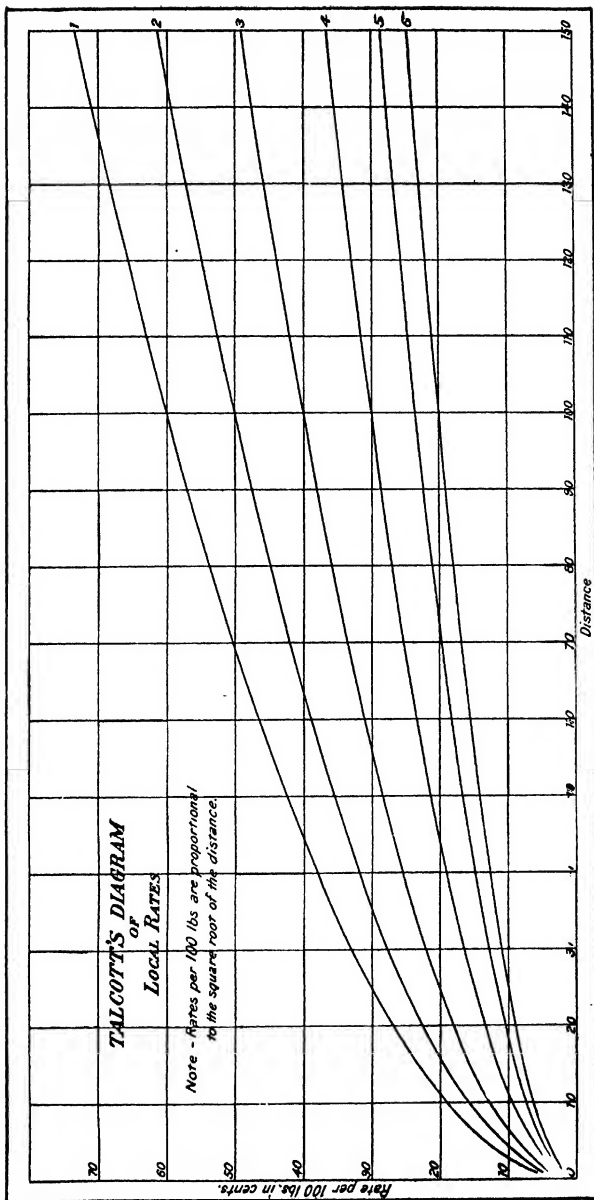

Q. Is that condition caused by actual water competition down the river to the ocean?—A. By actual competition. The whole question of discrimination was raised by the merchants of Atlanta, who demanded lower rates, and was argued before the Interstate Commerce Commission when I was commissioner of the association; and I suppose, if I had known it was a matter of any interest, I could have brought the record up here. It is easily accessible.

Q. Does it seem to you that the conditions, competitive and others, in the Southern States justify the setting aside of this long and short haul clause as it is at present?—A. I do not know to what extent it is set aside at present. I will say, however, what my own judgment in that matter has been. Long before the interstate commerce law was passed my own practice was in every way possible to do away with such discrimination.

Q. Would you describe it as a discrimination?—A. I do not say that it is necessarily an unjust discrimination, but it is a discrimination; and I did away with it at that time on the ground that the losses in revenue were not large enough to justify my company in putting itself in a position to be attacked all the time for discriminating, believing that it was better to forego some little extra earnings than to be put in the position of having to defend such rates as just and reasonable.

Q. You would acknowledge, then, that distance is an element in making rates?—A. Yes; I do.

Q. Will you specify in what way it becomes a factor or to what degree?—A. In my early experience in making rates I was called upon to make local tariffs very largely, and the question of what the relative charge should be in proportion to distance necessarily had to be considered. I informed myself. Fortunately I was helped by some publication in a magazine where somebody had done a great deal of work which I would have had to do myself; that there was a general consensus of opinion apparently among railroads that the charges per ton per mile for short hauls should be higher than for long hauls; and I endeavored to find out some scale which would be convenient for use. As an engineer and mathematician I wanted some mathematical scale, and I discovered that the nearest scale to it—that is the nearest scale to fit the actual conditions of tariffs—was not in proportion to the distance, but in proportion to the square root of the distance; that is to say, double the charge for four times the haul. The rate for 25 miles would be just one-half of that for 100 miles. That, you can see, was a very easily remembered rule, and I have used it a great deal. Mr. Markham alluded to the Mobile and Ohio tariffs, which were made on that basis, this morning in conversation with me; he remembered them. I had occasion to examine the official tariff of the present commissioners of the State of North Carolina, and I discovered that it was based on the same scale, taken from one of my own old tariffs. It was in connection with my report that I made to the court on the Cape Fear and Yadkin Valley road for the receiver of the road. It became necessary under an order of the court to divide the earnings between different sections of the road that were covered by different mortgages, and give each section of road proper credit for gross earnings and to make this division for 5 years. I was called on as an expert to divide between the long and short hauls—where it was 10 miles on one section of the road and 50 miles on another to say how the earnings should be divided between them. I thought the proper way to do would be to make the divisions on the scale of the approved tariff of the North Carolina commission, which was done, and subsequently, in the examination before the master, the

chairman of the commission was put on the witness stand and stated that the division was, in his opinion, just and fair, for he had found by comparing that it fitted exactly the scale on which their tariffs were made. So that it is in evidence that my scale is in use to-day.

Q. Is it in use in any other States, so far as you know?—A. I do not know; I have had no occasion to investigate. It is used on the Southern Railway, I know. In other words, the scale that I established as the general manager of the old part of the Southern is still maintained there and probably on the Mobile and Ohio. Whether anybody else has adopted it or not I can not say. I have frequently had requests for a little diagram that I made to show it so that you could see by the lines what the relative rates would be.

Q. Will you submit one of those diagrams for us?—A. I will do it with pleasure. It simply shows the rate line as a curve. Others have also used the scale I introduced a good many years ago. The first was Mr. Henry Fink, now president of the Norfolk and Western road, when he was first on that road; but it was not then the Norfolk and Western—it was the Atlantic, Mississippi and Ohio before it was reorganized. Under the law it was required that the cities of Richmond and Petersburg should have the same rates to points on our two roads, which crossed at Burkeville, 53 or 54 miles from the two cities of Richmond and Petersburg. In making tariffs for local stations beyond the question came up of the proper division for the relative hauls, and my scale was adopted as fair by Mr. Fink for the Atlantic, Mississippi and Ohio. Of course I thought that if it was a proper scale at all it would be fair for the division of rates, and subsequently I got out a table of percentages known as "Talcott's Table of Percentages for Division of Rates." I have been called on by Mr. Culp, of the Southern road, and others time and again for copies of it. Mr. Fink adopted it also for the division of rates between the Shenandoah Valley and the Norfolk and Western, which I think is another indorsement of the scale as a fair one.

Q. What other basis of making the local tariffs by State commissions would be adopted usually—the proportion of mileage directly?—A. No; never directly; but the allowance for long and short hauls does not agree with my scale. Sometimes it does not differ very much from it on one class, while on another class it would be entirely different.

Q. Is the long and short haul clause enforced, or was it enforced by the State commissions within the several Southern States?—A. Generally, yes; I think. It was not enforced in Virginia. I ought to amend that. I happened to be on a road the charter of which exempted it for a long time during my management from any State interference with the rates. There was only one condition upon which the State could interfere, and that was that we should not pay more than 15 per cent in dividends; but as they had kindly increased the capital stock we had no show of paying 15 per cent dividends, and we did not come under that law at all. Although I did not study very closely the requirement of the law, I do not recollect any enforcement in Virginia whatever of the long and short haul provision. We adopted it in Virginia, and all our tariffs on the Richmond and Danville road were made on that basis—no more for a shorter than a longer haul. For instance, starting out I would make rates in classes on my scale from Richmond to Burkeville—about 50 miles south of Richmond, where we were crossed by the Norfolk and Western—with lower rates from Petersburg, and as the law required they should be the same to that station my rates would drop there, and with the lower rate I would just simply go back to a station nearer Richmond and carry that on. After passing this competitive point we could gradually work up to the scale again. In other words, in one class I recollect there used to be two intermediate stations that would have the same rate as Burkeville.

Q. It would not seem to you justifiable that there should be a direct drop?—A. No; not on the Richmond and Danville. There was one direct drop there; but I preferred to do away with it and reduced the rate to the stations between the competitive point and the terminal point so as to do away with it—so as to make rates equal but not have a higher rate for the shorter haul.

Q. In your judgment, then, the long and short haul clause is a proper and reasonable regulation in the making of rates?—A. Provided it does not exclude competition by forcing a reduction of rates at the intermediate points that the railroad can not submit to. For instance, I do not think it makes so much difference whether it is a water competition or a competition from any other source, if it is legitimate and proper and revenue can be made by meeting competition. On account of the highly competitive conditions at some points I do not think it is always just to forbid the meeting of that competition, even if it does make a discrimination at intermediate points.

Q. An elastic prohibition allowing for modification in intermediate cases would seem to you to be justifiable?—A. Yes; I have always thought so, and I think so now.

Q. And does it seem to you that the evasion of this provision of the interstate commerce law through the Southern States that exists is detrimental to the interests of that section?—A. I can not say without knowing more in detail where those discriminations exist and the causes for them. Of those facts I am absolutely ignorant at this time.

Q. (By Mr. FARQUHAR.) Does the practical carrying out of the long and short haul raise the long haul rate?—A. At some points, yes; at many, no.

Q. Is not what you lose in handling short haul freight—and all roads must, I presume, lose—put on to the long haul?—A. It ought not to be and never was in my knowledge on my own road.

Q. Do you say that the principle contained in the interstate commerce bill of the long and short haul is a practical principle of railroading, or is it a theoretical principle of the politicians?—A. I think it is a theoretical principle in part, but I think that there is a measure of justice at any rate in it. I took it as a measure of policy that, unless I could positively demonstrate to the satisfaction of people who are not capable of taking a demonstration always—the public—that we were not unjustly discriminating, we would better make some sacrifice of revenue than to be constantly at war with our patrons upon whom we depended, and therefore that this discrimination should be wiped out as far as possible. I mean, of course, the discrimination of the higher charge for the short haul than the longer one. I do not think it is just and reasonable to require it to be an absolutely fixed cast-iron rule.

Q. Is it not practically true that within the last ten years the rates on the long and the short haul, if they have been divergent from the principle announced in the bill, have really come nearer equalization than they ever did, and are all the time coming nearer equalization?—A. I must qualify my answer to that, as I do everything that relates to the time within the last ten years. I believe such to be the case, but I have not the means of demonstrating the fact at my command now. If I had known that question would come up I would have made some comparisons to show you that it is the case. I think I could have done so.

Q. Do you know a single road in the country that strictly observes the rating of the long and short haul provision? Do you know of a single railroad in the United States since the passage of that act that has observed it?—A. I did not up to the time that I ceased to have the means of knowing what they were doing. We were, of course, called upon to defend our course. I acted for the association to defend it before the Interstate Commerce Commission in one case. I think we were always prepared to defend it. I should say that I was called upon myself to defend the roads against the charge that it was an unjust discrimination.

Q. (By Mr. A. L. HARRIS.) Was not the provision put into the law to correct the abuse of charging so much more arbitrarily for the short hauls than for the long hauls?—A. Yes; I think it grew out of the fact that the disproportion in charge for short hauls and long was in many cases extreme.

Q. Then, was it not really a question of business and not of politics?—A. Perhaps I answered that question a little hastily. I do not know much about politics. I would like to amend that answer.

Q. (By Mr. KENNEDY.) You did not use the word politics.—A. No; it was in the question, and I answered the question generally; but I did not think about the word politics in it.

Q. (By Mr. FARQUHAR.) You would answer that it was a remedial measure so far as the disproportions had existed before the passage of the act in 1887?—A. Yes.

Q. And has been beneficial?—A. It has been beneficial; yes.

Q. If not carried out to the letter?—A. Yes.

Q. We only want to get at the facts. The other statement is so broad it might be taken up. I know some railroad men have said that no railroad can carry out the law.

THE WITNESS. I think they have all tried to carry out the law. Those that were under my jurisdiction as commissioner of the Southern Railway and Steamship Association did, but they claimed they could not carry it out in every respect, and would defend themselves against the charge of failure to comply literally with the law.

Q. (By Mr. FARQUHAR.) What experience did you have in making your freight tariffs on commodity rates?—A. Originally the Southern classification was a compromise measure between all the roads in that territory, where they all had different classifications; and it was brought about by competition with the Western lines, the Green Line, as it was known, coming into that territory. In the very outset, in making that new classification, they were met with conditions in the Western business that had to be provided for. There were certain Western products that could not be put in the classes at all, that must be treated as commodities.

From time to time in our meetings to discuss the question of classification there were constantly propositions made and good reasons shown why certain things would not stand class rates. You may change this class rate as is proposed, it was argued, but there is no occasion to change the rate on this commodity. Then, as a matter of compromise, we would take it out and make a commodity rate for it. So, from having only a half dozen or so commodity rates the number increased until the alphabet was not long enough to cover them all. I see by looking at the classification sheets that others have been introduced since 10 years ago, 1890, when I was familiar with the question.

Q. Have you not about nine classes in the Southern classification now?—A. Originally there were six classes, but it takes in a, b, c, d, e, f, g, h, i, j, k, l, m, n, o, p, q, r, and so on. So there is a great deal of it.

Then, when the classification was adopted, there was another thing to consider. In the limits of a State they had State classifications which were entirely different from the general classifications agreed upon, and we had to issue exception sheets. I think many of these are still in existence. Whether it is because the State commissioners have not modified their classifications to suit the general classification, or whether it is because there is some benefit to the railroads in them that they keep them, I do not know; but some of them are kept.

Q. (By Mr. RIPLEY.) Knowing, as you must, from experience, the complicated character of freight classification, does it seem to you that the power to make or to approve of such a classification might wisely be vested in the Interstate Commerce Commission?—A. Certainly not, if we were to have one uniform classification for the whole country. The conditions do not admit of that in my opinion.

Q. Will you state the objections that occur to you against the promulgation of such a uniform classification for the whole country?—A. I only state it as the result of my own experience. When we adopted the original Southern classification there were some of us who were exceedingly anxious to have it based on what is known as the official classification. We preferred to use that classification, in which there were four classes. When we came to make the new classification we found it would not do; it did not fit our Southern conditions. In other words, it would put some things in the fourth class that would not stand fourth-class rates, and we had to have some lower classes. We were not thinking of making so many commodity rates at first, and it was supposed that by having a few commodity rates we could make the adjustments on them and the four classes might be enough, but I think a good many things would have to be made commodities and come out of the classes in the South if you attempted to enforce the official classification in that part of the country.

Q. (By Mr. CLARKE.) Is it not a fact that goods may be properly put into the fourth class in the region of their origin and should be advanced to first class when they reach or approach their destination?—A. I think that is proper and actually the case in some respects. Where, as in the South, they are endeavoring to encourage manufactures commodity rates are made for manufactures which would put them in a very low class; but when they strike the official classification they go right up to first class. I think that is a practical illustration of what I understand you to mean, and I think there is not any impropriety in it.

Q. Take the case of California fruits as an illustration. Fruit is abundant in California. It is at certain times the principal article of freight. It may belong in a low classification properly, but when it gets farther east it becomes a rarer commodity, and there are certain reasons incident to its perishable nature which also have a bearing, and the price of it becomes higher when it gets nearer the places of distribution because there is smaller competition, etc. Would it not seem, therefore, that unless there can be some uniform system of transfer from one classification to another, that it is absolutely impossible to have a uniform classification and do justice to the different sections?—A. I think so. I think also that would be illustrated by a comparison of the classifications of the different States. The Florida railroad commission, naturally looking after their product down there, would put Florida oranges in a lower classification than they do in Virginia, where they do not raise them. Though I have never made the comparison, I am sure you would find that fully illustrated in the State classifications.

Q. (By Mr. A. L. HARRIS.) Is the country now divided into divisions for classification?—A. No; except so far as between the Official covering the Northern lines and the trunk lines and those roads that take the trunk-line classification, as, for instance, the Norfolk and Western and the Chesapeake and Ohio coming into the South. They are essentially Western lines; they take the trunk-line classification, and the others take for their business what is known as the Southern classification.

Q. You have a division known as the Southern division?—A. The Southern division; yes.

Q. And one known as the Western?—A. I do not know anything about that;

that must be west of the Mississippi. Our Southern classification does not go to the Mississippi; it does not take in the Mobile and Ohio and the Illinois Central. They have always been out, on the ground that their competitors were largely on the other side of the river, and they had to work with them and not with the roads farther east.

Q. (By Mr. RIPLEY.) Do you make that statement in the light of present conditions? Do you understand the present Southern division does not extend to the Mississippi?—A. Originally it did not, and never did, as far as I know; and I presume it does not now, from the remarks made here this morning with reference to the Western classification.

Q. (By Mr. CLARKE.) Would it be feasible in railroading to establish a zone system of classifications, so that an article should go in one classification until it reaches the border of that zone, and then pass into another if it is carried for a long haul?—A. I should have to study the conditions before I could answer that question intelligently; I am not prepared to say it would be possible or practicable.

Q. (By Mr. RIPLEY.) Do you recognize that by a change of classification rates may be advanced or decreased?—A. Certainly; you can put things in a higher or a lower class.

Q. Have you any knowledge of the recent changes in the Southern classification?—A. None whatever.

Q. Were distinctions made in the original Southern Railway and Steamship Association classification between carloads and less than carload lots?—A. Yes; some.

Q. Have you any opinion as to whether that distinction was as great as it is at the present time?—A. No. That fact could only be arrived at by detailed comparisons, which I have not made.

Q. Have you any knowledge respecting the causes which led to the low rates at Richmond, Lynchburg, and Norfolk on through business from the West?—A. The rates from the West to Richmond were naturally reduced when the Chesapeake and Ohio opened in 1874, because they made trunk-line rates to those cities the same as to Baltimore. At that time the trunk-line rates to Baltimore, whatever they were, were adopted by the Chesapeake and Ohio. The Western business had been coming through Baltimore prior to that time and then down to Richmond, being distributed South on the rates from Baltimore to the South added to the trunk-line rates to Baltimore. But when the Chesapeake and Ohio adopted the Baltimore rates at Richmond, naturally there was an entire change. They could not charge any more than the locals from Richmond south instead of the locals from Baltimore. That made a readjustment. The present basis of making rates, as I understand it, is one of comparatively recent adoption—that is, they make Richmond, Lynchburg, Norfolk, and Portsmouth, and perhaps Petersburg, gate cities from the West; and the Western lines agree to make the rates the same to all these points, notwithstanding the length of the haul varies. Then the Southern lines make their rates to interior points by adding either locals or agreed rates to interior points. That is something entirely new. That method of making rates has come in since I had any connection with the traffic, and I am not familiar with the details of it.

Q. Does it seem to you to be an improvement over the conditions which prevailed 10 or 12 years ago?—A. I do not know the reasons why the change was adopted. There may have been good and sufficient reasons for it, but what they are, I am not informed.

Q. Have you any information respecting the recent cases before the Interstate Commerce Commission, involving the cities of Danville and Lynchburg?—A. I have not. There was a complaint at Danville, but I have not read about it. I remember receiving the papers from the Interstate Commerce Commission's office, but I did not read them.

Q. Are there any fast-freight lines operating over the Seaboard Air Line at the present time?—A. No.

Q. No fast-freight lines or express lines which transport freight in the South?—A. No; the freight lines are run entirely by the railroads themselves, who do the freight business now, except so far as it is carried on passenger trains by the express companies.

Q. Have you any information as to the relations between the railroads and the express companies in that business?—A. No; I have not any recent information. Never since I became connected with the Seaboard Air Line have I had occasion to examine that company's contracts, and I do not know what the arrangement with the express company is. I am not informed as to the contracts of that company with the express company.

Q. What were the former relations between the express companies and the fast-freight lines which did business over those railroads?—A. There were no fast-freight

lines in the South that I know of; nothing like the Northern fast-freight lines. They were all made up by a combination of the railroad companies, each putting in its quota of cars and making a line organization, which was the railroad companies acting jointly; and the railroad companies severally had no intermediary, such as the fast-freight lines on some roads North. Now the express company's contracts, so far as I have knowledge or am at present informed (and my information dates back to the time when I had means of knowing absolutely), call for transportation on passenger trains, and the railroad companies agree to give them the available space, not to interfere with the transportation of the mails or passengers and their baggage. In other words, the railroad is, or was, the sole arbiter as to how much space they had that could be used for express, and how little. But the rates were made by the express company, and the divisions were made between the railroad company and the express company on a percentage basis—a certain percentage for local and another percentage for through business, the express company getting a larger proportion of the through competitive business than it did of the local business. I do not recall those percentages now. I could give them nearly, but I do not like to state figures that are not absolutely correct.

Q. Can you make any statement respecting the general physical condition of the railroads in the Southern States? Have they improved of recent years?—A. Yes: they have improved very much in every respect, both as to track, weight of rails, capacity of engines and of cars, and their equipment generally. They are improving every year, too.

Q. What is the practice in that part of the country as to making charges for new equipment and improvements? Is it to make these out of earnings or usually by the issue of new stock?—A. Generally out of the earnings, because the usual way is to purchase additional equipment on the car-trust plan, where the payments are made monthly or quarterly.

Q. Are these car trusts common in the Southern States at the present time?—A. They are quite common; very general, I think.

Q. Now as to the improvements that are made in the way of additional facilities for handling business?—A. They are required every year. There is a difference of practice, some roads charging the cost to operating expenses, and generally when they do that they note it as a betterment included in operating expenses; others charge to the property account as a construction expense if it is of any magnitude. I do not think there is any fixed rule; each company determines for itself how it shall charge it.

Q. Have you formed any judgment as to what is the proper basis for capitalization of a railroad? Should it be the original cost, or should it be based on earning capacity?—A. I have had that question before me more than once, and I am free to say it is the hardest problem that ever was propounded to me. I do not see how you can properly disregard the physical value of property and place the capitalization solely on a road's earning capacity, and yet it is a fact that the public and financiers appreciate a property only for what it will earn. I have seen that test made too often to doubt it. I was called upon in the Cape Fear and Yadkin Valley case. The question there was that of separating a property which had been worked as an entirety, no separate accounts having been kept of its earnings, and of determining the relative value of the different parts that happened to be covered by different series of bonds. Not only had the earnings to be divided in order to show the relative earning capacity of each section of the road, but each section had to be appraised physically. In that case I presented several plans on which the value of the bonds could be ascertained. The one that I recommended to the court was based on my conviction of what was proper; that it should be treated as a partnership concern, four partners putting in their property at a valuation and doing business and each one getting credit, not for the business performed, but for the amount contributed by each. That is the nearest illustration I can give you in the way of a case that involves that principle. Practically, the court made the award, I think, on that basis, with some slight modifications in my percentages. In other words, I consider the value of a property and the value of the franchise as two different things. I have had that same question presented in propositions to consolidate, where there were different properties in a big system, with different stockholders, and the majority or control held by one party, the question being how a fair consolidation could be made and stock issued to the stockholders in the consolidated road. I have had to make recommendations in such cases, but I can not recall now precisely what they were. I arrived at some conclusion in that particular case.

Q. In your judgment, the actual investment in a property should bear a definite relation to the capitalization, should it not, rather than that the capitalization should be based solely upon earning capacity?—A. I think so. A road is certainly worth something; the very property, if taken to pieces and carted away, has some

physical value. There is where the question comes in, and it is argued both ways, one contention being that you should take only what the old rails would sell for and what the buildings would be worth for farm purposes, and what the equipment would sell for.

Q. You are assuming that the physical plant is worth more than the earning capacity of the road?—A. Not necessarily. It is not likely that a road would be torn up if there was any value to the franchise whatever; but in the event the franchise was worthless, the physical value of the road would be the only element of value in the road.

Q. What was the principal cause of the various receiverships of prominent railroads, such as the Norfolk and Western or the Richmond Terminal, etc., 4 or 5 years ago? Were they due to defect of management or to financial mismanagement?—A. Financial mismanagement, or, I would rather say, I do not know that that expresses it exactly. I might say that in their anxiety to build up a big system they bought properties and paid higher prices for them than should have been paid—more than they were worth. In other words, in the case of the Terminal company, they diluted an exceedingly valuable stock by hanging on to it weak properties until they broke its back. I speak of the Richmond and Danville road. A more solvent institution never existed until they loaded it down; and it was not really bankrupt when they put it in the hands of the receiver. It was not in default even on a note—a very strange case.

Q. (By Mr. KENNEDY.) Was not rate wars one of the great factors?—A. No; not in that case nor in the case of the Norfolk and Western—the Atlantic, Mississippi and Ohio, which is now the Norfolk and Western.

Q. Ruinous competition or rate cutting has nothing to do with bringing about the receiverships?—A. I am referring to these two particular companies. In many of them failure was due to reckless competition.

Q. (By Mr. RIPLEY.) There is danger, then, in the growth of great consolidations, that they may be formed on a basis which will not stand the pressure of adverse years?—A. Yes; if left to the judgment of individuals they are apt to make mistakes and issue too much stock.

Q. The criticism has been made of the Southern Railway that it has acquired many of its constituent properties at a very high figure, and that its capitalization at the present time is excessive. Have you any statement to make respecting the capitalization of roads in general through the South?—A. No. I think you referred to the Southern. If my memory does not fail me, the Southern has actually asked permission of the legislature to reduce its capitalization.

Q. It has at the present time?—A. I think so; at the last legislature; but what disposition was made of the request I do not know. I heard at the time that there was a move of that sort; that they had erred in putting their capital too high.

Q. (By Mr. KENNEDY.) The legislature of what State?—A. Virginia. The Southern is chartered in the State of Virginia. The State gave the road a very liberal charter, without any name, and the opportunity to fix the name afterwards. (Testimony closed.)

WASHINGTON, D. C., April 19, 1901.

TESTIMONY OF MR. GEORGE H. ANDERSON,

Secretary Chamber of Commerce, Pittsburg, Pa.

The commission met at 10.55 a. m., Chairman Kyle presiding. At 2.37 p. m. Mr. George H. Anderson, secretary of the Chamber of Commerce, Pittsburg, Pa., was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Senator KYLE.) Please state your full name, address, and occupation.—A. George H. Anderson; secretary of the Chamber of Commerce; Pittsburg. I have prepared a brief statement in writing which I wish to submit, and as it has been done with a great deal of haste I would be very glad to explain my written paper with any information that your questions may draw out.

(The witness announced his subject to be "Transportation as affecting industrial affairs in the United States," and read as follows:)

"In accepting your courteous invitation to appear before you and contribute any observations of my own regarding the matters under consideration, I fully appreciate the fact that the questions of labor and industrial activities in their economic, social, and political aspects are second to no others affecting the welfare and prosperity of our country.

"I have taken the liberty of following my own line of thought, rather than undertaking to discuss in minute detail the propositions so intelligently considered and submitted by your committee, and trust that details may be brought out by a supplemental talk before your body.

"You will understand that most of my practical observations in the matter of industries and transportation have been made in the Pittsburg district, where I have resided all my life, and these can not fail to throw some light on the matters under discussion, when it is understood that Pittsburg is the largest producing center in the world, and has contributed a full share in that export traffic which now exceeds \$2,000,000 daily in excess of imports, and is a leading factor in the unexampled prosperity of our nation.

"The Old World, in its supremacy as a producing center for a thousand years, achieved the height of its success mainly because the cheapness of labor, which brought its working people to the verge of a pauper class, who were only glad to earn enough for daily bread of the coarsest kind, and utterly without any hope for a betterment of condition for themselves or their children.

"In this country, richly endowed as it is by the Creator, no such model for industrial conditions can be accepted, but we may consider the experiences of older countries as so many studies to perfect the system of the new.

"In our land the conditions of success and prospect for continued prosperity are, in my view, to be found in a system of transportation, the cheapest and best to be attained, that will bring our products to tide water and thence to the markets of the world; or, in other words, cheap transportation rather than cheap labor will enable the United States to hold its vantage ground in the world's traffic.

"The increase in population and wealth in this country is largely due to its industrial development, and this increase would have been simply impossible but for an expansion in railway facilities, which, to the credit of American enterprise, has always kept in advance of the requirement.

"Take for illustration the city of Pittsburg. In 1830 it had a population of about 12,000, and up to 1850 the increase was very moderate until the entry of the Pennsylvania Railroad in 1852.

"This was the real beginning of a career of prosperity in industrial lines unexampled probably in the world's history. The advent of the Pennsylvania Railroad was followed by the Pittsburg, Fort Wayne and Chicago system, west and north. These were followed by the Baltimore and Ohio, Pittsburg and Lake Erie, and a number of others of more or less importance, and last of all the Bessemer, or Carnegie road, connecting the traffic of the Great Lakes with Pittsburg. The especial business of this line is to bring ores from the Lake Superior region to the furnaces in this district, and having vessels, docks, and mines of its own, is enabled to carry its great burden of traffic at the cheapest possible cost, and marks Pittsburg as the greatest producing and distributing center in tonnage in the world.

"During the last year 2,290,000 car loads were handled in Pittsburg (not including freight in transit); in tons, 57,050,465; river traffic, 8,813,166; total, 65,863,631 tons.

"The population within corporate limits is 330,000; in the county, which is the real Pittsburg, are over 800,000 people, and of this number 150,000 men are employed in the various productive plants.

"The total capital employed is estimated at \$2,000,000,000. The Pittsburg district, taking Pittsburg as a center, within a radius of 60 miles, contains a larger population than any corresponding area in the United States west of the Atlantic coast, and is really an empire of industrial enterprises.

"With these brief facts, it will be easy to see that a complete interdependence exists between industrial interests and transportation; neither could prosper without the other.

"*Wages.*—The wages of the railroad men are probably the most stable of any. The tendency is toward piece or contract work—the river men being paid by the trip and mechanics by the piece. In times of depression it is the rule to give the trainmen approximately full time, and to let the extra men go. In shops there is a reduction in hours, but not in rates. Blacklisting discharged employees is not done on any of the large railway systems.

"*Provisions for sick and disabled employees.*—On some of the large systems there are established volunteer relief departments, to which the railroad companies contribute enough to pay all expenses, and they also guarantee to make up any deficiency in the event that the contributions of the members are not sufficient to pay all obligations. Membership in the relief department is entirely voluntary.

"Pennsylvania lines west of Pittsburg have about 30,000 employees, with 18,500 members of the relief department, or a little over 61 per cent.

"From the date of organization, July 1, 1889, to February 28, 1901, nearly 11 years, the payments to members have been—

	Number cases.	Amount paid.
Death benefit:		
Accident.....	498	\$296,257.19
Natural.....	1,401	882,524.45
Disablement benefit:		
Accident.....	54,433	819,587.65
Sickness.....	80,870	1,024,096.67
Total cases.....	137,212	3,002,465.96

"The members of these departments are strongly in favor of them, and vigorously oppose action and efforts on the part of representatives of life and accident companies and officers of labor organizations having benefit orders to have legislative action taken to break up relief departments of railroads.

"*Safety appliances.*—The introduction of safety appliances, such as automatic couplers, air brakes, and hand holds, while costing the railroads of the country a good many millions of dollars, has reduced the number of casualties to railway employees from 28 per cent of the total number of cases reported to 10 per cent of total cases reported.

"*Extract from Book of Rules.*—The use of intoxicants by employees while on duty is prohibited. Their habitual use, or the frequenting of places where they are sold, is sufficient cause for dismissal.

"This rule is strictly enforced on all larger railroads, and has a most excellent effect on the men, and drunkenness is very rare among railroad men where it was very common 20 years ago.

"*Unjust discrimination and undue preference by railroads.*—This is not practiced to the extent that public opinion would lead one to believe. If one city or district is specially favored in any respect, it is but a short time until the railroads in other districts are compelled to grant same concessions in order to protect industries dependent upon them, as by protecting your patrons you sustain the life of the railroad.

"Stability of rates is more desirable than extremely low ones. Discriminations against any special locality can not exist for any very great length of time.

"The favoring of special shippers and special commodities of the Canadian roads has forced railroads in the United States to give equal concessions; and if these rates are not remunerative the loss must be made by excess charges in other commodities and on other shippers.

"If one city or district is specially favored, it is but a short time until railroads in other districts will be compelled, in order to maintain themselves, to offer shippers same or better rates than the specially favored district temporarily enjoys.

"While recognizing the importance of railway service as the greatest factor in industrial interests, I wish to call especial attention to waterways transportation, without which, in spite of railway facilities, the commercial traffic and general prosperity of our country would be dwarfed and crippled.

"The waterways of the Great Lakes furnish transportation for over 25,000,000 tons annually at a rate simply impossible in railway service. The greater part of this vast traffic is in the ores of the Superior region, and, at a cost of half a mill per ton per mile, has made possible the supremacy of the United States in iron and steel production.

"The navigable streams in the great Mississippi and Ohio valleys carry a burden of over 30,000,000 tons, which is distributed from the head waters of the Ohio to the Gulf of Mexico, thence to the world's markets.

"The nation is to be congratulated that our Government, appreciating the inestimable value of these great arteries of traffic, through which pass our commerce which is the lifeblood of the nation, is doing all that is necessary to preserve and improve these so that the best results may be attained.

"The scarcity and high price of fuel in the older countries is rapidly taking from them their supremacy in productive forces. With the cheapest, best, and most abundant supply of fuel, the center of industrial production will be changed to the United States. Not only so, but with our unlimited coal deposits and favorable transportation rates by rail to the Atlantic coast, and water to the Gulf, the world will pay tribute to the United States for its fuel supply in the future. The construction and ownership of an Isthmian canal will still further advance our facilities for export, and would prove the greatest boon to our commerce.

"I am compelled just here to digress slightly, in calling your attention to the imperative demand for reinstatement of the United States merchant-ship service, to carry our own productions into market. Unless the Government makes provision for this lack in transportation, pray let me inquire what use there would be for such canal without ships to traverse it? It would simply be a convenience to the ships of other countries, without any corresponding advantage to ours.

"There should be no rivalry between rail and water transportation. One is simply a powerful auxiliary to the other. In Europe, where improvement of waterways for transportation is carried on to an extent not dreamed of in this country, it has been found that where navigable waterways have been established new railroads have been found necessary and older and unprofitable ones paralleling these streams have been made prosperous.

"The London Chamber of Commerce, the best authority on industrial ethics, says in its Journal of March, editorially, that the enormous sums expended in France, Germany, Austria, and other countries on the Continent in construction of canals and other waterway improvements is from an enlightened commercial policy, giving the easiest and most economical transportation of products to markets, and unless Great Britain adopts similar measures she will lose her pre-eminence as a producing nation.

"Words coming from such a source are of the deepest importance, and this country should not be slow in giving them the most profound consideration.

"The great Kiel Ship Canal, connecting the waters of the North Sea with the Baltic, originally constructed by the German Empire solely for military requirements, has furnished a genuine surprise to its makers.

"Reports from Kiel for the first year of its operations, ending March, 1900, show that 26,951 vessels used the canal, all of which are merchant vessels, many being large, ocean-going ships, except 652 belonging to the German navy.

"In our own country, the first of a proposed line of steamships from the Great Lakes to Europe direct will leave Chicago for Hamburg via the Welland Canal and St. Lawrence River. Other steamers are scheduled to follow.

"The effect of carrying American products from the heart of our country to central Europe by continuous water transportation can only be surmised. It may result in a revolution in the carrying trade to markets in the Old World.

"The magnitude of interests involved in the transportation and industrial situation are worthy of careful investigation and the enactment of proper laws for their government and control.

"The Interstate Commerce Commission has been created with a view to restraining railways from any undue exercise of power or discrimination unfair to the general public. In my judgment this body should be sustained in its work by adequate legislation consistent with equity and proper railway management.

"Pooling agreements should be legalized as between trunk and competing lines; such agreements made public, and under control of the Interstate Commerce Commission. To refuse legal authority for such pooling is to continue the system without restraint or publicity, which is against public policy, and leaves a wide-open door to unfair discriminations.

"One of the most serious questions in the whole range of the subjects under investigation is the proper method of dealing with the great army of men employed by railway and industrial interests. In my judgment, most of the strikes could be avoided and differences settled by a friendly plan of arbitration and a recognition of labor associations. Our system of education is such that American workmen have sufficient intelligence to understand their rights and courage to maintain them.

"After all, it is a matter of punctillio to agree to meet individual workmen but reject their representatives. Wise laws of recent enactment in England and France providing for arbitration of labor difficulties have caused strikes to be almost a thing of the past, and might be adopted with good results in this country.

"Your commission has before it an exhaustive investigation of the conditions of transportation and industrial interests of our country, and if possible present plans by which equitable and harmonious relations shall be maintained between these great factors in the country's progress.

"Should these be successfully carried out your work would be of incalculable value, and, in my judgment, the great factors necessary to these ends will be found in conciliation, arbitration, and mutual forbearance."

Q. (By Mr. KENNEDY.) I want to ask you, Mr. Anderson, if there are any discriminations practiced by the transportation companies against Pittsburgh at the present time that you have to complain of?—A. The question is a very pungent one. I have given the matter a great deal of consideration, and I find that discriminations against Pittsburgh have largely disappeared. The time has gone by

when Pittsburg suffered greatly from railroad discrimination, and with the best information I can get from people who are most largely interested in the transportation interests of Pittsburg I can find no special causes of complaint. I imagined there were such causes until I made an investigation.

Q. You think that all the shippers are treated alike by the railroad companies as far as the roads are concerned?—A. If there is any discrimination against certain people or certain interests I have no knowledge of it, nor could I obtain any information indicating that state of affairs.

Q. As secretary of the Pittsburg Chamber of Commerce would you be likely to know of such practices if they existed?—A. Yes. I would like to state, in further answer to your question, that some three years ago the chamber of commerce, with the theory that there were discriminations against Pittsburg interests, attached a transportation board to the chamber of commerce and employed one of the most competent men they could get in connection with it. We maintained that bureau for 2 years, and at the end of the time divorced the bureau from the general business of the chamber of commerce for the simple reason that we could find nobody who had any complaints to make against the transportation interests. As far as I am concerned, as head of the chamber of commerce I took every pains to make that department of use to the people, and, if possible, find out if there was any discrimination. I found no system of discrimination against our people at all. Whether things go on that I could not discover is another matter. Our doors are wide open to all people transporting, and with the exception of 2 or 3 trivial complaints there was no discrimination, and they were corrected as soon as the railroad's attention was brought to them. I could not find any. Yet I told you here my own personal opinion had been that there was; but I had no authority for that belief except general impression.

Q. You do not know, then, that these discriminations did exist in the past?—A. Yes; I knew of my own knowledge they did exist in years gone by.

Q. You think now that there is a marked improvement?—A. A very marked improvement, and I have gone as far as a man can go in finding out from the other side their purposes and their actions in regard to this matter; and most reliable railway men I have talked to about the matter say that they are glad to be relieved of any apparent necessity of making discriminations. In the early days of railroading a railroad officer would have a brother, a cousin, or other relative in, say, the coal business, and would give him a special rate on coal to Philadelphia, and the man across the road would send his coal to Philadelphia and pay double the price for transportation. There seemed to be no way to remedy the evil; but under the present condition of affairs, and on account of the supervising power of the Interstate Commerce Commission, I am sure that discriminations have been almost entirely abandoned.

Q. Do you think the change is due more to the action on the part of the Interstate Commerce Commission than to the community of interest or a better working understanding between railroad managers?—A. I think it has come about largely by both these influences that you speak of. Public opinion, which clamors for recognition and correction of wrongs, has been a potent factor in mending matters, and now that the Interstate Commerce Commission has access to compel men to develop the condition of their business, I think it has had a great deal to do with lessening the discriminations practiced in this country.

Q. Has the great prosperity of the country, which gives the railroads all they want to do without discriminating and cutting, had anything to do with bringing about a better state of affairs in this respect?—A. I had not thought of that especially, but I would think it reasonable that it would have such a tendency. During the last 2 or 3 years, as you all know (and I speak more especially of Pennsylvania interests and of the Pittsburg part of it, knowing more about it), the railroads have had all they could do, and more. They have been overtaxed. Traffic has gone north and south of the Pennsylvania lines simply because they had not cars for transportation. All their roadbeds were lined with trains carrying the products of the State from one end to the other; and it would be entirely reasonable, it seems to me, that there would be no occasion for railways to practice any such discrimination as has been indulged in heretofore. The thing is to only get the railroad to carry your stuff. The question of discrimination does not cut any figure of late.

Q. You think, then, that good times have had a good deal to do with this change?—A. I certainly do. The railroads have been participants in the general prosperity of the country, and their reports show their income has been largely increased, their profits being correspondingly great, without any special increase in the rates of transportation.

Q. Would you fear, in the event of another era of business depression, that they might get back to this practice of discriminating to get trade, or do you believe

that by that time there will be such a consolidation of railroad interests that they will practically pool their business without any permission of the Interstate Commerce Commission or the laws of the country?—A. My general answer to that question would be that I believe most sincerely and heartily that legalized pooling, under proper restrictions and under the control of the Interstate Commerce Commission, will cause the discriminations, as a rule, to disappear throughout the United States. That is my judgment; I am very strongly of that opinion.

Q. Have you thought about the little need that there will be for legalized pooling and the lessened demand for it by railroad magnates at the present time as a result of railroad consolidations and community of interests?—A. The refusal of the General Government to legalize pooling will force the railroads into consolidation, in my judgment. Then you will have the condition of affairs that you hint at. If this system of pooling is recognized and under proper control, it will release the railroad companies from the necessity of such a consolidation, which I think will be a very bad thing for the general interests of this country.

Q. Don't you see it taking place?—A. But to still further answer your questions, I would call your attention to the fact that the railroad interest, as I said in my report, is the great industrial interest of this country. The money of capitalists is invested in railroads; the money of estates, widows, and orphans, and almost any man or woman who has a little surplus money or a great surplus of money is interested in railroad securities; and if it was thought advisable to refuse to allow railroads to make equitable rates, and to allow them such means of preventing the cut-throat rates as have prevailed at times, and railroads destroyed each other, as they ultimately would, it would bring a disaster on this country not comparable with anything that has ever taken place before. I look toward and dread the time that railroads might become bankrupt by restrictions of that kind, and disturb the interests of the country commercially, industrially, and financially, and it is the duty of this commission, as well as that of every thoughtful citizen, to see that the railways are properly protected. Great as they are, and rich as they are, public sentiment has a great deal to do with maintaining the railway system profitably or of letting it go to the dogs. You all are old enough to see the effects of railroad cutting. I am getting a carload of produce at half price; I rejoice that I only pay \$50 for this car of freight when I used to pay \$150. The managers of other railroads hear of it, and they bring a carload through their road for half of that again, and in addition come to my place and give me a chrono, or a free pass, or something of that sort. I don't know anything about it, excepting that those rates are ruinous, and that no railroad could maintain itself long under such a condition of affairs, and no thinking man or community of men wants the railways to be prostrated or lose money and become bankrupt. If they should we would all be in the same condition; but I look, as far as is possible from my point of view, to the fact that this nation of ours is so richly dowered with natural resources, mineral, agricultural, climatic, with everything that is conducive to wealth and prosperity, and to the fact that we have acquired just now such a position of vantage over the Old World producers, and I believe that we will all conclude that it becomes us all as much as possible to preserve this condition of affairs rather than to injure the railroads by putting a restriction that would act injuriously on every industrial or agricultural interest of the country. They must be preserved and cared for as an integral part of the prosperity of the country.

Q. You say if legalized pooling is not allowed, that these consolidations or community of interests which I have alluded to would be apt to be forced because of refusal. Do you believe that there is now such a consolidation of the railroads of the country, uniting three or four great systems, and that the community of interest and management between those great systems is so compact that the roads are virtually relieved of the necessity of asking for legalized pooling?—A. Perhaps that is measurably true, and I believe the great lines of transportation railways of the country have been driven to that resort as the only alternative between throat-cutting rates and saving themselves from loss. I think if Congress had legalized pooling 3 or 4 years ago, that such a thing as the great Pennsylvania system trying to control the Baltimore and Ohio, or of any great system controlling the other by acquiring a majority of its stock there would be no necessity for these things; and after that I never could see how anything but a destructive and wasteful competition between railroads will ensue unless they have themselves the privilege of pooling, or unless other courses necessary to their safety shall be provided. I think you have struck the hingering question to-day affecting the transportation interests of the country.

Q. In what way would you enlarge the powers of the Interstate Commerce Commission to have it more effective?—A. I would suggest, without a great deal of thought on the subject, that their powers could be properly enlarged by placing them in charge of pools to be carefully provided for by law, and that the decisions

of the Interstate Commerce Commission should bind the railways unless they are decided afterwards illegal by the courts. A man or a company must have his or its day in court. There is no infallibility among men that I know of, but I think it stands to reason that if there were, if laws were provided for pooling under the care, oversight, and direction of the Interstate Commerce Commission, that their decisions should stand, and they would prevent unjust discrimination. Such laws would make all railways more or less prosperous and relieve the railway companies from this dire necessity of controlling the stock of other roads in order to cut loose from dangerous competition. The waste of competition has been a great factor at times in the affairs of our country, and these vast combinations that have been formed within the last 2 or 3 years are the result of wasteful competition between institutions of the same kind, one on one side of the street and the other on the other. One city has a great industrial plant, and an adjoining city has another of the same kind: the competition is great, and the result is loss of property, loss of money, bankruptcy. This country for a hundred years has been subject to these vicissitudes in trade until we come to look for a general panic about once in 10 or 15 years, after which everybody will start up again. That seems to be the American idea. I think as years go by we gain wisdom by observation. We do not want to break up every 10 years to be disgraced before the world, but we want to preserve what we have. These combinations have been driven into the position they occupy, because I think the claim is an unreasonable one that the one general expense of 10 manufacturing plants is no greater than would be the expense for a single plant. In other words, they can reduce the cost of production and give the people of the world the benefit of the reduced cost and avoid this competition which I spoke of as being so dangerous to the interests of all.

Q. (By Mr. KENNEDY.) You make suggestions of legalized pooling, and yet you make admissions the other way, which suggests to me to ask you if you do not concede that this combination, or this consolidation and community of interest movement has gone so far forward as almost to make the question of legalized pooling an obsolete one?—A. It is drifting in that direction; just another view of the same question.

Q. (By Mr. PHILLIPS.) In the event of general consolidation, how would you suggest that unreasonable freight rates could be prevented by the public? What course would you advise, or legislation would you suggest, to prevent the roads from charging unreasonable rates?—A. If they effect such consolidations as have been hinted at I know of no way to correct; it might be such an imposition upon the people of the country that the Government would be compelled to take possession of the railroads; the public would be driven to that last extremity.

Q. You spoke of the difference between water transportation and land transportation: could you give the commission the cost of transportation, say, to New Orleans by the river, and the cost by rail to New York, and the difference in distance?—A. The question opens up a very interesting branch of this investigation, and in my report I referred tentatively to it, so that you might think it over later on. Coal is carried from Pittsburg to New Orleans by water, 2,000 miles, in round numbers, at an operating cost of less than half a mill a ton a mile, if I am right in my calculations—a dollar a ton from Pittsburg to New Orleans. That is probably the cheapest transportation in the world—a half a mill a ton a mile. Coal has been carried by contract in late years at 50 or 60 cents a ton, and the empties brought back by the boats carrying these fleets of coal, so that if you count a mill a ton a mile you are giving the transportation interests a large and reasonable profit.

I think that no railway transportation can be profitably carried on at much less than half a cent a ton a mile. I think that is about the minimum the railroads can carry freight at a profit, judging from all the information I have. That rate would make the cost at the minimum rate to New York, which is 450 miles, \$2.25 a ton. Hence it requires no argument to prove that if the United States Government keeps these waterways open, by such improvements as are common to navigable waterways of the whole world, that this country can maintain its supremacy over all other peoples of the world in the matter of supplying cheap transportation, and particularly of coal. Coal is becoming the great staple of the world. You can't manufacture anything without coal. Fuel is of more importance than ore or anything else. If there is no fuel you can not make anything out of the other elements. Until within the last few years there was a good supply of fuel in Europe, but thoughtful people say that the supply is diminishing yearly in the ratio of the increased productions of Europe. The natural result has been a coal famine in Europe, and they have not seen the end of it. Coal within a year has sold at the mines in England, and the supply is short of the demand, at as high as \$8 a ton.

A firm in the coal business that I know very well has sent several cargoes of coal to London within the last year, and the price of transportation by the ocean is comparatively high at this time for the lack of bottoms. This firm sent two cargoes of coal to London. They sent special agents with the cargoes to look after the handling of the coal and see that nothing went amiss with the cargoes, port rates and all these things being new to our people. The firm gave away many, many tons of their coal—delivered it to people in London who were anxious to see what American coal was like—to see whether it was good for fuel at all. The two cargoes were therefore sold under these conditions, and with expenses of extraordinary character, and when the money came back from the sale the firm found they had netted 25 cents a ton more for that coal than the highest price received in this country during the year would have brought. Since that time a good many cargoes have gone to London, and cargoes are going to continental Europe. In southern Europe, in Italy and Spain, but particularly in Italy and on the Mediterranean coast, hundreds of manufacturing concerns have closed their doors to go out of business for want of fuel. The United States minister to Italy within a few months has written home his impressions to the United States Government, and they were sent out to the public generally. He states that 112 manufacturing concerns, to his knowledge, had gone out of business with abundance of orders on hand; that what little coal that could be bought in the neighborhood was \$9 a ton, while coke was \$12 a ton.

The serious part of this whole question is right here, not that the man who has coal and coke to sell can make so much money by sending to Europe, but it looks very much as though the producing centers of the world were going to be shifted to the United States. Then, if the question of transportation, which is a most important one, is wisely handled, if we are given laws that will improve our waterways so that we may have equal chances with railroads without discrimination, without excessive charges, our producing interests will be brought to a point that is hardly dreamed of by any of us. No man can tell where the destiny of this country will lead us. History tells us there was a fight in this country for about one hundred years to make our expenses, our expenditures, in Europe pretty nearly equal to our exports; in other words, have as small a deficiency as possible, and we fought against that difficulty for about a hundred years. We were, as a nation, like a man spending more than his income every year, and after having maintained an existence all this length of time, with the balance of trade against us constantly, until overwhelmingly in debt to Europe, with the usual panics, repudiation, etc.; now we find that under the present condition of affairs we are gainers about \$600,000,000 in gold a year. Foreign nations are paying tribute of \$600,000,000 to this country annually, and the amount can be increased to double that amount by wise policy in the producing interests and the same in the transportation interests of this country. It is a question of transportation, in my judgment, even more than of production.

Q. (By Mr. PHILLIPS.) Can you give the commission the cost of shipping from Pittsburg by way of New Orleans to Europe, and the cost of shipping from Pittsburg by way of New York to Europe?—A. Rates of freight from Pittsburg to Europe, via New York and New Orleans, are subject to great fluctuations. Ocean rates are governed entirely by the amount of freight offering. The smaller the volume of tonnage the lower the rate; and as the grain business is so large in volume the ocean rates are always higher during the season of the year when grain is moving in large quantities, and vice versa.

Shipments of grain at present are very light, and, consequently, rates very low on everything. For instance, the present rate on grain from New York to Liverpool is about 14d. per bushel, or about \$1 per ton; while last fall the rate was as high as 6d. per bushel, equal to about \$4 per ton; and rates on iron and steel in proportion.

The rate, Pittsburg to New York, on steel rails, which has been one of the largest items of export, is \$2.80 per gross ton, so that at present rails could be shipped from here to Liverpool at about \$1.25 per gross ton.

Shipments from Pittsburg to Europe, via New Orleans, are not of usual occurrence. If river navigation were more certain, so that contracts for cargoes could be made in advance, doubtless these could be made advantageously, especially during the period of heavy shipments of cotton, when dead-weight cargo is desirable at ballast rates.

I only know this, that when you get goods to tide water the transportation then is infinitesimally small as compared with transportation by land. I think it is estimated that the operating cost of ocean carrying vessels is a tenth of a mill a ton per mile; not the price that a man will build a ship and carry goods for, but it costs the shipowner that amount in wages and general expense of working the vessel.

Q. (By Senator KYLE.) Do you think the ocean carrying conditions will be improved by the reestablishment of the American merchant marine?—A. This follows as a corollary. I am strongly in favor of the Government acquiring ownership and assuming operation of the Isthmian canal. I think it is necessary for the future of this country, but it does smack a little of absurdity that we should spend \$300,000,000 to construct a canal and not have any ships to go through it. Every year, on account of the increased cost of transportation and the lack of increase in means of transportation, the shipmasters have raised the rates, and we are paying an enormous tribute to foreign ships. It is not, therefore, a great thing to ask the United States Government for a few millions of dollars to do as other nations do and have been doing, and by which means they have established their merchant marine by subsidies.

Q. You justify subsidies, do you?—A. I do. If anybody can show how the reestablishment of the merchant marine can be accomplished by subsidies I would adopt them.

Q. (By Mr. FARQUHAR.) Would the subsidizing of the American merchant marine induce the carrying of freight any cheaper than the lines do at present?—A. I could not tell you, but I could go a little further and anticipate part of your question by saying that we can't find bottoms to carry the stuff we have now even at the present prices.

Q. Isn't it the general rule that all commerce will take the line of the least obstacles and the cheapest?—A. Yes.

Q. Have you any plan to propose to this commission to reestablish the American merchant marine, maintain seamen's wages, and secure interest on money to Americans who want to make investments, even if the ships are subsidized?—A. Subsidies meet all deficits of increased wages and increased cost of American transportation. That is what the subsidy is for: paying it right out of the Treasury. Then we control our own transportation in a measure, and we must do that. Other countries have done it, and it seems to me it is inevitably true that we must do it if we want to reestablish our merchant marine. In this great, rich country of ours it seems to me a shame that we have not got it. And let me state another thing right in this connection. A vast market for American products is on this American continent, right at our very doors—Mexico. The Latin-American countries are all anxious to buy goods from the United States and transfer their business from the older countries of Europe to the United States. They sent their commissioners to this country, and they impressed that fact upon us by every possible means. Their mercantile agents come here and tell us: "We want to transfer our markets to the United States, but, gentlemen, you must deliver the goods. The Germans deliver them, the English deliver them, the French, the Spanish, the Italians deliver to us all our goods. We have no merchant marine that we can buy your goods and deliver them in." They are clamoring for trade with the United States, and we can not supply them because we can not deliver the goods.

Q. (By Senator KYLE.) How long should the subsidy continue, in your judgment?—A. I have not thought of that. We might take observation from the older countries and see how long they have had to pay it, also whether the lines could at last become self-supporting. It eventually leads to free trade. I am a believer in protection a priori, but when we can sell nails, structural iron, and everything made of iron and steel abroad, the necessity for the tariff disappears.

Q. The infant has grown?—A. It can take care of itself. Now, when this baby marine launches out it has got to be taught to transport itself. Somebody has got to provide the means for holding this infant industry up. But in the course of time, when it is found our ships can sail as fast as those of Europe and we can manage as cheaply as others, then let the subsidy cease. But I do not know when that will be or how long it will be.

Q. (By Mr. PHILLIPS.) Is it not a fact that our shipyards are all busy and overworked to-day, and that such men as Hill are entering upon the business? Have we not now men exploiting the land? Are we not turning to exploit the ocean without the subsidy, and are not our shipyards turning out work as rapidly as possible?—A. I think not.

Q. Then how do you account for Norway and Sweden making more rapid progress in shipping without subsidy than other countries with it?—A. Because they were maritime nations from the beginning; they were such 2,000 years ago. They sailed ships when no other country could sail them. They sent their armies down and overran other countries. Their people are sailors. We are thinkers in this country. Even our men that work with their hands are being educated, and they are thinkers. These fellows were simply sailors and buffeted the storms. They had powerful physiques and overcame everything that came in their way. We have men who must receive more attention than those savages did. We can

not ask men to work for 10 cents a day and expose themselves to the storms of the ocean, as these Scandinavians of the North did. They were born sailors; their country was poor, and they did not know that iron in Norway and Sweden was worth anything. They did not know it was under the ground; if they did, they did not know how to use it. But in our country we look at things without the lapse of a thousand or two years. We have to pay more for labor, and when we put ships on the ocean we have to pay men more wages.

Q. Do you think it would be proper and right to grant a very large subsidy without regulating the cost of transportation or the Government having anything to do with fixing freight rates? Or would you have the Interstate Commerce Commission consulted in regard to the rates, if the Government gives a large sum?—A. I would suggest as a solution of that query that the Congress of the United States create a new department, called the "department of commerce and industry," and that the business of subsidies should be entirely in the hands of that department. I think that is a necessity of the Government that can't be in any way overlooked. They send seeds around the country from the Department of Agriculture, and the Secretary of the Department of Agriculture and the Secretary of the Interior Department give attention to many matters, but these questions you have under advisement here overshadow them all a thousand times, and they have no representative in the Cabinet of the United States. It is high time they woke up to that fact. Wide-awake people that we are, we must wake up to the fact that there are still some things that we do not have in this country, and one special lack is that of a department to be known as the "department of commerce and industries."

Q. (By Mr. PHILLIPS.) Still you would not make that more important than the Agricultural Department?—A. Of course, the Agricultural Department is established already.

Q. (By Mr. KENNEDY.) You said in your prepared paper that there should be no rivalry between rail and water transportation. Would not that eliminate competition between the two methods of transportation and remove the influence of the waterways upon lower rates of transportation?—A. There is such a thing as legitimate competition that we must take cognizance of. The rivers are placed here by the Creator, and no doubt intended for transportation and the development of civilization. They are the great balance wheel compelling equity from railroad companies against extravagant charges. I might go further and say that the railways have no right to complain of the cheapness of water transportation. The heavier and the cheaper products are transported at a rate that justifies their being carried from one part of the country to the other, just as the ore from Lake Superior is carried a thousand miles—into Pittsburg—and turned into steel, because of the cheapness of transportation. The railroads at the lowest paying rate that can be imagined can not bring ore to Pittsburg and enable us to compete with any other country in the world; and therefore the iron ores of Lake Superior would be worthless to us, and the railroads should not complain. But the very moment that there are a thousand vessels carrying ore from Duluth and the ports of Lake Superior to the ports on Lake Michigan and Lake Erie, that moment the demand for railroads for the class of goods that can not be carried by the slow way of water transportation arises, and railways will spring up and they will find a profitable business in the transportation of those articles, to say nothing of the transportation of passengers who will not go by the slow boats. I want to say that from absolute knowledge. You take France and Germany especially, and they have improved every little creek and natural stream of water that could be improved by any possibility, and made it into a canal or a navigable stream. They have pushed the improvements by dams and dredges and locks, and all that, hundreds of miles into their mountains, and men working in the forests a long way up from their distributing centers, where they have the means of working in wood, iron, and other things, sending the products of their farms down. They find that they get cheap transportation, and they develop their country to a very great extent. In a short time those streams have been paralleled on both sides by profitable railways all through France and Germany. Anyone of you who have traveled in those countries can see it for himself. There never were any railways there before. There is an improvement there which anybody would not—

Q. (By Senator KYLE.) (Interrupting.) Has there been a decrease in the tonnage since?—A. I do not know. I thought it incredible when I read an article I find in the Chamber of Commerce Journal. A leading editorial in that paper gives notice to Great Britain that she must improve her waterways; that the British must construct new canals; that they must give their people cheap waterway transportation, or their prestige is gone as a manufacturing country. We all know that the

London Chamber of Commerce is the central authority in all commercial and transportation matters for the British Empire, and so much importance is attached to the expression of the London Chamber of Commerce that the president of that body is by courtesy, I think—I do not think it is by law—by courtesy, is entitled to a seat in the cabinet, because he is supposed to represent the sentiment of the commercial world through the London Chamber of Commerce. No act that is passed by Parliament affecting the commerce or the industries of Great Britain is enacted without being submitted to the London Chamber of Commerce first of all. They are of all nations of the world a commercial nation, and we must not be the last to learn from the experience of a people who have led for a thousand years, as has Great Britain. This is a most humiliating statement for them to make.

Q. (By Mr. KENNEDY.) Have the water rates had an influence on the rail rates?—A. Most unquestionably; and a wholesome one.

Q. Then you will qualify your statement that there should be no rivalry between them?—A. I do not see why, from the fact that railways are jealous of water transportation. They would interfere with the improvement of the Ohio and Mississippi rivers if they could, and yet they know as well as, or better than, anybody else that the improvement of these waterways and the development of traffic on the lines of the waterways has made the railways pay.

Q. There is competition between them, is there not—naturally, rivalry?—A. There is, but I said there should not be.

Q. (By Senator KYLE.) You mean hostility? Healthy rivalry is a different thing.—A. Healthy rivalry is a different thing. Let me illustrate. When I was a lad there was no commerce on the Monongahela River at the country river towns. A few boats, little rafts, and logs would go up and down once in a great while, and that was all. Pittsburg was a little town of no account outside of its own local interest. General Moorhead got a concession from the General Government and the State of Pennsylvania to put a system of locks and dams in the Monongahela River as far as Brownsville. People all thought he was crazy, and that the enterprise would break him up before he got through with it. But he got a considerable improvement on the Monongahela, and soon after the river was made navigable this wonderful Youghiogheny coal was discovered. That coal came out in small quantities and gradually increased the traffic on the river until it amounted to millions of dollars. Now the Pennsylvania Railroad Company has that river paralleled with railroads on both sides and they are paying routes. On the Ohio River, where the General Government has been making improvements by the movable dam system, the different railroads, the Baltimore and Ohio, the Wheeling and Kentucky, the Pennsylvania system, and the Vanderbilt system are paralleling the Ohio River. They have paralleled the river up to Mr. Phillips' town. And that is supposed to be one of the favorite water routes for bringing the lakes and the Ohio River into connection by waterway transportation.

Q. (By Senator KYLE.) And yet the water tonnage on all those rivers has increased year by year, I believe?—A. It has increased year by year. The increase is not a regular increase, for the reason that the vicissitudes of low and high water sometimes interfere with the year's traffic, but in the general average you will find that the increase of traffic on the western rivers is in an enormous ratio. As I said in my paper, the traffic handled in the Mississippi Valley on the rivers is 30,000,000 tons—an amount which we can scarcely grasp—and that could be increased to double the amount if the Ohio River, which furnishes most of the freight, were improved. The Ohio River furnishes more than the Mississippi and all its other tributaries. We give the Mississippi Valley 17,000,000 tons a year against 13,000,000 or 14,000,000 tons originating on the Mississippi system itself outside of the Ohio; and if you will come to Pittsburg, I will show you there 6 months or 5 months or 4 months of the year a million tons of coal in the pool waiting shipment on the rise of the river below, a million tons of freight. The one initial dam, movable dam, made by Colonel Merrill, of the United States Army, known as the Davis Island dam, is a thing well worth a visit by anyone who has not seen it. That has given Pittsburg a harbor from 10 to 12 miles long and as deep as you want it all the year round, and when the rivers are in a natural condition of activity and fit for boating, as they are now, there is no dam in the river at all—free open navigation, and the boats come and go. But when the rivers begin to fall it is necessary to store the water. Then the movable dam appears in the river, and in 24 hours there is a lake storing water 10 or 12 miles around Pittsburg up the Monongahela to Dam No. 1, and the same up the Allegheny, and in that harbor you will find a million tons of stuff awaiting shipment to New Orleans. The Government is pushing that plan of river improvement, and there are perhaps 10 or 12 or 14 of those dams now under way.

Q. (By Mr. PHILLIPS.) How do the boats pass through that dam? Does it not

obstruct navigation?—A. They avoid that by means of a lock. The lock is the largest lock in the world, not excepting the Suez Canal lock, and will take four Ohio River steamboats through at one time and a whole fleet of coal. It is 612 feet long and 115 feet wide. One of the wonders of the world is that Davis Island dam and lock, and that system is being pushed as rapidly as possible until there will be continuous navigation on the Ohio River from one year's end to another. There are some 12 dams under contract now, and some nearly completed, and when these dams are completed, as they will be in some years, you will find that the navigable period of time will be increased on the Ohio River about 2 to 3 months and there will be a corresponding increase in tonnage.

Q. (By Mr. KENNEDY.) Are the people of Pittsburg making any contention with the railroad people about the discrimination that is practiced against Pittsburg in favor of Buffalo?—A. Yes, there is complaint. There is discrimination in theory, and it is the only act of discrimination that I have any knowledge of whatever.

Q. Will you please describe it?—A. As well as I can. It is due to the Trans-continental Traffic Association—I do not know what you call it, but it is the association that controls the traffic of the East and West. They fix their terminals. Pittsburg is an eastern terminal, and so is Buffalo. Those are the termini of the system. Pittsburg is 70 miles nearer Chicago than Buffalo, and we are charged the same rate to Pittsburg that is charged from Chicago or Milwaukee or Buffalo, and they have 70 miles in their favor. Now, the thing does not stop there; it would not hurt to pay as much as Buffalo if it did. Buffalo is near the center of a large market, and she then is enabled to deliver her goods in the centers adjacent to Buffalo at a much lower rate than we can get to those centers, because we have 70 miles additional to traverse to reach her territory; to reach her limit as it were. We are 70 miles behind her in eastern shipments, in that we have to pay for the extra 70 miles going east, and Buffalo pays nothing for it going west, and that is a general source of complaint. Our merchants have time and again called attention to it, and the Chamber of Commerce took the matter up and visited the railroad companies and labored with them and said, "Why do you not give Pittsburg credit for this 70 miles?" They make a plausible answer and say, "Why, this thing affects a dozen different railways. The Pennsylvania Railroad can not correct it, because it is the only one which comes here. They have this 15 per cent. You will have to regulate the whole system. In the course of time you will perhaps get the redress that you want, but you can not get it now because you are one of the terminals." Then, again, you see a man can ship to the Buffalo terminus at a certain rate and then get down to New York much more cheaply than we can from Pittsburg to New York, and we do not like that. Then, they say New York is a competing point. And so is Buffalo a competing point. The river is there, and the Welland Canal comes in there, and laymen like myself can not answer those things. I can not, I am sure. If we were all in business and we were shipping to a competing point, we would have to compete with everything that was at that point to obtain the trade. If we had the trade in a point that was not competing we would charge what rate we pleased, and we would charge a good round rate. And that is the point of contention with the Pittsburg men, that we do not get shipments from the west on the same equitable terms that Buffalo does.

Q. (By Mr. KENNEDY.) That makes more competition between Buffalo and those points west of Buffalo?—A. Yes; they throw that in; that they can move stuff from Buffalo to Europe without breaking bulk.

Since writing the above, I learn that the differential in favor of Buffalo as against Pittsburg has been removed, and the two cities in question pay the same ratable charges on through freight.

Q. (By Mr. PHILLIPS.) Do you know how large the ships are that can get through the canal?—A. I think a vessel drawing more than 14 feet of water can not get through the Welland Canal. The Canadian government has asked the United States again and again to join in deepening the Welland Canal, giving us all the concessions we want, or to unite with us in constructing an entirely new water route. Or they say they will come over on the United States side and pay half the cost of constructing a United States waterway altogether on United States ground. The British people appreciate the value of getting to tide water without breaking bulk on the lake tributaries.

Q. (By Mr. KENNEDY.) Have the merchants of Pittsburg made any complaint about recent increases of rates by changing goods from one classification to another?—A. No. I could em- race in the answer to this something I said a little while ago—that the substitution I am connected with tried the experiment for 2 or 3 years of proving to our own people that there were wrongs in the way of discrimination which should be righted, and we made a complete failure of it. So

if there are instances of discrimination they are kept carefully from the public to the extent of furnishing any reliable information on the subject. I was, I confess, very much disappointed. I believed that there was a large amount of discrimination against Pittsburg, from public opinion and general clamor, and I thought that the chamber of commerce was the intermediary by which those wrongs could be righted.

Q. I am not speaking particularly about discriminations. I am speaking about raising the freight rates indirectly by changing goods from a lower to a higher classification.—A. I do not know of any general complaint.

Q. Has that come up in a recent period?—A. I think not. I only know, as I think I should have told you, that I am not an expert in railway transportation. I only deal with such facts as I can compass; but from the best knowledge that I am able to get the railroad companies themselves—the great trunk lines—have been engaged for years in an endeavor to simplify the classifications—to make them more uniform throughout the whole country—that they are at work at it and have been for years, and they have reduced the number of classes very largely already. I believe this is their claim, that if they are left alone they will, in the course of time—say within a year—secure as nearly as possible an acceptable and suitable classification of freights for the whole country. They think that is a matter which they alone are able to handle successfully.

Q. I should like to ask you whether, in your opinion, labor organizations on the whole have been beneficial to the industries at Pittsburg. Of course, that includes all those engaged in those industries.—A. I would not say they have. Up to within the period of a few years I think that most of the labor organizations in Pennsylvania worked mischievously to the men who were members of the organizations; but now, within the last half dozen years, I am undergoing a change of mind on that subject. I meet the officers and representatives of such bodies, and they are men as intelligent as the general run of men sitting around this table. I was going to say—which is saying a great deal. They are not unreasonable. I have myself been nearly all my life employing men and opposed to labor organizations, as I say; but now I am less opposed than I was.

Q. (By Mr. PHILLIPS.) Opposed to organized labor?—A. That is what I mean; and I have never yet seen it fail in a single case where organized labor has asserted itself, that, with a meeting of both parties, it has not been settled; and now I believe that the men who are controlling are entitled to more consideration than they ever were before, and if properly handled under proper regulations. I think they can be made more useful in preventing strikes and labor troubles which are constantly threatening this country. From my own standpoint, generally, I do not see the difference between meeting three or four intelligent mechanics who are representatives and conferring with them about the difficulties in the trade with the employer and consulting with the men who are in workshops; and that has been mainly the point of difference. The employers will say, "If a man is overworked and underpaid let him come into this office and we are here to hear him; but if he and his colleagues think that they are not getting justice, and they send the secretary of their union and the representatives of the union, we will not hear those 3 men." Now, from the standpoint of simple justice and equity, why are they not justly entitled—if there are 5,000 men working in a big works, they can not all come in in a body—to send their representatives to this manufacturing concern, who represent themselves by delegations and not by the stockholders in a body? And I assure you that the character of the men is such that you can very well afford to confer with them. I see pictures in the paper there [indicating] of two or three gentlemen who are officers of the trades unions about Pittsburg in this sheet-steel trouble, showing how the employers had to receive them. They made an amicable adjustment of the whole difficulty. The labor leaders showed themselves just as intelligent as the men who control the Carnegie works in their own line of business: and by and by, I think, when they come to have the right of representation, if you choose to call it so, and a right to organize for all lawful and proper purposes, you will get a better understanding of those men, and there will be fewer strikes and less difficulty in the labor situation than there was under the old condition of affairs.

Q. In view of the great growth of corporations, which are said to be soulless, and of the elimination of many individual employers, do you see the necessity, as a measure of self-defense, for the men to organize for self-preservation?—A. I think it is a good thing for them. I do not know how they could have their difficulties or their questions of right or wrong settled in any other way than by organization. In the old times a man would have a blacksmith shop and he would work himself and have two or three helpers. Then they did not need any organization; they did not need any representatives. He was among the men and he knew what was wrong and so did they. Now, the men who control the great industries of

the country do not know their men; would not know them if they should see them. If a man should go into the office of the employer and say "I have been abused and cheated out of my wages," the employer could not settle the trouble. He does not know anything about the man or his work, or his rights or his wrongs. But if the men are represented by intelligent men and the managers and foremen that know the conditions of affairs are, they stand a better chance of settling those things than by going in singly and making a plea themselves.

Q. (By Mr. KENNEDY.) Do you believe if a representative, who is not subject to discharge, is sent to the concern there is less danger of wreaking vengeance?—A. Yes, that is one element in this question; it is a very important one.

Q. (By Mr. PHILLIPS.) Do you think that this great consolidation of corporate wealth has or has not a tendency to make both a labor class and a capitalistic class? Is there going to be hereafter the same chance for a laboring man to advance, become a capitalist, that there has been heretofore?—A. That question is a little deep. I do not know any good reason why an intelligent mechanic could not be promoted to be a manager and finally a stockholder and maybe president of a great industrial association. I do not see any reason why he should not if he has the brains and the intellect to raise himself above the army of his fellow-men.

Q. (By Senator KYLE.) How about some of the managers of the Carnegie works and the president of the Pennsylvania Railroad and some of those men?—A. The managers of the Carnegie works are all men that have been taken from the ranks, and the consolidation has chosen those men to conduct those vast business interests.

Q. Is that true of Mr. Schwab?—A. Yes: Mr. Schwab was a working man in the yards of Mr. Carnegie's works when he began, and he is the president of the billion-dollar association. And Mr. Corry was taken from the ranks.

Q. (By Mr. KENNEDY.) And Mr. Carnegie was?—A. Mr. Carnegie delivered messages from the telegraph company to my father's tanyard down there—a little bullet-headed boy—and I can scarcely imagine that he should control the industrial world, nearly, but he does.

Q. (By Mr. PHILLIPS.) Did not these men all start when the industry was small? And is it not true that they could not have done so if the industry had been quite large?—A. The Carnegie institution—the Edgar Thomson Works—was a big institution when Mr. Carnegie took hold of it. They could not make good steel, nor good steel rails. By and by they got an intelligent workman there. His name was Jones. Mr. Jones showed the Carnegie people how to make good steel and good steel rails. He was a workingman, taken out of the Cambria Iron Works, and he met a very shocking death in one of those great retorts. One of them burst, and he ran in to help the men, and they were all burned together. But he was a workingman, as I told you, taken from the furnaces at the Cambria Iron Company. Other men came along. There were men in there who were capitalists who were all turned out of their jobs—all capitalists. Mr. Carnegie turned them all out, and put these workmen in one at a time, until there is scarcely a man who is at the head of the Carnegie concern, unless in some clerical department, that did not start in the yards of the Carnegie Company. Mr. Schwab is a conspicuous example, as is his brother, and Mr. Corry is another. They are all young men, and have worked at the furnaces and at the rolling. And I can see no good reason why, in view of all these great consolidations, that men having the skill and brains should not be promoted just as they were. The question of these consolidations is attracting the attention of thoughtful men all over the world. We do not know what the future of this thing is to be. I do not know how we can forecast it successfully, and it is of such magnitude that we are trying the best we can to look out for the future. In the first instance, many people say we are all going to destruction in this country because individual effort will be crushed out and nothing but the monopoly will be left. But, in point of fact, since these consolidations began (some half a dozen years ago the first of them was undertaken in the great industrials of this country) we have begun to control the markets of the world. We can make things more cheaply, and it seems we are making better things than we did before. The query, then, is, if we abolish these consolidations and put the concerns all back into their original condition, whether we would not be working a serious injury to the general welfare of this country. These are questions that are too great for me, but they ought to be considered. The rapid progress we are making in supplying the world is of such a character that we must be careful and conservative when we disturb the elements of trade that have done so much for us.

Q. The champions of industrial combinations are now saying that one of the very fruitful causes of financial panics or crises in the past has been overproduction, and if that could be done away with there would be less danger of the financial troubles; and they say that these great consolidations that are taking place enable those in control of a certain line of industry to keep the production

equal to the current demand, and in that way prevent overproduction; and that when all lines are so controlled that will be the means of preventing panics and crises. Do you take that view of it?—A. Scarcely. It has this bearing: The world is getting larger. It needs and uses more material. The world is richer and it has more money to pay for what it wants. Our own country has grown from a handful of people in 1776 to nearly 80,000,000 people now, and we are ourselves consuming enormously. The world is expanding rapidly, and the wants of the people are expanding in proportion. So I do not see really any very great danger from overproduction at the present time. But if there were, and these combinations have the power to curtail production, to that extent they have the power to avoid panics.

Q. (By Mr. PHILLIPS.) Would they also keep up prices in doing so?—A. I suppose they would. But there is a feature of these combinations that has never been broached here. As yet I have not said anything about it. But I want to say that I can see nothing illegal and nothing especially harmful in combinations per se. I can see nothing but good that will come out of a condition of affairs where we get out of the excessive competition and cutthroat prices to a condition of healthy business. But when we consolidate interests worth a million dollars and capitalize them at \$10,000,000 or \$20,000,000 and people buy those securities and all that kind of thing, that bodes ill for the future of this country. You can not pay interest on water. You may temporarily; but the world is wide, and even the great consolidations of this country may find themselves hustled by smaller and more active industries before they are through with it. The serious question before us is the watering of stocks to an unlimited extent, and the fact that people are foolish enough to invest in them. The very people who denounce these combinations are the people who invest their money in these stocks.

Q. Do they not also extort money from the people to pay dividends on these stocks?—A. Oh, that is all right if you hold them and I hold them. But it is on the widows and orphans that it is all unloaded by these fellows. They do not care whether there are any dividends on the water; and those are the men who are unloading the stock of those concerns. I may be talking to some of my friends here who are in it. [Laughter.] I am afraid of that feature of consolidation; and yet if people want the securities and like them, who is there to deny their right to go ahead and buy anything they choose, whether it is water or solidly based stock?

Q. (By Senator KYLE.) You can not furnish people with common sense?—A. I do not think you can. But I believe, on the whole, the influence of these consolidations has been so far for the increase and the betterment of the traffic of this country.

Q. (By Professor JENKS.) Can you tell us anything with reference to the freight rates out of Pittsburg on tin plate?—A. No; I do not know a thing about the rate on tin plate.

Q. Do you know whether it has been customary for any of the steel manufacturers or the plate manufacturers there in Pittsburg to pay freight themselves in advance and enter their goods "freight paid"?—A. Oh, yes; that is a common occurrence.

Q. You think that is the usual custom then?—A. I know it is very largely the custom; I do not know whether it is altogether the case, but I know of my own knowledge that it is quite customary, and that it is considered good business for people to pay the freight and deliver their goods.

Q. Do you know whether under those circumstances the charges that they make that are called freight charges are the actual charges they pay to the railroads, or whether they make that a nominal charge?—A. Presumably the actual charge.

Q. Have you heard of freight rates being charged to customers in Pittsburg itself?—A. For Pittsburg productions?

Q. Yes. For example, if a person were to buy, we will say, a ton of tin plate in Pittsburg, as to whether, in addition to the regular price, there would be a freight charge added, although it was to be delivered in Pittsburg?—A. I never heard of such a thing. I do not think anybody has had the "gall" to try and charge a freight rate in addition to the price fixed on tin plate unless he was buying tin plate for foreign delivery.

Q. The statement has been made at different times in the case of goods shipped out of Pittsburg with freight prepaid that the freight charges were fixed at the will of the manufacturers, and were not strictly the same as those that were paid to the railroads; and it has even been asserted that a freight charge was made at times for goods made and delivered at Pittsburg itself?—A. Can you think of any particular concern that has done that? I would like to investigate it. Can you think of any?

Q. You might look up the matter as fully as you can with reference to tin plate.

I want to ask one question more, if you please: You said something with reference to this consolidation of railroads through the buying of stocks by one railroad of another, and of the large monopolies. You stated somewhat further that you could see no remedy for the evil except the ownership and management of railroads by the Government.—A. It seems to me that is the last resort.

Q. Do you understand at the present time that the Government would have the right to fix rates of freight on a railroad if it wished to?—A. Only under the general necessity—you might call it the war necessity, if you like—that would compel the Government to take radical action in assuming the control of the railroad.

Q. That is a different matter. The question is as to whether you understand there would be anything unconstitutional in a law, for example, that should empower the Interstate Commerce Commission to decide whether a rate was reasonable or not, and in that way practically to fix a reasonable rate?—A. That is, whether the Government has a right to prescribe the rate?

Q. Yes. Instead of buying or owning the roads itself, and managing them, might it not reach the same result by simply empowering a certain body to fix reasonable rates?—A. I believe it has a constitutional right.

Q. Yes. Do you think that would answer the purpose as well as buying the road?—A. I do not know but it would. They have the right to own the capitalization. The organization of the railroad company by the General Government gives it what is called the right of eminent domain, whatever that may mean. It is a public incorporation, and it is incorporated for the benefit of the public; and the General Government and the government of the States, if I understand this thing—whenever these institutions cease to be a public benefit, or whenever they are inflicting a wrong on the public, the power of the Government will pull those things up by the roots. I do not care whether it is a railroad or steamboat or Carnegie's works or what it is. If the Government can destroy a corporation, it can make necessary laws to regulate it. But the Government has the right, and it is preserved in all the constitutions of the States, that whenever a corporation ceases to perform its acts and functions for the good of the country and the purpose for which it was organized, the Government reserves the right to wind that corporation up, disband its organization, and pay the stockholders their money. So, if they have the right to do that, the smaller is embraced in the larger. To adjust that matter the Interstate Commerce Commission might be the proper medium, as between the people and the General Government, for bettering just such conditions of rates.

Q. (By Mr. PHILLIPS.) How would you regulate these great combines? What legislation would you suggest to meet these new conditions in the interest, not only of the industries, but of the people?—A. The only thing that presents itself to my mind, after a great deal of consideration, is this: That the States should amend their general laws or their constitutions, as the case may be, so as to refuse to incorporate any institution on any other than an actual cash basis. I think that is the main thing. I do not see why a lot of men should come together and put up a thousand dollars in cash and capitalize a corporation for a million dollars or anything over that—and of course that allows for good will. If they are running or selling a business that has a good will worth \$10,000, and it is ascertainable, put it down at so much money; put down every property interest; put down every interest at its own full value. Whenever you get beyond that, the Government of the United States should absolutely refuse to incorporate any industrial or transportation company. That, perhaps, would check this condition of affairs.

Q. Ought the combines to be prohibited, when they have control of the home market, from selling, when there is opposition, at ruinous rates and recouping off people abroad? If an independent concern sells goods in one of those markets the other great concern simply sells at cost and below, yet maintaining its price every place else. Is that fair? Should not the people be protected against that?—A. You are picturing an ideal state of affairs. The millennium is not here yet. I am not sure but that it would be good policy if you and I had a flour mill and we had a market for all the flour we could make except a thousand barrels every year and were getting a good price for all the balance—I am not sure, I say, that it would not be good policy for us to ship at the end of the year this thousand barrels that is bearing on the market over to Liverpool and sell it for a dollar a barrel less and keep the price up here. That is good business, and there is no human law or device that I know of by which you can prevent that condition of affairs.

Q. But you are speaking of foreign shipments. How about it at home?—A. You are getting a paternal government of the most pronounced character. I do not know how you could do that.

Q. This Government seeks to protect our industries from foreign competition by a tariff and to give our infant industries a chance to grow. Now, has a big

concern a right to follow up a small industry and club it out of its market?—A. I think not. Anything that would interfere with legitimate enterprise ought to be a fair subject for governmental interference. But as far as outside markets are concerned, it were better to let them alone. You may recall that 30 years ago steel rails were worth \$100 a ton, and that \$100 a ton was paid in gold to foreign countries. The purchases drained this country of gold. They were only manufactured in Europe, and they were paid for in gold. Our money was only worth 50 cents on the dollar. But Mr. Carnegie, with his enormous monopoly from the day he began to make rails, brought them down from \$100 a ton to about \$20, and scores and thousands of men were employed who never would have known what it was to be inside of an industrial plant.

(Testimony closed.)

WASHINGTON, D. C., May 7, 1901.

TESTIMONY OF MR. P. J. MCGOVERN,

Chairman Southern Classification Committee.

The commission met at 11 a. m., Vice-Chairman Phillips presiding. At that time Mr. P. J. McGovern, of Atlanta, Ga., chairman of the Southern Classification Committee, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your occupation and address?—A. Chairman of the Southern Classification Committee, Atlanta, Ga.

Q. Will you make any statement respecting the organization of this committee, its relations to the railroads, and its functions?—A. Possibly I could best answer that question by quoting from a letter which I wrote on September 15 last to the Hon. John D. McInnis, president of the Mississippi railroad commission: (Reading:)

"File 710.]

"SOUTHERN CLASSIFICATION COMMITTEE,

"Atlanta, Ga., September 15, 1900.

"Hon. JOHN D. MCINNIS,

"President Mississippi Railroad Commission, Jackson, Miss.

"MY DEAR SIR: Some little time ago we received a letter from Mr. T. C. Powell, assistant freight traffic manager Southern Railway Company, stating that you had probably communicated, or would communicate, with us respecting recent changes in the southern classification, and he asked that we prepare and send you a list of the changes that had been made in the southern classification, together with the reasons for those changes. We have received no communication from you on the subject, but that fact has not been the cause of our failure to write you. Press of other matters, including preparations for a meeting of our committee next week, at which quite a lengthy docket is to be considered, has operated to prevent an earlier compliance with Mr. Powell's request.

"The country may be said to be divided into three classification districts or territories:

"1. The territory covered by the official classification, and which may be roughly defined as the territory lying north of the Ohio and Potomac rivers, and east of the Mississippi River and Chicago.

"2. The territory covered by the western classification, which may be defined as the territory lying west of Chicago and the Mississippi River.

"3. The territory covered by the southern classification, lying south of the Ohio and Potomac rivers and east of the Mississippi River.

"Of course you understand that in all three of the territories referred to various exceptions to the classification are in force, in the shape either of commodity tariffs or what we term classification exception sheets.

"In dealing with classification matters we usually divide the classification into three parts:

"1. The general rules which govern in the application of the rates and which are published in the first part of the classification.

"2. The descriptions of the articles, setting forth the name of the article, manner in which it is to be packed, etc., and

"3. The ratings themselves, showing what class each particular article is to take.

"Now, in the recent revision of the southern classification, changes have been made in all three of the parts above referred to. Some of the rules have been changed or modified; many of the descriptions have been changed and, we believe, greatly improved and simplified, and a good many of the ratings themselves have been changed.

"No statement has been prepared, or could be very satisfactorily prepared, which would show the actual and exact changes in the rules, descriptions, and ratings. Indeed, the only satisfactory way by which to ascertain the changes would be a comparison of the present and former classifications, item by item. For instance, the furniture list has been entirely revised and greatly reduced as to the number of items in it, and it would be impracticable to show in tabulated form the exact differences between the old classification and the present one. Necessarily, therefore, what follows must be stated in a general way, and without attempting to give you exact details as to each of the many articles or items in the classification.

"*Organization and objects of the Southern Classification Committee.*—The Southern Classification Committee was organized April 15, 1899, and its articles of association provide that the object of the committee is 'for the purpose of establishing uniform freight classification, and the publicity of same, and to aid in fulfilling the purposes of the laws of the States, and of the United States, affecting commerce.' Its membership is composed of 'Transportation companies members of the Southeastern Freight Association, and members of the Southeastern Mississippi Valley Association, and other companies operating in the territory south of the Ohio and Potomac rivers and east of the Mississippi River (including coastwise steamship companies parties to tariffs of through rates governed by the southern freight classification).'"

So that the commission will understand that the territory embraced in the membership of the classification committee is that lying east of the Mississippi and south of the Ohio and Potomac rivers, and we include also the Atlantic coastwise steamship companies that handle business into and out of that territory.

"The need of such a committee has long been recognized by the carriers in this territory, and negotiations looking to its formation had been in progress for several years prior to its final organization. Similar committees have been in existence in the official classification territory and in the western classification territory for many years previous, and have demonstrated their value and usefulness.

"Prior to the organization of this committee classification matters were handled by the freight traffic associations, along with other rate questions; but it was believed that the time had come when this important branch of the rate-making problem ought to be given separate and special consideration by a committee representing the whole territory; that an official ought to be employed to gather necessary and proper information and data bearing on classification matters, and in short that the growth of transportation interests and traffic in southern territory justified this further step in specialization."

The membership is the same now; it fluctuates a little, but it is 42 members now.

Q. (By Mr. PHILLIPS.) Only one member representing each line?—A. Each line has 1 vote—each system, you might say, because some of the systems have 4 or 5 or more separate corporate lines, corporate interests, and our articles provide that where there are 2 or more members with 1 traffic official only 1 vote is allowed, so that we have 42 separate interests. I can not say that they are independent; a good many of them are affiliated interests like the Baltimore Steam Packet Company, which is a member of the Seaboard Air Line system or interest, and the Chesapeake Steamship Company, which is a part of the Southern Railway interest, but they are separately managed.

Q. (By Mr. RIPLEY.) You have a copy of the by-laws and constitution of this committee?—A. I think so.

Q. Will you insert that in your testimony?—A. I will file it as an exhibit.

(Continues reading letter to John D. McInnis.)

"The articles of association provide for a subcommittee of 15 members, which is composed of representative lines, and includes both rail carriers and water carriers. It is the duty of that subcommittee to carefully consider all facts and information submitted by the chairman, or by shippers, to hear complaints, statements or arguments from shippers or their representatives, whether oral or written, and thereupon to submit recommendation for the individual concurrence of all the members of the entire committee, which at present is composed of 42 railway and steamship lines. If thus concurred in, the recommendations are published by the chairman of the committee, for the use of all lines."

I think that far will answer as to the organization of the committee and its relations to the railroads.

Q. Are any functions given to this committee other than those of making up the classification? Do you have any powers other than that of recommending? Can you enforce the classification?—A. The subcommittee recommends to the general committee, and if concurred in by the general committee, the chairman then publishes it and it becomes the official issue of the members.

Q. Does it become thereby binding upon those members? That is, are all the members of the association compelled to accept that rating?—A. They are not compelled. They accept it and they file it as their own issue—rather they have a general notice on file with the Interstate Commission to the effect that our issues shall be considered their official issue unless the commission is advised to the contrary. If we

do something that a line does not care to accept, it would give us notice and also file that notice with the Interstate Commission. We have had very little of that.

Q. But might a line act independently thereupon if it chose?—A. Oh, yes; oh, yes. We have had very little of that. We have had some differences with one of the large lines in our territory. We have about settled that, or hope to shortly.

Q. Do all or a considerable number of these representatives actually meet at one time together, or is it arranged by correspondence?—A. It is done in meetings, and the subcommittee of 15 practically does all the work of the committee. As you will understand, it is like certain Congressional committees; this subcommittee does the work, and it is nearly all done in meetings. At those meetings—the total membership being 15—two-thirds is necessary for a quorum and we usually have 12 or 13 present.

Q. (By Mr. CLARKE.) Are the representatives usually the traffic managers of the several roads?—A. The traffic officials; that is, traffic managers, general freight agents, assistant general freight agents. The same officials who make the classifications make the rates in the rate-making organizations.

Q. (By Mr. RIPLEY.) But in making the rates they to some degree act independently, do they, or do they all concur in making the rates in the same way they do in the classifications?—A. They all concur. The principal difference between our articles and the articles of association of what we call the traffic organization, as distinguished from ours, is that they require a unanimous vote on any subject. One negative defeats it. Now, you will find that in our articles of association we have a five-sixths rule.

Q. Will you explain before you go further the different associations to which you have referred, and can you point out from the map the territory covered by the rate-adjustment associations and the others?—A. Yes. The Southeastern Mississippi Valley Association takes in the territory which is bounded by a line drawn from Cincinnati down the Ohio and Mississippi rivers to New Orleans and a line drawn from Cincinnati down through Middlesboro, Chattanooga, Birmingham, and Montgomery to Pensacola, Fla. The Southeastern Freight Association takes in the territory east of that just defined and going as far east as Gainesville, Athens, Augusta, and Charleston. The territory east of that last described is known as the territory of the Associated Railways of Virginia and the Carolinas.

Q. These three associations now which you have defined have what functions, and what is their relation to the Southern Classification Committee?—A. They make the rates on all the competitive traffic in their respective territories—not local, but competitive.

Q. And what is their organization?—A. Their organization is somewhat similar to ours, composed of all lines that want to join.

Q. Do I understand you, then, that there are two classes of associations operating for the railroads in the Southern States—one class of associations which makes the rates and one other association, entirely distinct, which makes the classification?—A. That is correct.

Q. And there is no relation between those two kinds of associations—the rate making and the classification?—A. It is all really a part of the rate making. The making of freight classifications is the making of rates. It is a part of the rate making and, as I stated, formerly the rate-making associations handled the classification as one of many rate questions, but they do not give it enough attention. They had too much else to do. In the other two sections of the country they had classification committees, and they thought the time had come when they ought to have one down South. You might say this committee is auxiliary to the traffic associations. It is an offshoot from them.

Q. The point I wanted to make was this. You said, I believe, that two factors enter into the final determination of a rate: First, the rate itself; and, secondly, the classification of freight to which that rate applies?—A. Correct.

Q. Is there, then, action by the same individuals looking to harmony between those two factors which go to make the final rate?—A. The two things are determined by practically the same people acting through different bodies. To illustrate, the general freight agent of the Central of Georgia Railway, Mr. Winburn, is a member of the conference committee of the Southeastern Freight Association, and he is a member also of our classification committee. Now, the fixing of what the first-class rate shall be from Atlanta to Richmond is dealt with by him in the Southeastern Freight Association. But when it comes to be determined what articles shall take that first-class rate he acts through the classification committee.

Q. In the one case, however, in the classification committee, you state that five-sixths may fix the classification?—A. That governs. That does not prevent a line from acting independently afterwards, if it wants to. It may refuse to accept the classification. Naturally we understand, or we ought to understand, that no articles of association can deprive a line of its inherent right to make its own rates, since the Trans-Missouri decision. We understand that.

Q. These are not, then, in any sense pools?—A. Not at all.

Q. And they have no financial functions?—A. None whatever. The articles explain that the expenses of the committee are divided on the mileage basis. That is the only money we handle. Our committee does not even undertake to enforce or to scrutinize the application of the classification after it is once published.

Q. Any railroad, then, which chooses to dissent from the rates or the classifications fixed by these several associations is at liberty to do so?—A. Oh, yes, it has that right; you can not take it away. It would be illegal for it to sign its right away to do that.

Q. How many classifications have you actually issued?—A. We have issued three since the organization of the committee. I will file a copy of each with the commission, and I will file a copy of the old classification, No. 25, which was superseded by our first issue.

Q. What do you mean by No. 25? Do we understand that there have been 25 previous issues of these classifications?—A. Yes; we used to show that [showing inside title page of No. 25]. That is where we got the number.

Q. (By Mr. CLARKE.) Was that number 25 prepared by your committee?—A. No; that was the last one published prior to the organization of our committee. It was superseded by our first publication, No. 26.

Q. What body prepared that?—A. The Southeastern Freight Association. Now, as I stated a while ago, prior to the organization of our committee, the classification feature of the rate-making matter was handled by the traffic associations. That was published by the Southeastern Freight Association and shows that it was concurred in by the S. E. M. V. A., which means the Southeastern Mississippi Valley Association.

Q. (By Mr. RIPLEY.) Was it also concurred in by the Southwestern and the Virginia and Carolina associations?—A. It does not show; but it was concurred in.

Q. That is to say, there was still a single classification for the Southern territory, although it was not made in just the same way as at the present time?—A. Exactly. It was really made in the same way, except that it was not made through a separate committee, as is now the case.

Q. We have had at various times complaints before this commission from merchants' associations that the recent classifications, Nos. 26, 27, and 28, have introduced many changes in the classes, and especially in the distinction between carload and less than carload lots. Will you make a statement respecting these several classifications?—A. I was going to answer that by reading these other sections of my letter to Colonel McInnis. [Reading:]

"In the preliminary meetings leading up to the organization of the committee it was urged by many, and was generally conceded, that one of the first duties of the new committee would be a thorough and systematic revision of the entire classification. Such a work had not before been attempted. Under the old plan, classification matters were handled piecemeal; additions and changes were made from time to time without proper regard for the effect which such action might or ought to have upon other analogous articles; and the result was, as every one familiar with the situation well knows, that the classification abounded in conflicting ratings, inconsistencies, and incongruities.

"The new committee undertook the revision. It began with the iron and steel list. A special subcommittee of 6 members was appointed to deal with the question. That special subcommittee held a 2 days' session in October and another 2 days' session in November, 1899. It reported to the standing subcommittee an entire revised list of iron and steel articles, both as to descriptions and ratings, which report was approved by the subcommittee without substantial changes, and was concurred in by the various individual lines; and the changes thus adopted were published in Southern classification No. 26, effective February 1, 1900. It is a fact that this revision of the iron and steel list contained advances in a good many ratings.

"In continuation of the work of revision the standing subcommittee held an 8 days' session in Washington, D. C., December, 1899, at which time the entire classification (with the exception of the iron and steel list) was carefully gone over and a revised classification submitted. That revised classification was considered at meetings of the entire committee held in Atlanta, Ga., January 4-5, 1900, and January 21, 1900, which were the largest gatherings of transportation lines ever held in the South for the sole consideration of classification matters. The recommendations of the subcommittee were carefully gone over, item by item; substantial modifications were made in those recommendations; further correspondence ensued between important lines as to those modifications, and the result was finally promulgated in classification No. 27, taking effect June 1, 1900.

"The foregoing statement of facts as to the method of procedure is submitted to show that these important matters have been given the fullest consideration and that the advances recently made in the classification have not been the result of a preconceived attempt on the part of a few of the principal lines to put up the rates

¹ See especially charges regarding changes and advances in Southern Classification, carload rates, etc., in testimony of Mr. J. M. Langley, *post*, p. 859.

on the shipping public. At no previous time in the history of Southern transportation has the matter of freight classification, in all of its bearings and features, been given such close, thoughtful, and thorough consideration.

"Now, it happened that the revision referred to came at a time of extraordinary trade conditions, which, in the opinion of the committee, justified substantial advance in many of the ratings. There had been marked increases in the prices of many important commodities, and this seemed to be especially true of those articles whose use and cost enter most largely into the operation of transportation lines. As bearing on this point, we submit herewith a statement prepared by one of the principal lines in this territory, showing a comparison of the cost of railway material and supplies during the years 1897 and 1900, together with the percentage of increase in the said cost. It is a fact, of which you are no doubt aware, that some of the lines in this territory have actually shown a reduced net revenue during certain periods as against an increased gross revenue during the same periods, and this is attributed entirely to the increased cost of materials used in operation and not to any other or special cause.

"But we insist that the revision of the classification would have occurred regardless of trade conditions, and that the object of the revision was not entirely and solely for the purpose of increasing the ratings, as has been stated in some quarters. The need for the revision has been previously above explained, and in going over the classification it was believed and found that many of the existing ratings were unreasonably low in and of themselves; that, based on values, risk, density, method of packing, etc., some advances would be entirely proper, and by comparison with the ratings in effect on the same articles in the other two classification territories it was also believed and found, and could be easily demonstrated, that the ratings on many articles were unreasonably low. It was observed in some instances that the rating on an ordinary article of shipment not subject to any special conditions of supply or demand was three or four classes lower than in the official and Western classifications, and where there seemed to be no justification for this difference the rating was advanced.

"We do submit, with the utmost deference, that the honorable commission, of which you are the head, clothed with the authority to establish reasonable rates and classification in the State of Mississippi, ought not to finally disapprove and set aside an entire classification, planned and formulated in the manner and under the circumstances above described, without substantial and excellent reasons. It does seem to us that the work of the Southern Classification Committee, organized as above explained and dealing with these matters in the thorough and systematic way above set forth, ought to have the most careful and detailed consideration by your honorable body before undertaking to decide broadly that everything done by the classification committee has been wrong, unwise, or improper.

"*Classification No. 26 as compared with No. 27.*—As already stated, classification No. 26 went into effect on February 1, 1900. Upon comparing it with No. 25 the first important change that will naturally occur to you is the fact that the old double-column plan was abandoned for the single-column plan. In other words, classification No. 26 shows only one rating opposite each item, while the previous classification showed two ratings opposite many of the articles, one in the 'carrier's risk' and the other in the so-called 'released' column."

Q. (By Mr. HIRLEY.) Will you explain what that means?—A. In classification No. 25, and in all previous classifications for many years, we showed two columns of ratings. The commission will understand it in a moment at a glance. In the first column we showed what is known as the carrier's risk or common law liability rating; in the second column we showed the owner's risk or limited liability rating, the first column rating being naturally higher than the second. Now, in going through the old classification No. 25, we found that there was no sort of consistency or uniformity or anything approaching uniformity between the two columns.

Q. Can you illustrate that by an example?—A. I believe I can do it better this way: We found that about 1,700 items or articles were shown only in the carrier's risk column, the first column; two hundred odd articles were shown only in the second column; 590 or 600 items, the remaining items, were shown in both columns. Now, we found that where two ratings were shown they varied all the way from 14 per cent to 280 per cent—that is to say, the carrier's risk rate was 14 per cent higher than the owner's risk rate in some instances and 280 per cent higher in some other instances. We found further that, probably owing to a clerical error, misunderstanding, or what not, many articles were shown only in the first column that were subject to great risk in handling. For instance, you will find acids N. O. S.—that is, acids not otherwise specified—only in the first column. Everybody understands that acids are a risky thing to handle, and yet in this old classification they were shown only in the carrier's risk column, an anomaly or absurdity that may have had its birth in some clerical error somewhere. There [pointing to classification No. 25] are two columns, and a list of acids. Some are only in the first column and some

only in the second column and some in both, all under the head of acids, and no uniformity about it. Well, we did not see any reason why we ought not to abandon that old system and put every rating on the limited liability or bill of lading basis. Limited liability simply means that you accept the bill of lading of the carrier. Then we said, "If a man refuses to accept that, as he has a perfect right to do, we will make the common law or carrier's risk rating a uniform percentage higher," and we did. We made it 20 per cent higher, in line with the rule of the trunk lines.

Q. That is the rule in this official classification, that when carried at carrier's risk it is 20 per cent higher?—A. Twenty, and ours is now 20. For a while ours was 30.

Q. What changes took place between Nos. 25 and 26 in addition to the ones that you have mentioned respecting carrier's and owner's liability?—A. That was the first change. I will read on here [reading further from letter to John D. McInnis]:

"Without presuming to criticise the makers of the first classification, 25 or 30 years ago, we have never been able to discover any necessity, or good reason, for the double column plan. If a similar plan has ever been in force in the other two classification territories, we are not aware of it. We were not present at its birth, but we shall always congratulate ourselves that we participated in its obsequies. It abounded in inconsistencies, it being found upon investigation that the difference between the released ratings and the carriers' risk ratings varied all the way from 14 to 280 per cent. Articles were shown in the carriers' risk column only, which were of extraordinary risk in handling, an absurdity which does not admit of any sort of explanation. Furthermore, under the old method of handling classification questions, ratings were changed without stating whether the new ratings were to be shown in the released column or in the carriers' risk column; and the matter was therefore left to the discretion of the rate clerk handling the publication of the changes.

"We do not believe that any one will contend that the change to the single column plan was not in the direction of simplicity and uniformity, and it only remains for us to consider what effect, if any, the single column plan actually had upon the rates charged the public; and this is especially proper, because this change has been made the basis for erroneous or misleading statements to the effect that Classification No. 26 advanced the ratings on some 1,600 articles "by indirection"—in other words, we tried to slip up on the public, by putting up the rates on them without changing the actual figures in the rating column.

"Now in Classification No. 25 some 1,700 articles were shown in the first or carriers' risk column only; and in publishing Classification No. 26, all of those items were transferred to the limited liability column, which is the only column now used. The very first item in Classification No. 25 will serve as an illustration: Accoutrements, military, are shown in the carriers' risk column at the first class rating. This rating still governs, but it is the limited liability rating, because all of the present ratings are subject to rule one of the classification, which provides that the ratings shown in the classification apply only on property shipped subject to the conditions of the standard bill of lading. What has been the actual effect? If a man had a shipment of military accoutrements to forward from Jackson, Miss., to Atlanta, Ga., under the old classification, he simply accepted the bill of lading of the initial carrier at Jackson and paid the first-class rate. If he had the same shipment to forward next Monday, he would simply accept the bill of lading of the initial carrier at Jackson and pay the first-class rate; and assuming that the first-class rate from Jackson to Atlanta was the same on January 31 as it will be on September 17, the rate actually charged is exactly the same in both instances, and the conditions of shipments are practically the same. The technical argument has been made that by putting these various articles on the limited liability basis, we have actually advanced the rates, because the shipper would have had the right formerly to demand a common law liability bill of lading, whereas he would now have to comply with the terms and conditions of the standard bill of lading. As we all know that 99 per cent of the business of the country is handled on the bills of lading of the various carriers, and, therefore, on the limited liability basis, we simply ask you, in all sincerity, whether this feature of the matter justifies the statement that the ratings were advanced on the 1,600 or 1,700 articles referred to.

"Now, with the exception of this change to the single column plan, and with the exception of the iron and steel list, which we have previously referred to, Classification No. 26 was not an advance over Classification No. 25, but as a matter of fact contained more reductions than advances."

Now, if we may summarize that: In classification No. 26 we abandoned the single column plan and we put all articles on the limited liability basis, which means in everyday business practice that we said, You must accept the bill of lading of the initial carrier. By some sort of a strained, technical, or literal argument you might say that we advanced those 1,700 items, but the charge was not any more on the goods moved than it had been. Now, that has been made the basis for a statement by the New York Merchants' Association, repeated at different times, and accepted

by other organizations, that No. 26 advanced the rating on some 1,600 articles. As a matter of fact, there were about 1,700 changed in that way. No. 26 advanced the iron and steel list, as already stated and admitted without any sort of hesitation. It advanced them considerably. With that exception it was a reduction as compared with No. 25.

Q. (By Mr. CLARKE.) The limited liability column showed lower rates than the other column, did it not, before this change was made?—A. Yes.

Q. Then, if the other column was abandoned, and the limited liability column retained, how could that be an increase? Would it not seem to be a decrease?—A. Where an article had previously taken a limited liability rating, we let that stay. This change, which was possibly a technical advance, was with respect to the 1,700 articles which were shown in the carrier's risk column only. We transferred those bodily to the other column. What had been previously, say, military accoutrements, first-class, carrier's risk, we made first-class, owner's risk. Now, I admit that technically that may be an advance, but if a man had a shipment of that kind to move, either before or after the publication of No. 26, he simply took his shipment to the station, and took the carrier's bill of lading and had it moved, and he had the same thing to do after it went into effect. He would take it to the depot and the shipment would move for the same rate per hundred pounds to the same destination.

Q. Then you transferred those 1,700 articles from one column to the other without changing the rate?—A. Without changing the rating. I want to bring out that point clearly to this commission. I have never had an opportunity to deny it before under oath, or under anything like these circumstances. I want to emphasize here that we admit a technical advance on those items, but no practical or actual advance.

Q. (By Mr. RIPLEY.) I find in notes upon hearings before the Interstate Commerce Commission on changes in freight classification in December, 1899, a statement on page 53 that the Interstate Commerce Commission found there were 754 changes in the southern classification then put in force. Have you any knowledge about that hearing? Could that have been a hearing upon this classification No. 26?—A. When was the hearing?

Q. December 18, 1899. Or was that upon the official classification?—A. December 18, 1899?

Q. Yes.—A. We had not issued any then.

Q. The statement has been made further, before this commission, that No. 26 introduced a much wider difference between carload and less than carload lots. Will you explain the bearing of such differences upon the jobbing trade and upon the interests of New York as a jobbing center and on the cities of the South?—A. I think reference is made to No. 27 as compared with No. 26. I will answer as to No. 26. We have already stated that the iron list was substantially changed and that it was considerably advanced. It may be that in doing that we had a few more carload ratings than we had previously had. But I want to say that it was not for the purpose of helping any jobbing point or hurting any other jobbing point or with any such purpose. We did not think of that at all. I think reference is made to No. 27, and I will read on from here and we will come to that [reading further from letter to John D. McInnis]:

"Classification No. 27 as compared with classification No. 26.—The first change to be noted is in rule 1, and this merits some explanation."

I will read rule 1. Rule 1 in No. 26 reads this way: (Reading.) "The reduced rates specified in this classification are 'released' rates and will apply only when the shipper or owner executes a release on the form prescribed by the several carriers. If the shipper or owner fails or refuses to execute a release, the shipment will be accepted and transported at carrier's risk, and the rate will be 30 per cent higher than the rates specified in this classification. Where the property is charged for at the carrier's risk or higher rate it will be transported at the carrier's liability, limited only as provided by common law, by the laws of the United States, and of the several States, in so far as they apply."

No. 27, rule 1, which is in substantial conformity to the rule in the official classification—if there is any difference, it is simply a little bit more favorable to the shipper, not much, but a little—reads this way: "The reduced rates specified in this classification will apply only on property shipped subject to the conditions of the standard bill of lading."

"If the shipper elects not to accept the said reduced rates and conditions, he should notify the agent of the receiving carrier in writing at the time his property is offered for shipment, and if he does not give such notice it will be understood that he desires the property carried subject to the standard bill of lading conditions, in order to secure the reduced rate thereon. Property carried not subject to the conditions of the standard bill of lading will be at the carrier's liability, limited only as provided by common law and by the laws of the United States and of the several States, in so far as they apply. Property thus carried will be charged 20 per cent higher (subject to a minimum increase of 1 cent per hundred pounds) than if shipped subject to the conditions of the standard bill of lading."

(Resumes reading of letter to John D. McInnis.)

"For years past there has been a desire in this territory to bring about uniformity in the bill of lading used by the various carriers for domestic shipments. At various times in the past special committees have been appointed to deal with the subject, but without definite result. For some 13 years past the lines in the official classification territory, embracing the largest traffic section of the country, have used what is known as the 'Uniform bill of lading,' and it has been published as a part of the official classification.

"Shortly after the organization of the Southern classification committee it was believed that the committee furnished the proper machinery to carry this matter through to some definite conclusion, especially because the committee covered the entire Southern territory, and the members were therefore understood to be familiar with the laws and legal requirements in the various States. Early in 1899 a special bill of lading committee of 6 lines was, therefore, appointed. That special committee held a 2 days' session at Asheville, N. C., in July, 1899, and submitted a standard form of bill of lading and shipping order to the various lines in the Southern territory. We are glad to submit herewith (marked 'Exhibit A') copies of the forms then proposed for initial rail carriers and initial water carriers, respectively. Negotiations and correspondence proceeded; various slight modifications were proposed; objections to some of the provisions were advanced, and finally another meeting of the special bill of lading committee was held at New York in February last. At that meeting the various suggestions and amendments were taken up and considered; a standard form of bill of lading was finally adopted; it was approved by the standing subcommittee, and afterwards by the various individual lines, and was finally put into effect on June 1, 1900. We take pleasure in handing you herewith (marked 'Exhibit B') copies of the forms thus adopted for initial rail carriers and initial water carriers, respectively."

I will send to the commission the exhibits referred to here and also the statement referred to in a previous part of this communication showing the increases in the prices, as between years 1897 and 1900, of many of the principal articles used in the operation of railways—materials, iron and steel, etc. [Resumes reading.]

"This bill of lading conforms essentially to the uniform bill of lading in use in the territory north of the Ohio and Potomac rivers. It is believed to embody the best features of that bill, with some additional provisions designed to fit transportation by water lines. We respectfully ask your honorable commission to give it careful consideration so as to determine for yourselves whether or not there be anything in its provisions illegal, unfair, or onerous to the shipper. If so, the classification committee will welcome and carefully consider any criticism or comments which may be submitted looking to its modification.

"We now beg you to note the difference between rule 1 of classification No. 26 and rule 1 of classification No. 27. The former provided that the ratings shown in the classification were released ratings, and that if the shipper declined to execute release he would be required to pay 30 per cent higher than the rating specified in the classification. The present rule provides that if the shipper elects to not accept the conditions of the standard bill of lading he shall give notice in writing, in which case he will be charged 20 per cent higher than the limited liability rating as shown in the classification. We believe you will agree with us that the present rule, as compared with the former rule, ought not to meet with serious objections on the part of the shipping public. If a shipper demands that his property be carried subject to common-law liability, he has the right to do so, but we charge him 20 per cent higher than the regular rate in order to compensate the carrier for the increased risk."

Q. (By Mr. LITCHMAN.) Is not that susceptible at least of two constructions—first, that you make use of that fact to force an increase of rates to the amount of 20 per cent, or else the other construction that in lieu of that the shipper has got to take his own risk, which has not been the custom heretofore?—A. Oh, it has been the custom heretofore, because even in respect to these 1,700 articles upon which the ratings show a carrier's risk only, as a matter of fact, there was not one instance in a hundred where the shipper did not accept the regular bill of lading on his property or had his own bills printed, which was the same thing.

Q. Has it ever been tested in court whether the railroad has power to force the shipper to ship at his own risk?—A. We do not force him to ship at his own risk. We give him very clearly a published optional rate. He can take the bill of lading rate, which is 100 per cent, or he can demand a common-law liability bill of lading—a plain receipt, with instructions to transport and deliver—and he pays 120 per cent of the rate.

Q. I understood you to say that it had been the custom of the shipper to ship at his own risk until you presented these two options.—A. I said it was the custom even on those 1,700 articles where the rate was all carrier's risk, and he did not demand the common-law liability. In the old classification there were 1,700 articles upon which we showed only one rating, and that a carrier's risk rating, so that if you had one of those 1,700 articles to ship (and many of them were very important

articles such as dry goods and other things) you would have had a right to go to the agent of the carrier and say, "I want a common-law liability bill of lading. I want a receipt, without any sort of limitation, with no conditions at all, except such as the common law and the statutory law of the various States may have prescribed or fixed."

Q. Was there any extra charge for it?—A. None at all. That was the only rating we published, but notwithstanding the right of the shipper to call on us for a common-law bill of lading probably 995 out of a thousand shipments were handled right along in the usual course of business on the regular bill of lading of the company or on the printed bill of lading that many of the large houses got up for themselves in book form.

Q. Was there any change of rate when they took what you called the carrier's risk rating?—A. No; it was all one.

Q. Now, when you made the change to the new classification was there an addition of 20 per cent on account of that carrier's risk bill of lading?—A. There is the point. Take accouterments. In the old classification we showed accouterments in the carrier's risk column at first class. We now show them in the single and only column, which is the limited liability column at first class. So that even under the old classification if you had a shipment of accouterments and demanded a common law liability bill of lading you could have got it at first class, whereas to-day if you demand it the rate would be 20 per cent higher.

Q. Than it was before?—A. Higher than it was before. Now, I have said that was technically an increase on the 1,600 or 1,700 items, but in fact it was not, because in everyday business fully 99 per cent—I believe I am safe in saying that 99.5 per cent—of the business has been all along and is now and will continue to be handled on the regular bill of lading.

Q. Now, then, that being the case, would your association have adopted a schedule of that kind if they had not had an idea themselves that your liability, whether there was a carrier's liability bill of lading demanded or not, came under the common law?—A. It did not cut any figure at all in the matter.

Q. Then why was it adopted?—A. We wanted the single-column plan and we wanted that to be a limited-liability plan. We wanted this so that the other rating should be a fixed percentage higher to cover all, rather than that we should fix the carrier's risk rating and then say that the rate on which 99 per cent of the business would be moved would be a percentage less. We could make all these ratings higher than they are and then say that if a shipper accepted the bill of lading of the carrier we would make it a percentage less.

Q. You think virtually it is the same thing? A man wants to be sure that his goods are protected, and you would compel him to pay 20 per cent for it?—A. Oh, no; we do not attempt that. We do not say that his goods are not protected if he accepts our bill of lading. We claim that the bill of lading is a legal document, that there is nothing unfair or illegal or burdensome in it.

Q. You have two bills of lading, have you not, one of which is a carrier's risk bill and the other is a shipper's risk bill?—A. We are supposed to have, but in fact we have but one, because there is not one time in 100 when the other is demanded.

Q. If I am a shipper and desire to have my goods thoroughly protected, I have to take the carrier's bill of lading, haven't I?—A. Yes; to have all the protection of the common law.

Q. And in order to get that I have to pay 20 per cent more?—A. Yes.

Q. You force me to the alternative of taking the risk myself or paying 20 per cent more?—A. Theoretically we do and technically we do, but in everyday business practice, whether by the double-column plan or whether we make it 20 per cent or 30 per cent higher than the other, it does not cut any figure whatever.

Q. (By Mr. PHILLIPS.) In case goods carried on a carrier's risk bill of lading were lost or destroyed, the owner could not recover?—A. He could recover unless it happened from one of the exemptions that I understand the common law gives us. There are four, I believe—the act of God, fraud on the part of the shipper, inherent defect in the article, or inherent vices in an animal. These are the limitations, I believe, though I am not a lawyer.

Q. If shipped at the carrier's risk, they could collect for any other damage?—A. Yes.

Q. What is the difference between the owner's risk and the carrier's risk?—A. As to conditions of bill of lading?

Q. Yes.—A. I would have to read the bill of lading to state all the differences in conditions.

Q. Just in a general way?—A. In addition to these limitations, stating it briefly, the bill of lading limits us from further risk by reason of fire, chafing, leakage, and all those damages incident to ordinary transportation which are not the fault of the carrier. The carrier pays any number of claims where the bill of lading would protect the carrier if contested; but if the claim is made by a shipper doing business

with him the carrier pays it. If you inquire among business people, you will find, I venture to say, that whenever they have something broken or damaged and put in a claim the claim is paid, although the bill of lading might let the carrier but if taken to the courts.

Q. (By Mr. RIPLEY.) In making this change that you have mentioned, are you getting into line with the policy of the official classification committee?—A. The only consideration that we gave the official classification in this revision of ours was simply to compare it as we went along, article for article. There was no disposition and no suggestion to model ours after the official or after the Western, either as to the difference between carload and less than carload ratings, or the number of carload ratings, or as to any other feature. As we went through the classification, item by item, some one would watch the official and another the Western, and we would compare. But to say we started out with the idea of harmonizing the classifications would be simply incorrect.

Q. Does your action in thus limiting your liability bring you into line with the official?—A. As to this liability question?

Q. Yes.—A. It does. I thought you meant the ratings.

Q. What would you have done in this change of liability is to simply bring your Southern classification into line with the classification adopted by the roads north of the Ohio River?—A. Substantially. There are some little differences, but I do not want to worry the commission with them all. It is substantially the same.

Q. (By Mr. LITCHMAN.) You have never had any cases in court to test the validity of your two forms of contract, have you?—A. There has been no test in our territory. If there is anything illegal in our bill of lading, we want to find it out, because it would weaken the whole document.

Q. (By Mr. FARQUHAR.) I would like to ask whether, while the word "force" has been used, it is not entirely optional with the shipper which bill of lading is to be used?—A. Entirely so. If the additional risk to the carrier in the shape of this carrier's risk rating is worth anything at all it is worth 20 per cent, because 20 per cent of the rate may be a very insignificant percentage of the value of the goods. The rate from here to Atlanta, first class, is something like \$1.07. A first-class article of high value insured for the additional 20 per cent or 21.4 cents per 100 pounds might be very cheap insurance. We do not admit that 20 per cent is an excessive difference. We used to have 30 per cent and in some cases under the old plan it ran up to 280 per cent.

Q. What proportion does this carrier's risk property bear to the whole amount carried?—A. I am sure it is not 1 per cent. I doubt if it is one-half of 1 per cent. I doubt if it has varied one one-hundredth of 1 per cent as between the time when the old classification was in effect and the present.

Q. (By Mr. LITCHMAN.) Substantially the only difference between the two bills of lading is that under the carrier's risk all sorts of risks are assumed by the carrier, whereas under the shipper's risk bill of lading you simply assume the risk of injury caused by your own agents?—A. Under the carrier's risk we assume all risk except that which the common law and statutory law exempts us from.

Q. Under the shipper's risk you assume only the results of your own negligence?—A. We do not assume certain specified risks unless they are the result of the carrier's negligence. We do not admit that we put everything on the shipper except the results of our own negligence.

Mr. PHILLIPS. You may proceed in your own way now to present the facts.

The WITNESS. We come now to the real question of complaint on the part of the shipping public, and the representatives of the shipping public, respecting the general advance we made in our classification nearly a year ago—June, 1900. (Reading:)

"We now come to the changes in the descriptions and rating as shown in classification No. 27. For reasons already stated, it would be impracticable to show in tabulated form the exact advances made, but we do not hesitate to say that the number does not exceed 400 or 500, as compared with classification No. 26."

I think the commission will find that the last annual report of the Interstate Commerce Commission touches upon this matter; that a statement showing the number of changes was prepared by the auditor of the Interstate Commerce Commission and that it showed 500-odd advances and 100-odd reductions. I merely estimate it here as 400 or 500. It was nothing like 1,600 or 2,600 as has been stated by some parties earnestly, and perhaps honestly, but without proper information. (Reading further from letter to John D. McInnis:)

"And many of these advances have been made on unimportant articles of shipment. In revising the classification the committee endeavored to be as consistent as possible, and it will be found, for example, that all druggists' articles, in boxes, have been made first class; that small grocery articles, in boxes, have, as a rule, been made second class, and that ordinary hardware and iron and steel articles, in boxes, have likewise been made second class. One reason for this was to prevent underbilling of drugs, groceries, and hardware; and it may be in order to state at this point, and we say it with regret, that the underbilling or false classification of freight in the Southern territory seems to be continually on the increase.

"But in the statements which have been submitted at different times in behalf of the shipping public, through the press and otherwise, mention seems not to have been made of the fact that no advances have been made in ratings on such articles as agricultural implements; fertilizers, L. C. L.; cotton bagging and ties, green fruit, machinery, soap, stoves and hollow ware, vegetables, vehicles, vinegar, wooden ware, and other important articles of shipment. Nor was any advance made in the ratings on iron and steel articles, as compared with classification No. 26.

"Of course the Classification Committee does not pretend to be infallible. As the venerable and honorable J. H. Regan well and tersely said at the recent Lookout Mountain meeting, the making of a freight tariff or a freight classification is not one of the exact sciences. Commercial conditions are constantly changing; an article of luxury to-day may become an article of common use or necessity one year hence; local industries are multiplying in the South; new discoveries in science are constantly working changes in the whole character of the cost and use of some articles; competition between carriers and markets and products is ever increasing and becoming more complex, and he would be strangely out of touch with the times who would argue or contend that the freight classification of 10 years ago would fit the traffic conditions of to-day, or that the freight classification 10 years hence will not necessarily differ greatly from that now in use.

"The Classification Committee, however, invites and welcomes all information or data from shippers or their representatives which will aid the committee in arriving at a fair and just conclusion. At previous meetings of the committee various representatives appeared and made oral statements and arguments to sustain applications for changes in the ratings; and for our next meeting 147 subjects have been docketed, and in the great majority of cases this has been done upon direct request from shippers who have urged readjustment of the ratings. Some modifications have already been made, as witness supplements Nos. 1 and 2 to classification No. 27, copies of which we beg to inclose herewith. Undoubtedly some other modifications will be made at our approaching meeting. Our contention is, and we make it respectfully, that all these questions are given intelligent and conscientious consideration by the committee; and that while we sometimes err, we are always ready and willing to make correction upon the proper showing. It is self-evident that it is not to the interest of the carriers to make their rates exorbitant, or so high as to unduly limit or restrict the free movement of traffic over their various lines.

"Respectfully submitted.

"P. J. MCGOVERN, *Chairman.*"

Q. (By Mr. RIPLEY.) You have not spoken of the matter of carload lots. Will you speak of that topic now?—A. I want to say something on that. The Classification Committee has not, and I do not believe any classification committee ever has, proceeded under any fixed rule with reference to whether an article ought or ought not to take a carload rating or whether it ought to be 20 per cent or any other per cent less than the less than carload rating. There has been no thought on the part of our committee to increase the number of carload ratings or to widen the difference between the carload and less than carload rating. The only rule, if it can be called a rule, is that our committee has endeavored, as far as practicable, to limit the number of carload ratings to those articles which are naturally or ordinarily moved in carload lots. In fact, we have actually a comparatively smaller number of carload ratings than either the official or western classification. I want to deny most positively and emphatically that the Southern Classification Committee has gone to work to prevent New York City or Chicago or any other long-haul seaport or market from doing business in the South, by increasing the number of carload ratings, so as to build up the interior southern jobber, or for any other purpose whatsoever.

At more than one of our meetings we have had with us a gentleman from Atlanta, Mr. W. E. Newell. He is not only a jobber of hardware in Atlanta, but he is chairman of the Transportation Committee of the Southern Hardware Jobbers' Association. Mr. Newell is naturally looking after the interests of his own company and of other jobbers in that section, and naturally he would like to have a carload rating on everything. The commission will understand that the jobber at Atlanta wants as low a carload rating or rate as he can get. He wants to bring his goods in there in large lots and distribute in small lots at a total charge to the ultimate destination which will at least approximate the through rate. I will illustrate that. Suppose New York is the natural or controlling source of supply for a given commodity, and a jobber in Atlanta deals in that commodity. He wants to get as low a carload rate as possible from New York to Atlanta, and then he wants to distribute it at a less than carload rate from Atlanta to, say, Tallapoosa, Ga., or Anniston, Ala., at a combined total charge which will approximate what the New York jobber could send the less than carload shipment through for. That is the whole situation of the interior jobber in our or any other territory. He wants to be able to bring and reship at a total charge approximating the through rate on the same quantity as he reships to the same point of destination.

P. J. M'GOVERN:—SOUTHERN FREIGHT RAILROADS.

Q. (By Mr. PHILLIPS.) Then you claim the railroad can not ship the short distance in less than carload lots at a proportionately less rate than for the longer distance?—A. I say that, although that is not the carload question. All rates for short distances are higher per mile than for longer distances.

Q. They want it at the same rate per mile?—A. No; they do not ask that. They ask that the carload rate from New York to Atlanta, plus the less than carload rate from Atlanta to Heflin, Ala., we will say, will at least approximate the through less than carload rate from New York to Heflin direct. That is what every interior jobber wants, and the far-off jobber, as a rule, wants no carload ratings at all. That may be stated as the case of the New York Merchants' Association v. The Southern Hardware Jobbers' Association.

Q. (By Mr. KENNEDY.) Does he not strive to get a lower rate? For instance, we had testimony here showing that goods can be shipped to Chicago from New York and then reshipped back into New York territory for less than they could be sent from New York to the intermediate point between New York and Chicago.—A. They want as low as they can possibly get.

Q. Is that practiced in your Southern territory; that you may ship goods from New York to Atlanta and reship backward 200 miles toward New York at a cheaper rate than they could be sent from New York direct to that destination?—A. It might be possible on some articles; but I do deny that there has been any deliberate intention or thought on the part of the committee to bring about such a condition as that. There may be cases where there is a special carload rate from New York to Atlanta which will enable them to go back 100 or 150 miles. It may be true, but I doubt it. It would simply show a wide difference between the carload and less than carload rate.

Q. Do instances of that kind come to your notice?—A. I do not recall any. Take agricultural implements. In carloads they are sixth class, subject to a minimum of 20,000 pounds. Some implements in small lots are first class and second class, along there. So you can see if you ship a car to Atlanta and then distribute it on the first or second class rate out, you can go a good distance before you reach the through first or second class rate to that final destination from New York.

Q. Do you aim to arrange your classifications so that will be impossible?—A. No; that is not really considered. We simply take up each case on its own merits. That is all I can say. I do state positively that it is not the policy on the part of our committee, and has not been the custom or thought of the committee, to keep the through shipper from doing business in the small places in the South, or to build up the interior jobber, or vice versa.

Our committee is composed of 42 lines. That includes every coastwise steamship company operating from Boston, New York, Philadelphia, or Baltimore to the South Atlantic ports. Those are the lines that will carry the business for the New York or other Eastern jobbers to our section. Those lines are members of our committee. Now, evidently, if the Classification Committee is doing anything to prevent their markets from shipping down into our country those water lines either do not know their business or else are not attending to it. Take the Old Dominion Line from New York to Norfolk. A large part of its entire business is the south-bound business from New York via Norfolk to our territory. If you were to wipe out that business you would probably wipe out the Old Dominion Steamship Company. Now, that line is not only a member of our general committee, but its traffic manager, Mr. Walker, is a member of our working subcommittee of 15, and attends nearly everyone of the meetings. It will certainly not be argued by any trades body at New York or anywhere else that the Old Dominion Company has deliberately set out to bring about its own destruction. If the committee is deliberately trying to build up the interior jobber and ruin the New York jobber's business in that territory, then it is deliberately going about reducing the business of the Old Dominion Steamship Company; and Mr. Walker does not know it and therefore does not know his business. Now, I do not think that is the state of the case.

Q. You were speaking of the steamship companies. I want to ask you a question about that. Do they ship at very much lower rates from New York to points in the South reached by railroad from New York than the railroads ship for?—A. There is a fixed differential. Take New York to Savannah, the rates by water are very much lower than all-rail rates.

Q. Mr. Langley, of New York, said if there was any cheaper water rates they did not know it, which would leave the inference that the railroads control the steamship lines and prevent them carrying cheaper than the railroads to points reached by boat.—A. I think he must have meant interior points. Mr. Langley must know that the rates of the Ocean Steamship Co., for example, from New York to Savannah, are made by the Ocean Steamship Co. They do not consult anybody. Those rates are not even subject to the jurisdiction of the Traffic Associations. You can pick up any tariff and it will show the all-rail rates New York to Savannah considerably higher. I do not remember how much. The all-rail lines put in rates as low as they care to go, but they know they are a good deal higher than the ocean rates. The ocean companies reduce the rates without consulting anybody.

Q. How is it with the Old Dominion Company shipping to Norfolk?—A. It is the same way.

Q. They ship much cheaper than could be shipped by rail from New York?—A. I should judge so. I do not know how much cheaper. I take it for granted the rail lines can not meet the Old Dominion rates from New York to Norfolk.

Q. (By Mr. RIPLEY.) Is it not a fact that a large amount of the stock of the Old Dominion Company is owned by the railroads?—A. I understand that to be the case. The Old Dominion Steamship Company is a trunk line between New York and Norfolk. It handles business for every rail line leading from Norfolk, and I can understand that it would be the most natural thing in the world that each rail line should want to have an interest in the boat line.

Q. (By Mr. FARQUHAR.) Who makes the differential?—A. If you mean to interior ports, it has been fixed by agreement from time to time.

Q. Are the coastwise lines a part of your commission to make this differential?—A. They are a part of the Traffic Association that makes these differentials. That differential question is really older than the association itself. The present differential begins at 12 cents on first-class. It at one time was only 6 or 8 cents. It has been brought about just as anything else of that kind would be brought about—by arbitration. Sometimes they go to war, and when they get through the matter settles itself just about as the arbitrators would have settled it. If the Pennsylvania Railroad, for instance, and the other rail lines to those ports had their say there would be no differential. The Ocean Steamship Company may say, "We ought to have 20 cents differential; we ought to have all the business; it is all the business we can expect to get much of." The other fellow says, "You are not entitled to any differential; you make about as good time as we do; you ought not to have any differential." But they compromise, say, on 12 cents.

Q. Have you any idea whether the trunk lines of the South do not control the coastwise commerce by controlling the stock of the coastwise lines?—A. I understand that the rail lines, operating from Norfolk and those other ports, do own a large portion of the stock of some of those coastwise steamship lines. Take the Ocean Steamship Company. It is controlled by practically the same interests as the Central of Georgia Railroad; and the Chesapeake Steamship Line from Baltimore is practically the same as the Southern Railway. The Baltimore Steam Packet Company is controlled by practically the same interests as the Seaboard Air Line. There are two or three of these ocean lines which, however, are trunk lines. Take the Clyde Philadelphia Line, the Old Dominion Line, and the Merchants and Miners' from Boston, all operating to the Virginia ports, Norfolk, etc. They are all trunk lines. I can understand why the rail lines leading from Norfolk might want to have a voice in the management of these trunk steamship lines, so as to see that they get a fair share of the business brought to Norfolk, aside from the fact as to whether they are profitable or unprofitable in their operation. From good traffic reasons it seems to me they would want to have an interest, and I believe they do largely control through stock ownership.

Q. Since you have gone into both the transportation and traffic arrangements, have you found any friction at all with the coastwise lines and the rest?—A. There is just the same competition and friction between them as between the different rail lines.

Q. Is it the policy of the large trunk lines of the East reaching into Southern territory—Mobile, New Orleans, Atlanta—where it is part rail and part water, to take shipments by all rail if they possibly can?—A. They try to be neutral. Take a line leading to Norfolk, like the Atlantic Coast Line. The Old Dominion and the Pennsylvania are both connections at Norfolk, as is also the Merchants and Miners'. There is a friendly interchange of business.

Q. Substantially the same as on the lakes, where the trunk lines own their own boats?—A. Yes.

Q. (By Mr. RIPLEY.) While on that subject, you might make a statement regarding the extent of this differential. Some ports have a differential between all-rail and water. Is that true between Norfolk and Richmond, for instance?—A. You mean that New York to Richmond is higher than New York to Norfolk?

Q. No; I mean the rate from New York to Norfolk is the same whether by water or by rail, whereas Richmond has a differential, and Richmond complains that she is not on the same basis.—A. I did not know that; but I should judge it is this way, that the Old Dominion Company has such good service from New York to Norfolk that it can get its share of the business at equal rates; or possibly the Pennsylvania Railroad, with its own line, says, "We do not propose to give any differential, and we do not propose to arbitrate, and if you want to go to war go to war." You say the all-rail rate is not higher than the rail-and-water? I do not know why that is.

Q. I was so informed, and that Richmond complains that she is not put on a competitive basis with Norfolk for that reason.—A. I do not think she is entitled to the same rates from the East as Norfolk. It is farther inland, you know.

Q. (By Mr. PHILLIPS.) Would she not be all rail?—A. I should say by rail there should not be much difference between all rail from New York to Richmond, and all rail to Norfolk.

Q. (By Mr. RIPLEY.) Coming back to the topic we were discussing before, carload and less than carload lots, I would like to ask again whether in changing the number of carload lots you are coming into line with the policy of the official and western classifications or not?—A. Not at all. In the first place, we have not made many increases in the number of carload ratings. I could not say whether it is 8 or 45 or 32, though I am sure it is not 50 since the committee was organized, and if in doing that we are getting any closer to the condition of things in the western or the official territory it is merely a coincidence. It is not the result of any belief that theirs is a better system of ratings than ours, nor to increase the advantage of the carload shipper. If that were our intention, or it were believed to be a better thing by the committee, we would have gone ahead and increased the number and be done with it.

Q. The point I wish to make is this, whether you are getting into line with the official in various ways, so that at some time there may be a prospect of uniform treatment of shippers all over the country in respect to the distinction between carload and less than carload lots?—A. It may be we are drifting closer together. I do not think it could be said we are getting wider apart; but there is no systematic effort, so far as I know, on the part of any one of the three classification committees to get closer together.

Now, as I stated, in making our general revision some time ago we did watch the official and the Western as we went along, and on light articles especially I believe it would be found there is more uniformity than 5 years ago. I may leave here to-morrow to attend a meeting of the official classification committee, a special meeting to consider carload minimum rates. In the letter I wrote Chairman Gill before I left home, I said I thought that with respect to the question of minimum carload rates all three classifications might be brought into closer harmony, because the conditions are probably the same everywhere in the country. If 12,000 pounds is a proper minimum carload weight in one part of the country, then it should be a proper minimum all over the country on the same article.

Q. Will you explain what is the basis on which you introduce a carload rate?—A. It simply comes up in the ordinary course of business. We have a certain article which is, we will say, fourth class. The manufacturer or jobber, usually in the North or outside of the territory, says: You charge fourth class any quantity. That is not fair. We could increase our business down South greatly if we could come in there on lower rates on carload lots. Unless the matter has already been considered and declined by the committee, I almost invariably tell the applicant that I will list the subject for our next meeting or put it on what we call the docket. The attention of the committee is called to the application and we furnish any information we can, and the committee takes it up and considers it. The committee may think it is not an article upon which it is proper to make a carload rating or that there is no necessity for it.

Q. What determines?—A. Judgment and experience. We have no rule. It is just a business matter. The carriers may say that the article is not a carload commodity; that it does not usually move in carloads, or that, even if it is a carload commodity, there is no good reason for the reduction of their revenue. We may not believe that the making of a carload rate will increase the business enough to compensate us for the reduction in revenue, and we decline to do it.

Q. Just there we might raise the question as to whether a decision upon a business matter of that kind ought really to be made entirely by one party to the contract; in other words, whether some constituted authority—we will say the Interstate Commerce Commission—ought not to have jurisdiction, or whether the shippers ought not to be represented in some way. The complaint is made by the shippers that decisions in these matters are based not on any rule but on what you call judgment; that these decisions are made by one party concerned without any right or power on the part of the other.—A. That is a pretty big question. My own idea of that is that the carriers ought to be allowed to make their own rates. Those rates must be reasonable in and of themselves. If the shipper does not feel that he has been fairly treated he ought to appeal to the courts, and the carriers as taxpayers ought to aid or assist through the medium of State commissions or through the medium of the Interstate Commerce Commission by paying part of the expense of that suit. That is as far as I go. I do not believe it is a part of the business or function of the Government to fix rates. This is deep down in me. I have been with this thing for a good many years, and that is my deliberate opinion. The seller fixes his price. The seller is the carrier. If it is a yard of dry goods there is no recourse. In the case of a common carrier there is a recourse because of the peculiar business or functions of the common carrier. It has been pretty well settled that the rate must be just and reasonable, and that the courts have authority and power to determine whether or

not it is just and reasonable. The shipper should not be put to the sole expense of having it determined for him as to whether he is being treated fairly or not. I say every private or corporate citizen (including the railroads) ought to aid in maintaining a tribunal which would relieve the shipper of the burden and cost of having that case determined for him. As a citizen I am willing to chip in my share of that cost, but I do not believe it ought to be in the power of the Government to fix rates. I can not in my own mind disassociate or clearly distinguish between the power to make rates and the power to make property unprofitable.

Q. (By Mr. PHILLIPS.) Do you believe the State has not the right to fix the rate of travel per mile as well as freight rates?—A. That is my belief, that the State ought not to have power to fix rates for the transportation of people or articles.

Q. (By Mr. A. L. HARRIS.) The States do fix them?—A. They do.

Q. (By Mr. LITCHMAN.) Why do you take that position?—A. I do it because I believe that capital invested in the railroad business ought to have the same free swing and latitude as capital invested in any other kind of business, except that the carrier ought to be made to fix its rates at fair and reasonable figures, to be determined by the courts if disputed.

Q. Do you not support State control when you take that position?—A. No; I think there is a distinction between saying that the State can fix the rates and saying that the courts can determine whether or not the rate is fair and reasonable.

Q. You take into consideration that the existence of the railroad as a public carrier is due to special privileges?—A. I understand that.

Q. Under the special privilege, should not the State step in to protect its people?—A. Does that mean fixing the rates?

Q. Yes.—A. As I said, owing to the peculiar business of railroads, owing to the close influence that their rates of transportation may have on the making or unmaking of business, and owing to the fact that they are given certain privileges, the right of eminent domain, and so on—owing to all these things, they are somewhat different from sellers of ordinary merchandise. They sell their services to the public. If you go to buy an article the price is fixed by the seller. You have no recourse unless you can go somewhere else and buy it. I do not think it would be right to have railroad rates exactly on that basis.

Q. But when you go to the railroad to buy transportation you have nowhere else to go.—A. You may or you may not. I am willing to concede the difference between them and the seller of a yard of dry goods, from whose price there is no appeal. I concede that, because of the difference in the nature of their business, the price for transportation must be fair and reasonable in and of itself. I say further, if the shipper feels he is not getting that kind of rate, that he is not being treated fairly and reasonably, he ought to go to the courts and he ought not to be compelled to give up his business and go to the expense of employing an attorney and making a test on his own hook. I am willing to contribute to the maintenance of a railroad commission in the State or an interstate commission, whose duty it shall be to take that case up and handle it for him through the courts. But I do see a great and clear distinction between that and that the State shall make the rates.

Q. (By Mr. PHILLIPS.) Ought he not be heard before appealing to the courts?—A. That is another point. Suppose the carriers do say that they will make no important changes before consulting the other fellow. How will they go about it? We have shown clearly that the interest of the Merchants' Association of New York may not be the same as the Southern Hardware Jobbers' Association. We would have to advertise that there would be a public hearing as to whether or not we should change the classification on certain articles. And when everybody got there they would not be able to agree among themselves. It is a historical fact that a good many years ago committees from Atlanta and Athens and Macon and various other commercial centers attended a meeting of the old Southern Railway and Steamship Association, to urge a more favorable adjustment of freights. Sol Haas, who was at that time traffic manager of the Carolina roads, said, "Gentlemen, you go off and agree among yourselves as to your relative adjustment; how much higher or lower one point shall be than another. We will adopt your figures. We will not reduce our rates, but if you can agree how much higher or lower one point shall be than another, we will accept that." There were delegations there from all these towns, and the question was on rates on corn, flour, meat, etc., from the West. They went off and had a meeting, but they could not agree at all.

This suggestion that the public ought to be called in to our deliberations in advance of a change would not apply to reductions. I do not suppose anybody would object if we were going to reduce, and the history of rates in this country is a history of reductions. The only substantial advance that has ever been made at one time in the South was this classification 27, and I believe if we had known what was coming we would not have made that. There has been not only the evidence submitted to the commission here, but floods of correspondence and oral hearings and all. We thought there was going to be some complaint, but not that there was going to be so much.

Q. (By Mr. LITCHMAN.) How far would you strengthen the powers of the Interstate Commerce Commission in that direction?—A. I do not think it ought to go any further than I have stated.

Q. Would you have a court of appeals that would expedite a decision of the cases?—A. I think the matter is getting so enormous that there ought to be an auxiliary supreme court or something of that sort, some court of equal and conclusive powers to handle just these railroad questions—these differences between the carriers and the public; and that the Interstate Commerce Commission should first review these cases and, as it does in many cases now, advise the complaining shipper whether there are any good grounds for the complaint. If it felt there were grounds justifying further procedure in the matter, it should tell the shipper, "We will handle this for you and call upon you at the proper time for your testimony." I am willing as a citizen to contribute my share, whatever it may be, to the maintenance of that sort of a tribunal.

Q. (By Mr. PHILLIPS.) Would you have that national?—A. I would be willing to have it both State and interstate.

Q. (By Mr. A. L. HARRIS.) You would have two courts of last resort in the country?—A. What I mean is this, that, as a railroad traffic official, I am not willing that the Interstate Commerce Commission shall fix or have the final authority to fix all interstate rates. I would be willing that an auxiliary supreme court or some similar tribunal should have the power to finally determine the question brought up as a legal question by the Interstate Commerce Commission. If a man feels that he is not getting the right kind of a freight rate he must carry that question now through all the courts to the Supreme Court of the United States.

Q. You would avoid the long delay in some way before the case is decided?—A. Yes, yes; if a rate is unfair, then it ought to be determined. If it is unfair, the shipper is being unfairly treated, and that ought to be found out and corrected as soon as practicable, because it is possible that the shipper's business is being destroyed while that is going on. Such a case is possible. But I am not willing to say, nor do I believe it right, that the railroad commissions in the several States or the Interstate Commerce Commission ought to have the power to fix the rate on that article before or after a complaint.

Q. You are aware of the 8 years that expired between the time of bringing the complaint before the Interstate Commerce Commission and the final settlement by the Supreme Court of the Chattanooga case?—A. Of the Chattanooga case?

Q. (By Mr. FARQUHAR.) Do you not think, and would not every railroad man in the whole country think, that there ought to be some legal measures to bring a case for final decision in the appellate court before 8 years, when the decision is as to the principle involved in the long and short haul clause, as it was in that Chattanooga and Nashville case?—A. Why, it seems to me that it ought not to take 8 years to decide that question.

Q. Wouldn't you think, considering that the case came into court properly and that it was 8 years before it reached the appellate jurisdiction of the United States, that it was a farce?—A. If a certain rate is unfair to a man and consequently injustice is being done him, it is not right that he should be held up and that the injustice should continue in force until a constituted body like the State railroad commission of Georgia or the Interstate Commerce Commission here could get that to a final decision in the Supreme Court of the United States. When you ask me whether it is unfair or a farce that it should require 8 years to settle this or any other matter, I do not know. I do not know the causes of the delay, or if there was a delay. It seems to me it ought not to require 8 years.

Q. (By Mr. A. L. HARRIS.) Suppose a complaint is filed before the Interstate Commerce Commission, as now constituted, that a certain rate is unreasonable, and it takes 4 or 6 or 8 years to decide it. Would not many changes come upon freight rates before the case were decided?—A. Oh, they might.

Q. And the complainant lose all interest in the matter?—A. Oh, he might. The road might voluntarily reduce rates below the rate asked for by the complainant originally.

Q. You think that there should be some more speedy action in some way?—A. It seems to me so; but bear in mind I couple with that the strong conviction that the State ought not to have the power to fix that rate per se, and I say that as a citizen as well as a traffic man. I have been in touch with this subject a good many years and I do not believe that the State ought to fix the rates.

Q. You do not feel that it is even practical, then, after the railroad has fixed a rate, for the Interstate Commerce Commission or any body like the Interstate Commerce Commission to have the right of approval?—A. Well, it would have the right of approval in this way, that every rate is supposed to be all right. It seems to me that it is understood to be all right until it is complained of.

Q. But you would not submit it to the Interstate Commerce Commission in the first instance for its approval?—A. I do not think the carriers ought to be required to do that by law, or ought to be expected to do that.

Q. That is partly owing to the fact, is it, that rates are changing from time to time and the roads could not raise or lower the rates without consulting the Interstate Commerce Commission?—A. Why, I think the carriers ought to be allowed to go along in their regular business and make the rates from time to time and from day to day and file them with the commission. If the approval of the commission be necessary before a rate can be put in force, does not that carry necessarily with it the idea that the commission makes the rate?

It could continue to withhold approval until the rate reached a figure, higher or lower, that it could approve. Would not that be fixing the rate? Our country has gone along growing and developing; the railroads have gone along with that growth and development, and it has been done in the way we are doing now, the traffic officials making the rates and publishing them. They ought to be required to file them with the commission, and they should have publicity. There ought not to be anything secret about them, and there ought not to be anything preferential about them, but they ought to be as fair as they can be made, and certainly fair as between people at the same place. Subject to the general provision that they must be just and reasonable, I think the country is safe to let them go along at that.

Whereupon, at 1.08 p. m., the commission took a recess until 2 p. m.

At 2.10 p. m. Mr. McGovern took the stand and resumed his testimony as follows:

Q. (By Mr. RIPLEY.) I see on the cover of these classifications the statement "subject to change on legal notice." Does that mean that these changes of classification are made without any previous statement to that effect to the shipper? We have had some complaint at various times from the shippers that they make contracts for long periods in advance, and that these changes in classification are promulgated suddenly and without warning, subjecting them to considerable inconvenience and loss. What is your policy in that matter?—A. Legal notice simply means the notice required by the act to regulate commerce as amended, 10 days' public notice in case of advance and 3 days' in case of reduction. Now, that is the means we have of advising the public of changes; we issue the classification; we give them out as soon as we can after the matters are acted on by the committee in session. In the case of subjects that have been taken up and acted upon on the request of a shipper, or anyone else, we advise him before publication, you understand. In other words, there is no disposition at all to hold back this information until we are ready to plump it at them, as it were. I undertake to reach all complaints as soon as I can after action upon them by the committee, and to tell the complainants what we have done. I wrote letters just before I left home advising of an advance we are going to make the first of next July on the dry goods question.

Q. You are speaking now of advances which are to occur next July?—A. One advance is to occur next July.

Q. Are you going to make any change, or have you considered any change in the dry goods classification with special reference to cotton piece goods?—A. That is the very thing I was talking about.

Q. Will you explain the situation in that respect?—A. Our present classification shows a long list of articles here under the head of dry goods, which we term the cotton-factory products, backbands, calicoes, cambrics, canton flannels, etc., etc. Now, the dry goods people say that this list has outlived its usefulness. It may have been all right when we began specifying these things, but that the whole nature and character of the dry goods business has changed since then. They no longer sell an article as calico; it has some fancy name, some French name. The word calico is hardly ever used, and they asked us to change the wording of the classification somewhat in line with the official, which simply says, "cotton goods in the piece." Now, we have agreed to do that. The wording is not exactly the same as ours. We make it "cotton fabrics in the original piece," "made wholly of cotton," and so on. In doing that the committee decided that a little later on, the first of July, they would increase the rating from fifth class to fourth class. So the shippers will have plenty of notice of that. We don't try to withhold any information from the public as to what has been done, but that pointing to the classification is the means we adopt for the general publication of it.

Q. And wherever possible, as in this case, you give notice 2 or 3 months in advance, so that shippers may accommodate their contracts?—A. No; not 2 or 3 months. Usually it is just from the time the letter is written until we can get out our next publication.

Q. You recognize, do you not, that many contracts between merchants are made; necessarily, a number of months in advance, and that a change introduced in the freight rate may cause confusion where sales are on close margin—as, for instance, in cotton piece goods?—A. I recognize that, and that particular custom seems to be growing, but it does not disturb that much when we reduce. We make more reductions than advances. I really don't see how, in the making of a particular classification, we can accommodate it to all those trade conditions. If 10 days is not enough legal notice in the case of an advance, then make it 20 days; if 3 days is not enough for reductions, then make it 15 days, or 10 days; but when you undertake to say that

the makers of the rates, whether the railroads or any other rate-making body or authority, must try to accommodate themselves to all of those trade conditions, why, then, it means that there could hardly be any change at all. Now, about the largest dry-goods jobber in Atlanta, Mr. Dougherty, of the firm of John Silvey & Co., happened to come up with me on his way to New York City to make his next-fall purchases. At this time, when people are just commencing to wear their light clothing for the warm months, he is on his way to New York to make his fall purchases. He said that the postdating of bills was bad, and they are trying to get an agreement between jobbers all over the country to discontinue it. That started, probably, by the dating of bills 15 days ahead, or 10 days ahead—just far enough ahead to get the goods there; now it has gone into months. I do not see how we could accommodate a thing like freight classification or freight rates to every trade condition.

Another instance: Leggett & Co., of New York, have explained to us that they bought their canned goods almost a year ahead, and they urged that in putting canned goods up from fourth class in less than carloads up to third class in less than carloads we had disarranged their business. The reverse is true in most cases. We have made more reductions than advances since Publication No. 27. Of course there is no complaint, then, even if it goes into effect right away.

Q. Are you in position to show us specifically, or insert in the testimony specifically, the list of the items on which advances and reductions have taken place? You have made the statement that on a number of items more reductions than advances have been made. We hear complaint from many quarters that while the number of reductions may be greater than the number of advances, that the items so changed are such as to yield an increased revenue to the roads?—A. Oh, I think that must be incorrect. It can hardly be possible to say that we have picked out two or three little unimportant articles and made reductions on them, and that we get it all back by putting up the rating on important articles. It is simply incorrect and untrue in every sense. Absolutely, that is not true. No. 27 contained general advances. We have now started with that, and we are making four reductions or more where we make one advance. I know, from just my general knowledge of the matter, that since the issue of No. 27 we have made four reductions to one advance.

Q. (By Mr. CLARKE.) Is it a fact that when you have made reductions you have generally increased the revenue of the roads?—A. I can not say that that is a fact; but we do often make reductions because we believe it will increase the business an amount sufficient to compensate us for the scaling of the rating.

Q. Is not that the general experience of railroad companies?—A. It is the general experience that when they make reductions they believe it will increase business, that it will inure to the benefit of the company.

Q. Now, I would like to inquire what is the occasion for the advance on cotton piece goods that you propose to make the 1st of July?—A. I am glad you asked that. Under our present classification the fifth-class rating applies only on certain specified articles; they are clearly designated. That low classification was originally intended to cover only the articles made by the Southern mills 15 or 20 years ago, when they first began the manufacture of cotton fabrics in the South, and in fact even less was charged then than now. The articles consisted of rough sheetings, domestics, and all those coarser, cheaper fabrics and yarns, and the Southern carriers put them first on the sixth-class basis, so as to enable those mills to get on their feet. It was a species of protection by means of a freight tariff or classification. They were afterwards raised to the fifth class. That list has been increased from time to time, until it includes many more articles than it did at first, because there are many more different kinds of these cotton goods made in the Southern States than there used to be, but it does not include a lot of other goods; for instance, it does not include corduroys. Within the last few days I have had a letter from a New York house about corduroys. He insists the cheap corduroys ought to take the fifth-class rate, because they are not worth more than some of the things we have in this list. Well, now, when we changed the wording so as to read "cotton fabrics in the original piece," it evidently let in corduroys, upon which we are supposed to be getting first class to-day. In other words, we put in under the reduced basis a whole lot of fabrics not in there before; and we think that in changing the classification so as to meet the trade demands as to phraseology we are fully justified in putting the rating up, after a little further notice, to fourth class. My own opinion is that it ought to be third; I told some of our members at a recent meeting that I believed it ought to be third. It is third in official territory, and when you take the character of the business, the weight and value of these cotton goods, I do not see why it ought not to be third.

Q. (By Mr. RIPLEY.) Respecting the amount of these advances resulting from several classifications, one of the shippers recently looked up a rate upon axes, and the figures which he gave as illustrative of the changes during the last few years—from about 1896 to the present—were as follows:

From Louisville, Ky., to Atlanta, Ga., the rate on axes about 5 years ago was 68 cents in less than carload lots. It now appears to be 81 cents. The rate from Louisville, Ky., to Jacksonville, Fla., on less than carload lots, 5 years ago, was 40 cents;

it now appears to be 50 cents. The rate from Louisville to Birmingham, Ala., was formerly 47 cents; it now appears to be 58 cents. The rate from New York to Atlanta on less than carload lots was formerly 73 cents, and is now 86 cents. Those rates show a very substantial increase during the last 4 or 5 years, and I want to ask you whether those, for any particular reason, would seem to be abnormal, or whether changes corresponding in amount to these have been introduced all along the line. In other words, by reason of the introduction of these several classifications have the rates been advanced, roughly speaking, 5 per cent, 10 per cent, or, as in some of these cases, 15 or more per cent?—A. I see. Now, with the exception of Jacksonville, Fla., to which point I think those are commodity rates—those are class rates. With the exception, then, of Jacksonville, all of that has grown out of the change from fourth class to third class, and you needn't go back several years. That was one of the advances we made in No. 27, classification No. 27. We now have it third class. Those figures you name there except as to Jacksonville are former rates for fourth class, and the advanced rates are third-class rates. Now, that was advanced from fourth class to third class, and I think that would be a fair average of all advances we have made. There has been no horizontal advance or anything like it. We advanced aqua ammonia in bottles, I remember, from fourth class up to first class. We did it because, as explained in this letter to Captain McInnis, we made all druggists' articles in boxes first class, and for the additional reason that the other two classifications had it first class, as I remember, and for the still further reason that we did not see why it should be down on the fourth-class basis as it is used only as a toilet article. We thought it was an article that could be fairly put up a little bit higher. But on the whole I should say that the advances shown on that statement as to axes will represent a fair average on all articles which we advanced.

Q. The advance of, say, the 15 per cent?—A. Yes; I think that would be fair. It might be 14, it might be 12, it might be 19, but I will assume that is a fair average.

Q. (By Mr. LITCHMAN.) To the superficial observer, does not that justify the claim that has been made that you had advanced the rates by changing the classification?—A. Why, of course, we advanced the rates when we advanced the classification. Certainly no traffic official or witness has ever denied that.

Q. Now, the claim made before this commission is that that is a method of changing rates, and that it is unjust to the shipper.—A. Well, when we advance the classification we certainly advance the rates.

Q. (By Mr. RIPLEY.) You did it with that end in view, of course?—A. Partly. I have stated in this letter to Colonel McInnis that there would have been, and ought to have been, a general revision of the Southern classification regardless of trade conditions at that time. There were two objects. One was to overhaul it and improve it, and the second was to get more revenue. We did not make any attempt to deny that we were for more revenue, but that we were after both objects.

Q. I would like to, if possible, bring out the basis on which you make such changes, where you advance from one class to another. Do you ever compute or have in mind the direct increase in revenue which will result, or do you look solely to the commercial conditions which prevail in respect to that commodity?—A. We do both. We try to consider everything, every fact, every circumstance surrounding that particular question. Our committee adjusts that matter precisely as this committee would do if called upon to state what the rating ought to be on any article, say, candles in boxes. You would want as full information as you could get; or if you had already fixed it and were asked to reduce it you would want all the light you could get. The principal duty of the chairman of the classification committee is to get that light. In the old manner of handling it, they did not have anyone whose duty it was to get that information. We take an article, consider the weight, the specific gravity, and all that sort of thing; and the value of it. Then perhaps further facts are presented to show that local factories are springing up in the South, etc. There is nothing exact in it. If there were, we would all find it easy. We take a thing and measure it and weigh it, and compute its risk to begin with.

Q. The cost of transacting the business is in a very small degree the basis of your charge?—A. Of course we always have that in mind, especially with respect to heavy articles; but we do not figure what the cost of transportation would be. We can not do that.

Q. You have some letters there illustrative of the way in which you handle some of these questions. Perhaps one or two of those might be of interest, without taking very much time.—A. I brought along a few—I will leave them all with the commission—a few of what we call docket advices. I will read one. (Reading:)

[Docket No. 1291.]

SOUTHERN CLASSIFICATION COMMITTEE,
Atlanta, Ga., April 9, 1901.*Hair, for plastering. (Previous No. 1012. File 831.)*

Listed upon request of Mr. W. T. Tilden, No. 250 North Front street, Philadelphia, Pa.

The present classification on plastering hair is as follows:

Hair, viz:	Class.	
Plastering, pressed in bales, or in paper sacks, compressed in bundles, L. C. L.	3	
Same, C. L.	4	
Official:	L. C. L.	C. L.
Hair, n. o. s., in paper sacks, compressed in bundles	2	..
Hair, n. o. s., in compressed bales	3	..
Hair, as described above, min. wt. 20,000 lbs.	..	5
Western:		
Goats', hogs', and plastering hair—		
In paper sacks, machine compressed, in solid bundles	3	*5
In sacks	1	*5
Pressed in bales	3	*5

The request is that the minimum carload weight be reduced to 20,000 lbs., on the grounds that that minimum is accepted in Eastern territory and that an ordinary car will not load to the required minimum.

Respectfully submitted.

P. J. MCGOVERN, *Chairman.*

Now, that was not reached at the last meeting. We did not complete the docket, or I could tell you what they decided to do. What I think they ought to do is to grant the request. I think that the minimum on that plastering hair ought not to be more than 20,000 pounds. I will see if I have another one.

The witness submitted Docket No. 1295:

[Docket No. 1295.]

SOUTHERN CLASSIFICATION COMMITTEE,
Atlanta, Ga., April 9, 1901.*Butter and cheese in common and refrigerator cars. (Previous Nos. 336, 501, and 561. File 324.)*

The Armour Packing Company, of Kansas City, Mo., has written several of the members, and also the chairman, urging a reconsideration of butterine.

Prior to the issue of Classification No. 26, the rating on butter was as follows:

Butter (in common and refrigerator cars), viz:	Class.
In cans, boxed or crated	3
In cans, n. o. s.	2
In kegs, firkins, buckets, pails, and tubs	3
Classification No. 26:	
Butter, viz—	
In cans, boxed or crated, kegs, firkins, buckets, pails, or tubs, in common cars	1½
Same, in refrigerator cars, carrier's option	1
Classification No. 27:	
Butter, viz: In cans, boxed or crated, or in kegs, firkins, buckets, pails, or tubs	1

The chairman understands that the Armour Packing Company request that the ratings shown in Classification No. 25, and as quoted above, be restored.

Respectfully submitted.

P. J. MCGOVERN, *Chairman.*

That butterine question has a history all by itself. We advanced that further back, independent of that general advance, because we had it so low that, when we did the icing on mixed lots, it cost the carriers sometimes more than the entire

* Min. C. L. weight 20,000 lbs.

revenue. Mixed lots of cheese and dairy products were carried so very cheaply down through Louisville to Atlanta and that country that some of the lines—and especially those which carried for way points, so that there was very little left in the car for the long distances—paid more out for ice than the gross revenues on the shipment; therefore, we put the rate up. The Armour Packing Company asked that we restore that old classification, because they said that their butterine is shipped in with mixed packing-house products, and that they pay their own icing. (Reading last paragraph of Docket No. 1295:)

"The chairman understands that the Armour Packing Company request that the ratings shown in Classification No. 25, and as quoted above, be restored."

Well, now, that was denied. If all butter and butterine were shipped in or with solid earloads and the shipper paid for the icing, we could probably afford to do it, but we can not make a lower rating on that than we do on the butter business generally shipped in small lots. So the committee denied the application.

Q. Have you ever had an appeal to the courts in respect to your classification of any particular product, or to the Interstate Commerce Commission?—A. I do not recall any complaints since the committee was organized. The Merchants' Association of New York, I understood, was going to file a complaint with the Interstate Commerce Commission; whether general or specific I do not know. I have not heard anything further about it. I do not recall anything done by the committee which has been made the basis of a complaint to the Interstate Commerce Commission.

Q. Another topic that I would like to have you speak upon, if you will, is that of underbilling and the degree to which the railroads might possibly be protected against underbilling by the action of some governmental agency, through the Interstate Commerce Commission, through inspectors, or some other way. Will you describe the situation as far as underbilling is concerned?—A. I am glad you asked that question. This matter of underbilling, by which we mean either underreporting of weights or false description of goods for the purpose of getting a reduced rate, is one of the most troublesome things that the transportation lines have to contend with to day. It is not only because they lose revenue by this underbilling. That is probably not the most serious feature of it. It either prevents the honest shipper from doing business or drives him into underbilling himself. That is the very worst feature of it.

Q. Will you give us some examples?—A. Well, I do not want to mention any names. I do not want to name any firm. I have a particular individual or firm in mind, and this kind of test was recently made. The shipments of a large jobbing concern in one of the Southern cities by a single line of railroad from that point in one day were weighed and carefully inspected, and were found to be underbilled some \$11. Thinking perhaps that it was an exceptional case, the parties making the investigation waited a week or 10 days, or some longer time, and made another somewhat similar investigation, and found the underbilling to be \$17 that day. Now, there are several lines at that point, and the conclusion then reached was that that particular house was probably underbilling \$50 a day. Whether they got the benefit of it or simply gave it to their customers, we have no means of knowing. If they sold the goods delivered, they took the benefit of it themselves; if they sold f. o. b., of course the customer would get the benefit of it. But the very worst feature of that particular thing is that there is another house in the same city and in the same line of business that, I believe, does not underbill, or certainly does not want to underbill. I maintain that it is the business of the carriers, no matter what it may cost them, to stop the underbilling by the concern that does underbill, and therefore remove the temptation from the other concern that does not want to do it.

Q. This same underbilling may take place by what we might call underclassification, may it not?—A. I meant by underbilling the underbilling of weights and misdescription of the goods to get lower than the published and legal tariff rate.

Q. Did you not state to me that they went to the extreme at one time of shipping matches and gunpowder in the same package?—A. I do not remember that. I remember stating that we found a case where whisky was billed as molasses. If I had the time to show you all the ingenious ways in which this thing is attempted, how brazen some of them are, the commission would probably be astonished. Whisky was billed as molasses. Vinegar was billed as molasses.

Q. (By Mr. PHILLIPS.) Well, vinegar billed as molasses would be cheaper than molasses, would it not?—A. The rates in that country on molasses are lower. Whenever the rate on one article is no lower than on the other article, there will be no false classification.

Q. Could you name some other matters along that line—some further illustrations of underbilling?—A. I could mention some apparently systematic underbilling. Why, it is coming up every day, and more frequently—all sorts of false descriptions.

Q. Explosives?—A. I don't remember anything so desperate as that. They will take a part lot of machinery that has a fly wheel in segments and try to get that shipped separately on a different car as rough castings. There are thousands of devices.

Q. Do the railroads ever have part in that in order to give cheaper rate of freight?—A. Undoubtedly. There is no doubt in the world that many soliciting agents have put the shippers up to it. A man came to me a year ago—a manufacturer of overalls and hickory shirts in Atlanta—and showed me a letter from Rice, Stix & Co., of St. Louis, complaining that the rate had recently been put up. Well, the fact was that he had been billing as cotton-factory products, and some inspector had discovered it. He said: "I do not remember who it was, but some fellow told me to bill my goods as cotton-factory products." I did not try to pump him about it. I did not care. It was none of my business, but I advised him what to do and wrote him a letter. I said: "I could lend you encouragement and say that the matter will be taken up at the next meeting, and you would go home satisfied that something was going to be done; but I will not do that, because I know they won't reduce the classification. What you want to do is to go to the rate makers and get rates from Atlanta to Ohio River points and St. Louis, etc., on your goods as a commodity; and because you can show that you compete with Baltimore that you are entitled to low rates out in that country." Whether he did it or not, I do not recollect. As to what percentage of the total underbilling is either instigated or connived at by the railroads it would be the merest guess in the world, but I am satisfied that it is a very small per cent of the total.

Q. Would it not be criminal where the railroads have connived with them?—A. It would.

Q. It would be a violation of the law in discrimination, would it not?—A. Yes; the worst kind—morally bad as well as legally bad.

Q. You believe that obtains quite largely in your section?—A. I think it is a small percentage of the total underbilling. I say I have not the slightest doubt that in many cases it is started in that way. The soliciting agent is greedy for business, you know, and tells his customer how to go about the matter; to bill his goods as cotton-factory sweepings or bill it as something else. But I am sure that is the cause of a very small percentage of the total underbilling.

Q. (By Mr. RIPLEY.) And yet the percentage of all shipments which are underbilled is considerable?—A. It is considerable. I seem to see more of it all the time. Now, whether it is a greater percentage of the total volume of business than it was 10 years ago I do not know. The business is larger, and it may be that there is not any greater percentage of underbilling, but it seems to me there is.

Q. Are the agencies, such as your committee, protecting the roads or acting in any way to prevent this?—A. Our committee has no machinery for that at all, but the traffic associations have. An effort is under way now to extend that work very much in the Southern territory.

Q. (By Mr. PHILLIPS.) Well, do the traffic association take measures to prevent this, do you think?—A. Yes.

Q. You think they are working for that, do you?—A. Yes; they have some agents, but they have not enough.

Q. (By Mr. RIPLEY.) Would it be possible in the nature of things for any single road to be rigorous in its policy of making inspection and of enforcing a particular classification rate from a general agency?—A. It should be from a general or joint agency.

Q. Do you see any advantage in having the enforcement of that classification to some degree intrusted to a body like the Interstate Commerce Commission?—A. I do not.

Q. Do you think the railroads are perfectly competent to take care of that themselves?—A. I do, if they want to; yes. I go further; I say if they want to do it they can do it, and if they do not want to do it either the Interstate Commerce Commission or any other tribunal would have trouble in attempting it. They would have all sorts of obstacles. The record books would be in the press, and a thousand excuses would be given. Now, if the roads want to do it—and I think they ought to do it in protection to the honest shipper—they can do it, and they are doing it to a greater extent in the North and East than we are.

Q. (By Mr. PHILLIPS.) Have you any legislation to suggest along that line to prohibit that?—A. To prohibit underbilling?

Q. Yes.—A. I think the present legislation is adequate, but it seems hard to convict; at least convictions are very few. The penalty is all right now for underbilling. Maybe it is too heavy, and if made lighter there would be more convictions. There ought not to be any imprisonment. I think the fine is enough. There is a fine and imprisonment now. I think the imprisonment feature ought to be repealed. It is more difficult to get a railroad agent or a shipper up to the scratch of testifying against the other fellow when the penalty is a term in the penitentiary than it would be if the penalty were a thousand dollars or five hundred dollars fine. I think the imprisonment feature might be profitably omitted.

Q. Do you think a fine would be sufficient to prohibit?—A. I think it would in a great many cases.

Q. Would you make that fine cumulative?—A. I would if it could be shown that it was deliberate. I would not stop at one prosecution. If a fellow had been under-billing vinegar every day, from one to five dollars a day, he ought to pay more than the fellow who did it only once. The presumption would be that he did it deliberately, and he ought to be made to pay for his wrongdoing. But apart from the question as to whether the law provides adequate penalties, or whether it is practicable to enforce a law in that respect, it is the moral duty of the carriers, regardless of expense, to see that this thing is stopped, if only to protect the shipper who does not resort to it. It is one of the greatest abuses to-day in the whole traffic field, in my judgment.

Q. (By Mr. PHILLIPS.) Are not the companies who own their own cars using them for discriminating purposes also?—A. Shippers who use their own cars?

Q. Yes.—A. You refer to the mileage question, now?

Q. Yes.—A. It has been done. You mean that private companies carry their own goods in their own cars and receive a greater mileage than allowed others?

Q. Yes; lower rates.—A. Yes; that is correct. It is done, as I understand it, by allowing them a greater rate per mile for wheelage than is paid others, and which is usually three-quarters of a cent per mile per car. I have heard of cases where they paid 1 cent, and often more, per mile to the owner of that car.

Q. (By Mr. FARQUHAR.) Do you regard the giving of commodity rates as a discrimination on the part of the roads in favor of shippers?—A. Not at all.

Q. Are commodity rates a favor to the road or a favor to the shipper?—A. If a commodity rate is made by a carrier it is supposed to be an advantage to both. It enables the shipper to move his business and enables the carrier to obtain new traffic at a profitable rate.

Q. What is your policy in respect to giving commodity rates instead of putting it into classes?—A. Well, in most cases the commodity rate governs only where the business is to move. If you reduce the classification you reduce it all over the territory. Now, I gave an illustration of that a few moments ago. There is a man at Atlanta manufacturing these cheap overalls and shirts. He wants to ship to St. Louis. I told him it was useless to ask the classification committee to reduce the classification on those things to fifth class; that he did not need it; that he did not want to have them reduced unnecessarily. I asked him if he had any trouble shipping to Birmingham? He said: "No, sir; no trouble in shipping to Birmingham or to Chattanooga. The only trouble is to get out to St. Louis and the other territory and up there where I come in competition with Baltimore." I went on to tell him how to get it to the attention of the traffic association and then wrote him a letter confirming that. Now, if it were a question between that man's not doing business at St. Louis and our reducing our rates all over the Southern territory on overalls and shirts, we would be obliged to say: "You can not do that business; it will cost us too much to enable you to do that business."

Q. Why should you take care of his business in St. Louis?—A. I do not think it was wrong. On the contrary, it was right for the roads to help him to go to St. Louis, because the roads are in business and he is in business, and they help each other and it becomes a partnership. I have got a pair of overalls here that I have to land in St. Louis at a certain price, and in order to do that I will put my price down and you must put your rate down. It seems to me it is a fair, sensible business proposition.

Q. Well, if you take up overalls, how many other articles will you take up and make commodity rates on?—A. The rate-making people are taking up and extending the rates all the time.

Q. So your policy of classes will amount to a very little if you go on?—A. It amounts to a great deal.

Q. Through commodity rates you can encourage the road there to give commodity rates when they can not take regular class rates?—A. It does not encourage the roads to give commodity rates. I do not know that I clearly understand you.

Here is an article that is first class in the classification. If it were reduced to fifth class that would reduce it all over the South on every line, regardless of distance, regardless of origin or destination. I say to a manufacturer that it is useless to ask the classification committee to do it, but that there is no reason, it seems to me, why he ought not to have a rate to St. Louis which will correspond to the rate that his competitors have, and that in order to accomplish that he must go to the traffic associations, and I tell him how to go about it. Now, I can not see that that was not a perfectly sensible proposition from both sides.

Q. In other words, he was a pet patron, and all the rest had to take the classification you gave them?—A. Not at all; no pet. It was no more than I would do for any other manufacturer.

Q. Why, the railroad immediately interfered there in the Baltimore trade?—A. Yes. The Baltimore fellow did not like it, and the line running from Baltimore to St. Louis probably did not like it.

Q. No other manufacturing man in Atlanta there got the advantage this man did to get the goods out to market?—A. Yes.

Q. Commodity rate?—A. Yes. We do it for the furniture people, bag manufacturers, paper-box makers. It is the policy of the Southern roads to do that, and, I may state, the policy of the Western roads and the Northern roads. When they reach out beyond their own territory to compete with other shipping points they put down the rates or make commodity rates.

Q. It has been the general policy of the Southern roads to give commodity rates?—A. No, sir; I can not say that. What I would say is it has been the policy of the Southern roads to make commodity rates for Southern manufacturers, to enable them to reach out for trade, but not to reduce the classification of freight within the territory, because it is unnecessary.

Q. (By Mr. RIPLEY.) Do I understand that by the reduction of commodity rates all persons got that same rate, but that the reduction of the commodity is made by each railroad independently?—A. No; the commodity rate shows exactly between what points it governs. That is what we mean by a commodity rate.

Q. In other words, all manufacturers of that commodity in Atlanta get the same advantage in reaching St. Louis?—A. Precisely.

Q. Without discrimination?—A. And, further than that, if there were similar manufacturers of the same goods in Birmingham, Montgomery, Macon, or Augusta, or any other point down there, we would give them a corresponding reduction.

Q. (By Mr. FARQUHAR.) Is not that a discrimination?—A. That is a discrimination in their favor, but not an unjust discrimination. I claim that is a sensible business-like discrimination, and that is just how the business of the country has been built up. Unless it can be shown that the purpose was directly to give that man an advantage over somebody else in his neighborhood or in his territory, I can not see anything wrong about that. That has made our Southern iron business. We make lower rates northbound on pig iron than on manufactured iron articles coming into that territory.

Q. I believe you said the reason you raised the iron and steel tariff there was because the railroads, in their equipment and otherwise, had to use iron and steel, and a higher price made a higher rate?—A. Yes.

Q. How long did that measure of recompense hold on the roads?—A. It is in effect yet.

Q. Now?—A. Yes. And that brings up another feature of that iron matter. The Old Dominion Works at Richmond had some correspondence with me about that iron and steel list, and I told Mr. Clark, who is president, I think, or wrote him, that it might be that a little later on we would have to revise that list again. Things might settle down; we might have to put the ratings back, but we did not think the time had come yet. We can not tell what the conditions may be a year from now. We may have the ratings on iron 12 months hence lower than when we started.

Q. (By Mr. CLARKE.) Are these commodity rates mostly remunerative to the roads?—A. They are believed to be. I do not believe that any general freight agent or any traffic manager has ever yet made a rate lower than he believed it would cost him to haul the business.

Q. That being the case could not the roads afford to reduce all their rates to substantially the basis of the commodity rates?—A. Not at all. I have just said on this question of overalls that we would tell the manufacturer in Atlanta that if it were a question between our having to reduce the whole classification all over this territory to the fifth-class basis, and saying to him that he should not ship to St. Louis, we would be obliged to say to him that he should not ship to St. Louis. Now, it seems to me that answers that question. We can not afford to reduce it all down to the commodity rate basis, but we can afford to haul it at a much lower rate to St. Louis than we are hauling it for, and still make some profit on it, if it enables the manufacturer to do business. It seems to me that it is precisely like a man's stock of goods. He will sell some of it at 5 per cent profit, and some at 10, and on some he is obliged to make 40 or 50.

Q. (By Mr. FARQUHAR.) That is honest.—A. That is the whole traffic question right there.

Q. (By Mr. CLARKE.) If you had only commodity rates then, you would hardly be able to do business?—A. If we reduced all the rates down to the lowest rate basis, commodity rate basis, we would go into bankruptcy.

Q. Then the commodity rates are remunerative only as an exception to the rule?—A. They are remunerative as additional business—for increased traffic.

Q. Do you have any other shipment contracts with any steamship companies?—A. You mean for the Southern railways.

Q. Yes.—A. They have their traffic arrangements for dividing the rates on percentages. You mean coastwise steamship companies?

Q. No.—A. Oh, I do not know of any contracts with transoceanic lines. There may be; I do not know anything about that.

Q. (By Mr. FARQUHAR.) Is it a fact that the great Southern manufacturers and producers of iron and steel and coal there got their start from discriminating rates, commodity rates?—A. They got their start from our joining with them in meeting the competition outside of their territory, but we did not reduce the rates correspondingly on all the iron products coming into the territory. To illustrate: The Peninsular Stove Works at Detroit wants a lot of pig iron, and they say they are going to get it where it suits them best. The furnaces of Birmingham have to enter into competition with the Mahoning Valley furnaces and the Pennsylvania furnaces, and in order to enable them to do that the Southern roads make them a rate as low as \$1.50 a ton from Birmingham to the Ohio River, but not less than what it costs, them to handle it. They still think they made a little profit. The pig iron is made up into stoves and shipped back to Anniston or Birmingham. If it came to a question of hauling all iron in that territory on the pig-iron basis, or telling the pig-iron furnaces to close up, they would have to say, "Gentlemen, you will have to shut down your furnaces. We are not going with our eyes wide open into bankruptcy, and that is what this would mean." There is one feature in this whole thing that it seems to me we always ought to keep before us. The making of a competitive freight rate, mind I say competitive, is subject to precisely the same conditions as the price of the thing unshipped. You meet competition if you have to, and the maker and the carrier join in a partnership, and both are helped, and nobody is hurt, except the man who would have done business from some other point of shipment, possibly. The shipper is not hurt, the carrier is not hurt, the user or consumer is not hurt, and that is the plan on which the internal commerce of this country has been developed.

Q. (By Mr. RIPLEY.) Is it not true that there has been a very great increase in the number of these commodity rates in recent years?—A. They are on the increase. Your mean in our territory?

Q. In your territory.—A. They are on the increase.

Q. Quite rapidly?—A. They are increasing right along, and usually the increase is on some new article of manufacture. There is a concern in Atlanta just starting in the manufacture of rugs. How in the world they do it, I don't know. They bring the wool from Philadelphia, and make it into rugs, and then they ship them out West. The secretary of that concern talked with me, and he probably has asked for a line of commodity rates on his products from Atlanta, not to points right around there, but to points out West where he was reaching out into that territory.

Q. You spoke sometime ago of the rates upon pig iron as compared with manufactured products. Do I understand you to say at the present time that the rate on pig is lower than the manufactured iron?—A. What I meant was this: That we make lower rates on pig iron, and for that matter, on other products of iron from all points in the South to points outside of that territory than we do on all iron products coming into the territory. For the cast-iron pipe people at Bessemer and Anniston, we make rates on their pipe out to Ohio and all that Western country, and East, at about the same rate as pig iron.

Q. (By Mr. KENNEDY.) You can not make it lower outside of your classification boundaries can you?—A. As far as we reach. We make them through to New York and Boston, and to the Ohio River when going to the Western territory.

Q. (By Mr. RIPLEY.) However, there have been times when the rates on pig iron was higher than the rate on manufactured iron?—A. Yes; that was true once, and it came about in this way. There was a time some years ago when they made the cast-iron pipe rates from the Birmingham district to the Ohio River the same per 100 pounds as pig iron. You see that made it read less per ton because cast-iron pipe is 2,000 pounds and pig is 2,268 pounds per ton.

Q. Right there, in that same connection, is it not true at the present time that the rates on cotton manufactures are lower than the rates on raw cotton?—A. Yes; in some cases they are. They are higher and lower. The rates are not made with relation to each other, but it is a fact that the cotton rates from the South are in some cases higher than the rates on the factory products. As I say, they are not made with relation to each other; they are made on a different basis.

Q. Would it not seem to introduce an element of injustice between Northern and Southern mills if the Northern mills have to pay more on their raw material than you charge on their manufactured product?—A. Oh, in a general way, yes. I would say that the raw material ought not to be higher if it would cut any figure. I do not believe it cuts much figure, and, in a general way, I would say that the rate on raw cotton ought not to be higher than on the same thing when its value is increased by the application of skill, or by manufacture.

Q. Now, is there anything in the nature of the railroad business itself which would tend to lead the carriers to bring into line the raw product and the manufactured product for the protection of the New England competitor?—A. If it had amounted to anything, it would have come up before this. Now, the New England manufacturers have not raised the point, and if they did raise it and urge it, I do not know whether we would reduce cotton rates or put up the other thing; but it does not seem to have affected the business one way or the other. I do not know that there is any necessity to reduce those cotton rates.

Q. I found quite a little complaint at Richmond of the difficulty introduced into business by reason of the fact that all their products coming in from the West to be shipped into the Carolina territory came into Richmond on the official and then went south on the Southern, whereas the Western manufacturer who ships directly into the South ships on the Southern classification all the way?—A. That is right.

Q. Can you suggest any way of obviating that difficulty by the extension of the uniform classification, or anything of that kind?—A. Well, it does not grow out of that trouble. The complaint would exist even if there were only one classification. It comes about in this way: The rates from the West to Richmond, proper, are subject to the official classification—that is, the rates to Richmond on goods stopping there. The rates are made the same as to Baltimore. But on through business going into the Carolinas, not Atlanta, not Charleston, not Savannah, but into the Carolinas and a few points in Georgia through Richmond, they have what they call proportional rates to Richmond, subject to the southern classification. It has been done since 1886. That is what the Richmond people complain of. In other words, it is not so much of a classification question as it is a rate question. If there were only one classification, we might still make a lower proportional rate to Richmond on business going beyond than when it stops there. Take Cincinnati. Cincinnati to Richmond is 62 cents, but the proportional rate on business going to the Carolinas is only 32 cents. The classification does not have much to do with it.

Q. A very important question before this commission is that of uniform classification, prescribed or not by the Interstate Commerce Commission, but in any case a uniform classification for the whole country; and a large contingent of shippers in the South complain at the present time because of the difficulty in computing or verifying their rates, through the existence of these different plans of classification. In your judgment is it possible or will it ever be possible to bring these several classifications together, or to prescribe a single one for the whole country?—A. A great deal has been said about a proposed uniform classification to govern all over the country. In my judgment that thing is not impossible, but I believe it to be impracticable, and I believe that if they had it they would find that it did not cure all their ills, that its value had been overestimated. I have stated that I believe it would be impracticable. I will explain that. Ignoring all questions of exception sheets, just let us suppose that there are only three general classifications in the country now without any exceptions to each. Suppose that it was the duty of the Interstate Commerce Commission, or of a general committee, or of this commission, or any other body to unify those three classifications, and to bring them into harmony and at the same time not to violently disturb existing rates. Now then we would go about it something like this. We would take the official classification and the Western classification and the Southern classification, and we would go through them item by item. We would strike an article that was first in one and second in the other and third in the other. To bring it down still finer and better, perhaps, take cotton-factory products. They are first in the Western territory, they are third in official territory, and they are to-day fifth in the Southern territory. Now, how would we reconcile that? Bear in mind that we do not want to violently disturb existing rates, which are believed to be about right. Well, the official man would say, I do not want to put that up to first-class, and I do not want to reduce it to fifth. Now, Mr. Western, you must meet us half way, and Mr. Southern you must meet us half way. We must strike a compromise somewhere, and, if we do, we will have a complaint from everybody where we advance rates, and we will reduce unnecessarily in some other cases, or else we must start a separate class. Well, call that class 19, if you please, or class 36. When we got through, there would be probably 80 or 90 or 100 classes. Now, nobody wants to see anything of that kind. Nobody wants any 100 class classification. That is why I say I believe it would be impracticable. Fundamentally, and more important still, I think is this: That the country is so vast and conditions are necessarily so unlike. Conditions are not the same in Maine as in California or Florida. As an illustration of that: Some time ago we established a rating on tree-covers. A man in Florida has a patent there for what he calls a tree cover. It is made of canvas, and there is a framework that folds up and is put in a package. It is made to protect the orange trees in case a sudden frost is threatened. Now they have not anything like that in Indiana; they have not anything like that in official classification territory; and we made a much lower rating, I am satisfied, on that than if it were to govern all over the United States, because we wanted to protect the oranges so we could get the haul of them.

Q. (By Mr. PHILLIPS.) Now, there is one statement you made in regard to the difference of classifications in the different sections of the country on cotton.—A. Cotton-factory products?

Q. Yes. Now, would there be a reason why it should be class No. 1 and a much higher rate in the West than it is in the South and East?—A. There is an excellent reason.

Q. And is there much difference on other things in the other classifications in these different districts?—A. The rates may be higher or lower in one section than in another, but here is a case where the classification also differs.

Q. Well, the class No. 1 in the West would be much higher than No. 4 would be in your section, would it not?—A. Yes; it would be higher there. Their first-class rates for like distances are higher than our fourth-class rates, I think; but even if they were not higher, there would still remain the difference in the classification, whatever the scale of rates might be in the different sections. We are supposing that we want to try and harmonize these classifications. Now, the only way we could do that would be to start a new class for cotton-factory products. I do not see any other way in the world to do it.

Q. But if there were no difference in the cost of hauling, then you could make a lower classification, couldn't you?—A. Oh, we would not stop at the cost. We would have to consider all the circumstances. Now, answering the chairman's question as to why cotton-factory products ought to be first in one section and third in another and fifth in another. I do not know about the Western territory, but I can understand that out there it is purely a consuming territory. They are simply dry goods to them. There is no question of encouraging the development or growth of cotton mills. It is a simple dry goods proposition out there, and they have got it first class. The official territory where they are third class is both a producing and a consuming territory, and the third class, I have no doubt, was a compromise in 1887 when they first made and adopted the official classification; a compromise on all the rates they had in force. I have no doubt that about 1887 the New England mills had very low commodity rates to the West. It was probably 50 cents to Chicago, and the third-class rate from New England to Chicago to-day is 50 cents. I have explained as to our territory that we started out with sixth class, which is the lowest merchandise class. That was done to put these Southern mills on their feet. We afterwards put it up to fifth. To-day we have commodity rates to the West, in competition with the New England mills, which are lower than fifth class and actually even lower than sixth. We have tried to fit the tariffs and classifications to the conditions, and that is what the other fellows have done, I am satisfied, in the North and West.

Q. (By Mr. KENNEDY.) What will they do when there comes a community of interest in all these railroads?—A. I think it will gradually level itself up when the conditions get alike as to density of traffic and when each territory is a producing as well as a consuming territory. It will gradually level itself up, and I think that finally, though it may be some time hence, the rates will be as low in one section as in another. There is not any inherent reason why a road in the State of Ohio, earning so much per mile per annum, should not have about the same rates as a road in any other State where the population and business are about of equal density, which earns about the same revenue per mile per annum. There is no inherent reason why the rates in Florida should be higher or lower than in California or Maine. It is a question of commercial conditions.

Q. (By Mr. A. L. HARRIS.) Is it possible to have a uniform classification all over the United States?—A. It is possible, but you would have so many classes that it would be an impracticable thing. It can be done, there is no doubt about that, but it might take 200 classes—I don't know; but if you were going to put everything in the same class in all of the three classifications, and at the same time not violently disturb the present rates, it could be done only by the multiplication of the number of classes.

Q. If it could be done, would it simplify rates going from one territory to another?—A. It would where the rates are made on combinations, as we call them. A combination rate means a through rates, made by adding two rates; and where you cross these boundaries, like the Ohio River and the Mississippi River, you have to make a combination rate. Undoubtedly it would be more easily done if the same classification governed up to the boundary and beyond. But a great deal of the trans-boundary business is made on through rates subject to classification for example; and from Pittsburg and all territory east of there through rates to our section are governed by the Southern classification. You go to Buffalo or Boston and ask for the rate to Atlanta and they will show you a tariff with a through rate governed by the Southern classification. That is done for convenience, and done also to keep the interior in line with the port.

Q. (By Mr. RIPLEY.) I would like to ask you to speak on the peculiarities of the Southern situation as far as the long and short haul is concerned, the existence of water competition, and the difficulties which the roads experience in making rates under those circumstances.—A. The principal difference between the rate system in the South and in the other two general sections of the country is that we have lower rates to what we call basing and competitive points than we have to the small local stations. Those competitive points started out with water points like Nashville, Pensacola, Selma, Augusta, Savannah, Charleston, and New Orleans. They begin there. When the first roads were built they had to meet those rates. If they did not exactly meet those rates they partially did so and had to fit their tariffs to the conditions as they

found them. Later on, as new roads were built, a new kind of competition sprang up; that is, the competition between rail carriers. Here is Atlanta, a point of consumption; here is Baltimore. There is a system of rail carriers from Richmond to Atlanta, say, and another set of carriers from the West to Atlanta. There was competition between carriers and between markets that got the rates down to these large all-rail points, where there is no water at all, and those points have grown in number, but not greatly so, from the construction of new roads. Now, in the South, we have not believed that we ought to be called upon to put down rates to every intermediate point, where competition does not exist, because we do meet the competition at one of these competitive points. That is our position on the long and short haul clause. The only difference in conditions as between Georgia and Ohio is that in Ohio they had about reached a flat fourth-section basis before the law was ever passed. I remember asking Mr. McLeod, of the Cincinnati, Hamilton and Dayton road, just after the law went into effect, or about that time, how he made grain rates from points along his line to the East before the act to regulate commerce went into force. He said, "Well, of course, at Cincinnati we had our rate fixed at 87 per cent of the Chicago rate. Then we would go out and make the first group of stations about 1 cent higher than Cincinnati. We found that that was about as high as we could get, because at the next group we would strike nearly always East and West lines, and if we made it more than a cent higher from a given point, why then we would find it going some other way." When he got through, I said, "Then your rates are about the same as they were before?" And he said, "Just about." I said, "You get just about the same proportion out of them?" And he said, "Just about." I had previously said to him, "How did you divide your rates when you made them just 1 cent or so higher than the common point?" He said, "We added that 1 cent to our common-point proportion. After the law was passed they all blocked their roads out so as to give each line not less than 150 miles in the division of the rates." So I said, "Your rates are just about the same as they were, and your proportion is just about the same?" And he said, "Just about." That country up there is so gridironed with roads that they can not make the rates as we do in the South. The conditions are different. When we get enough roads in the South we will get to make our rates as they do in the North; we will just fall into it naturally.

Q. Your justification of the reduction of the rates to a competitive point where there is either water competition or the competition of several roads would not seem necessarily to apply to points which are not on the water and where railroad competition is not so extreme? I refer to places like Albany and Americus, Ga., and Cordele. Those are purely arbitrary basing points, are they not?—A. They are not; no. If one single line at one of these points says "we are going to make this a basing point because we believe it to our interest," there is competition and the others must meet it. You have got to compete not only with sensible traffic officials on the roads, but with others who are not so sensible but who are still doing what they believe for the best interests of their road. Now, competition is anything that compels a carrier to reduce a rate.

Q. Does it seem fair and just that the action of one road which, as you characterize it, may not be acting in the wisest way, in designating a certain point as a basing point, and giving it lower rates than the surrounding district, should be followed by the other roads, and that thereby that particular town should be built up at the expense of the surrounding country?—A. It is the road that first reduces that does it.

Q. And it compels all the others to do the same thing?—A. They must meet the rate or stay out.

Q. Is there not a disposition on the part of some of the more conservative roads to object to the designation of some of these new towns as basing points?—A. Undoubtedly so. I do not say that every basing point ought to have been made so, and I think some of them ought not. I think Cordele is one that ought not to have been made a basing point, but one line forced it and thought it was going to be to its interest to do so.

Q. Do you not, in admitting the system, open the way to just such arbitrary discriminations between towns as you have described?—A. Why, yes; we make it possible.

Q. And does it not sometimes operate to the disadvantage of the more conservative policy of the roads themselves?—A. Why, undoubtedly; if a line makes an unnecessary or unwise reduction, it operates to the actual loss of the more conservative lines.

Q. Do you see any way in which, either by legislation or by change of policy on the part of the roads of the South, this tendency to designate a number of towns arbitrarily as basing points may be stopped?—A. It will not be stopped, but it is going on very slowly, and there is very little more of it now than there was 15 years ago. There has been no tendency to rush into the thing. There have been very few points added to those low-rate points.

Q. I find a good deal of dissatisfaction in parts of the South, in certain towns, because competitive towns have been thus designated as basing points, on which the rates to the whole surrounding country are based and fixed, and there seems to be a feeling on the part of those towns thus discriminated against that they should be protected in some way by the interstate-commerce act or by some other agency, by the railroads themselves, perhaps.—A. I know there is such a feeling. I have testified in cases of that kind.

Q. Can you suggest any remedy, or have you any to propose?—A. I do not think they are entitled to any remedy. It is due to competition and competitive rates. If you reduce all the points around there, that is not competition. That is where the injustice may come in.

Q. Do I not understand that there are basing points where there is no competition—points on a single road?—A. No; I do not know of any such points. We speak of basing points and competitive points and common points in about the same sense. I referred to Atlanta, Macon, Albany, Americus, Selma, Birmingham. Birmingham has no water competition, but the rates have been forced down there below the Atlanta basis from the West. They are always lower than to Atlanta from the West. In the Social Circle case I think it would be a great injustice to Augusta to give Social Circle the same rates.

Q. You say that Birmingham has lower rates?—A. From the West.

Q. Lower from the West than Atlanta?—A. Yes.

Q. Is it not true that Birmingham and Atlanta have the same rates from the East?—A. That is true.

Q. Now, I find great complaint at Atlanta from that condition. They say that if Birmingham has the same rate east through Atlanta that Atlanta has the roads in the opposite direction ought to give Atlanta the same rate that Birmingham has.—A. Not at all.

Q. Will you explain why?—A. Yes. From the East those points have been grouped. Birmingham and Atlanta have always been in that group. It was a compromise.

Q. Who put them in that group?—A. The roads.

Q. For what reason?—A. Because they had a group basis; that is all. Now, coming to the adjustment from the West, the rates were about the same to Birmingham as to Atlanta. But when the Kansas City, Memphis and Birmingham road was built from Memphis to Birmingham, some 12 or 13 years ago, why, the map was changed. That road said: "We are not going to make the rates from Memphis to Birmingham, our own points, any higher than from Memphis to Chattanooga." They finally compromised on a scale of figures. They made them themselves. They did not compromise with other carriers, but they compromised with themselves on a scale of figures beginning with 75 cents first-class. Before that it had been 90 cents first-class, as I remember. They made it 75 cents first class, and those are the rates to-day. I was with the Louisville and Nashville road at that time, and we endeavored to hold the rates as they were from the Ohio River, Louisville, Cairo, Evansville, and Cincinnati, and we did hold them for a while. Finally one line from one point on the Ohio River said: "We will not stand it any longer. We are going to put in a rate of 4 cents above Memphis." This is the established differential and was fixed by Judge Cooley's decision in 1886. And they made a 79 cent scale from Louisville, Cairo, and Evansville to Birmingham, and those are the rates today.

If Atlanta is entitled to lower rates from the East than govern to Birmingham and other points west of Atlanta, then why is not Athens, Ga., entitled to lower rates from the East than Atlanta, because Athens is east of Atlanta; and why, in turn, would not Elberton, Ga., be entitled to lower rates from the East than Athens, because Elberton is east of Athens? Yet Atlanta and Athens and Elberton all take the same rates from the East. It is simply this: That each shipper is, naturally and properly, looking out for his own interests. Now, if you scale the rates out on distances, regardless of general conditions, commercial and otherwise, which govern in fixing freight rates, you would make Anniston lower than Birmingham and Birmingham lower than Montgomery, which the Atlanta man does not want. We simply stopped at Birmingham, so far as the rates from the West were concerned. The situation at Birmingham was forced upon us, as already explained. We did not go farther than that.

Q. Why not stop at Atlanta and force it on some other town?—A. There was no line reaching Atlanta which sought to force down the rates to Atlanta. It was the new line at Birmingham which forced the reductions at Birmingham. That line, as already stated, was the Kansas City, Memphis and Birmingham road. They said, "We do not see how we can undertake to maintain higher than these figures from Memphis to Birmingham," and they would not maintain higher, and the rates have since been continued on that basis. I have told other people just what I now tell the commission, and have insisted, on the witness stand and otherwise, that the carriers could fairly and fully defend the lower rates from the West to Birmingham than to Atlanta.

Q. (By Mr. LITCHMAN.) The solution is for Atlanta to build another railroad?—A. Atlanta's rates are all right. Atlanta is growing faster than any other point in that country. Atlanta is not suffering from freight rates, and she would not solve it, either, by building another railroad. She has got all the railroads she wants. Birmingham did not build that road from Memphis, and Atlanta is not going to build a road from Memphis or from the Ohio River to get a reduction of rates.

Q. (By Mr. RIPLEY.) Is there not, however, a new road being projected to Atlanta?—A. I think it is problematical. I think that these different rates that have been heated and forged and welded and pounded and hammered into their present shape are about as near right as practical people can make them.

Q. But commercial conditions may change?—A. They may change and we will try to meet those conditions. It is our business to watch that and try to fix the rates to fit the conditions.

Q. Here is an example that I should like to ask you to explain, simply as an illustration of the system in the South. At Montgomery, Ala., which is about 175 miles above Mobile, the rates from the north are all based on Mobile. The combination rate to Mobile, plus the rate from Mobile up to Montgomery, is less than the direct rate from the north. To illustrate specifically, a merchant in Montgomery told me that he shipped 2 carloads of fruit jars from Crawfordsville, Ind., to Montgomery. He shipped them to Mobile and then paid the local rate from Mobile back, those fruit jars going through Montgomery on the way out. By having them hauled 350 miles farther he saved \$75 on the two cars. Now, that is the situation which I find prevails in all lines of business.—A. I can explain that. For a great many years past the Mobile and Ohio Railroad has said that it would make the rates from the western country to Mobile the same as to New Orleans. I never believed, and I do not believe now, that it was justifiable or that it was necessary, but that was another condition and not a theory. That was the condition, and the rates from the West to Mobile to-day are the same as to New Orleans; and the rates to New Orleans, as you may easily understand, are very low as against direct river competition. Now it is true that you can take some of the rates to Mobile, made in that way, and add the rate back and it will cut the direct rate. You may naturally ask why a lot of sensible traffic people allow that thing to continue, and my only answer is that they have found it better to let some business go that way than to reduce the Montgomery rate, which they fear would carry with it Columbia, Eufala, Atlanta, Columbus, and all those places. Here is where it began. Through the policy of one road reaching Mobile, the rates to that point were forced down to the same basis and held on the same basis as the rates to New Orleans, where the good Lord has fixed competition for us, and where God's highway is. Now, that is healthy competition. It may have been wrong; I think it was wrong. Colonel Clarke, of the Mobile and Ohio road, knew more about the railroad business than I do, and I am sure he thought he was right. But through that policy the condition is forced on a man that enables him to ship down to Mobile and back to Montgomery at a lower rate than he could have shipped directly to Montgomery for.

Q. Why shouldn't they haul it and stop it and claim the same rate?—A. Because they used to do that and they found that gradually the agents were hunting combinations. Now, they have stopped that, and they say that any shipper at Montgomery has a perfect right to ship to Mobile and reship; but if he does, they will not give him a bill of lading to Montgomery at lower than their published legal rate filed with the Interstate Commerce Commission.

Q. My point is this: Why not change that combination to charge what it costs to Mobile, plus the rate back, but not go through the farce of hauling the freight down 175 miles and hauling it back?—A. It might come down another way. It does not necessarily go through Montgomery, but it is given to Mobile, and it is taken as a Mobile shipment, and the Montgomery man must have his arrangements to have it reshipped.

Q. I find that Atlanta shippers, for instance, claim that they can very much more cheaply conduct their business by establishing houses or agencies at, we will say Mobile, or possibly Charleston, certainly at Savannah, for the distribution of goods, while the center of their business is at Atlanta. In other words, instead of bringing the goods into Atlanta, it is better to stop them at Savannah and distribute them from that point on account of the high rates to Atlanta. In fact one man, an important merchant at Atlanta, made the statement to me that there was a strong tendency on the part of all the jobbers in that city, by reason of the freight rates in force, thus to establish branch houses at Savannah and not to ship their goods into Atlanta at all. Is not that likely to operate to the disadvantage of a city like Atlanta?—A. I had not heard of any warehouses at Charleston or Mobile. There are four or five or more concerns in Atlanta, with their headquarters and principal business at Atlanta, which have located warehouses in Savannah in order to get the benefit of the lower rates to Savannah, made via ocean routes, and then to reship inland, not to the entire inland territory, but to such territory as they can reach from Savannah, at a better total combined rate than the rate into Atlanta, plus the rate from Atlanta. Now, as to how much of that is being done or how much will

finally be done, I do not know. If it comes to pass that Atlanta commences to do all its business at Savannah, it will be up to the roads to decide what they will do about it, because there are some roads that haul Atlanta business that do not see any Savannah business. They are all looking after their own various interests, and they are watching as closely as they know how. Now, if that business grows to sufficient volume, it may force a reduction to Atlanta, and finally it may force a reduction to all interior points.

Q. I know that one jobber told me that by threatening to establish a branch house at Savannah he had been able to force a particular road to grant him a reduced rate to Atlanta.—A. Maybe he was mistaken about that. I think Mr. Charles Conklin, when he got his commodity rate on tin plate east and west, used as an argument that if they did not give it to him he would move his works to Savannah and get his plate there by water. Now, whether that induced them to do it or not I do not know. I did not think they ought to make a rate as they did at the time, and I do not think so yet, for this reason, that the rate has not been used for manufacturing purposes. He ships a great deal besides manufactures. I did not think the rate ought to have been made; but if it had not been made and that gentleman, whoever he was, had moved to Savannah and established his manufactory there, and that sort of thing should go on increasing and the manufacturers at Atlanta, Chattanooga, and other points should find after a time that they could not do business, why, it might come to the roads to say that they would put the rates down or would do just what they thought was for their own interest.

Q. You have spoken thus far as if there were effective competition between these several roads. Is it not true that there is a strong tendency toward an amalgamation of these roads? In other words, is not the Central of Georgia controlled by the Southern road, and are not a number of other roads, such as the Nashville, Chattanooga and St. Louis, controlled or owned by what is called the Southern system? Is there not a tendency on the part of all these roads to go into common hands, so that the competition that was effective protection to the public has ceased?—A. There is current history enough as to the consolidation that is going on. What the final outcome will be I do not pretend even to surmise. I do not believe any of us can tell now. But as long as there is healthy competition between two or three or more roads for any particular traffic this consolidation is not going to hurt anybody.

Q. (By Mr. PHILLIPS.) How many miles at present are controlled by Mr. Spencer's present Southern system?—A. The Southern system has over 7,000 miles. I forget the exact mileage.

Q. How many miles are there outside of that system controlled by individual corporations?—A. Well, our last monthly statement showed over 29,000 miles. I forget exactly. They have over 7,000. Our committee expenses are apportioned on mileage basis, and they pay a little over 20 per cent.

Q. (By Mr. RIPLEY.) Does that control the Central of Georgia?—A. That does not include the Central. That is managed separately, and is a strong competitor of the Southern, and each line is working as hard for the business as if they were deadly enemies. Now, how much harmony of policy among the owners there may be, I have no idea in the world; but in actual daily practice if a man wants to ship from Atlanta to New York, the Central man does not, by any means, get out of the way until the Southern man can get the shipment. The management is charged with the making of rates, the solicitation of business, and there is the same general hustling for it just as though there were an absolutely separate and distinct organization and ownership, as well as management.

Q. Is it likely, however, that they can continue this competition with the Southern?—A. I think so, until they are actually taken in under one management and have the same traffic officials. I have known traffic officials on different divisions of the same road to compete with each other, each looking out for the interests of his division. As long as you do not have them under one management you will have competition.

Q. Isn't it the simplest thing in the world, however, to extend the single management, as far as the traffic officials are concerned, over an absorbed road?—A. Oh, yes; very simple. It is done by a circular.

Q. Suppose the Southern System controls at the present time a majority of the stock of the Central of Georgia and that the Central of Georgia controls in turn two or three other smaller roads. It would require merely the issue of a circular to extend the traffic management of the Southern over the entire group, would it not?—A. Well, they would have to take it into ownership first. But what I meant was that there is no practical difficulty in extending jurisdiction of the traffic official over a new road any more than over a branch line that is completed.

Q. (By Mr. PHILLIPS.) Is there a tendency to further combine?—A. I think there is; I think they will divide into groups. I make the point right here that I, as a railroad employee, am just as much interested in that proposition as any shipper. Whenever there ceases to be competition for John Doe's business, there will cease to be competition for my services. Now, it seems to me that we are approaching the time when there will be 5 or 6 separate systems in the South. They may all work in

harmony to the extent that the separate owners of the separate properties may agree among themselves—and it will take only a few men to agree to it—that in a general way they will maintain rates. In a general way they may take some sort of action—some concerted action—with respect to legislation or litigation, or what not. As long as there is active competition (and there will be active competition as long as the roads are under separate managements) between 2 or 3 of these roads at a point, I have no fear for the future. I believe that my services will be in demand for what they are worth, and that there will be the same kind of competition for the merchants' and the manufacturers' shipments, too, and I do not feel at all alarmed at this consolidation. To a certain extent it is perfectly natural and proper. The continuing of a disjointed lot of little lines under separate interests or managements has not anything to recommend it.

Q. (By Mr. RIPLEY.) Did not the Louisville and Nashville and the Southern System come together in just that way that you describe?—A. They compete at a great many points. They are strong competitors. There is absolutely no merger or community of interest about their management that I can see.

Q. The absorption of the Louisville and Nashville by the Southern System, or by a system like the Pennsylvania, which, it is reported in the South, is looking at the problem of purchasing both the Southern and the Louisville and Nashville, would bring all interests together, would it not?—A. Well, if they could be consolidated, after a while there would be no competition, and I do not want to see that come. I think it will be a bad thing for the roads, as well as for everybody else. I honestly believe that final consolidation and removal of all competition would be just as bad for the roads as anybody else.

Q. What would be the evil effect?—A. Public opinion. That is something that the roads can not afford to ignore.

Q. (By Mr. LITCHMAN.) Do you think that after that consolidation had taken place the public would begin to ask who should run the combination?—A. The public would find some way of giving expression to its dissatisfaction; and no one of us, railroads or anybody else, can afford to ignore that. What shape it would take nobody can guess. It is too remote. This gigantic combination and consolidation is an entirely new condition. I do not know of anything like it in the history of the world. What the final outcome will be would be guesswork, and what the people might do would be guesswork. But I do not believe it would be a good thing for all the railroads of the United States to be under one management. I do not believe it would be a good thing for the roads themselves, or anybody else.

Q. (By Mr. CLARKE.) Do you think it would be a good thing to have a very few great systems which would compete with each other?—A. I think probably to a certain extent that would be a good thing for the public and for the roads themselves. As I stated before, up to a certain point consolidation is perfectly natural and proper. Take the Southern Railway, for example. I have counted over 50 original lines in that system. The system, as it is, may be unwieldy and it may not; I do not say; but why should rates have to be made over three or four roads to get from Washington to Atlanta? Isn't it better for there to be one system from Washington to Atlanta? I do not see that the public need fear their dividing into groups until they reach a point where there ceases to be groups and it becomes a group. They may group the whole system. I do not believe that would be a good thing. Taking our own territory down there, it seems to me that if they should have 5 or 6 systems in the country east of the Mississippi River, there would be plenty of competition.

Q. Do you recognize discriminations as an evil to the public as well as to the railroad?—A. You mean unjust discriminations?

Q. Yes; I mean bad discriminations.—A. Well, I think that some few unfair discriminations will always arise; they are bound to arise from the nature of the business, the multitude of the transactions, the immensity of the thing. Why, there are bound to be unjust discriminations, though not intentional, perhaps.

Q. Are they not likely to be very much diminished by the community of interest found in one system?—A. If you refer to rebates and that kind of discrimination, I think so. They are likely to be diminished by consolidation.

Q. When a merchant knows that he is getting the same rate as his competitor, is it not to the advantage of trade?—A. Unquestionably; and to the advantage of morality.

Q. (By Mr. RIPLEY.) I would like to bring up for discussion the so-called discrimination of rates against Charleston, a case which was argued before the Interstate Commerce Commission about 2 years ago and upon which a decision has not yet been rendered. I bring that up simply in order that you may use it as a basis for a discussion of the system of rate making in the South. The complaint of Charleston before the Interstate Commerce Commission is that it is unfairly discriminated against by rates from the West. The rate from Chicago, I believe, through Asheville to Norfolk is 72 cents, whereas the rate from Chicago to Asheville and from Asheville to a point an equal distance down is \$1.35. That great discrimination against Charleston prevents, so they claim, the growth of an export trade in any way equal to the growth of the export business at Norfolk. I should like to

ask you if you could explain the system on which the rates from the West to Norfolk and Charleston, respectively, are made, and the justification the roads find for the very much higher rate of \$1.35 as against 72 cents?—A. The simple answer is that they maintain as high rates to both points as they can. That is all there is of it.

Q. Does it not seem, however, that there should be some final court of last resort which should equalize in some way, either up or down, the rates of those two cities?—A. We have a court like that now. We have our final court. If you mean some tribunal that should decide immediately whether or not Charleston is being unjustly discriminated against, I believe I answered that question this morning in a general way. But as to that Charleston v. Norfolk rate question, it is perfectly simple. They maintain as high rates to each point as they can. The fact that one road does a little business through Asheville cuts no figure whatever. It might withdraw from the Norfolk business. It does not haul enough business from Chicago to Norfolk to pay for axle grease. The rates to Norfolk are the same as the trunk-line rates to Baltimore. The rates to Charleston are maintained as high as they can be as against the rates through Baltimore and thence *via* ocean. They do not fully meet the ocean competition, but they approximate it. But here is the serious point about Charleston. If you voluntarily reduce Charleston so as to put it on the Norfolk basis, how are you going to refuse to reduce Augusta, Macon, Atlanta, and all these points? They are still higher than Charleston. Chicago to Atlanta is higher than Chicago to Charleston.

Q. Atlanta is not as remote by a considerable distance, however, is it?—A. It is not so far and yet the rates are higher. Now, our defense to the Atlanta man is that we maintain Charleston as high as we can maintain it. We can not put it up. A great deal of the business is going down by ocean now at the present rate. But if we should give Charleston the same rates as Norfolk, we would have no moral defense on earth for holding up the rates to these interior points.

Q. You have already admitted that you do not conform to the long and short haul clause. Why need you, then, by reducing Charleston also reduce Augusta?—A. I said voluntarily. If we voluntarily put down Charleston because some other place having trunk-line competition is lower, what moral defense could we have, leaving out the question of legal defense, for not also reducing Macon, Augusta, and Atlanta, etc?

Q. Have you not the same moral defense as elsewhere throughout the South?—A. Not at all. Where we have a lower rate to a farther point there is some sort of competition at the point beyond which has forced it down. It does not make any difference whether it is a wagon line or a steamboat line or a rail line or what.

Q. But if it is a railroad whose action is unreasonable?—A. It makes no difference. Anything that forces down a rate is competition.

Q. Is it exactly safe for a community to trust to that policy?—A. We believe it is. The roads are looking after their own interest in this, and in doing that they are looking after the interest of the towns along the road. What has brought about this relative adjustment in that country? It has been arbitration and warfare. It has been molded into that shape. I venture to say if a proposition were made tomorrow to reduce the rates to Atlanta some line would insist that corresponding reductions should be made to Macon and to Augusta, etc.

Q. Is it not possible for these roads to see that their interests are one, that this friction which prevents wise adjustment in the interest of certain districts may be overcome?—A. It is not friction. It is competition. It is healthy competition. It brings about a fair relative adjustment, an adjustment that the carriers believe is fair to the patrons of their lines at the points at which they are most interested. It is the best kind of competition.

Q. The traffic manager of the Southern system desires to reduce rates on cotton from the Mississippi Valley to Carolina mill points?—A. Yes.

Q. The instant he proposes to do that the Mississippi Valley roads say, "We will not permit that to be done, because that is taking business which we haul up through Cincinnati to the East." Consequently, Mr. Culp is prevented from granting what he believes to be a measure of justice to the Carolina mill points?—A. That is right. The Mississippi line says, "If you reduce the cotton rates from Mississippi to the Carolina mills to fit a new condition or demand up there, it will take business away from our lines; it will take business away not only from the Eastern spinners through Ohio River gateways, but more especially the dealers or factors at the port of New Orleans; and if you reduce, we will make corresponding reductions. We will have to put down the rates." I can not see that all that is preventing a fair adjustment of rates or that that sort of friction is not a good thing for everybody. Would it be a good thing to let them reduce the rates to the Carolina mills and let the New England factories be kept from handling it? It seems to me that the carriers, in looking after their own interests, are looking after the interests of the manufacturers on their own lines.

Q. They are, on their own lines, but how about the other communities?—A. Is not that likely to bring about a relatively fair adjustment in the whole territory? Is not that healthy competition?

Q. It is. As I see the situation, except that each system, wishing to correct certain abuses in its own territory, what it regards as evils, is prevented from correcting these by the inertia or competition of other roads; and conditions that may be iniquitous are perpetuated because of this pulling and hauling between competing interests. When they all get together in one consolidation, or harmonize their interests, may they not readjust the entire matter?—A. Now, I know you did not intend it, but it seems to me you put it in an extreme way when you say, with reference to the cotton rate to Carolina mills, that the proposition was advanced to cure any evil or what might be an iniquitous evil. It was not that at all, nor are there many such cases, I believe. I think that is putting it in an extreme way. I think this is a fairer way to state it: There was a general adjustment of rates in the territory, which included the cotton rates and all other rates. It was not made haphazard, nor as a matter of caprice. It was made as a matter of judgment and arbitration, controversy and war. After so many years it has settled down into that condition, and it is very difficult to disturb it. If we voluntarily reduce Charleston, so as to make it the same as Norfolk, we ought to put down the other points I have mentioned. As to the cotton question, that is a new condition. The mills have multiplied so rapidly in the Carolina territory that they can not get sufficient home cotton to meet the demand.

Q. (By Mr. PHILLIPS.) Is it fair or equitable that Charleston and these other cities should pay a greater rate than Norfolk?—A. I think it is.

Q. (By Mr. RIPLEY.) The distance is the same.—A. No; Charleston is farther from Chicago than Norfolk.

Q. Not from Asheville.—A. No; but you must take the short line every time. The roads that make the rates are the direct roads—the Norfolk and Western, the Chesapeake and Ohio, and the trunk lines—and they make them the same as Baltimore. Baltimore is a little under New York, as you know—3 cents, I believe.

Q. The gist of this whole argument is to bring out, if possible, the degree to which the competition of competing carriers in any territory may prevent the correction of what each one of these carriers may concede to be an injustice within its own territory, and which it would correct if it could act alone.—A. It could act alone.

Q. That means war.—A. It may mean war, but some people in this country think that would be the very best thing; that you should price your transportation rates as you do coffee and sugar. What was the effect on the cotton question? The rates are lower than they were. There were two conflicting views and there was a compromise. The arbitrators told them to meet halfway, and the rates were reduced. That is all healthy competition.

Q. But I think you will find that the several parties to that arbitration still feel that if they had been left to act alone they could have granted a greater measure of justice to their patrons.—A. Yes; but it might have been a great measure of injustice to somebody else. The former rates on cotton from Mississippi to Carolina mills were not unjust rates, and hence the reduced rates are not unjust. So I do not think you ought to say that the full measure of justice was not done. Probably those who differed in their views are not convinced, but they have accepted the arbitration, so far as I know.

Q. Come down to this case of Charleston again. The argument of Charleston is that it is the same distance from Chicago practically that Norfolk is.—A. Through Asheville?

Q. Through Asheville; and consequently that it is entitled, perhaps, not to the same treatment that Norfolk is, but that at least it should not be subjected to a discrimination amounting to the difference between 72 cents and \$1.35. And they applied to the Interstate Commerce Commission some two years back, although the decision has not been rendered yet. If the equalization of those two rates would enable Charleston, as is claimed, to participate in some of the export business of raw products from the West, who is going to finally decide that matter unless the Interstate Commerce Commission be given an extension of its power?—A. The courts finally decide it.

Q. Do you see any objection to conceding to the Interstate Commerce Commission the authority to pass upon such matters as a court?—A. I do not see how it can pass upon these questions, as it now does under its present functions, and then also be a court of final resort in addition to that.

Q. (By Mr. PHILLIPS.) Would it be best for the decision to stand until reversed?—A. No; it is not right to assume that the railroads will do wrong, pending the final decision of the Charleston case, and to assume that the Interstate Commerce Commission will do right. I think it is better to let the roads go on as they have done, making their own rates subject to review by the courts.

Q. (By Mr. RIPLEY.) If you go to a city like Charleston and see the grass growing in the streets and business stagnant, you can not help feeling with them there should be some remedy.—A. Is there grass growing in the streets down there?

Q. I saw plenty of it.—A. It is not on account of the freight rates.

Q. (By Mr. LITCHMAN.) Is not the direct distance from Chicago to Norfolk less than the direct distance from Chicago to Charleston?—A. Considerably less.

Q. Is not the freight rate to Norfolk made by the railroad or transportation lines of the shorter distance?—A. Yes.

Q. Is not the rate on the route by way of Asheville fixed in a measure to compete with the rate made by the shorter line?—A. Not only in a measure but actually.

Q. Then that is the secret of the condition, is it not?—A. Those are the conditions as to Norfolk.

Q. (By Mr. FARQUHAR.) Why should Chicago freight go by the Asheville route at all?—A. I do not know.

Q. As a railroad man, why should it?—A. They do not handle enough to amount to anything, and I do not believe they make much money out of what they do haul. The Southern Railway Company and some of its connections have a through line, which they call the Asheville line, and they publish tariffs applying from St. Louis, Louisville, Cincinnati, Lexington, and Cairo, and they have put Chicago in. There may be a little money for them in the Chicago-Norfolk business, but I do not think there is much, and certainly not if they try to compete for the export business. But it is just like the case of a man who will keep certain articles whether he sells any or not. The Asheville line does not fix the rates at all. The rates are made the same as to Baltimore. That is the fixed basis.

Charleston has gone ahead very little in the last census decade. Savannah, just below there, with the same rates, has gone ahead 25 per cent. Atlanta, an inland point, with higher rates than either Charleston, Norfolk, or Savannah, has gone ahead over 30 per cent. I think Atlanta has increased 37 per cent. That is a remarkable thing. I said recently that the longer I stayed in this business the more I am coming to believe that freight rates do not have much to do with the making or unmaking of a community. You can find many illustrations of that fact. Nashville, Tenn., has better freight rates than any other inland city in the South, better than Chattanooga, Birmingham, Knoxville, or any of those points, and yet she has gone ahead only about 5 per cent. Atlanta had only about 65,000 in 1890 and Nashville 80,000, while Atlanta now has 89,000 and Nashville 81,000. Richmond, with undoubtedly favorable freight rates (not because the roads want to give it to her, but because her competition gives it to her), has gone ahead very slowly. Atlanta has passed her in population. Now, right in the Atlanta group are the cities of Rome, Dalton, and Athens, and others that have gone backward, and yet they have precisely the Atlanta rates. Here is Danville, where they have felt so strongly about freight rates for some years (they make the same complaint about Lynchburg that Charleston makes with reference to Norfolk), they have gone ahead about 40 per cent in population, whereas Lynchburg has lost a few hundred in population. Of course, I do not argue that if you want a town to flourish like a green-bay tree you must put up freight rates, but it does look as though rates did not make much difference.

Q. (By Mr. LICHMAN.) How far has the development of new industries tended to build up those places?—A. I do not know. Danville is a large manufacturing point and has very successful cotton mills. Its backbone is its tobacco. Lynchburg is a good tobacco town. Danville pays higher rates on tobacco than Lynchburg does, and Danville people may very sincerely say that they would have doubled in population if it had not been for freight rates, but it does not seem to me that there is anything conclusive in freight rates.

Q. Has not the marvelous development of industries in the South had an effect on the increase of the population?—A. Then why should Danville go ahead so rapidly and Lynchburg, just north and having the same kind of trade, standstill?

Q. They have no cotton manufacturing?—A. No; I do not think they have built any new cotton mills in Danville; but in Asheville they have no cotton mills and that has increased in population.

Q. How far has the use of Asheville as a winter resort tended to increase it?—A. That would have increased it some. There may be good reasons why two twin cities like Charleston and Savannah, just a few miles apart, should differ so in their growth, one stand still and the other go forward 25 per cent.

Q. (By Mr. CLARKE.) Have you studied the problem with reference to the changing character of the populations of those respective places?—A. No; but I would suppose, as between Lynchburg and Danville, in the same State, with the same social life and all that, and the same commodities constituting their principal business, it could not have been the character of the population that would hold one at a standstill (and that the lower rate point) while the other should go ahead so rapidly.

Q. Is it not a fact, as a general proposition, that the growth of towns depends largely upon certain enterprising men in those towns?—A. It might be facilitated by freight rates. In other words, if a road should set out deliberately to kill one town with freight rates and hothouse process the other, it might be able to do it as against local wealth and energy. No one knows why Atlanta is as big a town as it is or why the capital seems to float in there. That city is conceded to-day to have more fine buildings than Louisville with 204,000 people. I am not trying to get in an advertisement for Atlanta, but it is the fact.

Q. (By Mr. RIPLEY.) Your argument is the same as that of the little boy, "Father

is dead and mother is dead and I have got to hustle."—A. It may be. Look how Chicago has gone ahead of St. Louis. We all remember the time when they were rivals.

(Testimony closed.)

WASHINGTON, D. C., May 8, 1901.

TESTIMONY OF MR. EDWARD P. WILSON,

Secretary of various Ohio commercial organizations.

The commission met at 10.43 a. m., Mr. Phillips presiding. At that time Mr. Edward P. Wilson was introduced as a witness, and, being first duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your occupation, address, and previous experience?—A. My residence is Cincinnati. I act as secretary for the National Association of Manufacturers, for the Cincinnati Board of Trade, Bureau of Transportation, the Manufacturers' Club of Cincinnati, the Merchants and Manufacturers' Association of Cincinnati, the Cincinnati League, and the Ohio Valley Improvement Association. I have been in this class of business since 1890. Prior to that time, from 1863 to 1890, I was connected with the traffic bureau of different railroads.

Q. You may state one or two of the important roads in order that we may see your interest and experience.—A. My first service was with the Louisville and Nashville Railroad, and, following that, with the Louisville, Cincinnati and Lexington, which is now a part of the Louisville and Nashville; following that, with the Cincinnati Southern; following that, with the Chicago and Northwestern. I left the Chicago and Northwestern in 1890.

Q. You have had experience with a passenger business as well as freight?—A. Yes.

Q. The first topic we might take up is the interest of Cincinnati in the trade of the South, and especially the relative adjustment of rates as between Western and Eastern trade centers.—A. Cincinnati has been for the last three-quarters of a century developing in growth and prosperity upon business with the South. She was one of the principal points of supply and distribution to the South during the old days when the steamers carried the goods to all points south from Cincinnati and distributed via river and bayou throughout the South. They carried her goods there on as good terms as they could be carried from any distributing center in the world; and consequently Cincinnati gained a prestige in Southern business that she has never lost. But the revolution which was brought about after the civil war by the construction of railway lines into the South, and by improved service in transportation by rail, of all goods, threatened to take from Cincinnati her prestige as a distributing center by reason of better facilities being awarded to rival cities in the nature of railway development. The Louisville and Nashville Railroad was the first important railroad built from the Ohio River into the South, and as it formed its connections through the South, naturally Louisville was brought into prominence as a distributing center and threatened somewhat to rival Cincinnati.

The fact that communication from Cincinnati to Louisville was for a long time only by river, and after that by an independent line of railroad, placed Cincinnati at a disadvantage in regard to rates of distribution. This caused a demonstration of strength and power in the construction of her own railroad at an immense expense. At her own expense she built a railroad to Chattanooga, which was considered the most important strategic point south of Cincinnati for distribution. Since that road has been opened and its facilities thoroughly decided the position of Cincinnati and her relative position to rates in the South has been very largely improved, but by certain influences that I will explain later it has never been what the people of Cincinnati consider themselves entitled to by reason of their geographic position and the rail construction.

About 1879 competition for Southern business was exceedingly brisk, both from the Eastern seaboard and from Western centers like Chicago, Cincinnati, St. Louis, and Louisville. The railroads were independently handled and managed, and competition was very brisk and threatened to destroy them all. This condition naturally brought about a disposition to agree on something, and in the final round-up the agreement was made to divide business and maintain rates and to give to the Eastern cities practical control of the trade in manufactured miscellaneous articles which had their practical origin at that time on the Eastern seaboard, and to give to the roads leading south from the Ohio River a good rate and good trade in what were then known as the peculiar products of the West—packing-house products, grain, and its products, and the indirect products in the shape of whisky and beer, etc. Those were practically the staples in which those cities had their advantages. In addition to that there was a considerable shipping trade, which was more or less affected by this agreement.

The result of the agreement was to make rates of freight from the Ohio River points about what the roads pleased on the heavy products, but to maintain high rates on the miscellaneous industrial products and to protect the Eastern shippers in the enjoyment of that trade with the South, their output being transported by ocean to the Eastern seaboard and distributed inland by the very excellent system of railroads that even then existed. It will probably be remembered that Georgia had more railroads than any other State in the United States before the war, and the Eastern seaboard had excellent facilities, consequently, for hauling the trade in miscellaneous articles.

Now the development of commerce and the development of the country and of agricultural products naturally has been westward, and manufactures of all classes have gone westward until the line of the Mississippi River is hardly the boundary line of the manufacturing district now, whereas the Allegheny Mountains were the boundary line before. All of that territory between the Allegheny Mountains and the Mississippi River is growing into a manufacturing district, and every diversified product of human industry is produced there and offered for sale to the South. There is scarcely an article on which the rates are not higher proportionately to the consuming section than from New York and New England, and many of our manufacturers have been driven to maintain warehouses in Boston and New York for distribution to the South.

Q. You mean they ship to the warehouses and distribute from there?—A. Yes. There are certain articles stored in New York and distributed by ocean and rail to the South that might be sent from the factory direct if the rates were not against them.

That is probably an extreme statement of the case, but, to illustrate, I would like the privilege of reading a statement that was made in 1892 to the Interstate Commerce Commission, and which was practically true of business for the 12 years previous to that, and practically true for the business since, for there has been no material change in the principle. Atlanta, for example, is a very important distributing point South. I have a table before me prepared then showing the distances from Cincinnati and New York to Atlanta, the comparative rates, and comparative percentage. Cincinnati is 475 miles from Atlanta and New York is 876 miles from Atlanta by rail. The distance from Cincinnati is 54 per cent of the distance from New York, but the first-class rate from Cincinnati is 91 per cent of the New York rate; the second-class rate is 94 per cent of the New York rate, as is also the third-class rate. Coming down into the lower classes, one is 69 per cent, but that is on one of the articles on which we use the privilege of Western product rates. This illustrates what we regard as a solecism in the making of rates. Why first-class and second-class articles of manufactured products, which are as indigenous to Ohio as they are to New England, should now be 94 per cent of the New York rate, when flour, which is now being produced more largely in the Northwest and has almost left the Cincinnati district, is carried for 69 per cent, we do not see. This condition is found very marked at some of the other Southern points. For instance, the distance from Cincinnati to Meridian is 55 per cent of the distance from New York to Meridian and the first-class rate is 107 per cent of the New York rate.

Q. You refer to Meridian, Miss.—A. Yes. I have only selected a few figures from this statement, but it is analyzed and presented to the Interstate Commerce Commission in 1892 with this statement. (Reading:)

"The burden of this Complaint lies against the relation which exists between the current rates of freight on manufactured articles and merchandise from Eastern Seaboard Territory to Southern Territory, and the current rates of freight exacted upon light commodities when shipped from Central Territory to the South, and against the unfair basis of the general construction of the tariffs under consideration, whereby the rates charged for transportation of commodities classified under 'Numbered Classes' bear a much higher percentage relation to the rates from New York than do the rates on commodities enumerated under the 'Lettered Classes.'

"Complainants allege that this improper relation, between rates as above set forth, which has the effect of restraining and impeding the growth of productive industries in Central Territory and encouraging and promoting similar industries in Eastern Seaboard Territory, is the direct result of an agreement established by convention between the officers of defendants above described, whereby, in order to secure stability in rates of freight and to prevent competition between the lines leading, respectively, from the Eastern Seaboard and Central Territory to the South, it was decided to secure to the Eastern Lines and Eastern Territory the traffic in merchandise and manufactured articles and to the Western Territory the traffic in food products and similar heavy commodities.

"The complainant submits that a compact as above recited was made during 1879, and that the principles then agreed to still govern the construction of rates, notwithstanding the changes in trade conditions and the development of transportation facilities which have taken place during the interim."

That is the burden of the complaint presented in 1892. That complaint was decided upon by the Interstate Commerce Commission May 29, 1894. From their

syllabus I will quote [reading]: "It is ordered and adjudged, that the above-named defendants, and each of them, engaged or participating in the transportation of freight articles enumerated in the Southern Railway and Steamship Association Classification as articles of the first, second, third, fourth, fifth, or sixth class, do, from and after the 10th day of July, 1894." * * * Then follows a table specifying the maximum rates to be charged, being a practical reduction of about 40 per cent from the tariff that was complained against. This is the deliberate judgment of the Interstate Commerce Commission and was carried to the United States court, but the case has never been decided upon its merits. The only point that has been reached—and that is the sticking point in this case—is the decision of the Supreme Court that the Interstate Commerce Commission had no right to name any rates; in other words, that there was no jurisdiction. Nothing was said about the merits of our case. Hence I submit this statement as my testimony sustaining and supporting the fact that there is a malformation of the tariffs from our Territory to the South, as compared with the tariffs obtained from the Eastern Territory to the South.

Q. Do we understand the contention of Cincinnati, then, to be that in 1879 a virtual agreement was made by the roads operating in the South that rates should be so adjusted that the Eastern centers should have a monopoly of manufactures in the South, whereas the Western centers should have the market for the packing-house products and grain products from the West; and since that time conditions have changed so that manufactures have now moved westward and that the West demands entrance on equal terms for her manufactures into this Southern territory?—A. That is right.

Q. Was this original agreement in the nature of a formal contract, so far as you know?—A. The record of this case that I have quoted from will support the statement that the agreement was partly formal and partly informal—the record of the Southern Railway and Steamship Association introduced in evidence before the commission. The written contracts are a part of the record, and the inference is a part of the record. The proceedings of the Southern Railway and Steamship Association have been printed and submitted as evidence before the commission. The contention was supported by the evidence.

Q. And although the case was presented in 1892, any readjustment in favor of the West has up to this time been denied?—A. A general readjustment has been denied, and there are only spasmodic instances of relief in specific cases, and I am not able to go into the details of that.

Q. Is there not some justification for lower rates on all classes of commodities from Eastern centers by virtue of the existence of cheap water transportation to Savannah, Brunswick, Mobile, and New Orleans?—A. Cotton is very compact, and there is not very much competition there. Of course that is the excuse, but they were controlled in their rates by agreement, and it is rather an excuse than a fact.

Q. Do we understand, then, that there is no real competition between the Eastern coastwise steamship lines and the railroads?—A. Less than it is represented to be; I will not say none. It is less fierce than the testimony of the officers would lead you to suppose.

Q. Are you aware of any friendly interest, through ownership or contract, in the steamship lines by the railroads?—A. When this compact was made the Central Railroad of Georgia owned the Ocean Steamship Company. It was its own line and it controlled it as absolutely as it did its railway lines, and there were close agreements with the other lines; so the members of the Southern Railway and Steamship Association had very little competition in fact. When the matter was brought before the commission the testimony of the officers generally referred to tramp steamers, and practical men know the competition of tramp steamers for regular trade is not very severe. It is more for specialties.

Q. Is there not water transportation down the Ohio and Mississippi to New Orleans and other river points to meet this water competition by ocean from Eastern centers?—A. That water transportation is recognized very much to the disturbance of trade relations at all river points. The rates down the Mississippi to New Orleans and all river points to Mobile, Pensacola, and other points that are claimed to be ocean points are very much less than the rates to the interior. The rates to Atlanta, for example, and rates related to Atlanta are very much higher than the rates to New Orleans and Mobile. Selma, where our rates are 104 per cent of the New York rate to Selma, as against 55 per cent of the distance, is excluded on the basis that there is water competition by way of Mobile from New York.

Q. Are you aware of any further agreement between the several lines operating in the South as to a division of business between Eastern and Western centers?—A. There were a number of agreements on that question made, but they were practically abandoned, as far as records are concerned, with the enactment of the pooling clause of the interstate-commerce law. So there has been no recorded agreement to that effect. It has simply been a practice.

Q. But the practice is as effective?—A. The practice is effective in keeping up

these rates. The published rates have been better maintained into the South than any other territory of the United States in the last 20 years.

I find in a circular entitled "Division of Territory South of the Ohio River" the following clause, which is called "Territorial apportionment of traffic between Eastern and Western lines:"

"(1) Western lines shall not make joint rates on traffic passing between points east of Buffalo-Pittsburg zone and points east of a line drawn from Chattanooga, Tenn., through Birmingham, Selma, and Montgomery, Ala., to Pensacola, Fla.

"(2) Eastern lines shall not make joint rates on traffic between points west of Buffalo-Pittsburg zone and points on or west of a line drawn from Chattanooga, Tenn., through Athens, Augusta, and Macon, Ga., to Liveoak, Fla.: *Provided, however*, That the Norfolk and Western Railway may participate in traffic via Kenova at the rates established by the association between points in the territory on and east of its line from Columbus, Ohio, to Kenova, W. Va., and on and south of the line of the Pittsburg, Cincinnati, Chicago and St. Louis Railway, Columbus, Ohio, to Steubenville, Ohio, and points on and east of the Chattanooga-Montgomery-Pensacola line as defined in paragraph (1)."

Q. That would appear to be still further division of this territory in the nature of a traffic agreement?—A. I doubt whether it is supported by any traffic agreement, but is a declaration of policy. That is about correct. I believe it corresponds with the practice at the present time.

Q. You criticize that policy?—A. That is a practice in restraint of trade. It deprives the purchaser as well as the seller of the absolute freedom that ought to exist between those two parties.

Q. The decision which was rendered by the Interstate Commerce Commission in this particular case was of no effect, you say?—A. Of no effect.

Q. (By Mr. PARQUHAR.) Was the decision based on nonjurisdiction?—A. It has not been decided, except for that decision of nonjurisdiction in the making of rates.

Q. Have there been other decisions of that character? Is it violating a line of precedents?—A. That was the pioneer decision on the rate question. That has been the center around which the conflict has raged ever since.

Q. Then, wherein is there any remedy by appeal to the Interstate Commerce Commission?—A. There is no remedy practically. The Interstate Commerce Commission can develop the facts and may announce its opinion for the education of the public; but its opinion has no legal standing, as I understand it—no vital force. It is simply a finding.

Q. This case went before the commission in 1892 and was decided by it in 1894?—A. Yes.

Q. And you have no decision of this particular case from the Supreme Court?—A. Nothing but the partial decision on one point. The case rests in the courts ready to be taken up at any time on the other pleadings.

Q. (By Mr. CLARKE.) Have your people ever brought any new complaint before the Interstate Commerce Commission?—A. No; not any people that I represent. There have been complaints from that region of country, though very few; I can not recall any now.

Q. Why would it not be of advantage to complain that the rates made are unreasonable and in restraint of trade, and get a recommendation, if possible, from the Interstate Commerce Commission to that effect, recommending the roads to change their rates?—A. That ground has already been traversed and defined by this record, and there has been a positive order of the commission directing the change, but the change has never been made. The courts, under the law, must intervene to order that change to be made, and they have not done so. It is hardly worth while to go at it again, and in fact our people are so thoroughly discouraged that I would not like to ask them to put up the money again.

Q. I understand you to say that the decision of the court was they had no right to prescribe rates. That did not go to the extent, did it, that they had no right to recommend a change of rate?—A. Well, there is a distinction that I perceive, but it has not been a consideration that would prompt our people to come to the front and try to use that agency any more for their protection. If a positive order, which the law allows this commission to make, is of no effect, where would its recommendation have any virtue? We have the moral support of the facts and of the commission in this record to fall back on now. We can quote from it any time. Our position is clearly recognized by that commission now. To reinstate the pleadings in order to modify the act of the commission from an order to a recommendation would be all the effect the further proceeding would be, would it not?

Q. Is it not within your knowledge that most of the railroad commissions in the country have only a power to recommend, and that their recommendations are generally observed by the railroad companies?—A. I believe that the railroad companies are more sensitive to the opinions of any other commission than to those of the Interstate Commerce Commission. It has been my observation that the State commissions within their jurisdiction have more respect paid to their decisions by the

railroads than the railroad systems of the United States have ever paid to the decisions of the Interstate Commerce Commission.

Q. Is it a fact, then, that since the decision of the court the complainants have practically abandoned the case?—A. No; they have rested upon their rights. They have not withdrawn it from the court nor in any way abandoned it. The lawyers still have the matter in hand, but have not seen a good opportunity to take it up.

If you will pardon me for the digression, I want to correct a statement I made a moment ago. I said I did not remember any complaint made since. I recollect that there is a very important complaint pending before the commission, which originated in Cincinnati, and which I had forgotten.

Q. What was the principal ground of appeal by the railroads to the court in your case?—A. The only point they made was that there was no jurisdiction.

Q. No jurisdiction to fix rates?—A. No right to name rates. Here was an order to make certain rates. The railroad companies concentrated their fight on the non-jurisdiction and the lack of power to name the rate, and all the fight has been centered around that point.

Q. Do you not think it would at least be of moral advantage to the complainants to have a recommendation from the Interstate Commerce Commission that the rates be reduced?—A. Well, I would not say that it would be of any advantage. Our people have simply been so paralyzed by the failure to get any good out of the stronger document that they have not considered it worth while to go ahead for a weaker one.

Q. They sought a remedy which the court has said could not be granted by the particular tribunal to which the complaint was made?—A. Yes.

Q. That tribunal continues to make recommendations in other cases, does it not?—A. Oh, yes. We are quite willing other people should make history; we have made our little bit of history.

Q. (By Mr. PHILLIPS.) Can you give any reason why the railroads pay more heed to the decisions of the State boards than they do to the national boards?—A. There is a smaller volume of business, probably, affected by the purely local State boards, and then there is a closer intimacy between the management of railroads and the State boards. A sort of everyday, neighborly relation obtains. The managers of the railroads are very well acquainted with all the commissioners along the lines of the roads in the various States. Their work in the States comes very near to corresponding with the wishes of those commissions. It allays dissatisfaction, although they have had some pretty fierce discussion.

Q. Do they not fear adverse legislation from the States more than they do from Congress?—A. That is speculative. Possibly that may be true.

Q. (By Mr. C. J. HARRIS.) Is it not a good deal of a fact that the State railroad commissions in many instances have the definite power to change and regulate rates?—A. That is my impression. I am not technically familiar with all the State laws, but it is my impression that that power exists in some of the States.

Q. (By Mr. RIPLEY.) The railroads have defended their action in most cases in making rates by saying that a reduction of rates in the interest of shippers would follow from what they call enlightened self-interest. Applying that to this particular case, does there seem to be any prospect of opening a way into the South from Western manufacturing centers by the voluntary action of the roads?—A. I believe that will have some influence, as intelligence works its way through the brains of the railroad men.

Q. Is there not, however, a certain obstacle toward action in that way by a single road because of these several agreements which exist between all the roads operating in that territory, so that no one of them will take any action until it has been agreed to by the others?—A. Well, it is customary to take joint action, and it is very difficult to secure joint action that involves any particular change looking to the reduction of rates unless it carries some decided advantage to the carrier with it. It is hardly worth while to go before these boards, or commissioners, or committees, with any change unless you can establish a feature of advantage to all the railroads.

Q. For instance, is it within the power of the Louisville and Nashville or the Queen and Crescent route to reduce rates from Cincinnati and Louisville into the Southern territory?—A. They have the power, but they do not consider it expedient. They naturally fear the consequences of independent action, because they all admit the necessity of acting together. That is the mistake with a number of individual officers. The officers of individual lines have recognized the unfairness of this adjustment, on evidence before the Interstate Commerce Commission. They recognized the unfairness of this adjustment, but said they did not dare to disturb it lest they would precipitate a rate war. That is their excuse for not doing justice—that their other interests would threaten their revenues in other directions if they did what they considered to be common justice in this particular regard.

Q. Is this, then, the situation, as far as the railroads are concerned—that the lines into the South from Western centers hesitate to grant what they might consider to

be in their own interest by reason of the opposition of the lines in the South on the eastern half of the Southern territory?—A. That is probably the controlling influence.

Q. Is it not true, on the other hand, that some of the lines into the South—into the eastern half of this territory—are hampered in granting certain reductions which they might otherwise make by virtue of the opposition of the roads into the South from the West?—A. Yes; each one follows the other when they do not want to do it.

Q. The point I would like to bring before you and ask you to discuss, then, is whether this balance of interest as between Eastern and Western roads does not prevent substantial justice by any one of them?—A. That is practically the effect of the situation.

Q. Is it a situation peculiar to that part of the United States?—A. I think it is—I believe it is. I do not know of any glaring instances of injustice maintained by any system of railroads that begins to compare with this system of unjust tariff from the Ohio River to the interior South, and I do not know of any case where the complaint has been clearly defined and supported, and has been so conspicuously ignored, as it has in this territory; and I attribute it to the fact that there are a very few dominant interests governing the transportation of the South, and that the dominant interests are pretty close together in their determination to protect each other in order to protect themselves; that is, I have reason to believe that a few prominent capitalists own the larger proportion of the stock in all of these organizations that do business in the South, both steamboats and railroads, and that they have agreed, not in writing probably, but practically among themselves, that they won't hurt each other.

Q. Do you see any tendencies at work in the nature of actual consolidations or leases, or reported unanimity of control, which promise any relief? In other words, will the consolidation of those roads still further enable the conflicting interests—the Eastern and Western lines into the South—to be reconciled?—A. Yes; I believe it will. As to whether it will result in relieving these specific difficulties or not I am unable to express an opinion, but the conflict of interests will be minimized in the near future by combination.

Q. Has Louisville been a party to the complaints before the Interstate Commerce Commission?—A. No.

Q. Are there any other points along the river that have taken issue with Cincinnati?—A. With this construction of rates, you mean?

Q. Yes. A. Both Louisville and St. Louis were offered an opportunity. They were afraid of their local roads, afraid to enter into any combination. Chicago and Cincinnati came together and employed counsel, but the people who had that sort of business in charge in Louisville and St. Louis asked to be excused, saying that they were too closely in the power of their local roads to take an antagonistic position of that kind.

Q. Chicago, however, did join issue with Cincinnati?—A. Chicago joined with Cincinnati.

Q. Did there seem to be any tendency on the part of Louisville and St. Louis to stand together as opposed to Chicago and Cincinnati?—A. I think they lacked cohesion, they lacked organization. The shippers at these points into the South did not organize or do anything in one way or the other.

Q. Does Louisville have any particular advantage over Cincinnati by reason of the adjustment of tariff on the Louisville and Nashville Railroad as against Cincinnati?—A. That fact is constantly asserted by shippers, but they have never been able to prove it with sufficient clearness to make a complaint.

Q. Is there a feeling on the part of shippers that Nashville also enjoys peculiar advantages in the distributive jobbing business as against Cincinnati?—A. It is known that Nashville is the recipient of a great many favors not accorded to any other inland city. It is not a matter of very great significance, but certain trades are so affected by it that they have established their warehouses in Nashville rather than fight it. I know some pretty large manufacturers who have warehouses in Nashville, and everybody gets the benefit of those preferences.

Q. (By Mr. FARQUHAR.) Is there not a reason why Nashville should receive the discriminations on account of both the rail and water rates?—A. That is the reason.

Q. (By Mr. RIPLEY.) Was not the Cincinnati Southern road built by the city of Cincinnati as a public enterprise?—A. Yes.

Q. And for what reason?—A. To bring Cincinnati into strategic touch with the South, independent of the passage through Louisville.

Q. Is there not a proposition pending for the lease of this Cincinnati Southern Railroad to the Southern system?—A. No.

Q. Or is there not a proposition for purchase?—A. No.

Q. Is there not a proposition of some kind now pending with a view to the absorption of this line, or of a part of that line leading from Cincinnati to some miles South?—A. No. There is a proposition to extend the lease of the Cincinnati Southern Railroad, which is now held by an independent organization known as the C., N.

O. and T. P. Railroad Company, a corporation organized under the laws of Ohio for the purpose of leasing that road, and the proposition is to extend that lease for 65 years. That proposition is being very favorably considered by the majority of people in interest. It is a mistake to think that that is the act of the Southern Railway or necessarily involves absorption by the Southern Railway. Unless something more definite is developed than has yet been made of record, the relations of the Cincinnati Southern Railway will not be changed by this extension of the lease from what they are now. The C., N. O. and T. P. Railway has had control of the road for 20 years, and the extension of it for 65 years to the same company under modified terms is all that is practically or officially developed. The impression is industriously circulated in Cincinnati and elsewhere that the outcome of this will be the control of the road by the Southern Railway system. If that could be assured to the people of Cincinnati, I think there would be very little difficulty in securing the extension; but that fact is very carefully guarded in all negotiations. Mr. Spencer is president of the Southern Railway, and also president of the C., N. O. and T. P. Railway. The trustees of the property have never received a proposition from Mr. Spencer as president of the Southern Railway. Everything he has offered has been as president of the C., N. O. and T. P. Railway. Now, that distinction is quite clear, quite practical, quite confined, and yet it does not exist in the minds of half the intelligent people of this country who consider the subject.

Q. (By Mr. C. J. HARRIS.) What is the C., N. O. and T. P. Railway?—A. Cincinnati, New Orleans and Texas Pacific Railway Company, a corporation under the laws of Ohio. The majority of its stock, nearly 80 per cent, is held by the Southwestern Investment Security Company. That is a company organized under the laws of New Jersey to trade in Southern securities. Now, then, the stock of that Southern Security Company in turn is owned partly by a syndicate known as the C., H. and D. syndicate; partly by the syndicate known as the Alabama Great Southern Junction Railway Company, Limited, which is a London company; partly by the New Orleans and Northeastern, or lines that are known as the Flower lines.

Q. (By Mr. RIPLEY.) Would you mind indicating on the map where it runs?—A. There are no maps. It is on paper. The Southwestern Security Company was organized by Ferdinand Ward and was one of the enormous companies organized to speculate in general securities, buy and sell, and they have gotten into their treasury about 75 or 80 per cent of the stock of the C., N. O. and T. P. Ry. Co., and have hypotheicated it to secure an issue of bonds. The Southern Railway owns a majority of the stock of the Southwestern Security Company, and the Southwestern Security Company controls the C., N. O. and T. P. Through that instrumentality the Southern has dominant influence in the councils of the C., N. O. and T. P. Ry. Co. It dictates its policy without being responsible for its debts or its transactions.

Q. (By Mr. FARQUHAR.) How much money did the city of Cincinnati put into this road?—A. The original sum was eighteen million six hundred and some odd thousand dollars, and they have borrowed money to pay deficiencies in interest. There were eighteen million six hundred and some odd thousand dollars of city bonds issued, and the proceeds of those bonds was put into the road. The city has been carrying those bonds, the road has been paying a part of the interest, and the city the rest, so that the road stands the city an outlay of about \$30,000,000 cash, while its income is a rental of \$1,000,000 a year. If the bonds which are about to expire can be refunded at current rates of interest the city, instead of having a deficiency in its income, will have a surplus. Hence a great many of the citizens of Cincinnati are very much in favor of perpetuating this lease on practically little better terms than they have to-day for 65 years, because their old issue of bonds will expire within a few years. They can borrow money at a little less than 3 per cent right here, and have an income from the road, and if it is leased I think the lease will be extended on those terms, on account of the excellent financial condition in which it will leave the city.

Q. Suppose that the road is leased, then, for the 65 years, what opportunities of absorption by the Southern system or any other system is there?—A. There is a clause in the proposed lease which is said to look to this absorption by the Southern road. It reads, "The right to sublet this property to any other than the Southern railway is denied." It is not a positive right to sublet to the Southern railway, but there is a limitation in the lease preventing their transferring the lease to any other road.

Q. But the subletting relates entirely to the mileage?—A. That is all.

Q. It does not relate to the ownership of the bonded condition at all?—A. The ownership will never be absorbed. The city of Cincinnati will never sell that road. The absolute ownership will probably never be changed, within the terms of this lease, at least.

Q. (By Mr. RIPLEY.) Will that absolute ownership, however, amount to anything?—A. You understand that I think that it won't sell. Of course we can't tell what it will decide to do in 40 or 60 years. Possibly legislation in Ohio, Kentucky,

and Tennessee will allow the city of Cincinnati to pass the title of the property to anybody whom it may choose, but it would be subject to these laws. The main thing to be accomplished to-day is to lease the property upon a long rental and give the city an income.

Q. You say in that lease there is only the clause of subletting, which seems to indicate the possibility of selling the system?—A. Yes; that is the interpretation that the hopeful put on it. It opens the door for the Southern Railway ultimately to absorb the control of the management of that road.

Q. On the basis of earnings, so far as you know them, would the terms of this lease seem to be favorable to the future of the road?—A. Very.

Q. As well as to the city?—A. Yes.

Q. Are there any clauses in that lease which guarantee to Cincinnati favorable treatment?—A. The fighting to-day is over that clause, how to express it, how to get it in there. There is a clause in the present lease which is very general, so general that it is insignificant and has been ignored, in which it is said that the lessee company shall not, under any circumstances, discriminate against the citizens of Cincinnati, or Kentucky, or Tennessee, but that is all it says. There is no penalty provided to secure its enforcement, and it is so general that it has amounted to nothing. Now in renewing or extending the lease the shippers are interested in having some declaration of policy, and are quite anxious to have the lessee declare and enforce a policy of protection according to their geographical situation and rights. They endeavored to insert a clause in this lease, and there the fight is going on just now. There are organizations in Cincinnati that will oppose the confirmation of the lease unless that clause is made very definite. There are a great many other interests in Cincinnati which believe that the numerous advantages that obtain from the lease are sufficient without forcing that, and therefore Cincinnati is not a unit in determining what will happen.

Q. The Southern road has been one of those against which Cincinnati has complained?—A. Yes.

Q. In this case before the Interstate Commerce Commission?—A. Yes; the Cincinnati Southern Railroad having been leased to foreign control has been controlled by the policy that has ignored the territorial advantage that Cincinnati claims she should have through its construction. We are powerless to affect the situation without going into a rate war with other roads that would be fatal, and there the controversy has begun and ended time and again.

Q. Now, suppose all those roads of the South whose opposition to one another prevents an equitable adjustment into the South from Eastern and Western centers came together into a single consolidation, or were owned by the same persons, would there or would there not be a greater possibility of eliminating rate wars and of adjusting the rates in every direction than there is now?—A. That could be made possible, naturally, by absolute control. The doing, of right, would be within reach and there would be no excuse, growing out of the competition of others, to offer. But then comes the old question again. The securing of equitable rates for Cincinnati depends on investment by the railway interests. The Southern is controlled in Cincinnati by other interests which are dependent upon the prosperity of the Eastern territory for their income.

Q. Have you any knowledge other than the press reports of a possible absorption of the Louisville and Nashville by the Pennsylvania Railroad Company?—A. None whatever.

Q. What would be the effect of such an absorption, either by lease or purchase, upon the interest of Cincinnati?—A. I do not feel able to answer that question. I do not apprehend any particular change one way or the other. We have the Pennsylvania Railroad interests all around us in Cincinnati and they are quite acceptable, and we have the influence of the Louisville and Nashville Railroad in the other direction. Their interests in Cincinnati are growing constantly, so that their service is being improved and, aside from their blindness to our rights in the way of relative adjustment, they are a very favorable adjunct to Cincinnati commercial prosperity. A consolidation of those two great systems, therefore, with the average intelligence that controls them both, should not cause any great degree of alarm, in my opinion.

Q. Have you any knowledge of any negotiations leading to the connection by lease or purchase or common control of the Southern Railway with the Cincinnati, Hamilton and Dayton, or other roads leading from the Ohio gateways north to Chicago?—A. None whatever.

Q. You mentioned sometime ago the adjustment of rates from St. Louis into the Southern States as compared with Cincinnati. Is there any ground of complaint there?—A. There has been very serious complaint by the shippers of grain from Cincinnati against the policy adopted in St. Louis, and from St. Louis to the South, whereby competition by way of Memphis from the grain fields of the West is made through St. Louis, but is not made through Cincinnati. For example, for a time the

rate applied from St. Louis to Southern territory on business coming from the Kansas grain fields in competition with the Kansas City, Memphis and Birmingham road was only 1 cent higher than the rate from Cincinnati and the roads from St. Louis to Cincinnati asked 7 cents for bringing grain from St. Louis to Cincinnati. The roads South would have been compelled to cut their rates about 5 cents a hundred pounds in order to equalize totals. This they refused to do, and that had the effect of erecting a barrier against the passage of any grain from points west or north of Cincinnati through Cincinnati, and the South gave the market to St. Louis and Western merchants.

Q. Is there any remedy available?—A. The only remedy is the consent of the roads to adopt in their practice the ordinary practice of longer lines, that of making the totals between any two points the same, and distributing them among themselves as they may deem equitable and just.

Q. In this case, as in the other that you mentioned, would the shippers of Cincinnati, do you think, be inclined to resort to a tribunal which had full power to prescribe or to regulate rates in such cases?—A. I would not advise them to—could not advise them to.

Q. Have you knowledge of any other complaints which would be laid before such tribunal if its powers were full and complete?—A. Not at this moment. There is no telling what might develop if the tribunal existed.

Q. (By Mr. FARQUHAR.) You said in your testimony that natural advantages possessed by one business center might have to be measurably sacrificed in making up those railroad rates for a section for the benefit of a place with less natural advantages. Do you think there is any equity in that?—A. I think you misunderstand what I said. Each locality competing with others in a common market is entitled to reasonable and just rates at the hands of the carriers serving it, and to the benefit of all its natural advantages, and no departure from the rule requiring rates in all cases to be reasonable in themselves can be justified on the ground that it is necessary in order to maintain existing trade relations, or "to protect competing markets," or to "equalize commercial conditions," or to secure to carriers traffic from certain territory assumed to be exclusively theirs.

Q. What is your notion as a railroad man in respect to a proposition of that kind?—A. When I was a railroad man I studied the immediate interest of railroads. If you could get a thing through it was all right.

A. Was the policy of the Louisville and Nashville at that time to the advantage of Nashville or other places and to the disadvantage of any places just as good on that line in cases where your directors had no interest in the landed property?—A. I do not think that I am quite prepared to deal intelligently with that proposition. That is a matter of ancient history. We were very crude railroad men in those days.

Q. Is it not pretty generally known that the system in the South has tended to build up sectionalism there? That is, were not geographic zones of influence built up to the advantage of certain great corporations?—A. There has been too much paternalism practiced by the railroads. I do not think the railroads have got any right to assume paternal functions over any city, locality, or individual. That is the basis of the Interstate Commerce Commission and the spirit of it. It was to break down practices of that kind that that law was brought into existence. Those practices prevail to a greater extent, maybe, in the far West than they do in the South.

Q. Have you any knowledge yourself as to whether the great importation of goods into the South is not entirely from the Northeast and the ports of the Atlantic and other distributing points instead of from Cincinnati or from the Northwest?—A. The Northwest and the immediate North are gaining on that business all the time, but they are gaining in spite of discriminations in favor of the Northeast.

Q. Do you think it would be the railroad policy of the Eastern association to make lower rates to admit these Eastern goods into the South than they would make to the Western men?—A. They have always done it.

Q. Will you call it self-interest or an inducement of trade, or what?—A. Well, my theory would be that there has been a large capitalistic ownership in the case of steamship lines, and that they make a great deal more money carrying business from the Eastern seaboard into the South than they would if the railroads carried it from the West.

Q. (By Mr. PHILLIPS.) When you were connected with the railroad system was discrimination quite common against shippers?—A. Yes; it was.

Q. And to the injury of the large shippers very frequently?—A. The large shippers generally had the advantage over the little fellows.

Q. Were there many people who lost their fortunes and their interests largely by discrimination of railroads?—A. Yes; there were. There were more losses of that kind, more people driven out of business through the help extended by the railroads to the favored shippers in those days than there are now.

Q. Well, what is your view about discrimination now—your observation? Is it

extensive yet?—A. Yes; it is extensive yet. The public has no idea of its extent, and I would not be in position to define its extent. I know it now rather from hearsay, but I used to know it from contact with the business. I still know from hearsay, but it doesn't amount to evidence; many other people know it, and you know it, so I am making no disclosure.

Q. What form does discrimination generally take now, from your best information?—A. Well, take the combinations of heavy shippers who have cars of their own. There are quite a number of them who own their own equipment, and the rental that they are able to command for the use of those cars is a veritable feast. It is a very ingenious way of affecting competition, and it has the effect of driving out of business the firms who don't see fit to own cars of their own, and has the effect of forcing firms and corporations who did not want to own to buy them or lease them. That is only one effect. There are others, probably.

Q. Have you any other?—A. I do not think of any other. That is one of the most clear.

Q. What effect, if any, in your judgment, has the Pullman Palace Car Company had upon the railroads generally?—A. I think that the facilities it has offered have been the most valuable of all facilities furnished to railroads from the outside, and probably the most equitable and the most defensible, and I believe that the Pullman Palace Company's management has enabled the railroad companies to afford to the public better service than could have been maintained by any other system. The merging of all the other lines into the Pullman Palace Car Company has been simply the survival of the fittest. The most powerful of the railroads have attempted to furnish that sort of service of their own, and it has proved a failure.

Q. (By Mr. RIPLEY.) The policy of the roads operating in the South, with which I understand you are somewhat familiar, differs, does it not, in respect to maintaining the rates at a perfect equality for all shippers?—A. Yes; I believe that the published rates have been better maintained in the Southern territory in the last 20 years than in any other territory in the United States. There have been fewer glaring breaks. There was, I remember, at one time a concession made from New York for the season to all Southern States of about 50 per cent of the tariff rate, by which means they took the entire spring business of the Southwest from the jobbers of the West. That was followed by a cut of rates, when it was too late, by the Western lines. They healed that difference up within a few months, and I have not heard of any such outbreak since, but those outbreaks have been constantly occurring in other directions.

Q. Now, proceeding to the discussion of the long and short haul clause, and the nature of water competition in the Southern States, will you make any general statement about that?—A. Well, my statement is more a matter of judgment and observation. I believe the prosperity of the Southern States has been largely depressed and impeded and delayed by the false principle of ignoring the long and short haul principle. I believe that the development of the entire country and the development of the railroad business has been pulsed by a principle to which the roads in the South have adhered after it was abandoned by all the other roads in the universe. The great railroad systems of the country rarely have any trouble over the long and short haul clause. All the contention is centered on that clause, as far as I know, in the Southern territory, and it all centers around the idea that they have got to make a low rate to meet water competition, and then add a local back to the interior and keep all the interior country which is without water competition checked up to high rates to give advantages to certain towns, whether they have commercial merit or not, that happen to be situated on a railway, creek, or canal. Any old thing serves the purpose of reducing rates on water competition if they want to reduce them. They can ignore it in nine cases out of ten just as successfully as they can maintain freight rates at other points. That policy has maintained higher rates to interior points all through the South and has been a barrier to Southern progress. That is my opinion.

Q. Has not the Louisville and Nashville Railroad been prominently identified with the opposition to the long and short haul clause?—A. It is the policy of the Louisville and Nashville Railroad that I have referred to.

Q. Was that policy in force before the enactment of the interstate-commerce act?—A. Oh, yes; it was an ancient custom all over this country. Most of the roads got well out of it long ago.

Q. You were familiar with its operation, then, at the time you were a traffic official of that road?—A. Yes; that principle was the principle in the beginning.

Q. So that you speak from personal knowledge of the situation as a traffic official?—A. Yes; I have observed the development of those roads in the last 35 years.

Q. Have any changes taken place in the nature of competition between waterways and railways which would affect this proposition?—A. Very serious changes. When the Louisville and Nashville Railway opened the business after the war to Nashville, water competition was the real thing from Cincinnati and Louisville. The boats

were plying constantly, and we had to meet that question every day. To-day it is a very rare thing that a boat loads with freight from Cincinnati to Nashville, Tenn., and yet the rates are made from Cincinnati to Nashville based on old river competition. The river itself has lost its prestige as a river, and is drying up. Unless it is improved it will soon be a highway instead of a waterway.

Q. It has not been drying up the last month or so?—A. That does not help navigation. Navigation is conducted under greater difficulties than usual. As a matter of fact, Ohio River shipping has lost its existence, with the exception of the transportation of very heavy commodities. In very heavy commodities it still carries a greater tonnage than any river in the country, but I discriminate between that and ordinary merchandise, commercial shipping. It is not probable that any system of railway transportation could ever deprive the Ohio River of its immense tonnage in the coal trade. It would be useless to attempt it. It is increasing constantly, but there is no shipping now of sugar or molasses. You would think you could get a much better rate from Cincinnati to Nashville by boat than by rail. Take a good whaleback steamboat rate to-day, and as you go into the higher commodities insurance militates to increase the rates. The excuse of river competition is used to depress rates to a point like Nashville, and the rates to the surrounding country are made higher by adding locals to them. The effect of that river competition is not so apparent as it was. When the principle was first inaugurated we had to make rates every day to beat the boats. There is no necessity for that now.

Q. Is it true that the basing point system to which you have already referred is in a way a derivation from the long and short haul system of making rates?—A. It is a successor to it, but a railroad crossing became a competing point, to which lower rates were made than to the locals on each side.

Q. Do you mean, then, that beginning with the theory that rates must be reduced where there was competition between water and rail, they extended that principle to the reduction of rates at points where two railroads cross?—A. Yes.

Q. Have you observed at any time any evil effects from the system?—A. Yes; it is evil in my opinion; evil to the railroads and evil to the people. It often prevents and has prevented the establishment of industries at more eligible points upon a railroad because they could not get rates to that point that they could get at the crossing. A great many enlightened railroad managers recognized that all through Pennsylvania, New England, Ohio, Indiana, and Illinois, and broke it down because of this argument: "If this man locates his industry 10 miles from the crossing that business belongs to us, and we had better carry it at the crossing rate than to put it in jeopardy." And they scattered industries all along the lines of the roads and it made them rich. The Pennsylvania Railroad is one system that has done this and has scattered industries from one end of the road to the other. A man doesn't have to own a corner lot at a crossing in order to get decent rates. But you go on the other side of the river, and you have got to go to Danville Junction or some place to get a basing point, or to Louisville, or to Bowling Green or some crossing. The Cincinnati Southern never debated that question, and there has never been any conflict with the long and short haul clause.

Q. How are they enabled to operate in practical competition with the Louisville and Nashville, one road adopting the long and short haul clause and the other opposing it every time?—A. Well, they build up their country; the Louisville and Nashville does not.

Q. (By Mr. PHILLIPS.) I would like to recur to one matter in regard to discrimination which seems to be quite general yet. Have you any remedial legislation to suggest along that line—any remedial legislation to prevent discrimination?—A. No; I am afraid that is beyond the reach of legislation. It has its root in the selfishness and ability of men to accomplish those things. I do not believe legislation can reach it. Possibly consolidation can reach it; possibly if Rockefeller gets more railroad stocks than Standard Oil stock he won't want the railroads to make rebates to the Standard Oil Company.

Q. A great evil, you admit, exists in discrimination, and yet you think there can not be any effective legislation passed to meet that?—A. I may be alone in my opinion. That is my opinion. There is ample legislation to reach all those people, but it is the instruments you want—the men, the moral force behind the guns. You have got plenty of legislation to reach all those things, but there is not the determination on the part of the courts or the people to enforce these things. Human nature is human nature. We have got lots of good laws that are dead letters, you know, because the people don't want them enforced.

Q. (By Mr. RIPLEY.) Do we understand that in your judgment the Interstate Commerce Commission has power sufficient to secure many of these results, but that the difficulty comes more in the disposition than in the law itself?—A. That is my candid conviction after about 10 years of diligent effort to use the interstate commerce law for the protection of the people. There is an apathy among the people which is just about as great an obstacle to its enforcement as any defect in the law.

I have been an officer of organizations seeking to get protection through the Interstate Commerce Commission during the last 10 years, and my observation is that the indifference of the people is more of an obstacle. A gentleman asked me a moment ago why we didn't reinstate our case before the court. It is because our people are indifferent.

Q. (By Mr. PHILLIPS.) You think the fault is more with the courts than with the Interstate Commerce Commission?—A. I do not like to say there is any fault in our courts. I believe the root of the evil in this country is that the people are not alive to the necessity of this thing. The courts will follow pretty nearly the impulses and requirements of public opinion.

Q. Would you be in favor of giving the Interstate Commerce Commission authority to enforce their decisions until they are repealed by the court? That is, to make them binding or mandatory until the court finally decides?—A. I have always felt that it would be right that the decision should take the same course as the decision of any other tribunal; that it should be mandatory unless the party against whom it is rendered takes an appeal and gives bond. That makes it effective from the time it is given, and suspended under bond as any other decision is suspended under bond. I do not believe in making flesh of one and fish of another. I do not believe in a different practice before the Interstate Commerce Commission from what obtains before any other court. A man gets a decision before the Interstate Commerce Commission and then he has to sue to get that enforced instead of letting the other fellow appeal. That is one of the most radical defects in the practice of that body.

Q. (By Mr. RIPLEY.) I was going to ask next for your views upon the question of classification and the enforcement of a uniform classification for the country at large.—A. I consider that a very important commercial question and one that I have been interested in for a great many years, the reducing to uniformity as far as possible the practice of the railroads in classifying freight. It can not be absolutely done; it can only be done approximately; but a uniform classification could be declared as the standard and put into effect at a given time. At the same time provision should be made for such flexibility as commercial circumstances would require, subject to investigation. That is, the commission or whatever other body had power over the administration of that classification should have the right to make modifications upon proper representations, and that should be the standard, in the absence of any ruling to the contrary. That would give us a basis of uniformity throughout the entire country and would at the same time afford relief against inflexibility. I do not think transportation rates can with safety be absolutely inflexible all over this country.

Q. Does Cincinnati, lying on the boundary between two great classification territories, suffer from the lack of uniformity in classification?—A. Yes; it is a practical inconvenience. In making business calculations shippers must take into consideration all the time what territory they are shipping into and what classification governs. If they are shipping into Southern territory, one classification has got to be arranged for; if into Western territory, another. The official territory is their immediate natural classification, and the Cincinnati merchant, therefore, has practically at all times to deal with at least 3 classifications.

Q. Do you see any possible resource in intrusting a greater measure of power over classification to the Interstate Commerce Commission?—A. None whatever.

Q. You would favor the right of appeal however?—A. Always.

Q. To such a body?—A. Oh, yes. I intended that it should be understood in respect to all my remarks in regard to the practice before the commission that the inalienable right of appeal should not be withheld from anybody.

Q. Do you recognize any distinction between the power to prescribe and promulgate rates, as conferred upon the Interstate Commerce Commission, and the power to approve of those rates when promulgated in the first instance by the railroads?—A. Yes. The power to approve of the rates in the first instance by the commission or the responsibility of approving of them would be demanding more than any commission would be capable of doing, and would be placing upon the commission a burden of responsibility that would be unwise and useless. The proper order of procedure, in my opinion, would be that every railroad should accept the responsibility of promulgating its rates and should have the right to enforce those rates until they were proved to be wrong, the burden of attacking them being upon the party who originates the proceedings against them. It is fair to suppose that railroad managers are honest and intend to make an equitable tariff in the first instance, but they are liable to error, and the demonstration of that error should not be made before themselves. I object to the principle of their deciding upon their own errors, and that is the only resort we have at present. Last winter the railroad companies, by one announcement, advanced rates throughout this country from 25 to 50 per cent on about 30 per cent of the commodities that were shipped, levying an additional tax upon the people by a stroke of the pen of several millions of dollars, and they knew it. Now, a great many of those changes were not resisted by the parties

to whom they applied. The greater proportion of the changes stood; but in some instances it worked absolute oppression, prohibition, and destruction of business; and the decision as to whether those rates should stand or not rested only with the railroads who made them. An appeal to the Interstate Commerce Commission only drew forth an opinion, and when that opinion was carried to the officers of the Government, the officers would not act upon it. Therefore, there was no tribunal except the parties themselves before which that matter could be brought. It was brought before them and a considerable modification was accomplished, which proves that the rates were not perfect. There are some of those changes that are still subject to litigation. Now, if the Interstate Commerce Commission or the representatives of the Government had had the right to suspend those changes until they were justified, the burden would not have been placed upon the manufacturers. There were instances where the entire profit of a business, built up after 11 or 12 years' effort, was absorbed by a stroke of the pen in a change of the classification of the output, and there were many instances where a large proportion of the profit was absorbed. Now, that is wrong.

Q. (By Mr. A. L. HARRIS.) I do not know whether I understand the witness with regard to the remedies which he would suggest for this condition that he has just spoken of. Is the remedy sufficient now with the courts?—A. No; it is a very long remedy to go before the courts. I know of one case that we prepared for the courts, and the preparation of that for the courts is costing the parties really more than is involved.

Q. Has the Interstate Commerce Commission at this time sufficient power of jurisdiction in a question of that kind?—A. They disclaim any power. They gave an opinion adverse to many of the changes but they disclaim the power to act.

Q. Now, suppose we go back to the power to approve rates. Would not that carry a little more power to the Interstate Commerce Commission in regard to the approval of the rates upon complaint?—A. That would be an endless task. There is no commission in the world that could go over a tariff and approve it. The man who made the tariff had probably an intelligent impulse in his mind when he made each adjustment. If you are passing in review my work, you have got either to absorb from me by some magical process my methods of thought or else you have got to ignore them, and you are liable to make very grave mistakes in passing in review my work. If I am an expert and I do that work subject to your criticism, you stand ready on receipt of a practical complaint to make me justify my work in one particular instance or in a dozen particular instances. That is a simple process and you are judicial and you can do that. But when I hand you this document and I require you to approve this and you take the responsibility off my hands, you take a responsibility you are not able to handle.

Q. As I understand, the present condition of the Interstate Commerce Commission is that even if it finds that a rate is unreasonable, its work is at an end there. It may make an order but that is all there is of it?—A. Oh, no; they are charged with the duty of summoning the district attorney to bring a suit to enforce that order. Then it goes before the court. It is a most lop-sided way of getting at justice. Your court of first resort decides the thing, and then you have got to become the prosecutor and the defender and the proponent of your own decision before another court instead of sitting still and letting it be appealed against you and the appeal justified.

Q. Do the railroad companies or the company complained against make any defense before the Interstate Commerce Commission, as a rule?—A. They do now; they did not at first. They make a vigorous defense now because the courts have made one or two orders excluding them or making them justify very clearly any effort to take further testimony. The first practice, you remember, was that they were not required to produce any testimony until they got into court and the court had the whole thing *de novo*.

Q. Would you make the finding of the Interstate Commerce Commission *prima facie* evidence in the court above or court of appeals?—A. It is made so by the law now, is it not? The evidence is *prima facie*. Yes, I would make the finding *prima facie*, and let the burden rest on the other side.

Q. Yes; then would you have a provision in the law to advance those cases upon the docket?—A. That is already there, is it not?

Q. Already in the law?—A. I think so.

Q. I was under the impression that it was not, for the reason that there were such long delays in the courts.—A. The courts have been very good in advancing cases. After they come before the courts, the courts have been very good about advancing them, as far as that is concerned.

Q. I had in mind a case that was just decided the other day in the Supreme Court on the long and short haul, between the Board of Trade of Chattanooga and the Eastern Tennessee and Georgia Railroad. That was stated in the papers at the time to have been 8 years from the time the complaint was filed.—A. Yes; in a general

way I have been cognizant of the progress of that case and I admit I was very much surprised at its coming up at this time. It is rather a matter of surprise to all who have been watching that case.

Q. Did not the Board of Trade at Cincinnati recommend the passage of the Cullom bill, or some bill carrying the provisions of the Cullom bill?—A. Yes.

Q. Have many of those recommendations, do you know, gone to Congress in favor of the enlargement of the powers of the Interstate Commerce Commission?—A. Yes; I think a large volume of them.

Q. Do you feel that the most important matter would be the one in regard to making the railroad or the claimant, whichever it may be, take an appeal the same as is done in any court?—A. I believe that is most important.

Testimony closed.

WASHINGTON, D. C., May 13, 1901.

TESTIMONY OF MR. OSBORNE HOWES,

Secretary Boston board of fire underwriters.

The commission met at 10.55 a. m., Chairman Kyle presiding. At 2.15 p. m. Mr. Osborne Howes, secretary Boston Board of Fire Underwriters, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Senator KYLE.) Will you give your name, address, and business?—A. Osborne Howes; No. 55 Kilby street, Boston; secretary of the Boston Board of Fire Underwriters.

Q. Have you a prepared article?—A. I have not.

Q. Do you propose to cover the general subject of the relation of Canadian and American railways?—A. Partly that. I have three subjects which I should like to bring to the attention of the commission, two bearing upon questions of transportation—that is, railroad and water transportation from Boston, so far as export trade is concerned—and on the subject of our merchant marine generally; then a third, if I have the time, on our trade relations with Canada.

On the first and the last I speak as a representative of the Boston Chamber of Commerce, of which I am a member, and the intermediate one, as representing the merchants' shipping interest of the past, through my father, grandfather, and great grandfather, and, to some extent, myself.

SENATOR KYLE: Yes. We will be glad if you will follow up that line.

Q. (By Mr. RIPLEY.) Do you have any official position in Boston in connection with the chamber of commerce or other organizations which entitles you to speak particularly about these organizations?—A. In the Boston Chamber of Commerce I am vice-chairman of their committee on reciprocal trade relations with Canada, and as a member I take an interest, of course, in the question of the development of Boston's trade with Europe and with foreign countries generally.

Q. Have you been on State commissions?—A. I have been on two—one that was called the Rapid Transit Commission, appointed for the purpose of improving the systems of transportation in and around Boston, and the other called the Metropolitan District Commission, appointed to prepare a plan for annexing the cities and towns in and around Boston to that city for the purpose of increasing its size.

Q. If you will take up those topics which you have, Mr. Howes, in the way and manner you think best, perhaps it will serve the purpose of the commission.—A. I may state then, at the outset, that Boston, next to New York, is the largest commercial port of this country. Our exports and imports for the year 1900 amounted in value to \$192,488,000; of that amount \$123,858,000 were exports, and \$68,630,000 were imports. The growth of the trade in the last few years has been quite constant, with the exception of last year, when there was a pause, due chiefly to the fact that the war in South Africa had drawn quite a number of the steamships upon which we depended for trans-Atlantic transportation to another line of service, thus leaving us, to some extent, denuded of our customary tonnage. The freight rates on that account were very high; high perhaps from all Atlantic ports, more especially from Boston, so that while at the present time wheat is carried from Boston at about a penny a bushel, last year it was about 3 pence, or 6 cents. This interfered with our development temporarily; now it is going ahead again, and I think this year the export and import trade of Boston will be considerably over \$200,000,000 in value. The reason why we have this trade is that Boston—sooner, I think, than any other city in the United States—through the

enterprise of its railroad companies has developed a system of terminals and dock facilities probably superior at the time they were built to those found anywhere else, and perhaps so to-day. The railroad companies built their own wharves, they built their own landing sheds and elevators, and were prepared, without intermediate charges, to put grain intended for Europe on board the vessels. Besides this, or in part perhaps due to this, we developed at a very early stage the system of carrying freight to Europe in large freight steamers, in contradistinction to passenger steamers or small tramp steamers. We have practically no tramp business in Boston. It is all carried on by the regular liners, running chiefly to Liverpool, so that Boston's trade to Liverpool is greater than that of any other American city—greater even than that of New York City. The steamers have been built of the largest size for freight-carrying purposes, and have been increased in size from time to time; the only limitation just now is the depth of our harbor channel which, unless we can get it increased, will probably put a barrier in the way of a very material increase in tonnage.

The four lines that we have there—the largest freight-carrying lines—are the Leyland, the Dominion, the Cunard, and the Warren. Three of these now carry passengers to some extent; one of them is simply a freight line. The export rates from Chicago or from western points to Liverpool via Boston are the same as those via New York. The local rates—the local east-bound rates—on sixth-class merchandise are 2 cents higher to Boston than they are to New York, and this has been thought to act somewhat as a deterrent upon the building up of a local grain business. That is to say, we have not there—as is found in New York, Philadelphia, and Baltimore—a large quantity of spot wheat, which can be shipped either to one foreign port or another as the exigencies of the trade require. The contracts for shipments are almost entirely made at Chicago or beyond, and it simply passes through Boston, giving us possibly in this respect less of gain in the matter of trade than we should receive if shipment were made directly from Boston, as is the case at New York. This has prevented the building up of a tramp steamship business and has confined our exports a good deal to England. We get very little of the continent trade; we get very little of what is called whole-cargo business, where a steamer is chartered to carry a cargo to one point or another in Europe or elsewhere. Apart from that I am not prepared to say that the 2-cent differential against us is a serious drawback. Theoretically it may be wrong, but practically, if a grain merchant were to bring 200,000 bushels of grain to Boston as a local venture and afterwards should wish to ship it, he could get a rebate from the railroads equivalent to 2 cents. The theoretic wrong is that there is no particular reason why when a shipment of certain carloads of grain leaves Chicago for Boston, part of the cars carrying grain intended for local use and a part of them carrying grain intended for foreign shipment, that the New York Central or the Lake Shore should receive more per car for hauling the former than the latter. They do the same service and practically should be paid the same price; but in working it out I do not think the system causes serious loss. The differential is about \$8 on a carload—that is, on a 40,000-pound carload. The rates at Boston are assumed to be maintained, as they are throughout the United States, by the rules of the Interstate Commerce Commission, but we have a belief that while these rates are officially promulgated they are by no means always observed. The statement is made that if a dealer has a large shipment coming from Chicago he can get a rate made that is a temporary rate. Perhaps the railroad agent at Chicago will write a letter notifying the Interstate Commerce Commission that the railroad has changed its rate, and then 5 minutes afterwards write another letter stating that it has been changed back to the old rate. At the present time we are aware in Boston of grain going to Europe via Baltimore—which has a differential in its favor so far as railroad charges are concerned—in such quantities as to indicate that there has been in addition some cut made in the rates. I think it is thought by shippers in Boston—those interested in steamers and interested in the shipment of grain—that railroad rates are still largely matters of trade; although if a cut is made in rates via one city, it is pretty quickly found out and the others adjust themselves to these new conditions. In times past—and to quite an extent at the present time—the fact that Boston has railroad connection with the West by Canada has been looked upon by our merchants as of distinct advantage. Until quite recently the financial and commercial interests of the American trunk lines ended at the Hudson River, and the tendency of such influences as they could exert in the direction of freight was unquestionably used to the detriment of Boston as a shipping point for grain intended for foreign markets. In this exigency the Canadian roads came to our help. It was for their interest to have the shipments sent to Boston, and through the competition which they could offer we received from the American trunk

lines a consideration which would not otherwise have been accorded to us. It is possible that recently that advantage has been partly neutralized. The New York Central has acquired by lease the Boston and Albany Railroad and now has a financial interest in having goods shipped to Boston, as great as and perhaps even more than it has in having them shipped to New York City. It has acquired the splendid terminal facilities of the company whose property it leased and is preparing at the present time to greatly enlarge these. The Boston and Maine has leased the Fitchburg road, which is also a great grain-carrying road, and the influences that it can bring to bear upon the American trunk lines by the large amount of westward-bound freight it controls has also a tendency to bring business to Boston rather than to divert it to New York or other Southern ports.

During the winter months of the year Boston has been in the past the shipping point for a great deal of the freight that has been brought over the Canadian railways. In summer grain that arrives at Montreal can be sent just as cheaply to Liverpool by steamer from that port as from Boston, and hence there is no reason why this grain should be hauled 260 or 270 miles farther, when it can be put directly on board the steamers at Montreal and carried across the Atlantic quite as well as from Boston. Therefore we never expect to get much grain via Canada in the summer. In winter, when the St. Lawrence is closed by ice, a great deal of grain has come to Boston for shipment. The tendency in the last year or two has been somewhat against this trade. A spirit of antagonism has to some extent grown up in Canada, a feeling due in part to the belief that trade relations between the two countries are not all that they should be, and out of this spirit of antagonism might well arise strong political feeling, which ultimately might have influence upon a great railroad corporation, such as the Canadian Pacific. Its effect has been to lead it to use Canadian shipping points rather than those in the United States, and on this account the Canadian Pacific has lately sent almost all of its winter shipment to Europe via St. Johns, New Brunswick. The Grand Trunk has also developed its terminal facilities at Portland, Me., which have injured Boston to some extent, but Portland is a city of the United States, and the Grand Trunk's winter shipments from that place have grown very materially in size within two or three years past and promise to be very much larger in the years that are to come.

Q. (By Mr. CLARKE.) The Grand Trunk line extends to Portland?—A. In going to Portland it carries freight entirely over its own line. It does not need to share any of its earnings with another railroad company. This is, of course, the reason for its action. This, in a general way, Mr. Chairman, is all I have to say in relation to our local questions of transportation.

Q. (By Mr. RIPLEY.) You might go on.—A. Very well; I will take up the next subject. What I have now to say is not a statement that I am prepared to make on behalf of the Boston Chamber of Commerce, for the reason that the chamber of commerce has never taken any action on the general question of the method to be adopted for the revival of the American merchant marine interest. There has been a division of sentiment between different sections of the chamber, and it has been thought well not to take any action whatsoever, so that these opinions are my own. I may state that my father and grandfather, and, further back my ancestors for several generations, have been American seamen. My father and grandfather were ship merchants in Boston, and it was my expectation to carry on the same business. For that reason I went to sea as an officer in the Pacific Mail Steamship Line, for the purpose of learning the business, and, having acquired more or less knowledge of steamshipping, the business fell flat and I left it. What I wish to say is that I think it is the desire of all Americans to have our merchant marine resuscitated, and that there is a willingness on the part of practically all of our people who think anything about this subject to do all that they can which will, in their opinion, legitimately bring about that result. Our merchant marine in the past has been subject to great fluctuations due to a variety of causes. In 1790 the merchant tonnage of the United States registered for the foreign trade was 364,000 tons. In 20 years from that time—in 1810—it had grown to 981,000 tons; that is, it had increased nearly threefold. That result was chiefly due to the enormous advantages which our people enjoyed in consequence of the disturbances in Europe growing out of the Napoleonic wars. Our country was practically the only neutral nation in the world. We secured a great deal of the freight-carrying which otherwise would have gone to other nations. But after 1810 the merchant marine of the United States suffered a very serious decline, and did not recover from that decline for 37 years. In 1830 it had fallen from 981,000 tons in 1810 to 537,000 tons, and with various ups and downs it continued until 1847, when it gradually gained the size that it had previously attained in 1810. It then amounted to 1,047,000 tons. From 1847 to 1861 it went ahead

with leaps and bounds, so that when the civil war broke out we had a merchant tonnage registered for foreign voyages of 2,496,000 tons, or a tonnage within a very small fraction equivalent to that which England at that time possessed engaged in the same business.

This gain, beginning in 1847, was partly due to the development and opening up of trade with California. The discovery of gold in 1849, and the great influx of migration which took place at that time, was promptly utilized by the American merchants by building new vessels and sending them out there. The profits of the voyages were very great. I have known of some vessels in which my family have been interested—new thousand-ton ships—that when they cleared from Boston Light on their voyages out to San Francisco had obtained freight money enough on that one voyage to pay the entire cost of building. Of course, that was a great stimulus to new construction. When in California these vessels found very little to do in the way of what would be termed a coastwise trade. The trade from New York to San Francisco was coastwise business; but there was no return cargo to warrant making the long trip homeward from San Francisco. Vessels would go to the Chincha Islands off the coast of Peru to load guano, or would go to China, India, the Philippine Islands, and various places to get return cargoes, either to the United States or to Europe. In this way we entered largely into the maritime business of the world. We found at that time that we possessed better vessels; that our officers and sailors were better adapted to the business; that we could make quicker trips, deliver our cargoes in better order than the ships and crews of any other nation. This was so well recognized that for 5 or 6 years before the outbreak of our civil war an American ship in Melbourne, Sidney, Hongkong, Calcutta, or in any of the great foreign seaports of the world, could obtain better charters to carry goods to England or to Germany than the English or German merchants would give to the vessels of their own nations. We obtained them simply because of the superior manner in which we carried on the business.

The decline came from the obvious causes of the war; the destruction of vessels by the Confederate privateers, and also from the high war rates that shippers in American bottoms were compelled to pay. That is to say, if an American vessel was loading in Calcutta for either Liverpool or Boston, she had to take her cargo at what the English merchant ship would get for the same business, less what the shipper had to pay in the way of war premiums, so that it made a distinct reduction in the possible profits of the American ship merchants. However, that would have righted itself when the war was over if the conditions in the matter of price had permitted us to build iron craft, or if we had repealed the laws that prevented the purchase of foreign-built ships by American ship merchants. We had begun iron construction before the war and begun it very successfully. There were 2 steamers—the *Massachusetts* and the *South Carolina*—built to run between Boston and Charleston, S. C., and 2 more—the *Mississippi* and the *Merrimac*—built to run between Boston and New Orleans. All of these 4 iron vessels had been constructed in Boston Harbor some years before the outbreak of the civil war. They were employed part of the time in the Government service as transports. One of them—the *South Carolina*—was in service as a merchant ship only 4 or 5 years ago, and may still be running between Panama and some of the ports of Central America on the Pacific coast, showing the well-built character of the vessels. In spite of this experience the tendency at that time among the American shipowners was to favor wooden rather than iron vessels, and they held to that under conditions which proved to a certain extent disastrous to them. I know of this particularly, because my father was the largest individual owner and manager of a line of steamers which was formed in 1866 to run between Boston and Liverpool, called the American Steamship Company. This company built its steamers of wood in spite of the advice that they should build iron vessels. These were wooden propeller ships. The enterprise unfortunately failed. There was not sufficient business, and the original cost of the craft was too high to make it possible to pay dividends on the business done. The same backwardness in this respect was shown in the case of the Pacific Mail Steamship Company during the time that I was in its service. At that time the Pacific Mail was receiving a large subsidy for carrying the mails between San Francisco and Hongkong, and I was an officer on the first steamer of the line that was built for trans-Pacific trade purposes—the *Great Republic*. There were also 3 others—the *China*, the *Alaska*, and the *Japan*. The company spent some \$5,000,000 in building wooden side-wheel steamers, which were as poorly adapted to the business they were intended to perform as it was possible to have them. They were built after the old type, just as steamers are now built to run up the Hudson River, that is so far as their engines were concerned, although long before that time the English had changed to the

propeller type of engine, and to the iron hull for ocean service. The steamer *Great Republic*, which was the first one to enter on the business, on one of the first voyages I made in her, left Yokohama with hardly any heavy cargo on board, simply coal enough to carry her over, and yet so deeply laden that the sidewheels would hardly turn around, and she proceeded at the rate of about 4 knots an hour until lightened up by the consumption of her coal. Four days out we struck a severe gale, which washed the paddle boxes and a part of the guards off, and we came into San Francisco with the paddle wheels bare of covering over them. Now, the money spent in building these vessels was practically thrown into the sea, so far as the development of American commerce was concerned. The subsidy voted by Congress engendered the belief in the minds of the managers of the company that they could do almost anything. There was in any event a profit obtainable and they built in a haphazard fashion.

The result of subsidies to American steamship lines, so far as they have been tried, has not been in the least satisfactory. A great deal has been said about the Collins Line to the effect that if their subsidies had been continued the line could have been built up. That line, unfortunately, was doomed before the subsidy ended. It was caused, perhaps, through no fault of its managers, but through circumstances, perhaps, beyond their control. As the committee may remember, it lost two steamers—one the *Arctic*, off the coast of Newfoundland under tragical conditions so far as the loss of life was concerned; another steamer—the *Pacific*—sailed from port and was never again heard of. This line at that time and the English lines at that time were largely passenger lines. They did not carry common freight. Freight was not carried by steamers across the Atlantic to any great extent until after the discovery of the compound engine and its subsequent developments; and at that time and now the passenger lines of steamers depend for patronage upon the success and safety with which they carry those who entrust themselves to their care. To lose two of its steamers in a short time would be fatal to the business of any company. In 1873 the White Star Line lost the *Atlantic* on the coast of Nova Scotia, and it required 6 or 8 years before it could recover its ground and have passengers go with it as freely as they did with other lines. A great many people I know would never think of going across the Atlantic on the French line of steamers, simply from the knowledge they have of the troubles that have occurred when an accident has taken place. The fate of the Collins Line was one of those misfortunes which come about through hard luck; through no fault, perhaps, of the managers; through no fault of the officers, because they had a splendid set of men on board of the steamers. Another line, if it had started at that time, and had not encountered these mishaps, would have had very much better success.

It has been frequently said that our merchant-marine business fell off and declined a long time prior to the war, for the reason that earlier in the century we carried a very much larger percentage of our exports and imports in American bottoms than we did at a later period. For instance, in 1826, 92½ per cent of all the exports and imports of the United States went in vessels sailing under the American flag; but at that time all the tonnage that we had registered for foreign voyages was 696,000 tons. In 1865, when we had nearly 2,500,000 tons, we only carried 65 per cent of our exports and imports, but this was due to the fact that our American merchants had found a better business than carrying these exports and imports of our own. They were then the common carriers of the world and were drawing large profits from transacting that business. With the vessels that my father owned and controlled, it frequently happened that they sailed from New York or from Boston on a foreign voyage and did not again return to an American port for 4 or 5 years. They were doing business all over the world. Now and then they would come home again for the purpose of refitting, but we were having such a profitable business at that time that whether the freight was American or foreign was a matter of indifference. At that time, too, when we were building up our trade in this rapid manner, we were paying to those whom we employed as officers and men on our vessels relatively much more, as compared with that paid on foreign ships, than we pay at the present time when compared with these foreign rates. It has never been, in the development of the American merchant marine, a question of maintenance. It has always proved that when we have had an opportunity we could pay more, simply because we obtained a great deal better service for what we paid. I remember on the first voyage that I made across the Atlantic—that was in 1861, on one of my father's ships—that we overtook and passed a number of English vessels, and the contempt was inexpressible with which our American officers looked down upon what they called "the lime juicers." These latter were not in a class with them.

The difficulty that we experience at the present time and have for years experienced is that we can not get the tools of our trade at a low price. So far as the

American shipbuilder is concerned, he has, unfortunately, acted during this long series of years as a dog in the manger in regard to the merchant marine of the United States engaged in the foreign trade. He has not been in a position, due to the high price of materials, iron and steel, to build vessels and maintain competition on equal terms with foreigners. At the present time the annual depreciation in vessel property is very great, representing approximately 10 per cent a year, so that if one vessel costs \$200,000 and another foreign competing vessel costs \$100,000 the depreciation each year practically represents what would be a fair return upon the money invested, and it is a dead loss to the American and a good profit to the foreigner. If the American shipbuilders had been willing—because it is largely through their insistency that the law has not been changed—if they had been willing to permit the purchase of foreign-built ships by American ship merchants they would have had just as much to build themselves for the coastwise business and probably a great deal more in the way of repairing than they have had of vessels engaged in the foreign trade, and would not have been the means of continuing our merchant marine in the paralyzed condition it has remained in for the last 30 years.

Q. (By Mr. CLARKE.) Has there been a difference of one-half in the cost?—A. There has at times. It has varied, of course, very materially with the difference of prices in the different countries, and that has not been a constant factor at all.

Q. You understand the difference to be much less now than formerly?—A. Oh, yes; it is very much less now. It is a curious fact in this connection that the difference in cost between the foreign-built vessel and the American vessel depends largely upon the character of the trade in which she is to be used. The roughly built freight steamer costs relatively more to build in this country than the finely finished passenger steamer. I have no means of knowing, but I have not the least doubt in my mind that Mr. Cramp, when he has succeeded in obtaining contracts for the construction of Russian or Japanese battle ships or cruisers, has made money out of the operation and that he has been given these contracts simply because he could build these war ships just as cheap as the foreigner could build them. The reason that he has been able to do this has been because of the immense amount of American labor that has entered into the construction of these vessels. The relative cost of the raw material in such craft has amounted to much less in the aggregate than would be the case with a common freight carrier, where the cost of the raw material is practically everything and the mere slapping of it together constitutes but a relatively small percentage of the charge. I know that a number of years ago I went through the shipbuilding works on the Clyde of the Messrs. Thompson, who built a large number of the Cunard steamers, and they told me, as an example of this, that they had all the woodwork for their steamers either made in Cincinnati, or had imported from Cincinnati to Glasgow the workmen who were to do it, because the work could be performed very much cheaper in our country or by our countrymen than by foreigners.

I am of the opinion that the resuscitation of our merchant marine would take place at the present time very quickly if the obstructive laws in regard to the ownership of foreign-built ships were repealed and we could place ourselves in this respect on the same plane as all of the other great maritime countries of the world, which have practically no restrictions of this kind. The fact that so much American capital has been invested in foreign tonnage, as, for instance, in the recent purchase of Mr. Morgan, indicates that it is not a question of capital. We can get all the money we want to build up our trade, provided, as I said before, we can get the tools by which that trade is to be carried on upon equitable terms.

Q. Is it your understanding that Mr. Morgan was able to buy those vessels as anybody would have been?—A. No; I should suppose Mr. Morgan, by the large purchases he has made of almost everything lately, was better able than most people.

Q. Then he has not been hampered in any way in buying them?—A. No; I should say in the case of the Leyland line he has been far from hampered. I understand that the Leyland stock represents seven stock waterings and yet he has paid a premium on that.

Q. But he has been able to acquire the tools of the trade?—A. Yes; except that they are under the English flag.

Q. Well, if it will not disconcert you, will you please tell us wherein there would be an advantage to him in having them under the American flag?—A. Oh, I should say, so far as Mr. Morgan is concerned, it would be perhaps a question of sentiment.

Q. (By Senator KYLE.) Of what?—A. Sentiment.

Q. Sentiment?—A. It is precisely similar to conditions that existed during our civil war; a large number of Americans placed their vessels under the English flag, or under the Hawaiian flag, or some other foreign flag. My people did not. They

preferred to pay the war premium, run all the risks of capture, and sail their vessels as Americans. It was a question of sentiment, and sentiment plays a pretty large part in the conduct of the affairs of this world.

Q. (By Mr. CLARKE.) Now, do you think that sentiment would be entertained more strongly by the owner than by the people at large?—A. I think it would be fairly developed. I think that if shipowners could buy their vessels in foreign shipyards that they would do so very quickly.

Q. They can buy them; that has been proved.—A. They can buy them; but I mean give to them American registers.

Q. Well, now, if they bought them there, they would not have them made here?—A. No; but they are not made here now. That is the trouble.

Q. Since steel has entered so largely into the construction of these vessels, and since this country has become the greatest producer of steel, is it not possible that they may be made here just as cheaply as abroad, and perhaps even more so?—A. I think so, in time.

Q. In your opinion, therefore, they do not need to be especially subsidized or encouraged by the American Government?—A. I do not think there is any need for subsidies. I should say even now that the construction of American vessels might be undertaken if we could obtain at our shipyards all of the advantages of our low-priced steel. That is to say, if American-made ship plates were in all cases, or in most cases, sold as cheaply to American shipbuilders as they are sold to the builders of vessels on the Clyde in Scotland and Tyne in England.

Q. If no foreign government was encouraging its merchant marine engaged in foreign trade by way of subsidy or postal bounty or any other method, would you see any necessity for this Government doing it?—A. I do not see any necessity at the present time, for the reason that I am not aware that in the transportation of freight any foreign government, with the exception of France and Italy, where it has proved a failure, are aiding their merchant marine by subsidies.

Q. Is the subsidy paid by Great Britain and also that paid by France limited to their passenger steamers?—A. That paid by Great Britain is entirely. That paid by France is a general subsidy and has proved a disastrous failure. It has not stimulated its merchant marine. I am not aware of a single vessel obtaining a mail subsidy from the English Government that is not a passenger steamer and a mail-carrying steamer.

Q. I hope I have not diverted you from your talk.—A. I had reached that particular phase of it.

Q. (By Mr. FARQUHAR.) The subsidy, Mr. Howes, that is paid to the Peninsular and Oriental, is that paid to passenger steamers?—A. Yes; these are all passenger steamers.

Q. But the Peninsular and Oriental line was never mainly dependent on passenger trade.—A. Probably not; they carry freight as well, but their main source of earnings is their passenger business.

Q. What do you say about the North German Lloyd, that has entered into the same business?—A. On subsidy?

Q. By both a German subvention and an English subvention.—A. The North German Lloyd has entered to some extent, running its steamers to the Far East, dividing its money, as I understand, with the Hamburg-American. These are passenger steamers that they have there. They carry freight, too, but they are more particularly maintained on a mail schedule.

Q. Is it a fair proposition to say that the whole of the Peninsular and Oriental and the joint lines there are not freight lines, simply as a matter of business?—A. No; they are not primarily conducted on a freight basis. The subsidy is paid to them on the ground that they are to make a higher rate of speed than it would be profitable for freight steamers to make. There are a larger number of steamers plying between England and the East that are purely freight steamers and that are paid no subsidies whatever. But the Peninsular and Oriental line has to run on schedule time, make a voyage at the rate of so many knots an hour, and the average has been increased with each renewal of the subsidy. It has had no competitors when the question of the renewal of the subsidy has come around, for the reason that the other lines running craft in that direction do not consider it of enough profit to take the subsidy in view of the conditions involved, the chief one of which is the high rate of speed.

Q. Out of all the Peninsular and Oriental boats, how many are on the mail schedule to China? Do you know the exact tonnage that is floated by them and the number of boats that the Peninsular and Oriental run in the eastern trade?—A. I could not state the exact tonnage. It is, roughly speaking, about 500,000 tons.

Q. Can you say how many are on the mail schedule?—A. Not definitely.

Q. Well, has not the proposition been openly made there, and discussed in Par-

liament there, that it was for the support of the Asiatic trade of the British Empire that that subsidy was paid?—A. Only so far as giving competitive mail service.

Q. Have not the Peninsular and Oriental in their annual statement said there that the subvention from the British Government was the entire aid that they had in competition with other nations?—A. In competition with other English vessels.

Q. Well, with other nations. There are other nations as well as that. The German combined line is almost as strong as the Oriental is, as far as mail is concerned?—A. The Hamburg-American is a large line.

Q. How many steamers have they got in the East?—A. They have not many out in the East; but they have a large number in other parts of the world.

Q. And greater speed?—A. As I said before, it is a question of speed. If the Peninsular and Oriental Company were willing to enter into the freight business, as so many of the other lines have that are not subsidized, undoubtedly it could make money. Its steamers, of course, are not adapted to that class of business. They are a swift class of steamers.

Q. Well, we will put it in another shape. The amount of subvention that the Peninsular and Oriental gets from the British Government is for the support of British commerce?—A. No; it is for the support of the political supremacy of the British Empire.

Q. Well, either way you put it.—A. If we were to run a line of steamers from Manila by way of Honolulu and pay a big subvention, I should not say that we were endeavoring to develop American commerce; I should say that we were endeavoring to combine together the outlying parts of our own domain, just as we pay a star-route mail subvention in our Western Territories.

Q. Well, Mr. Howes, are we not practically doing it now with the little transports without any lines?—A. Practically so. We are doing it because the Government pays for it.

Q. Pretty thoroughly, is it not?—A. Quite so.

Q. You mentioned the fact that the subvention of France had amounted to a total failure. Was not the failure a great deal in the fact that they bought their ships on the Clyde and elsewhere instead of supporting their own shipyards?—A. No; they have paid a higher rate to those which they have built at home; but it does not seem to have been of any advantage.

Q. It was no advantage and never was as long as they had free ships, and the cheap old ships of the world were there ready for the French merchant to get any time, and it killed the French shipyards?—A. No; I beg your pardon. The French merchant did not buy these; he did not purchase anything that was offered. You can not swindle a French ship merchant. The French are the best people in the world in the construction of vessels and in knowing what is the right thing to do. We and the English have copied the models of the French men-of-war from the time of the Revolution downward, because they have known how to construct hulls that were better in model and everything than either we or the English devised. They were not likely to be deceived in that way.

Q. Did Germany when she came to possess her merchant marine take the French plan of subsidy?—A. No.

Q. What exceptions did she make?—A. She never gave a general subsidy. She has subsidized some lines—only one line practically, the North German Lloyd.

Q. You make the proposition there of the failure of the French marine. Is it not a safe proposition to say that if they had not had the subvention the French marine would have been nowhere at all?—A. It is about that way now, for they have not the goods although they have paid the money.

Q. Is it not a fact that France held her own when she had that small subvention?—A. No.

Q. Has she not increased?—A. No, she has not increased.

Q. I am speaking of late years, of 1890 to 1891.—A. She may have for a short time, but they have made the experiment and they have found it a losing one.

Q. While she had the subsidy did they find it to be a losing one?—A. As respects their own past tonnage, no; as respects the tonnage of the world, yes. Relatively she is now worse off than she was before.

Q. Well, you must make a distinction between the tonnage proper of the nation and the carrying tonnage.—A. No, there has been a growth with all of the maritime nations of the world, in which the French have not participated. They have simply marked time.

Q. (By Mr. CLARKE.) I would like to ask one other question in regard to this purchase of Mr. Morgan, or other purchases that you think Americans should be free to make. Why is it that with our great steel production and with the wonderful skill of our builders we are not able now to produce even coarse freight vessels as cheaply as they can be produced in foreign shipyards?—A. I think one

reason is that we have not of late, so far as our shipbuilders are concerned, been able to get altogether the benefits of these low prices. If the American manufacturer of structural steel and steel plates intended for shipbuilding sells those articles to an English shipbuilder at a considerably lower price than he will sell them to an American in his own country, naturally he places the latter under a serious disadvantage when both are endeavoring to construct vessels that are to compete with each other on the high seas. This is the disadvantage which the American shipbuilder seems to be under at the present time.

Q. (By Mr. CONGER.) Do you know if that condition actually exists?—A. Well, it has existed. Prices of steel vary so tremendously in a very short time that it is hard to say that the condition exists now. That it existed last year or year before last, I feel confident.

Q. Do you understand that the structural steel which enters into foreign-built vessels is produced in this country?—A. I think to some extent it has been; steel plates certainly in large quantities.

Q. (By Mr. FARQUHAR.) Was not the reason why we exported steel plates the fact that they had a demand there and we had none here? What other reason have you got for it?—A. There was a demand there. There might have been a demand here at the same price.

Q. That may be, but it was not so as a business proposition?—A. There was a demand there at that price. The question is whether there would have been a demand here at the same price at which they were selling to foreigners.

Q. But we are not advised, this commission or anybody else, that the same price was offered there and refused?—A. What?

Q. The same price that was offered to the American builder that was offered to the foreign builder, so we were where we had always been in this country.—A. I do not know that they have ever been offered, but while—and this comes to me by hearsay, so it has to be taken for what it is worth—the price has been asked, and found to be higher than that at which similar commodities have been sold for at the same time on the other side of the Atlantic.

Q. (By Mr. KENNEDY.) Were you familiar with the subsidy bill that was pending in the last Congress?—A. I was.

Q. Do you understand that if Mr. Morgan had been the owner of these steamers that he has recently purchased at the time such a bill as that became a law, that he would get any benefit from that subsidy law?—A. It would depend on the date fixed in the law concerning the time of ownership. If the bill had been so drawn that any owner of a foreign-built ship, owning that ship on the 1st of July, 1901, could get a subsidy, he would have one. The date was a shifting one. What would have been the date when the bill finally passed no one could have foretold.

Q. Do you think that if that bill should be introduced and passed in the next Congress that these vessels that have been recently purchased would get the benefit of the provisions of that law?—A. I do not think it will pass unless they get the benefit.

Q. That is all I want to ask. [Laughter.]

Q. (By Mr. CLARKE.) What is your understanding of the relative labor cost of constructing freight vessels of steel in foreign shipyards and in this country?—A. I think there would not be at the present time much difference, provided you carried your vessel up to a tolerable high state of finish. I think quite likely that at this time, for a roughly constructed freight steamer, the labor cost of building here would be greater, even if the plates could be obtained at the same price, than it would be on the Tyne. There is always a difference. It is cheaper to build a freight vessel on the Tyne than on the Clyde, although they are both in the same country. One locality builds one class of vessels and the other another; and I think it quite likely that it could be built on the Tyne cheaper than here. But we have in this country a great advantage in the matter of labor. We hear a great deal of talk concerning its high cost, and less about its daily efficiency. On the occasion that I was speaking of, of going through the large shipyard on the Clyde, the chief of the house told me that he was able to get only about 4 days' work a week from his men; that it was the rarest occasion that the best men came to the yard in a condition to do work until Wednesday—usually about Wednesday noon. It took them that time to sober off after Sunday. He said this was one of the most serious obstacles that they had to contend with, and that it struck down his best men, as a rule. I found it true, through almost all of the northern part of England and the southern part of Scotland, that the loss to labor and capital in consequence of excessive drunkenness was something which Americans—unless they have been through those large industrial establishments—have no conception of. It is a condition which puts us—where this evil does not count as a practical factor in our operations—at a tremendous advantage in all industrial undertakings.

Q. (By Mr. PHILLIPS.) Do you believe with Mr. James J. Hill that ships can be constructed in this country as cheaply as they can on the Clyde?—A. I think with the same cost of raw material—I will include that—that a great number of large vessels can be built as cheaply here as they can there.

Q. He makes that assertion?—A. Well, he ought to know.

Q. (By Mr. KENNEDY.) It might be said that he might change his mind on that question because he did not come out in favor of the subsidy bill last winter.

Mr. PHILLIPS. Well, he made this statement in Chicago while this subsidy bill was pending, and was so quoted in the newspapers.

Q. (By Mr. FARQUHAR.) While you were speaking about the purchase of these boats by Mr. J. Pierpont Morgan, the Leyland Line, do you know what per cent they paid annually, the Leyland Line?—A. It has been a very profitable line. It has been a close corporation and it has not disclosed the amount of dividends paid; but it is currently reported that it has paid 15 to 20 per cent a year.

Q. It has been said it was 15 per cent?—A. I beg pardon?

Q. Take the proposition that it was 15 per cent.—A. As I said before, it has paid this on a capital that has represented 7 distinct waterings; that is, in stock dividends.

Q. (By Mr. LITCHMAN.) Then they water stock across the water?—A. Oh, yes; they are adepts at that.

Q. (By Mr. FARQUHAR.) Now, when the question is asked about the effect of the subsidy on Mr. Morgan, if he has purchased the line for a large sum of money on the stock and they make from 10 to 20 per cent there, do you think Mr. Morgan needs any subsidy to run his line?—A. I did not suppose the bill was based on needs.

Q. Do you think there is any necessity for Congress to give it to him?—A. No, I do not think there is any necessity for Congress to give it to him or to anybody else.

Q. Well, do you think the purchase of that amount of tonnage by Mr. Morgan there, that Mr. Morgan's plans are simply the fact of owning the tonnage and boats there as a productive industry, or that it is really an extension of the transportation features of the American continent into Liverpool and Southampton and Antwerp and elsewhere?—A. Oh, I think you are right that this is simply a development of his general system of transportation.

Q. (By Mr. CLARKE.) Would you see any objection to this country granting precisely the same subventions that other countries grant for rehabilitating the merchant marine?—A. Which other countries?

Q. In countries with which it would have to compete?—A. I should see no objection at all to our copying the English system under like conditions. I may say, answering your first question, that I went before the Committee on Commerce of the House a year ago, when it had the bill under advisement, and said that, while I did not believe in subsidies in the least and thought they were entirely useless, it seemed to me that there should be a brief amendment put into the bill, if it were going through, which would give to me, or to anyone else who did not want a subsidy, but was prepared to carry my business on on business principles without aid, the right to purchase my vessels wherever I saw fit. If those who built vessels in America, or who before a certain time owned foreign vessels and should agree to build an equivalent additional American tonnage, were to get a subsidy, that was granting logical protection to the American shipping interest. It was direct protection, instead of the customary method of indirect protection. But I never understood that the system of protection intended prohibition; it was simply to give a certain advantage to a national industry. If, after granting this direct protection, the law that prohibits the purchase of foreign-built vessels was repealed, I would, if I were a member of Congress, under such conditions, believing that the subsidy feature would fail, and feeling sure that under the other conditions the commerce of the country would grow, vote for the measure, subsidy and all—that is, taking the two together.

Q. (By Mr. FARQUHAR.) Now, Mr. Howes, about what amount of money do the Americans pay for the carriage of their goods to Europe and elsewhere?—A. That depends upon what you mean. You can not very well compel an Englishman to pay you for transporting goods over to England and then also pay you for transporting goods back again. We must limit ourselves either to the export trade or to the import trade.

Q. Take the joint exports and imports; how much does it cost the Americans?—A. I do not know that it costs—

Q. (Interrupting.) To use foreign tonnage, to pay foreign tonnage—how much money?—A. I think perhaps what we should legitimately pay them would be perhaps \$25,000,000 or \$30,000,000 a year.

Q. How much does it really cost, then, to carry the American exports and imports? We only carry 8 or 9 per cent of them.—A. Yes; 8.

Q. Well, whatever it may be—8 or 9 per cent. What does that 8 or 9 per cent cost the freighter?—A. I think, so far as the imports are concerned, those enter as a factor into the cost as a nation; so far as the exports are concerned, they do not enter at all. The English buy grain in Chicago, and they pay the transportation; we do not pay it.

Q. Would you say it is from \$175,000,000 to \$200,000,000 a year paid in cash?—A. Nothing like it; nothing like it.

Q. How much?—A. It is simply guesswork, but it can not be that. I should say \$30,000,000 or \$40,000,000 at the outside. That would be our import trade, which is all we can legitimately claim. We can not expect that the foreigner is to allow us to carry our goods to him and carry his goods to us. If we divide, that is all we can expect; and all that is rightly ours is what we import. If I buy 1,000 bales of jute in Calcutta and I bring it to this country, why, it ought to come, we will say, on an American vessel. The American tonnage even at the present time is carrying a great deal more of the import trade, and always has, than of the export trade. Last year we carried between 13 and 14 per cent of our import trade and only about 6 per cent of our export trade. If an Englishman buys 1,000 barrels of flour or 500,000 bushels of wheat in Chicago, he has the right to say how he will carry it. We can not expect to carry it for him, except to carry it over our railroads and deliver it to him at his vehicle, wherever that is.

Q. So you would say, then, that it only costs the American freighter for 12 months about \$30,000,000 a year?—A. I should say probably about \$40,000,000 a year.

Q. Have you seen any figures different from that?—A. I have seen a great many which I did not believe in the least.

Q. In what way?—A. I think they were overestimates.

Q. What do you make the basis of your estimate in finding the freight rates?—

A. On the average of freight rates on the quantity of stuff we import.

Q. What do you calculate in the ton? What figure do you make in calculating the tons, as all other people do?—A. There is no fixed charge, because it depends on where the bulk of your business comes from. If it is a long distance, it is quite high; and it depends also on the character of the commodities offered. Some are expensive and some are cheap goods. Now, you have to take into account that while with the magnitude of our export and of our import business the tonnage is tremendous in the exports, because we export so much grain and so many things of bulk rather than of value, our import business is in tonnage relatively small. That is, what we bring into this country, as a rule, are goods of a relatively high cost. They take up very little space, and do not represent a tremendous amount in the cost of transportation.

Q. Is there any agreed figure at all about the freight per ton on the average of all the imports and exports of a nation?—A. I do not think there can be.

Q. Would you take Mulhall as an authority? Would you take the British Board of Trade as an authority?—A. Yes; very good authority.

Q. Have you ever seen any figures where it had been figured at \$15 a ton, and that it cost this country \$180,000,000 to \$200,000,000?—A. I have seen in Mr. Chamberlain's reports something to that effect, I think, but I did not take any stock in it.

Q. Do you know that that is usually the figure that is used there in Great Britain by the British Board of Trade?—A. Fifteen dollars a ton?

Q. Yes.—A. It is possible. I did not know that. I beg your pardon, but I would like to ask you one question as to how large a part of that is based on wheat that is now being carried across the Atlantic at 2 cents a bushel?

Q. That is inclusive of every single thing on the British import line.—A. Imports, not exports?

Q. Exports, not imports.—A. I have not seen that statement.

Q. What I wish to say is that this has been the general figure of statisticians. Whether it is true or not, I am not pretending to say. Now, suppose it is \$100,000,000, or \$75,000,000, or \$50,000,000, is it not a good deal better, then, that the Americans should have that profit, as long as we could get a friendly bottom or friendly ship to carry that to America, than for the whole of our business to be controlled by foreigners?—A. I do not consider that represents profit. If it was \$100,000,000, if that were the cost, it might be done at cost prices. It may be no more than the labor is worth. If we were to divert that \$100,000,000 of freight, were to pay a subsidy equivalent to it, we should simply pay that in addition to paying for the service that was rendered.

Q. Well, I am not talking about paying it out in subsidies. I am talking about

keeping it inside the United States.—A. Other things being equal, it is more desirable, no doubt, to do as much of your own business as you can, if you do not have to pay too much for it.

Q. It would be the thifty way to do it?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Is there any other way of estimating the cost of freight, by per cent of the value of freight?—A. I suppose that there might be, but it is very difficult to figure. It is not only a very difficult thing to determine, but your basis of calculation varies every week. The quantity and distance of shipments vary, and then the price charged varies according to classification; so that it is about as nearly guesswork as any statistical compilation you could possibly make.

Q. I have seen, of course, the amount of freight carried stated and the estimated cost of carriage at 10 per cent, making out, of course a large amount paid for the transportation of American freight.—A. I do not believe that that basis is at all to be depended upon.

Q. Ten per cent, I believe.—A. Take it at the present time—the rates on our products. A bushel of wheat is worth 60 or 70 or 80 cents a bushel; the export charge is 2 cents; on corn the export charge would be 2 cents and the price less, of course; and rye in like manner. Now, on cattle the cost of carrying is very much less than 10 per cent; so if you go in this way through the great items of exportation you will find that the freight rate does not come anywhere near 10 per cent. There are, no doubt, certain articles, where the value is very small and the bulk large, that 10 per cent would constitute a fair freight charge; but I should say, as an average, it would be very excessive.

Q. (By Mr. CLARKE.) On imports it would be still less, would it not?—A. On imports it would be rather less, I should think; values enter so largely into the question.

Q. The agent of one of the lines in Boston told me that the cost of freighting some articles from Europe to this country was probably less than one-tenth of 1 per cent of the cost. Would you think that unreasonable?—A. I should say on cases of silk from Liverpool to Boston, coming from Lyon and across in that way, that that would be probably a fair estimate.

Q. (By Mr. PHILLIPS.) Recurring to the subsidy just a moment, is it or is it not a fact that Norway and Sweden have developed their merchant marine more rapidly than other nations without subsidy?—A. I should hardly say that they had developed it more rapidly. Sweden certainly has not; Norway has. Norway has been doing a great tramp business, so that Norwegian steamers carry a very large share of our foreign business. They employ their vessels precisely as American vessels were used 40 or 50 years ago, in business all over the world, and have been very successful. The profits they have made have been very large.

Q. And yet they have no subsidies?—A. No subsidies. A very large part of the Norwegian steamers, however, are built in English and in Scotch shipyards.

Q. (By Mr. CONGER.) I would like to go back for a moment to the argument or claim of those who say that only on imports the Americans pay freight. Is it not a fact in the internal commerce of the country that the great majority of sales are made delivered; in other words, the manufacturer paying the freight?—A. That is done to some extent.

Q. That is quite a common custom?—A. I think it is.

Q. Do we understand in the exportation of goods the contrary is the custom?—A. I do not say that is the case. I say that you can not figure on crediting or debiting the United States with both the exports and the imports; you must choose one or the other, and the imports would perhaps seem the more natural choice.

Q. Would it not be a fairer way to say we should divide on a combination of the whole?—A. We have not been willing to divide. We have claimed it all heretofore. I do not know that it would matter much. I said that merely because I noticed in going over the statistics of our shipping business that through the whole series of years, even from the very first, we have carried a much larger proportion of our import business than our export business.

Q. Take the exportation of wheat, for instance. Do you know whether it is the custom for the exporters of this country in Chicago or in the Atlantic seacoast towns to sell the wheat in this country or sell it delivered in Liverpool?—A. It is a double transaction as a rule. I think a man buys in Chicago so many thousand bushels of wheat, provided it can be landed in London or Liverpool at a certain price.

Q. In other words, it is sold delivered?—A. It is frequently sold that way. Then there is a good deal of spot wheat purchased in Baltimore, Philadelphia, and New York, and the English purchaser makes his own trade in chartering vessels to carry it.

Q. That would apply principally to the portion of wheat carried in tramp steamers?—A. It is perhaps a larger proportion of that. The freight rate may and undoubtedly does enter into the price in these through bills of lading.

Q. (By Mr. KENNEDY.) If our merchant marine were on an equality with that of Great Britain would it not then be simply a matter of competition, and the one giving the best terms for both import and export would get the majority of both?—A. Probably, assuming the facilities were equal. We used to beat them in facilities, and I hope we should do so again.

Q. (By Mr. CLARKE.) Is not the argument for free ships equally an argument for free imports of other manufactures?—A. Not necessarily, for this reason: The free-ship idea has been to confine foreign-built vessels sailing under the American flag to the foreign trade. The introduction of free goods to this country means they are to be used in competition in this country itself. When a vessel is engaged in foreign voyages, whether American, English, Norwegian, or any other, she has to meet the world's conditions. Nothing that we can do can determine the results one way or the other—nothing we can do nationally. For that reason all must stand upon practically a common basis. If they can build their ships cheaper than we they have that much advantage over us; and the only way in which we can make headway is to get our ships as cheap as they do, and then the best man will win.

Q. (By Mr. LITCHMAN.) One question right in that connection. What would you think would be the effect of applying to our foreign commerce the same provision of the navigation laws that has given to us the exclusive control of our coastwise trade?—A. In what way do you mean? By not allowing any other vessels to come in?

Q. Not giving clearance to any other vessels.—A. I think it would lead to one of the worst commercial wars the world has ever seen, and that we should come out of it losing more than we could by any possibility gain.

Q. Has that been the effect in the coastwise trade?—No; that trade is our own. We are asking foreign nations to buy of us and would be, at the same time, by the plan suggested, throwing an obstacle in the way.

Q. (By Mr. FARQUHAR.) I presume you would open the lakes to the free trade so the Canadians could build for us?—A. For trade between Canada and the United States—not coastwise trade.

Q. Do you think it is a disadvantageous condition that the lake trade is in now, under present restrictions which we have there on Canadian shipbuilding and Canadian traffic? Do you think the Americans suffer from it much?—A. I do not think they suffer, but I think if the restrictions now existing were taken off that most of the Canadian vessels would be built in Cleveland and Detroit and not on the Canadian side.

Q. There would be no necessity for the present law if that would be the fact?—A. So long as there are restrictions on one side there are apt to be on the other.

Q. Could you find a shipowner or shipbuilder who would agree to open the whole of that trade to the Canadians or to foreign-built ships that enter the trade?—A. I did not know there was any proposal to do that. The proposition simply was for vessels in the foreign trade.

Q. That, of course, is foreign trade; no doubt about that.—A. If the vessels on the lakes were restricted to voyages between the United States and a foreign country, they would have a very limited field of operation. It would hardly pay any shipowner, as you must realize, to put money into a vessel of that kind. He would want a vessel on the lakes that he could employ between any of the lake ports. Most of the business on the lakes is the transportation of ore, wheat, and coal between Lake Superior and the lower lakes.

Q. Of course it is in the hands of Americans and they are American ships, and American money in the furnishing of them. It is a practical way of doing business and a very good law that shuts out the Canadian from cutting us on rates.—A. I have no fear of the Canadians cutting under us.

Q. These foreign ships that you would buy in Europe you would give full American registry to?—A. Yes.

Q. So they could go into the coastwise trade?—A. I have tried to make that point clear. I said simply engaged in foreign voyages.

Q. Are you sure any law could be made to keep the American ship out of the coastwise trade—under American registry?—A. If that is legally impossible, then Congress is attempting every year many much more difficult tasks. It would be just as easy to restrict a vessel of that class from entering into the coastwise trade as it now is to prevent a foreign vessel from entering it.

Q. (By Senator KYLE.) You might proceed now with the third division of your subject.—A. I wish to call the attention of this commission, as vice-chair-

man of the Boston Chamber of Commerce committee on reciprocal trade with Canada, to the necessity of formulating some trade treaty with Canada within a very short time if we are to maintain and increase the trade we have there. I think it is appreciated by very few that the trade which the United States has with Canada is the best trade relatively that we have with any foreign country. Man for man the Canadians are the largest purchasers that we have. We are living in an era of trade extension when we wish to obtain our markets all over the world wherever we can secure them; but it is too often overlooked that the markets of the United States—the markets of a great manufacturing people—are chiefly to be found among those who may be termed a corresponding people; that is, a people having essentially the same tastes and habits that we have, and—what is quite as essential—who possess the wealth enabling them to purchase the goods which we have for sale. There is no people on the face of the earth that is so nearly like ourselves as the Canadian people. In fact, the Canadians resemble those of us who live along the northern border quite as closely perhaps as the people along the northern border resemble those who live in the Gulf States. We are practically alike in our political, social, and industrial conditions.

The Canadians have recently found in the United States a market in which they can purchase to better advantage than elsewhere the goods that they need, that satisfy their habits and tastes; and what is more they have the money to pay for these.

We have frequently had it urged that in seeking to establish reciprocal trade relations we should turn to countries which are unlike ours, which produced goods that we do not produce, so that the exchange would not be of what might be termed equivalent, but an exchange of dissimilar commodities. That, it seems to me, is a mistake, for the business of a country such as ours must to a large extent be carried on with those countries that are producing much the same goods that we produce, only under different conditions.

Take for example our internal trade or interstate trade, such as that between the States of New York, Pennsylvania, Ohio, and Massachusetts. This is probably more than equal in volume to the entire export and import trade of the United States. Yet each of these 4 States, which is every 24 hours exchanging goods by train load after train load, is producing practically the same things that the others produce, only under those slight varying conditions which lead to the making of a better market in one place than another.

I had brought forcibly to my mind the difficulty in the way of selling goods in a country which does not produce what we do during the time that I was in the Pacific Mail service. A part of that time I was employed on the steamers between Panama and San Francisco, and once a month the steamer which left Panama stopped at the port of Manzanillo, on the Mexican coast, for the purpose of landing there goods intended for the city of Colima, which was located 70 or 80 miles back in the mountains, and to which these were carried on mule back. This was the only means of access to the outer world that the city of Colima possessed, and all the trade that it did with the outer world went through that channel. The goods were sent from New York, Liverpool, London, Southampton, and Hamburg, were landed at Aspinwall and carried across the isthmus to Panama, and once in a month were put on board the steamer which made this delivery. Now, I happened to be on the steamer that took that cargo up the coast on several different occasions, and as freight clerk I had to discharge it. Colima is a city of about 100,000 people—that is the number of the people living in the city and immediate suburbs, yet the total amount of goods from the outer world that this city needed once in a month would have just about filled one respectable freight car. That constituted the needs of its people.

Now, the American manufacturer might send a traveling man through Mexico to build up that class of trade, and yet if the latter made a most successful trip his employer could not possibly get half enough out of it to pay his "drummer's" traveling expenses. The need there is for teachers, missionaries of civilization, to bring the people into a condition to use American goods.

If you go to Canada and you find the conditions reversed—the market is already made—the people ready and willing to purchase of us, rather than of anyone else, even when there are obstacles in the way.

Last year they purchased of us on a per capita basis—calling the Canadian people 6,000,000, for that is what they claim—\$17.50 per capita. The United Kingdom, which is our next largest purchaser, took \$13.25. Germany took \$3.60, but I think in the Treasury records there is a mistake, because there is a great deal credited to the Netherlands and to Belgium—goods which enter at Rotterdam, Antwerp, and Amsterdam, and are carried from there to Germany; hence I venture to say that Germany purchases of us \$5 per capita rather than \$3.60. Argentina took \$5,

Mexico \$2.65, France \$2.15, Italy \$1.10, Japan \$0.70, Brazil \$0.60. The 6,000,000 people in Canada purchased of us last year more than the 60,000,000 people who live on the American Continent south of the Rio Grande.

What is more, the Canadians purchased of us the goods that we most wanted to sell—the goods that yielded the best profit. I wish, for the information of the commission, to go through a comparative classification which I have made of the classes of goods which we buy of them and the classes of goods which we sell to them. I have taken the larger items from the report of the Canadian minister of commerce, because our reports do not classify them in this way. Carriages, carts, and bicycles, we bought last year, in value, of Canada \$17,639 and sold \$1,825,407. In 1894—six years ago—our sales were only \$250,000, showing an increase of fivefold in that time. Breadstuffs and grain, we bought \$421,313 and sold \$7,866,831. Of these sales the larger part was indian corn, which we can grow to better advantage than the Canadians. Animals, we bought \$3,073,907 and sold \$548,083. These animals that we bought were of all sorts—horses, cattle, hogs, and sheep. Our sales were largely horses, and were sent mostly from Washington into British Columbia, where the agricultural conditions are not as good as ours. Fish, we bought \$3,641,373, of which \$1,280,000 were lobsters, which are drawing toward extinction in our country, and we sold \$484,545 worth of fish, which was to quite an extent oysters, which we can raise better than can the Canadians. Hooks, nets, and seines, we bought none and sold \$305,224. Silk and silk manufactures, we bought none and sold \$549,805. Cordage and twine, we bought \$26,109 and sold \$978,850. The larger part of this was binding twine, which we sold to farmers in Ontario and up in the Saskatchewan Valley. Manufactures of rubber and gutta-percha, we bought none and sold \$2,651,113. Glass, we bought none and sold \$535,000. Hay, we bought \$715,000 and sold \$88,000. Our purchases of hay last year were larger than on ordinary occasions. Last year was, as you may remember, in the northeastern part of the country, a very dry season. We ran short of hay and had to purchase it where we could get it. In 1899 we purchased \$118,000 worth, and in 1898 \$24,000 worth, and in 1896 \$1,640,000. Whenever the crop in hay is short in this country we cross the border to get it. Paper, we bought \$23,000 and sold \$1,043,000. Vegetables, we bought \$149,000 and sold \$329,925. Hides and skins, we bought \$1,396,635 and sold \$2,128,488. Provisions, we bought \$38,944 and sold \$1,797,078. Leather and manufactures of leather, we bought \$45,308 and sold \$1,610,090, of which \$529,281 were boots and shoes. Books, we bought \$52,400 and sold \$1,095,019. Cotton and manufactures of the same, we bought \$144,782 and sold of manufactured cotton \$1,509,313 and of raw cotton \$4,491,575. Our trade in cotton-manufactured goods has gradually fallen off, as the year before last we sold \$300,000 more than last year. The differential duty favoring England—which I shall explain to you in a minute or two—is telling materially on our Canadian sales of manufactured-cotton goods. Fruit, we bought \$256,433 and sold \$2,288,828. Our purchases were to a considerable extent apples, and our sales were largely subtropical fruits and fruits such as peaches and the like which we raise in the Middle and Northern States. Hats, caps, and bonnets, we bought none and sold \$844,548. Electrical apparatus, we bought none and sold \$847,000. Plants, we bought \$3,500 and sold \$317,000. Seeds, we bought \$61,500 and sold \$1,740,000. Drugs, dyes, and chemicals, we bought \$43,657 and sold \$2,144,533. Wood and manufactures of wood—this is where they get the advantage of us—we bought \$14,087,088 and sold \$4,806,547. Coal, we bought \$4,026,608 of bituminous coal and sold \$4,359,742 of bituminous coal and \$7,108,624 of anthracite coal. The trade in bituminous coal between Canada and the United States is about an even exchange. It is largely a question of geographical location. The Canadians have not developed coal mines to any extent in the interior regions. They have none until you get westward pretty well out to the Rocky Mountains, where they are opening some mines now; but they have very good bituminous coal deposits at the two extremes. We have no bituminous coal on the Atlantic or Pacific water front, but we have it very largely in the center of the country.

Q. (By Mr. CLARKE.) Is there not some on the Pacific?—A. Do you mean on Puget Sound?

Q. (By Senator KYLE.) There is some in Washington State.—A. I went 2 years ago on Senator Perkins's line of steamers to San Francisco from Seattle, and on the trip I asked the engineer, "What coal are you using?" He said, "From Nanaimo." I said, "How is that? Don't you use the Puget Sound coal?" He said, "Our company owns mines there, but it is not good steaming coal. It is shaly." I found that in San Francisco they much prefer coal from Sydney or from Nanaimo.

Q. In British Columbia?—A. Yes. Take it on the map here [indicating on

map]. We supply Canada with bituminous coal from a point about 150 miles west of Montreal. There the coal from Pennsylvania and Ohio begins to come in. From there we run nearly to the Rocky Mountains, supplying the interior with bituminous coal. The Canadians supply us to some extent at both ends. On the Pacific, as I have said, there is no good coal that can be obtained from domestic sources, so it is supplied from Canada or New South Wales, in Australia. In New England our bituminous coal comes chiefly from the mines in western Maryland and West Virginia. Now, the cost of mining coal at the pit's mouth is as high in Nova Scotia as in West Virginia, if not higher. The mining in West Virginia is largely carried on by negro laborers at a low scale of pay. The coal of Nova Scotia is mined by white people, who are paid a higher rate of wages. At the pit's mouth there is not much difference, though the difference is in favor of West Virginia and Maryland; but the railroad haul to get this latter coal to tide water involves an average expense of about \$1.25 a ton, and this is put on the price of the coal. The mines of Nova Scotia are practically on the water front. There is a haul to Louisburg in the winter time, but this is a trifling expense compared with the railroad expense in Maryland and West Virginia. We in New England are now paying for that railroad haul. It is a condition that can never be changed. You can not change it by protecting the business from the present time to the day of doom. There will always be that disadvantage against us. Our natural source of supply is in Nova Scotia, which is almost on our water front, with no greater water carriage than there is from the capes of the Chesapeake to Massachusetts Bay or the coast of Maine. This is a tolerably even exchange of equivalents. One country supplies the deficiencies in the center and the other at the extremes. When we put a duty on bituminous coal Canada puts it on, and when we take it off Canada takes it off.

Metals and metal manufactures is one of the most important items in our series exchange—the most important so far as our sales are concerned. We have been purchasing to quite a large extent the raw minerals of Canada. For example, we bought of gold quartz \$14,135,000. It enters in as an element of trade, but it is about as crude an element as you could possibly get. Copper ore, we bought \$1,387,000; silver ore, \$1,350,000; nickel, \$1,040,000; lead ore, \$621,280. A large part of this came down from the Kootenai district in Canada, and went to the great smelting centers of Montana, furnishing there the variations in ores needed to get the proper flux in smelting various forms of metals. We do not, on the other hand, sell to the Canadians ores or crude metals. We sold them our metal manufactures in the following order: Manufactures of copper, \$1,930,000; agricultural implements, \$1,905,000; machinery, \$4,821,000; miscellaneous iron and steel manufactures, \$16,476,000; making a total sale of manufactured metals last year of \$27,707,000. Now, when you take into account that no longer than 5 years ago instead of selling them over \$27,000,000 of this class of goods we sold them only \$6,650,000, you will see the enormous increase that has been made in the absorption by Canada of our metal-manufactured wares.

But to put the classification in a little different form. The Canadians classify their sales in foreign countries by the products of the mines, fisheries, forests, animals, agricultural products, and manufactured wares. Now, I will first take 4 years ago—1896—and then last year. In 1896 we bought of Canada, products of the mines, \$7,438,000, and sold \$9,222,000; fisheries, \$3,302,000, and sold \$332,000; forests, \$13,528,000, and sold \$2,732,000; animals, \$3,341,000, and sold \$2,308,000; agricultural products, \$3,233,000, and sold \$10,124,000; manufactures, \$2,531,000, and sold \$28,184,000; that is, our total purchases of them in these lines were \$34,373,000 in 1896, and we sold them \$52,392,000. Last year, 1900, the Canadians sold us of the products of their mines \$14,135,000 worth of gold quartz, and a total of mine products amounting to \$23,700,000, and we sold them of the products of our mines \$11,600,000; of fish products, we bought \$3,689,000 and sold \$484,000; of products of the forests, we bought \$12,805,000 and sold \$5,200,000; animals, we bought \$5,326,000 and sold \$3,420,000; agricultural products, we bought \$2,041,000 and sold \$19,080,000; manufactures, we bought \$4,857,000 and sold \$61,362,000. In other words, we sold to the people of Canada of our manufactured wares more than \$10 per capita. We sold in Canada last year nearly as much of our manufactures as we sold of these to the entire world in 1870, and about one-sixth as much as we sold to the entire world last year.

I have emphasized this point because our people seem to overlook the existence of this enormous trade, one that is closely connected with us—on our very border. They do not realize that this trade gives employment to every department of American industry, from the time of taking the materials from the mines and the fields, and, while they are carried in their half-finished condition, through factories and workshops, into the stores, up to the time that they are transferred, in a fin-

ished state, ready for consumption, into Canadian hands. This is a class of business that needs to be encouraged, because it gives employment all along the industrial line, and gives a profit all along the same line. This trade is infinitely better than that which consists in digging the same amounts in value from the earth, or reaping it in the field and sending to foreign markets for sale in crude forms, for the reason that the manufactured commodity represents vastly more employment to American labor and larger returns to American capital.

Now, these Canadian trade conditions are eminently satisfactory, but the difficulty is they are not likely to continue so, unless we are prepared to do something toward meeting Canadian wishes in the way of giving her a market for what she has to sell.

Q. (By Mr. FARQUHAR.) If you would touch on the British differential now.—A. I am getting to that. The Canadians, about 4 years ago, proposed by act of Parliament to grant to any other country that would give to Canadian products what Canada considered equivalent tariff conditions a concession of 12½ per cent in the then duty, this to be increased the next year to 25 per cent. At the time there was no country prepared to take advantage of this offer except Great Britain, for Great Britain charges practically no duty on any Canadian product, except possibly Canadian whisky. For a time, in consequence of treaties with England, Belgium and Germany received this benefit until these treaties were denounced, as it is termed. Since then the English have enjoyed it without rivalry. Lately the differential has been increased to 33½ per cent, so that American goods entering Canada pay 50 per cent higher duty than is paid by corresponding English goods. Still, in spite of this differential against us (which, as Canada's duties average about 30 per cent, would amount on a shipment of \$100 to a benefit in favor of England of \$10, or in many instances the equivalent of a large profit on the sale), in spite of this difference American manufactures have entered Canada and in very many departments of trade have driven out the English manufactures. In cotton manufactures the latter have been able to lessen our sales, but in little else. That is partly due to the fact that it is easier for the Canadian to get to the American market than to the English market. Orders can be transmitted in 24 hours and executed in 48 or 56 hours, and again, if there is any question about the goods whether or not of the kind ordered, the differences can be easily settled. Again, we manufacture goods more to the Canadian tastes than do the English. The Canadians are more nearly like ourselves, though they would deny it, than they are like the English and they favor our styles more generally than they do the English. These are factors in our favor; and yet a short time ago very few people would have believed that American manufacturers could go into a neutral market and compete with and defeat the English on such grounds as these. We now enter an English colony; we go there at a disadvantage, and yet we undersell England in that market. I think there has never been a more wonderful exhibition of the ability of the American manufacturer to make fine qualities of goods at low prices and his ability to sell these in foreign countries than has been afforded by this experience of the last 2 or 3 years in Canada. It shows that we are above all competitors and that there is no country in the world that can compete with the American manufacturer and the American working man, without regard to tariff.

Q. (By Mr. LITCHMAN.) Have you gone far enough to learn how much of that trade has been retained by selling at a price less for the same kind of goods than they have been sold for in the American market?—A. I dare say that is done. All nations do that every day. I do not think they are discriminating any more in Canada than in Germany, France, or any other country. No matter what conditions of tariff you have, that is a method of trade—of making slaughter sales in the foreign markets—that the manufacturers of all countries employ.

Q. You are not like some economists who use that as an argument to take the tariff off?—A. No. Whether it is on or off trade of this kind will go on much the same. The future difficulty that we have to face is this: We have made great trade gains; but the Canadians are naturally dissatisfied. They sell us their crude commodities and that is all, and they do not sell a great deal of these, relatively speaking. They have a tremendous market in England which they have built up. Their sales in England last year amounted to \$107,000,000 in value, and in the future it will increase greatly on that.

A few years ago we were blind enough to believe that Canada had no market other than that of the United States, and that our proper diplomatic course was to close that market and thus force the Canadians down on their knees to beg to be taken as States into the American Union. We never made a more fatal diplomatic error. We raised that class of resentment which we would have felt ourselves if the same policy had been practiced against us. The Canadians are an Anglo-Saxon

people and you can not drive an Anglo-Saxon people, though you may coax them. The result was that we built up for Canada a new market. Instead of the transportation lines running north and south between their country and ours as they should, we forced Canada into building the Canadian Pacific Railroad, thus paralleling our railway systems. We forced Sir John Macdonald to adopt his "national" policy and to endeavor to build up manufacturing industries in Canada. We forced the Canadians to look across the Atlantic to England to get there the market which we refused them. Now they are independent of us so far as the market is concerned. They do not sell us enough to make it a vital question whether they do business with us or not. We are the petitioners. We see in Canada our best market; Canada sees nothing here that is seriously necessary to her welfare. The tendency has been and is to drive Canada away from us. Thus, in the future, if 33½ per cent differential is not enough, it will be raised to 50 per cent or 75 per cent, or it will be swept away by the federated empire of England and her colonial dependencies, a change which is by no means unlikely. In the transformations now taking place the old English free-trade system may go by the board, and England and her colonies find their advantage in trading between themselves and in supplying each other's needs. This change may not be so far off unless we intervene; and, looking to our own interests, we are compelled by the necessities of the case to intervene. It is not altogether our Canadian market that is in peril. Of our enormous exports, more than half are sold to England and England's dependencies and colonies. We can not afford to lose this English market.

If we can make a treaty with the Canadians which is satisfactory to them, and which gives to them something of a market here, we shall have a clutch on them which they will not care to break; and whatever may happen in other respects, this would be of distinct advantage to us.

Now what are the obstacles? There are three conditions which we have to meet if we are going to make a trade treaty with Canada. We must make concessions in the duties on fish, lumber, and coal. So far as agricultural products are concerned—potatoes and eggs and goods of that kind—it is a relatively small matter. As we are now selling to the Canadians \$19,000,000 worth of our agricultural products, it would seem to be rather discourteous to grumble because they sell farm products to the value of 2 or 3 million dollars to us. But on the larger items we must do something.

The coal interests of Maryland and West Virginia are exceedingly strong, and they naturally object to anything threatening their New England market.

As to the fish business, I have been a fisherman myself—a fisherman by descent, at least. We have the Gloucester fisheries held up before us as the "nursery of the Navy." What are you going to do, it is asked, to get the sailors to man our warships unless you protect the fishing industry in Gloucester? Now, I have had a strong interest in the fishing industry as long as it was American, but it has ceased to be an American industry. There is American capital invested in it and there are certain American officers employed on the fishing vessels. One of the members of your commission has lived there, and he will correct me if he thinks I am wrong. But the larger part of those engaged in the catching of fish are from Nova Scotia, New Brunswick, and Portugal. They are not American citizens. Some of the Portuguese will possibly become so, but those from the Provinces come there during the fishing season, and after this is over they go back home. Each year there is printed a list of the unfortunates who have lost their lives by various disasters during the year—a most pathetic list and often a large one. Last year, out of some 50 or 60 men whose lives were lost—it may have been 3, but I am inclined to believe it was but 2 who were Americans, and these 2 were captains of vessels; the rest were foreigners. That indicates how little of an American industry it is when compared with what it once was.

When we had our war with Spain, the United States Government, having a notion that this was truth and not mere tradition, sent down two battleships or cruisers to Gloucester to exploit that nursery of the Navy idea and get as many men as possible. These stayed there nearly all the time of the war, and I think they enlisted a little over 300 men—that is about half as many as would be necessary to man one battleship. Boston is not a nursery of the Navy and never claimed to be, but we enlisted some 1,700 men during the same time. So I say this is fiction. Yet, when this matter is brought up in Congress you will hear any amount of eloquence about these poor men giving their lives to hard service, who must be looked upon to defend the honor of the flag on the seas if ever the occasion calls for it. The American does not like this fishing business. It is too hard a business for him. He can find better pay on shore and be with his family.

The lumber interest, of course, is different. When our committee appeared

before the Anglo-American Commission, we were told that the lumber interest was one of the strongest in opposition to any change of this kind; and there again the reason is geographic to quite an extent. The market for lumber is largely in the New England and Middle States. It is a long haul from Minnesota and Wisconsin, and it is a short haul from Canada. The hard-pine lumber that comes in from the southern tier of States is also affected by its distance—a disqualification which can never be overcome by anything except a remaking of the world.

What I desire, gentlemen, to impress upon your minds as representing the chamber of commerce, is that our interests in New England largely turn us toward our northern neighbor. We look upon Canada as fairly tributary to our market; we believe that the border line is largely an artificial one, and that as we are, to quite an extent, cut off from the West, we should have the right, as far as possible, to exploit the country to the north and east of us. If Canada is ever to be made a part of the United States it must be by drawing the Canadians to us with the strongest possible bands of trade.

Q. (By Mr. CLARKE.) Do you know of any willingness on the part of the government in Canada to negotiate a treaty?—A. I am inclined to believe that there would be no difficulty in making a treaty on the ground of equivalent concessions, without regard to the special products.

Q. Is it not within your knowledge that special efforts have been made several times in recent years to come to a basis of agreement and a common understanding, and that the rock upon which they split every time has been the classification of articles?—A. Well, I know the rock they split upon very largely was the lumber interest. That was one part of the classification, no doubt. I had that statement, in effect, from Mr. Dingley, and I suppose that he knew. He was a member of the commission.

Q. (By Mr. LITCHMAN.) In what section of the country did that manifest itself most strongly?—A. The most prominent opponent was the distinguished Congressman from Minnesota, Mr. Tawney.

Q. Did it affect the lumber interests in Michigan?—A. Oh, no; Michigan is no longer the center of the lumber industry.

Q. (By Mr. CLARKE.) Is not the manufacturing industry in Canada generally opposed to a reciprocity treaty?—A. I dare say it is. It is also opposed to a differential tariff with England, but this does not seem to make any difference in the policy of the Government, however.

Q. Is it your plea that this differential of theirs stands in the way of a reciprocity treaty?—A. I do not think so. I think very likely it was initiated for the purpose of forcing something of the kind. I think it has now obtained such headway that it is working out its results on its own grounds.

Q. If Great Britain puts an export duty on bituminous coal, do you think there would be any import of that coal to this country?—A. Imports from where?

Q. From Wales?—A. No; there never has been for years; there would not be under any circumstances.

Q. You think it would be, then, about an even exchange so far as coal is concerned?—A. Between the United States and Canada, yes.

Q. And to the accommodation of the people in the extremes of the continent?—A. Yes, I think so; I think there would be an increase of trade on both sides.

Q. Is it your opinion that this country should make overtures to Canada for reciprocity?—A. I think it would be desirable. I think we have more to gain than Canada has.

Q. (By Mr. FARQUHAR.) Is it not a pity to disturb the present balance of trade which we have with Canada?—A. Well, this is one of those arrangements which should be made while we have the opportunity. You know the story of the Sibylline books, offered to one who would not take them when he could, and on each subsequent occasion the number was reduced and the price increased. It may be that way with us.

(Testimony closed.)

WASHINGTON, D. C., May 14, 1901.

TESTIMONY OF MR. WILLIAM NICHOLSON,

Manager Central Railway Clearing House, Buffalo, N. Y.

The commission met at 11.02 a. m., Chairman Kyle presiding. At that time Mr. William Nicholson, Manager of the Central Railway Clearing House, Buffalo, N. Y., appeared as a witness, and being duly sworn, testified as follows:

Q. (By Senator KYLE.) You may state your name, address, and business to the

stenographer, please.—A. William Nicholson, Manager of the Central Railway Clearing House, Buffalo, N. Y.

Q. Please tell the commission something about the organization of this clearing house, the purpose of its inception, its aims, and its methods.

The WITNESS. (Reading):

"CENTRAL RAILWAY CLEARING HOUSE.

"The clearing-house principle was made applicable to the through freight traffic accounting of the New York Central and Hudson River Railroad Company, its leased and operated lines, at the instance of Mr. John Carstensen, comptroller.

"As a natural sequence, a clearing house was established at Buffalo, N. Y. (the geographical center of the system), for the purpose of handling certain details of through freight accounts for the allied roads terminating at the Niagara frontier. Its advent was publicly announced, and its authority set forth by the executive departments in the following circular:

"[New York Central and Hudson River Railroad Company, Lake Shore and Michigan Southern Railway Company, Michigan Central Railroad Company, New York, Chicago and St. Louis Railroad Company, West Shore Railroad, Pittsburgh and Lake Erie Railroad Company.]

"FEBRUARY 10, 1899.

"JOINT NOTICE.

"Mr. William Nicholson is hereby appointed manager of the 'Buffalo Railway Clearing House,' to be established April 1, proximo, and to have charge of all accounts and statistics pertaining to through freight business passing over the above roads, now covered by through, joint, or fast freight line billing.

"S. R. CALLAWAY,

"*Prest. N. Y. C. and H. R. R. R. and leased lines.*

"W. H. NEWMAN,

"*Prest. L. S. and M. S. Ry. Co.*

"H. B. LEDYARD,

"*Prest. M. C. R. R.*

"W. H. CANNIFF,

"*Prest. N. Y. C. and St. L. R. R. Co.*

"J. D. LAYNG,

"*Vice-Prest. W. S. R. R.*

"J. M. SCHOONMAKER,

"*V. P. and G. M. P. and L. E. R. R. Co.*

"On February 21, 1899, a meeting of the chief accounting officers and auditors of freight accounts of the system roads was held in New York City, when the pursuing organization was effected.

"Name.—The Buffalo Railway Clearing House.

"Location.—Buffalo, N. Y.

"Membership.—New York Central and Hudson River Railroad Company, West Shore Railroad, Lake Shore and Michigan Southern Railway Company, Michigan Central Railroad Company, New York, Chicago and St. Louis Railroad Company, Pittsburgh and Lake Erie Railroad Company.

"Management.—The affairs of the clearing house to be under the control of a manager.

"Duties.—The clearance of freight-revenue balances accruing between the clearing-house roads, on all interline, joint, and fast freight line traffic passing through Buffalo or crossing the Niagara River at Black Rock and Suspension Bridge, billed on a through waybill; and to keep the accounts of the New York Central and West Shore fast freight lines.

"The complete and proper revision of all billing.

"The compiling and furnishing to the accounting departments of the roads members of the clearing house with all statistics, statements of earnings, etc., required by them from time to time, and the furnishing to other roads not members of the clearing house such information and statements as formerly required from the New York Central and West Shore fast freight lines.

"The checking and recording for the roads members of the clearing house, and the New York Central and West Shore fast freight lines, of all joint or fast freight line claims.

The keeping, under the supervision of the manager, of complete records of clearing house and fast freight line business.

"All freight agents of companies members of the clearing house to be considered

as agents of the clearing house, and to respect and comply with all orders of the manager thereof consistent with the accounting regulations of the clearing-house roads.

"Clearing-house traffic, other than fast freight line, to be waybilled exclusively without divisions of earnings on a special clearing-house waybill, to be used by all roads for business within the clearing-house territory.

"The clearing house to use, whenever practicable, the standard blanks of the Association of American Railway Accounting Officers.

"On April 7, 1899, another meeting was held in New York City for the purpose of electing an executive committee, to have supervision over the clearing house and to act upon questions affecting its management and development, resulting in the election as such committee of Messrs. John Carstensen, comptroller New York Central and Hudson River Railroad, chairman; R. H. Hill, auditor Lake Shore and Michigan Southern Railway; A. J. Burt, auditor Michigan Central Railroad; J. P. Curry, auditor New York, Chicago and St. Louis Railroad; C. H. Bronson, auditor Pittsburgh and Lake Erie Railroad.

"Its duties to be as follows:

"(a) To act on all questions affecting the conduct of the affairs of the clearing house as constituted or as it may be enlarged from time to time.

"(b) In conjunction with the manager, to decide all matters relating to expenses and the division of same as between roads in interest.

"(c) To act on all applications for increased membership.

"(d) To hold meetings upon call of the chairman or upon the request of any 3 members.

"It will thus be seen that the clearing house began its career with a charter membership of 6 roads, viz, New York Central and Hudson River Railroad, West Shore Railroad, Lake Shore and Michigan Southern Railway, Michigan Central Railroad, New York, Chicago and St. Louis Railroad, Pittsburgh and Lake Erie Railroad.

"The membership of the Michigan Central Railroad was discontinued at a meeting of the executive committee held in New York City on November 8, 1899, same to be effective December 1, 1899, thus reducing the clearing-house membership to the 5 other roads named above, the New York Central and Hudson River Railroad resuming junction settlements with the Michigan Central Railroad at the Niagara frontier under the same arrangement as obtained prior to the establishment of the clearing house. No further change in membership occurred until May 1, 1900, when the Cleveland, Cincinnati, Chicago and St. Louis Railway, and the Lake Erie and Western Railroad were admitted to membership.

"In view of the fact that these companies and the Pittsburgh and Lake Erie Railroad Company have no termini in Buffalo, together with reasons of a local character, the executive committee at a meeting held March 12, 1901, changed the name of the Buffalo Railway Clearing House to that of the 'Central Railway Clearing House.'

"As already stated, the initial province of the clearing house was to control the accounting of revenue on traffic passing the Niagara frontier. This it has satisfactorily accomplished, and the results have been promptly furnished to the accounting officers of the roads, in accordance with their varied requirements necessitated by a dissimilarity of accounts, and in time for inclusion in their monthly records.

"From time to time the duties of the clearing house have been largely increased, to the extent that at present it accounts for the revenue on traffic—

"(a) Interchanged between the New York Central and Hudson River Railroad, West Shore Railroad, Rome, Watertown and Ogdensburg Railroad, Pennsylvania Division of the New York Central and Hudson River Railroad, Monawk and Malone Railway, Wallkill Valley Railroad, Beech Creek Railroad, and Lake Shore and Michigan Southern Railway, New York, Chicago and St. Louis Railroad, Cleveland, Cincinnati, Chicago and St. Louis Railway, Lake Erie and Western Railroad, and Pittsburgh and Lake Erie Railroad, passing the Niagara frontier.

"(b) Between the Lake Shore and Michigan Southern Railway and Cleveland, Cincinnati, Chicago and St. Louis Railway.

"(c) Between the Lake Shore and Michigan Southern Railway and Pittsburg and Lake Erie Railroad.

"(d) Between the Lake Shore and Michigan Southern Railway and Lake Erie and Western Railroad.

"(e) Between the New York, Chicago and St. Louis Railroad and Cleveland, Cincinnati, Chicago and St. Louis Railway.

"(f) Between the New York, Chicago and St. Louis Railroad and Lake Erie and Western Railroad.

"(g) Between the Boston and Albany Railroad, Boston and Maine Railroad, New York Central and Hudson River Railroad, West Shore Railroad, Rome, Watertown and Ogdensburg Railroad, Pennsylvania Division of the New York Central and Hudson River Railroad, Mohawk and Malone Railway, Wallkill Valley Railroad,

Beech Creek Railroad, Lake Shore and Michigan Southern Railway, and all Pacific coast roads where transcontinental tariffs apply.

"As regards the latter class, viz, transcontinental traffic between the Atlantic and Pacific coast points, the clearing house also acts for the Boston and Albany Railroad and Boston and Maine Railroad companies in the matter of accounts, the agents of these companies reporting to and being subject to the rules of the clearing house.

"The revenue on traffic between transcontinental tariff points on the Pacific coast and those within clearing-house territory east of the Niagara River (including those on the Boston and Albany and Boston and Maine railroads), via the Michigan Central Railroad, is also taken care of in the clearing house, but the proportion of such traffic to and from local stations situate on the lines of the Michigan Central Railroad Company is accounted for by that company direct.

"Prior to the organization of the clearing house practically all business interchanged between the roads was settled for by the agents at junction points. The clearing-house territory, so far as accounting interests are concerned, is practically one railroad. The clearing house has no intermediate junction settlements whatever.

"The system in vogue does more than the modern audit-office plan in the way of economical, expeditious, and simple settlement. Take, for example, a shipment from Boston to East St. Louis. The old junction-settlement plan would require the stopping of the waybill at Albany, East Buffalo, and Cleveland for junction settlement between the roads handling the shipment. Under the modern audit office settlement plan it would be necessary for the auditor of the Cleveland, Cincinnati, Chicago and St. Louis Railway to render complete detail as to abstracts, division sheets, summaries, etc., to the Lake Shore and Michigan Southern Railway, New York Central and Hudson River Railroad, and Boston and Albany Railroad. With the clearing-house plan the waybill would be reported (forwarded) by the agent at Boston and (received) by the agent at East St. Louis direct to the clearing house, where same would be accounted for to roads in interest. At the end of each month the proper officer would be notified by it of the net debit or credit balance affecting the other roads for all waybills so handled in a given month.

"The old method provided that each individual waybill should be divided and settled between the roads, while now all waybills in a month between given points, taking given subdivisions, are brought to a total, which is subdivided. Considering the large volume of business handled by the clearing-house roads, the possibility of delivering shipments to consignees on proper rates or collecting proper charges is wonderfully increased, inasmuch as shipments moving over the clearing-house territory or to the Pacific coast beyond are waybilled through without any division of revenue being shown on the waybills, and as no junction settlements between agents are made, consequently no amounts are shown on the waybills as advance charges.

"It is therefore possible for agents to correct the waybills when delivery of freight is made to basis of proper through rates, inasmuch as there are no advances paid connecting railroads, which in case of error would compel them to secure authority to change before final settlement with consignees.

"It is assumed that the clearing house has done more than any other agency to provide for the delivery of shipments to consignees on proper net charges. The clearing house nullifies the multiplied settlements of the railroads, expedites the movements, and, so far as the public is concerned, minimizes the collection of overcharges, simplifies the accounting, and concentrates the preparation of statistics and other information for railroads in interest.

"The clearing-house system of accounting is based upon daily forwarded abstracts, daily received abstracts, and monthly balance sheets, with the necessary auxiliary forms, corrections, etc., as per sample forms herewith submitted.

"Estimated railroad balances are drawn for weekly, between the financial offices on figures furnished by the clearing house. A final net balance is drawn for at the end of each month. All moneys collected by the agents are remitted to the treasurers of the roads direct, no remittances account of revenue accruing for freight transportation being sent to the clearing house.

"The general supervision of the affairs of the clearing house is handled by the manager and his chief clerk. The work is divided into 11 departments, each in charge of a head clerk, as follows:

"ACCOUNTING DEPARTMENT.

"Consists of 9 clerks and takes care of the general accounts of the clearing house, as well as maintaining separate sets of general books for each of the New York Central and West Shore fast freight lines, viz, the Red Line Transit Company, White Line Central Transit Company, Great Central Route 'Blue Line,' Canada Southern Line, North Shore Despatch, West Shore Line, Nickel Plate Line.

"The cashier handles the receipts and disbursements account of the general expenses for the clearing house as well as for the fast freight lines specified above.

"APPORTIONMENT DEPARTMENT.

"Has 22 clerks. This department handles completed reports when received from the abstract department; stamps same with percentage stamp, showing proper percentages to be applied between points shown thereon. These items, shown in blocks, are drawn off on apportionment sheets, grouped as per stations from and to. At the close of business each month these sheets are footed, summaries balanced with abstract department, and revenue apportioned among all roads interested, on the basis agreed to and published by the traffic officials of the roads.

"Interline audit office settlement" accounts for all our 9 roads, in connection with the 49 roads west of the clearing-house territory, are handled by this department.

"STATISTICAL DEPARTMENT.

"Compiles road statistics and those required by the several fast freight lines. Makes classifications of commodities hauled, on forms set forth by the Interstate Commerce Commission; prepares special statistics of tonnage for the various freight-traffic officials, and furnishes Western freight agents and others with daily statements of billing covering their various territories. This department has a force of 23 clerks.

"ABSTRACT DEPARTMENT.

"Conducts the checking and auditing of forwarded and received abstracts, summaries, etc., notifying agents of various changes made in same. This department necessitates the employment of 37 clerks.

"REVISION DEPARTMENT.

"With a force of 37 clerks revises the waybills, issues corrections, files tissues, etc."

"CLAIM DEPARTMENT.

"Handles fast freight line over and under charge accounts; checks various claims for the fast freight lines; checks joint and interline claims for the claim agents of the roads members of the clearing house, the one check of the clearing house answering for the several checks under the old system, when the claims were sent from one road to another to be handled by each claim agent and checked by each freight accountant.

"This department handles all final balance sheets of the agents of the roads members of the clearing house, and prepares each day for the trunk line association a report of all east-bound waybills passing the Niagara frontier, this report being accompanied by a copy of each waybill. This work is conducted with a force of 52 clerks.

"DAILY EARNINGS DEPARTMENT.

"This department compiles for the 9 roads in the clearing house statements of daily earnings on all business interchanged, together with earnings on audit office settlement business, in connection with the several transcontinental routes, furnishing daily statements to the Boston and Albany Railroad, and the Boston and Maine Railroad on audit-settlement business. The weekly balances between the road members of the clearing house are estimated in this department, which consists of 13 clerks.

"MAILING DEPARTMENT.

"Employs 10 clerks. Collects outgoing and opens incoming mail. Strips interline and fast freight line tissue copies of waybills and distributes same to accounting officials, commercial and fast freight line agents; sorts claims and vouchers; has charge of all matter forwarded and received by express, sorts reports for various other departments, and performs general messenger service for the clearing house.

"BINDERY.

"This department has 1 employee, who binds abstract books, volumes of tissue copies of waybills, records of apportionment, as well as sundry volumes of records used in the clearing house.

"STATIONERY.

"Has 2 clerks, who handle and distribute the supplies of books and stationery and fill the requisitions of agents for blank forms, etc.

"TELEGRAPH.

"This department has 1 operator, who handles all telegraphic communications forwarded and received by the clearing house.

"The clearing house has a total force of 220 employees, divided as follows:

Manager	1
Chief clerk	1
Private secretary	1
Cashier	1
General bookkeeper	1
Head clerks	7
Stenographers	7
Telegraph operator	1
Binder	1
Stationer	1
Clerks	198
Total	220

"The total number of clerks employed on what may be termed actual clearing-house work is 158.

"The average clerical salary paid (exclusive of superintendence) is \$44.94.

"The Central Railway Clearing House has long since passed through the crucial part of its existence, and notwithstanding a new system of accounting, unfamiliar alike to agents as well as to others in the clearing house, it has been, from accounting, traffic, and other standpoints, a success from the date of inception.

"A partial idea of the enormity of its business, from the date of its organization to the present, can be gained from the following statistics to May 1, 1901:

Revenue cleared between membership roads	\$33,997,541.91
Total number of tons forwarded and received from stations on all roads, divided into 60 commodity classes	9,626,994
Total number of waybills revised and filed in revision department ..	2,860,987
Total number of waybill copies handled and distributed	14,300,198
Total amount increased revenue, account revision department	\$164,454.22
Total number of waybills abstracted for trunk-line commissioners on traffic moving east bound from the Niagara frontier, showing number, date, station from and to, weight in pounds, extended and footed	1,532,986
Total number of claims received from all sources and checked	114,264
Total number of letters written	129,878
Total number of telegrams forwarded and received	31,590
Total number pieces of mail handled	1,467,466
Total mileage included in clearing-house territory	11,257
Total number stations reporting to the clearing house	2,241
Total number agent's requisitions for supplies filled by stationery department	14,508
Total number of books bound in binding department 17,680, divided as follows:	
Abstract books	13,520
Volumes of tissue waybills	1,898
Records of apportionment	676
Sundry volumes	1,586

"Monthly meetings for consultation in regard to details are held in the office of the manager, and are attended by the auditors of freight accounts of the roads members of the clearing house.

"The clearing house is a progressive step in railway accounting. It is a move in the direction of economy, and when more thorough billing is established, more roads admitted, and when a universal system of freight accounting is adopted by the auditors of the roads the greater success of the clearing house will be assured. Toward the adoption of a uniform system of freight accounting the clearing house has already become an important factor.

"Prior to its establishment agents were obliged to report all waybills forwarded and received on each road in the territory now covered by the clearing house. By

the clearing-house method a daily forwarded and received report now takes the place of the six or eight formerly used.

"Its methods represent the most pronounced concentration of through freight accounting.

"At the recent railway congress in Paris Commissioner Knapp, Chairman of the Interstate Commerce Commission, announced that he favored a clearing-house system for all American railroads.

"The late George R. Blanchard, trunk line commissioner, who was also a delegate to the congress, fully agreed with Commissioner Knapp, and for proof referred to 'The great success of the railway clearing house at Buffalo, N. Y.'

"As regards the clearing house from a traffic standpoint, one of the most prominent railway traffic officials of the United States has written of it as follows:

" 'By the arrangement of through billing with settlements through the clearing house at Buffalo, every agent on the Pacific coast terminals of the Northern Pacific, Great Northern, Union Pacific, Santa Fe, and Southern Pacific, including their intermediate lines and connections through the gateways of St. Paul, Omaha, Kansas City, etc., are through billing and soliciting agents for every Eastern road that is a party to this arrangement; likewise the agents of the Eastern roads are correspondingly agents for the Western roads.

" 'It is our experience that no arrangement of accounting between connecting roads is so satisfactory and produces such good results as that of through billing with audit settlement. The work of the clearing house in that connection has been marvelous. It simplifies accounts, increases our traffic, disposes quickly and correctly of many errors in billing, cements and brings together in closer relation the various roads with each other, and, in fact, is one of the great modern improvements for the settlement of interchange traffic. Certainly no more correct, simple, or beneficial method can be adopted for promoting interchange business, as well as simplifying the auditing thereof.'

"The clearing house is not an institution or organization, strictly speaking, but is merely a branch of the auditing departments of the individual railways represented in its membership, the manager being subject, more or less, to the instructions of the chief accounting officials of each road in interest."

Q. (By Mr. RIPLEY.) You have referred several times to the fast freight line. Will you explain what those are, and what the tendency is in development of those fast freight lines at the present time—the relations that they bear to accounting?—A. The fast freight line was started in the days when one road was afraid to let its cars go on the tracks of another, when they transferred freight and made the settlements on the revenue thereof at junction points. In order to obviate the delays caused by that method of procedure, various lines were organized, such as the Blue, the Red, and the White lines, for the purpose of allowing the cars to go through, we will say, from New York to Chicago or St. Louis. A special waybill was prepared to meet the accounting requirements, and all read Blue or Red or White line, as the case might be, but in the waybills the division of revenue among the railroads was shown on each single shipment at the bottom of the bill, and when the first junction point was met the agent of the other road paid in cash to the agent of the initial road the revenue due him. He billed that car out, and when it came to the next road that man collected his share with the other fellow's charges shown as back charges, and so on.

Q. At the time these fast freight lines were introduced were the through rates made at a different figure from the combination rates such as had been charged before? In other words, were the rates accorded to these freight lines somewhat less than the rates charged on the preceding system?—A. No; I think they were based on the sum of the locals, there not being any competition at that time to amount to anything.

Q. (By Mr. FARQUHAR.) What was the relation of the fast freight lines then to the railroads?—A. The fast freight lines were nothing more or less than a branch of the traffic department of these combined railroads.

Q. The ownership of the lines being in the roads themselves?—A. Yes.

Q. I notice your mention of the fast freight lines of the Vanderbilt system. You omitted the Merchants' Despatch?—A. Yes.

Q. Is their relation to the roads somewhat different than the other fast freights?—A. Yes.

Q. A separate corporation?—A. Yes; it is a corporation.

Q. Not under the ownership of any road or any other system?—A. I think its stock is owned chiefly by the New York Central interests. Other lines are cooperative, the expense of agents and management and things of that kind being paid on the basis of earnings by the roads interested.

Q. Does the Despatch own its own cars?—A. Yes.

Q. And then it pays mileage for hauling?—A. No.

Q. Has it equal privileges with the other fast freight lines owned immediately by

the roads in respect to the right of way, etc.?—A. It has equal privileges as regards transportation, and it covers all territory which the other lines may cover individually. That is to say, the Red line is confined to the Lake Shore, the Blue line to the Michigan Central. The M. T. D. Company uses both lines.

Q. (By Mr. CLARKE.) Is the National Despatch of the same character as the Merchants' Despatch?—A. No, sir; I do not think it is.

Q. Is it a private corporation?—A. I do not think so. I am not familiar with the National Despatch. There are about 15 or more fast freight lines, I think, running over the New York Central.

Q. In the case of these private car lines, the railroad companies contract to pay mileage to them, do they not?—A. Yes.

Q. (By Mr. RIPLEY.) Do you audit accounts for separate parties, such as private shippers, who own lines of cars?—A. We have one or two private-car shippers, but they are being taken out of the freight lines as fast as possible.

Q. You are at liberty to name these?—A. I could not name them; I do not know them; I know the fact they are there; that is all.

Q. Have you any reason to suppose that the rates made—mileage rates, the cargo charge—made to any of these fast freight lines, or for shippers who own cars—is different from the rates charged to others?—A. No; I do not think there is any difference.

Q. Is that the same situation that has always prevailed?—A. Yes; the rate for mileage is the same for all, regardless of the ownership.

Q. But suppose that instead of charging by the hundred pounds shippers are able to control a line of cars, is it your impression that the charge, we will say, for hauling a carload of freight from Chicago to New York would be the same, whether it went in cars of the company or in cars owned by private individuals?—A. It would be the same.

Q. What is the system of division of earnings as applied between these different lines? Is it on the basis of straight mileage?—A. It is on a basis of mileage; yes.

Q. Is it not, however, different from that in the case of short lines, of branch lines, which are leased or are operating separately, and which are tributary to the more important lines? Can you illustrate the system?—A. It often happens that on a through line some railroads only have a small section of mileage, and to equalize expense of putting on locomotives and pulling the train a short distance they are given what we call constructive mileage, i. e., additional miles.

Q. In case of systems of greater length, we will say in case of the Rome, Watertown and Ogdensburg, and roads of that kind, there will be no constructive mileage—that is, that merely applies to short branch lines?—A. Constructive mileage is a very exceptional thing. The distance is generally limited.

Q. It is then an accepted principle in the distribution of earnings that distance should be the controlling factor?—A. It is.

Q. Are the tariffs as a whole on the systems of which you speak made up on the basis of distance? That is to say, is the long and short haul principle applied in general?—A. It is applied in general, and sometimes with the addition of an arbitrary charge for physical disabilities of switching and delivering—Philadelphia, for instance. It is understood by the Interstate Commerce Commission and all concerned.

Q. Do you have any general agreement with relation to the other trunk lines, such as the Pennsylvania, as to the distribution of earnings in interchange of traffic, that the policy of the Pennsylvania and the New York Central, and the Vanderbilt system shall be the same? Do you each pursue a distinct policy of your own in the matter of constructive mileage and of prorating, division, etc.?—A. That would be an individual matter between the companies.

Q. (By Mr. FARQUHAR.) Would it not be a matter on the first way bill?—A. Before the first through bill would be issued that would all be agreed with, consulted more or less in the matters of accounting to make it uniform to the shipping interests, you know; but that is strictly a matter of individual right.

Q. It is simply a matter of mutual agreement, without any competition, or any friction?—A. No; competition has nothing to do with it.

Q. A fair division?—A. Yes.

Q. (By Mr. RIPLEY.) Does the Trunk Line Association have any jurisdiction in such matters?—A. I could not say. This I know, that the roads all report east-bound tonnage to the commissioners, so they know what is going on—see the billing for themselves.

Q. In a number of cases I see that you speak of east-bound traffic?—A. Yes.

Q. Is there any difference between east and west bound traffic which makes it simpler to clear the account, in one case over the other?—A. No, excepting in regard to reporting this traffic to the Trunk Line Commission, that is all.

Q. Well, the Trunk Line Association has to do specifically with east-bound business?—A. Yes.

Q. And it has no jurisdiction over west bound?—A. I think not.

Q. In what respect does the east-bound business differ from the Western so that the roads can cooperate, perhaps, in making up rates and can divide earnings on east-bound traffic, while they can not do the same on business west?—A. Well, I can not see any difference between the east and west movement on that. I referred to our having to report only east-bound traffic to the Trunk Line Commissioners, and handling east-bound transcontinental traffic for the roads in interest. The auditors in the West on the transcontinental traffic, for instance, make up their received side of the account.

Q. Does the Central Traffic Association, of Chicago, have to do with business originating in the West and destined East? What are the functions of that Central Traffic Association as against the Trunk Line Association in New York, of which Mr. Goddard was formerly commissioner?—A. I understand that it is similar in character. I do not have any business with them to amount to anything, except getting tariffs and instructions to check revenues.

Q. Suppose that a line, in order to secure business, agrees to cart the goods for no charge—in other words, agrees to include cartage in its rate—who would know about it in the auditing and the clearing account?—A. I would not know anything about it, because the bill would read from the originating station, and might not show any such expense.

Q. How would the accounts as between the different roads be settled? That is sometimes done in order to secure business, is it not?—A. That would be done, I presume, by voucher.

Q. The statement has been made to the commission a number of times that that is done at times in order to secure business. Is that of as much frequency, as far as you know, at the present time, as it was formerly?—A. I do not think it is.

Q. What reason have you for supposing it is of less frequency?—A. I see that a great many of our bills carry legitimate advances on them for cartage of that kind, and there seems to be no question about the collecting of the revenue at the other end of the line, but I would not know that fact if the charges were left off the waybills.

Q. Suppose that two lines are interchanging traffic, and that the Eastern trunk line accept the regular published tariff rate, would it be possible for the traffic to originate and be carried on agreement by the shipping agent that the Western line would shrink its percentage? Or is it done, as far as you know? What I want to bring out is, how do you effect your clearing between roads in the case where the Western line has agreed to shrink its proportion?—A. That would not go into the clearing house you see. I only divide the waybills. In a case of that kind the waybills would be made to read correctly. Any shrinkage would be taken care of in some other channel.

Q. Would such shrinkage show as a matter of record at all?—A. Yes; I think it would.

Q. Is that system, so far as your experience goes, common at the present time?—A. I do not know of any of it at the present time.

Q. It need not necessarily come to your knowledge?—A. No; it need not.

Q. Does the matter of classification embarrass a clearing house at all—the system at present in force of several different classifications in different parts of the country?—A. It involves a great deal of labor in billing.

Q. Will you explain how you overcome the difficulty? For instance, are all shipments into the Southern territory from the Official territory on the Official Classification or the Southern?—A. Both.

Q. Are there special rules often made by the different railroads in interest?—A. As to certain commodities?

Q. As to which classification shall apply. For instance, from New York to Nashville, which classification applies?—A. Well, we would take the Official Classification in that case. The great bulk of the clearing-house traffic is on the Official Classification. Our traffic west of Chicago bears a small percentage to the total this side.

Q. Does any way seem clear to you for obviating this difficulty of different classifications for different parts of the country?—A. No; that has been argued with traffic officials between the East and West for years. It has never been done.

Q. What are some of the objections from a practical standpoint that stand in the way?—A. Well, in certain sections of the country, where a large class of particular freight is moved, it would be to the advantage to have a lower classification, of course, than would be prevailing in the East. That traffic would be distributed all over the different roads to the East.

Q. In your typewritten statement you referred in one place to 60 commodity classes?—A. Yes.

Q. Are there more than that at the present time, or does that vary from one time to another?—A. I think you will find that the Interstate Commerce Classification has about 40, beginning with the products of the forests, etc.

Q. Does the commodity system embarrass you at all in the making of rates? How do you keep account of it?—A. It does not bother the billing agents at all, because it is local at their station. We have to be on the lookout for commodity tariffs, which are printed and filed with the Interstate Commerce Commission.

Q. And they must, of course, be filed nearly at the same time?—A. Yes.

Q. Are there more of those commodity rates on west-bound traffic than east-bound traffic?—A. I do not know; could not state that.

Q. You simply deal with them?—A. Just as an accounting matter; that is all; the why and wherefore I do not know.

Q. You refer in several places to the new system of accounting in force on railroads, and again to the desirability of uniformity in accounting. Will you specify to the commission what some of the differences in accounting are, so far as it affects our interests here?—A. As regards general accounts of the railways, the Interstate Commerce Commission has mapped out the line for the exhibits of the operation of the companies, but below that comes the various traffic accounts which lead up to those figures. Some roads have a daily forwarded and a daily received freight report; others have weekly forwarded and weekly received reports. Some have daily forwarded and monthly received reports; some have monthly forwarded reports and monthly received reports. Nearly all railroads report corrected figures to the auditors, while others report the original figures. These are the things we have to contend with. In other words, the clearing house has to take care of 12 different systems of accounting, and make its record fit the ideas of the individual companies, so far as its accounting method is concerned.

Q. Has the Interstate Commerce Commission through its statistician been effective toward securing greater uniform accounts than previously?—A. It certainly has.

Q. Is there anything further it could do under the present law, or is it desirable from a railroad-accountant point of view, that they should take the initiative any further?—A. The Interstate Commerce Commission is no doubt at work developing these lines.

Q. Are you called upon to report to them as a distinct organization?—A. No.

Q. Have you been in the accounting and auditing department of any of the individual roads before you went to the Clearing-House Association?—A. Yes. I have been in the passenger department of the Erie, the freight department of the New York Central, the accounting department of the New York Central, and was auditor for fifteen years of the Fall Brook Railway.

Q. Do you know how far reports to the Interstate Commerce Commission respecting income, etc., are made full and complete?—A. I think they are made full and complete. They have to follow the schedule as required.

Q. The statement has been made before this commission that the income accounts are more strictly adhered to with firms than are the operating accounts. I wondered if you had any experience in that line?—A. No; I have not.

Q. Will you speak of the nature of the transcontinental business? You have to deal with it in a peculiar way respecting mileage and prorating, etc. What are the peculiarities of that business?—A. The peculiarity of it is that it is covered by these various classifications which govern freight from the point of origin to destination. The accounting part of it is satisfactory, so far as that goes. It is only in the revising of the waybills that we are inconvenienced.

Q. What is the difference between the Transcontinental Classification and the Official, for instance, in a general way? What were the reasons which led to the promulgation of distinct Transcontinental Classification?—A. Well, that is a traffic matter I am not familiar with. I could not answer that intelligently.

Q. You keep the statistics of these different roads respecting tonnage earnings, etc.?—A. Yes.

Q. Will you make a statement respecting the amount of tonnage and earnings the last few years? How do they compare with those of 4 or 5 or 6 years ago?—A. That would be rather difficult for me to do, on account of the clearing house having no data to compare with.

Q. Can you compare the tonnage and the clearings this year with last year?—A. Yes. There has been a general increase, a gradual development month by month.

Q. Even over the last year?—A. Yes.

Q. Do you ascribe that in any way to increased charges upon freight, or merely to the greater volume of earnings, or to maintenance of rates more strictly than before?—A. I ascribe it to maintenance of rates and the general prosperity of the country. There is more tonnage in every direction.

Q. Why do you say that rates have been better maintained?—A. Because I have heard nothing of any rates being cut.

Q. Do you hear of them?—A. Just in a general way.

Q. Do the railroads themselves, as far as you know, desire that rates should be maintained in their own interest? That is, have they made an organized attempt to get rid of cutting—to do away with it?—A. They certainly have; yes.

Q. Do they seem able to cope with that difficulty themselves, with no intervention on the part of the Interstate Commerce Commission or anybody?—A. I think they do. The community of interest of railroads is the greatest factor I know of in respect of maintaining rates.

Q. On the Vanderbilt system what is the proportion of east and west bound business? Is it nearly equal?—A. I can not say positively about that.

Q. Are the railroads attempting to increase the carrying and earnings within the last few years? That is, to get greater service out of each car?—A. I think they are.

Q. Can you show the way in which it is greater in this direction?—A. On account of demurrage charges being applied to stations holding cars at different times.

Q. Those are being enforced?—A. They are moving the cars quicker, turning them faster than they ever did before.

Q. The clearing house contributes to that end?—A. Yes; because the cars are moved quicker under that system; no holding cars for waybill at junctions. After the cars get to destination it is fair to presume they will get back quicker.

Q. What is likely to be the effect on the clearing-house association of the tendency of the roads toward consolidation—toward community of interest? Is it likely to lead to the establishment, in your judgment, of a universal clearing house?—A. A universal clearing house for American railways would be stupendous. I do not think it could be accomplished on account of the immense territory involved. The clearing house in England takes care of a territory about equal in size to New York State, requiring a clerical force of thousands, so I am informed.

Q. Are there any clearing houses in Europe—on the Continent?—A. I am not aware of any, except 1 in Ireland.

Q. That clears for all roads in Ireland?—A. I could not say positively. I imagine so.

Q. Coming back once more to the matter of fast-freight lines, are they gradually passing out of use? Is there a disposition on the part of the railroads, now that they have these great organized systems, to do away with them?—A. I think the tendency is in that direction, for some years ago we had 8 managers for 8 different lines, which are now under the management of 1. They are consolidating the lines, more or less.

Q. Is the number of these fast-freight lines operating over the Vanderbilt system greater or less than those operating over the Pennsylvania and the other trunk lines?—A. They are more numerous.

Q. Why should that be?—A. So far as I am informed, the Pennsylvania line handle all their through traffic east and west by way of the Star Union line, or the Empire line.

Q. What are these lines? Are they distinct corporations, or merely trade-marks for routes?—A. I am inclined to the opinion that they are trade-marks for securing freight. The Pennsylvania adopts the system of settling at all junction points where anyone enters the territory.

Q. You mean settling by cash?—A. Yes; either by cash or balance agreed on by the two agents, and then remitted by the treasurer.

Q. Is the Union Freight Line, operating over the Pennsylvania Railroad, a distinct corporation?—A. I think not.

Q. It has its own soliciting agents, however, does it not, with offices distinct?—A. I think it has. I am not sure of that; we have on our lines.

Q. Do all of your lines, for instance, have different offices? Do they solicit freight in the name of the lines rather than in the name of the company?—A. Yes.

Q. Do you keep them distinct—in all your accounts do you debit and credit to the account of the Blue, White, or Red Line, as the case may be?—A. They maintain separate accounts, ledgers, journals, cash books in each line; yes.

Q. And also in the case of the Merchants' Despatch Line, to which reference has been made?—A. Not the M. D. T.; no, sir. They are kept in New York.

Q. You have nothing to do with that in particular?—A. Only the revising of their billing; that is all.

Q. Have you anything to say respecting the desirability of a uniform bill of lading for the country as a whole? Testimony has been offered here at various times as to the inconvenience of having bills of lading different in different parts of the country?—A. I think a movement has been started for uniform bills of lading, uniform freight and expense bills, all over the United States. There is no reason why they should not be uniform. The Association of Accounting Officers has adopted a standard waybill which is now used by 160 railroads.

Q. Those are mostly in the trunk-line territory?—A. All over; everywhere.

Q. Are they used as a general thing in the South, do you know?—A. Yes. I am speaking of waybills—I do not know about bills of lading.

Q. What does the waybill specify respecting liability?—A. Nothing at all, except the published instructions required to be noted on them.

Q. (By Mr. RIPLEY.) Does the waybill limit the railroad as to liability?—A. No.

Q. Does the waybill as a contract in any way commit the railroad in its liability?—A. No; not as I can say. It is nothing more than an account—a bill.

Q. Not until the bill of lading is signed?—A. The bill of lading is the contract; yes.

Q. Why did the Michigan Central withdraw from the clearing-house association? You referred in your statement to that fact.—A. The Michigan Central had a weekly system of accounts; another reason was, I presume, that they preferred to handle their own accounts. They found more or less fault with the clearing-house method, claiming it to be more expensive. In consequence thereof, they were requested by the executive committee to withdraw their membership.

Q. Does the clearing-house system, then, enable each road in interest to arrive at a statement of the amount of the total business done by its competitors?—A. No; that information is never given.

Q. It is not published in any way, of course?—A. No. The auditor of the Lake Shore Railroad finds any information that is required to see that his revenue is properly accounted for, but as regards the Michigan Central he would have nothing to say.

Q. There is, then, a possible objection to this system in this way, as evidenced by the action of the Michigan Central. Has this clearing house taken any steps to obviate that objection; that is, to keep the accounts of each road peculiar to itself?—A. The accounts of each road are kept by themselves. We are not allowed to give, nor never have given, information of one road for the benefit of another. We have strictly adhered to that rule, because the manager is nothing more than an accounting official of each individual road, and has to protect the interest of each road against the others. The traffic manager of one road can not tell him to do anything unless the traffic managers of the other roads give their consent. This method has led to the enlargement of the scope of the clearing house.

Q. Of course, in the case of these roads you have an advantage, do you not, owing to the fact that they are all controlled by the same parties. Would there not be more or less difficulty if systems not controlled by the same interests were to become members?—A. I do not think that that would make any difference. I do not see why it should. There was some talk once of having the Delaware, Lackawanna and Western and other outside roads admitted.

Q. (By Mr. FAIRHUR.) You said, Mr. Nicholson, that this system of yours has abolished the old system of the settlement of agents at the junction points?—A. Yes.

Q. Do your waybills carry on them now the pro rate of all the rates—for instance, a transcontinental bill?—A. No; they do not.

Q. Do not all the fast-freight lines carry the pro rate on their bill?—A. Yes.

Q. As a matter of settlement for the fast freight, then, they have got to still hold the pro rate?—A. No; I can explain that to you better this way. The fast-freight bill can begin on a road outside of the clearing house and end on one outside its territory. Therefore it is necessary for us to show the proportion up to the entering junction and from the delivery junction at both ends of the clearing-house territory, there being in the line roads which are not in the clearing house.

Q. Now, this is a simplification entirely for the Vanderbilt system of keeping accounts?—A. Yes.

Q. Its merits are simply the fact that it is a systematic and a correct way of keeping accounts and a quick way of disposing of overcharges and other common differences that happen in transportation?—A. Yes.

Q. That is, you reach a quicker result through this, and at the same time you can present to the head of the Vanderbilt system the entire tonnage and the proportion of earnings and everything else?—A. Yes.

Q. How often—day by day or week by week or month by month?—A. We furnish earnings to the various departments every day and some statistics every day of certain classes of freight that this or that traffic manager may require—anything of that kind.

Q. So that it presents to the central office in New York City the earning ability of every single part of the road?—A. Yes, so far as clearing-house traffic is concerned.

Q. You have said nothing at all of the so-called Vanderbilt roads west of Chicago. Does your clearing house in Buffalo take in the clearings west of Chicago?—A. No; I can explain it to you in this way: East of Chicago we take care of everything, and the auditors of the roads west of Chicago take care of the West. The accounts are based on a received basis both ways; the auditors report the freight

they receive west, and we report east of Chicago all freight received and we strike a balance on the plan of the association of accounting offices.

Q. You make no account of a bill originating east here and passing through west on the Chicago and Northwestern—your account does not take in this matter west of Chicago?—A. No.

Q. So that practically your clearing house is for the eastern business?—A. Yes.

Q. And not for Chicago and the western through business?—A. That is it exactly.

Q. (By Mr. RIPLEY.) Are your books open to the inspection of the Interstate Commerce Commission?—A. I do not know that that question has ever come up.

Q. Suppose that the Interstate Commerce Commission were given authority to examine the books of railroad companies and to audit from an examination of the books of the clearing house. It could arrive at some information respecting the earnings of each of the systems and each part of this system, could it not?—A. It could on freight; yes. We publish no reports of any kind. Our figures are all incorporated in the auditors' books of the various companies and they publish them, of course. They incorporate our figures with theirs. The clearing house is merely a branch of the auditing department.

Q. Have you any criticism to make in any detail upon the system of accounting prescribed by the Interstate Commerce Commission, or is that fully in accord with the forms adopted by the association of railway accountants?—A. It is fully in accord with the association, except in minor details.

Q. There is complete harmony of action, then, as between the Interstate Commerce Commission and these railroad officials in that respect?—A. Perfect harmony exists between them. They are conferring with the executive committee of the association all the time.

Q. (By Mr. FARQUHAR.) Suppose that there was a shrinkage on the part of your waybills—say, east of Chicago for west bound freight. You would not have any knowledge of this by the waybill, whether there was a shrinkage or not?—A. That is right.

Q. Well, do you think there is such a custom at all? Say a bill with a proper pro rate is carried right to Chicago, and after that there is a shrinkage on the Wisconsin Central, for instance. Do you think it is good railroading? Is it done at all, or has it ever been done in your knowledge as a railroad man?—A. A shrinkage on the Wisconsin Central?

Q. Yes; in freight on the delivery back of Chicago, for instance, to any point.—A. It was done years ago in a similar case. I can not remember the road.

Q. Can you now, under modern railroad accounting, independent of the system of the clearing house? Is there not a possibility of a rate being made out on one-third or one-fourth of the whole business without the knowledge of the party who contracts for five-sixths of it?—A. No; I do not see how that would be possible without their knowledge.

Q. (By Mr. RIPLEY.) It might be done, however, with the acquiescence of the party controlling the five-sixths, might it not?—A. Anything might be done.

Q. (By Mr. FARQUHAR.) But as a railroad man practically, why should not the rebate be taken out of the whole business, all parties equally suffering, if there was a rebate made at the end?—A. Well, it would be probably handled there through a voucher. The billing would not be changed on account of the reduction of the tariff, the agents reporting it and the competitors seeing the waybill properly made out and collected, would not be able to get on to the fact the same as they would if it were published on the face of the waybill.

Q. It could not be very well done? It would be a very exceptional thing in a great business such as you control there, with 220 clerks, for instance?—A. To do it on a waybill?

Q. Yes.—A. I know we allow nothing to get by unless it is on the published tariffs of the traffic department. We are watched very closely on that, because we are not one road, but two or more, and the traffic managers watch at both ends. All we do is to follow instructions as regards the billing.

Q. In other words, you are strictly a clearing house, without the initiation of any changes or discriminations of any kind whatever?—A. Yes; that is it.

Q. (By Mr. CLARKE.) Has the establishment of the clearing house had the effect of simplifying the work of auditing at the several headquarters of the railroad?—A. Very much. We give the auditors a debit and credit balance affecting every agent on his system on the 15th of the month—that is, the first month after the account is closed. We use the whole system of the clearing house as one railroad.

Q. So far, then, as the expense of the clerical force is concerned, is it an economy to the several companies?—A. It certainly is; yes. The proportion I would not know, because I do not know the figures.

Q. Would there be any advantage in incorporating the passenger accounting in your clearing house?—A. That has been talked of, but I can not see personally where anything would be gained by it, the passenger business being all prepaid—that is,

you buy a ticket which carries you to your destination. Ninety-four per cent of the freight is collected at the other end.

Q. This is simply a clearing house of accounts, and not of cars, I suppose.—A. No; we have nothing to do with the cars, other than as they may affect our distinct fast freight line accounts. The practice of remitting mileage to the lines is being discontinued as far as possible, so that the car accountants of the different roads can handle that themselves. The clearing house has no interest in that.

Q. (By Mr. RIPLEY.) Mr. Blanchard has testified publicly that these fast freight lines were very expensive to the railroads and that they were desirous of getting rid of them. Do you know any way in which they operate to the disadvantage of the lines? What would be the advantage to the railroads in getting rid once and for all of these fast-freight lines?—A. The traffic officials look upon the line as a sort of trade-mark and consider that a great many shippers who send freight over the Red line do it because it is the Red line. They do not know what railroads it runs over at all. The Merchants' Despatch the same way. But in the western country the other side of Chicago the fast freight line is practically unknown. Business across the continent from that gateway has been billed for years on the road bill. It costs to operate a fast freight line from 2.5 to 6.6 per cent.

Q. You mean administration expenses?—A. Agencies, printing, etc., general expense.

Q. A part of those expenses, of course, would have to be borne by the roads themselves?—A. Yes. The lines are cooperative, and each line pays on the basis of its earnings its amount of expenses.

Q. Is the general opinion of railroad managers that it would be to the interest of the roads themselves to have these fast freight lines abolished?—A. From a traffic standpoint they want them maintained; from an accounting standpoint it would be an excellent thing for us and an economy if they were abolished.

Q. It would save money to the roads?—A. It would save money in the accounting department. Whether we would lose in the soliciting of freight is for the traffic officials to say.

Q. (By Mr. FARQUHAR.) If they were entirely abolished you would lose the entire power of the solicitation of freight that there is now in the competition between lines?—A. I presume that is so.

Q. Is it not a fact, too, that Western merchants especially patronize the Red or the White or the Blue line simply because they have had good service for a great many years; better service than even the roads could give them?—A. Well, it is the roads that have given it, you know, and it is the roads that have to give it in the end. Of course, preference is given to them, on account of their being fast freight lines. That is true.

Q. There is no question at all about the character of service about the fast freight lines anywhere, is there?—A. No.

Q. Then it is the best that can be found on the American railroads, and the customers are willing to pay for it?—A. Into that comparison also enters special trains, like our special horse trains, for instance, or the live-stock trains. I am of the opinion that those trains surpass the fast freights in speed. I will not say that, positively, but I am pretty sure that is so.

Q. (By Mr. RIPLEY.) You gave the impression at the outset that these fast freight lines originated because of the disjointed condition of the railway systems?—A. Yes.

Q. Now that the railroads have come together, is there the same justification for them from the railroad manager's standpoint as there was formerly?—A. Only from the soliciting side; from the accounting side there is not.

Q. (By Mr. FARQUHAR.) You used the word "trade-mark." It is trade holding, is it not?—A. Yes.

Q. These fast freight lines have thoroughly done their business and they hold their business?—A. And they had the fortune of starting in at a time when the traffic was pretty poor.

Q. And they have always had the advantage of taking up their waybills when the road could not make them themselves?—A. Yes.

Q. They had to take division sheets and make them up in the early days?—A. Yes.

Q. (By Mr. RIPLEY.) Is all this true of the lines like the Merchants' Despatch and the Blue, Red, and White lines? That is to say, do the railroads regard the dispatch lines with real favor?—A. Oh, yes; there is no discrimination. It is merely a branch of their traffic and operating departments. There is no favor, and the mileage is the same for each car whether it is their car, yours, or mine.

(Testimony closed.)

WASHINGTON, D. C., May 11, 1901.

TESTIMONY OF MR. ISAAC LEOPOLD RICE,*President Consolidated Rubber Tire Company, 100 Broadway, New York.*

The commission met at 10.06 a. m., Vice-Chairman Phillips presiding. At 2.50 p. m. Mr. Isaac Leopold Rice appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your full name, occupation, and address?—A. My name is Isaac Leopold Rice.

Q. And occupation?—A. My occupation is difficult to define. I am president of a number of companies engaged in developing inventions, such as the Electric Boat Company, which includes the Holland submarine boat. I suppose you have heard of the Consolidated Equipment Company, which produces electricity for lighting trains from the motion of the wheels? I am also president of the Consolidated Rubber Tire Company, and I am vice-president of the Casein Company of America, which is developing a new raw material in milk which is entering largely into industries now, such as the paint industry, paper sizing, glue, sugar of milk, and other cognate industries. All of these are based on patents granted by the United States Government.

USUAL MODE OF CAPITALIZING COMPANIES BASED ON PATENTS.

Q. In the organization of companies based upon patents, what is your practice respecting capitalization?—A. Well, the usual practice is this: The working capital is provided by the preferred stock, which is paid for in cash, and by means of which the patents are developed. The patents themselves are valued in common stock.

Q. Do you mean that the preferred stock is equal to the actual value of the tangible, physical plant, machinery, building, supplies, and so forth?—A. Well, in new inventions, as a rule, they have no tangible plant. That all has to be provided out of the capital which is subscribed. Take, for instance, the electric-vehicle industry. I am the father of that industry in the United States. I secured a lot of cash in that industry, about \$12,000,000, when practically there was not a plant in existence, simply for the purpose of developing the business. Take the Electric Storage Battery Company. I am founder of that industry in the United States, and we started with the mere patents; the money first has to be raised to develop the industry.

MODE OF PROMOTION—STOCKS NOT LISTED.

Q. What is the usual process of promotion in case of companies of that kind? Is the money usually advanced by an underwriting syndicate of bankers?—A. Well, in my case I have no syndicate, but I have a number of friends who have confidence in my judgment, and if I tell them that it is a good thing they will subscribe the money. I usually head the list by the largest subscription, very much the largest. My friends follow with whatever may be necessary to continue the business; it may be \$1,000,000, or, as it was in the vehicle business, \$12,000,000; it depends on the amount actually required to develop it.

Q. Are most of those companies of which you speak owned broadly throughout the country, or are they owned by a few people?—A. Owned broadly.

Q. They are, therefore, listed on the exchange?—A. No; they are not listed on the exchange, but are dealt in without being listed. I myself am not what is called a promoter at all. I take these things with the intention of developing the industry, and the people aid as they please with their stock subscriptions. I never have anything to do with manipulating the stock or anything of that kind. I have never done that; it is not in my line at all; people buy and sell the stocks according to the value that they believe them to have.

STOCK IS ISSUED IN PROPORTION TO ESTIMATED VALUE OF THE PATENT.

Q. In the case of such companies, at the outset, is the stock usually issued at a considerable discount?—A. No; we can not issue at a discount. The law does not allow that. It is all issued at par.

Q. What law do you refer to? In what States are most of these companies organized?—A. In the State of New Jersey.

Q. Does the law of the State of New Jersey at the present time require that the stock shall not be issued at a discount?—A. Oh, yes; that is positive.

Q. Do you mean, then, that the stock is issued only to such an amount as will probably make it equal to par selling value?—A. The valuation is fixed, although nobody can tell absolutely, but of course if a valuation were to be extravagant it would give the business a black eye to start with. If I value a patent at \$5,000,000 it means that I take it for granted that the patent will pay interest on \$5,000,000.

Q. That is the rule by which you determine value?—A. Yes; that is the way by which patent values are determined. It is like a mine. You buy a mine; you do not know what is in it; you think there is a great deal in it; you have to capitalize it at something, and you capitalize it at whatever your valuation is, provided you act in good faith.

THE WORKING CAPITAL IS SECURED BY ISSUING PREFERRED STOCK.

Q. (By Mr. PHILLIPS.) Does that value include the working capital?—A. Not always; the working capital is often represented by preferred stock, which represents actual cash.

Q. (By Mr. RIPLEY.) Is that at all different from the practice prevailing some years ago by which working capital was obtained from banks by loans?—A. Well, I have a holy horror of debts, loans, bonds, and everything of that kind. I believe people who go into a venture of this kind should risk their money. They know they risk it, and I do not go to widows and orphans for money of that kind; but unless people risked their money we should still be cave dwellers. The only thing that makes progress in the world is that people are willing to risk money for new inventions.

Q. Do you find any disinclination on the part of capital under those circumstances to buy preferred stock which is not a lien on the property?—A. Well, there is no disinclination among some people. The people who want Government bonds and securities of that kind would not, of course, risk their money. Other people would rather go to the stock exchange and buy stock on the market and gamble, rather than risk their money on valuable inventions that are going to be a benefit to the country. Most of these inventions I speak of have been of very great value.

ORGANIZATION AND CAPITALIZATION OF THE CONSOLIDATED RUBBER TIRE COMPANY.

Q. Do you have a practice of setting aside certain amounts for depreciation?—A. Yes.

Q. Will you state what that practice is? To make this a little more specific, will you make a statement respecting the Consolidated Rubber Tire Company, as to the actual amount of its capital and the circumstances under which that issue was made?—A. I was not the organizer of the Rubber Tire Company. I was asked to take the presidency of it after it was organized.

Q. You are, however, informed of its present condition?—A. Yes. The theory there was different from that of the ordinary newly patented article, because at that time this particular rubber tire, called the Kelly or the Grant tire, was very largely developed; in fact, at the time its patents had just been sustained it was in use all over the world, as it still is. It was not the case of my other companies, where the investors were taking something that had no real existence at the time and developing it into something commercially valuable, but it was taking something already commercially very valuable and which had a fixed value on account of its earning capacity.

Q. Can you state to us the manner in which that company was organized and what the issues of stock were?—A. There were issues of four millions of preferred stock and four millions of common stock. In other words, the patents were appraised—not only the patents, but the business, the earnings, the assets, and all these together were appraised as being worth \$8,000,000.

Q. Was that company formed from the consolidation of a number of other companies?—A. Not exactly.

Q. It had grown as a unit?—A. It was in this way: The patent of this company had been sustained, and the result was that a large number of other companies went out of business, and practically this company fell heir to all their business. But it was not a consolidation in the sense of a trust at all, and there are to-day numerous concerns in the rubber-tire field. The question with us is whether the patent, which has been sustained in one court, will be sustained in the other courts where suits are now pending. In that case we shall probably be the only tire manufacturers in the market, and of course the patent will then be extremely valuable.

Q. Does your charter permit you to enlarge your capital as such decisions of the courts shall seem to warrant?—A. No; we can not increase the valuation; that we can not do.

Q. You would have to secure a new charter in order to do that?—A. No; we would not do that. We would not increase the capitalization.

LOW QUOTATIONS OF STOCK DUE TO LITIGATION OVER PATENTS.

Q. What is the quotation of the stock of this company at the present time?—A. At the present time it is very low, because our patents have been assailed. At present the preferred stock is quoted in the neighborhood of 30, although we paid 6 per cent dividend on it all last year; and the common stock is quoted in the neighborhood of 5, although at the time the company was organized we showed a basis of 6 per cent on preferred and 4 per cent on common stock.

Q. Have you paid anything on common stock?—A. No; we never did, because shortly after we came into control of this property the patents were disputed, and notwithstanding the fact they had been sustained in one jurisdiction, the result was we found a falling off in our earnings. Patent business, you must recollect, is a very hazardous business. I have received a memorandum to-day showing 673,856 patents, the last number in the Patent Office, and I venture to say out of that total an estimate of 10,000 patents as the number that have made any money for the inventors is pretty large.

Q. Do you recognize any danger to your company financially, or any difficulty in its control, by reason of this very low quotation of stock?—A. Well, even if anybody bought the control, it would not change the situation of the company.

Q. It might, however, affect the management of the company, might it not?—A. Oh, yes.

Q. Have you any information respecting the merits of a large capitalization, with a consequently low quotation for the securities, as compared with a small capitalization and higher quotations?—A. There is no doubt that we could not have sold that stock if people had imagined there would be such a great decline in the quotations. That is one of the risks of buying any stock.

Q. These quotations which you have named are less than the ones at which the issue was made?—A. Far less. At the time the issue was made the preferred stock was quoted in the neighborhood of par, and the common stock in the neighborhood of 50.

Q. You ascribe this decline to litigation over patents?—A. Absolutely to that.

DEPRECIATION ACCOUNT—THE CONSOLIDATED RUBBER COMPANY ENDEAVORS TO SECURE A MONOPOLY.

Q. Will you state what your policy respecting depreciation is?—A. We have a regular depreciation account.

Q. This product is not in any sense a monopoly as we understand the term?—A. Well, it is not our fault that it is not a monopoly. We hope it is. We went into this and paid an enormous price for these patents on the understanding that it was a monopoly, the patents having been sustained by the United States courts.

Q. (By Mr. C. J. HARRIS.) Do you manufacture anything else, or simply control the patents?—A. Oh, yes; we control a plant which manufactures rubber tires for the purpose of this business. This plant is at Akron, Ohio. Then, we have a large number of licensees who simply pay us a royalty, for this tire is known all over the world; people pay a royalty even for the use of the name all over the continent of Europe, in Australia, and almost everywhere. Now, to take the other side of it. I know monopoly has a dreadful sound, but the invention of this carriage tire has been a benefit to the world. It has stimulated the carriage industry enormously.

THE PUBLIC POLICY OF GRANTING MONOPOLIES UPON INVENTIONS.

Q. (By Mr. FARQUHAR.) Do you intend to explain now this tire in its universality?—A. Well, what I intend to do is to give you an idea of the hazardous nature of the patent business. When you speak, for instance, of a monopoly many people think it a wrongful thing—although this species of monopoly is guaranteed by the United States Constitution. But if such monopolies were not granted the country would be many millions of dollars out of pocket. Moreover, the hazard of invention of that kind is great. Here is an illustration. Here is a brief on this patent suit where we have shown this method. (Referring to paper.) Here is a number of people who want a rubber tire; they find they need it. Suddenly a man discovers the thing. Here it is, then. It is a new invention of great value. Then the moment that is done everybody makes the same thing—either claims it was not patentable, that any mechanic could have found it, or makes it a little different in a curlcyne and claims it does not infringe. Now look at the styles here—all styles of carriage before the Grant patent. You find practically every single tire on the market copying the Grant patent. That is the history of all patents. First, the difficulty of making a successful invention—the enormous difficulty of making something that is really successful—and, then, after that everybody thinks he has a perfect right to

sell it if he can; and therefore, as I say, although patents have a monopoly to a certain extent, if they did not have at least the hope of protection nobody would invent.

RAW MATERIAL—EXPORT OF INDIA RUBBER FROM PARÁ AND MANÁOS.

Q. (By Mr. RIPLEY.) Do you experience any difficulty in getting a supply of rubber by reason of the existence of any of the rubber companies which are now operating in the United States?—A. Not so far.

Q. The raw material, then, is apparently free to all who wish to use it?—A. As far as we know to-day it is. Whether that will ever be cornered is something I can not tell. I have here a table of the export of rubber from Pará and Manáos. It is a very large output. I do not think anybody is likely to corner it, but such a thing is possible.

Q. What proportion of the total output of rubber of those South American countries is taken by the United States?—A. That is stated here. Out of 61,022,585 pounds the United States takes 27,413,469 pounds. Of course, outside of the Pará there is African rubber, Guatemala rubber, Colombia rubber; but for tires a very fine quality of rubber is required and that mostly comes from Pará.

Exports of india rubber from Pará and Mandos during the year 1900.

AMOUNT OF STOCK ISSUED A MATTER OF INDIFFERENCE.

Q. Have you any criticism to make upon the policy adopted in capitalizing most of the great industrial combinations at the present time, on the basis of your experience?—A. Well, on this question of capitalization, as long as the capitalization is in

stock, not in bonds, I really do not see that it makes a great deal of difference. Supposing you issue \$16,000,000 of stock, we will say; it sells at \$10 a share; you have really issued 160,000 shares of stock worth \$1,600,000. Supposing you reduce the capitalization \$10 a share, and you still have 160,000 shares worth \$1,600,000. As long as there is not question of public policy, as long as there is no question of transportation involving protection against excessive rates, or something of that kind, I never could see what difference it made how much stock there was.

BONDED INDEBTEDNESS IS GENERALLY UNDESIRABLE.

Q. In discussing as we were the basis of capitalization, your remarks are particularly applicable to industrial companies and not to railroads?—A. Yes.

Q. You do not regard bonds as favorable to the interest of the company or the investor?—A. I think a debt is always a burden, and the dangers of trouble and panics and upheavals are very much less if the bonded indebtedness of railroads or industrial companies is small.

ACCOUNTS SHOULD BE PUBLISHED AS SOON AS COMPANIES ARE ON AN EARNING BASIS.

Q. What have you to say respecting publicity of accounts in the case of companies such as those you have mentioned, in which the general public invest; do you accept any responsibility to make public reports?—A. My principle has always been that as soon as the company is on an earning basis, when it has passed the development stage, it should furnish accounts to the public. As long as the company is struggling in the development stage, then, to publish the accounts would be misleading for this reason: If you are building a house and you are laying the foundation, you have not anything to show for the house. If anybody goes to see the building and finds nothing; he thinks you have nothing and he is misled; but after it is finished you have your house and he can see it. In the same way you take a company in the early stage of development, with the vast amount of money required to develop it, and if you would simply give the cost of this development to the public and to the stockholders, they would all be panic stricken, because they can not see what is coming. These are development periods and they are known to be such, and stockholders put their money in for that purpose. But when the period is reached that you are on an earning basis—in other words, when you have become commercial—then I think it is your duty to inform the stockholders.

MAKING PUBLIC THE COSTS OF PROMOTION.

Q. Does the law of any of the States, so far as you know, require a statement respecting the costs of promotion in the first instance of these companies?—A. Not to my knowledge; I have only experience with corporations organized in the State of New Jersey.

Q. Would you advocate the insertion in all cases in companies' statements of the cost of promotion—that is, promoters' profits and fees incidental to organization, cost of underwriting, etc.?—A. Why, that is a new question; I do not know how to answer that exactly. You see the cost of promotion is a very indefinite thing. For instance, some people who obtain stock by reason of promotion receive it not only for the promotion, but for all the services to be rendered for a long time thereafter. It is a little bit difficult.

Q. In the case of this Consolidated Rubber Tire Company, was any stock issued for payment for promotion?—A. No; no stock can be issued for payment for promotion. The law does not allow that.

Q. Are stockholders generally entitled to a statement respecting the cost of promotion?—A. As I say, it is a very difficult thing to say. For instance, a man has a patent and he goes to you and says, "Will you furnish me money to develop this patent? I have capitalized this patent; I think it is worth so much. Now, if you will furnish me the money I will give you an interest with me." Now, he may give you much or a little. It depends on the quality of the patent, and on the difficulty of raising the money, and the risk involved, and a great many other things. If he has an article that is already on the market and which is paying a large profit, the probability is he will give you a very limited amount. If, on the other hand, he has something from which he anticipates a great fortune and which requires a great deal of capital, and a great deal of work, he is likely to give up more of his interest. It is one of those things that is impossible to figure and you never could get it truthfully, because few people would be honest enough to say, "I have divided the interest I have in this property in such and such a way," and in the great majority of instances one would never be able to find out how it was divided.

THE WITNESS'S FORMER CONNECTION WITH RAILROADS, ESPECIALLY WITH THE READING.

Q. Will you state to the commission for the purpose of the record your connection with railroads in the past?—A. Well, I was identified more particularly with what is now called the Southern Railroad. I was director in the Richmond and Danville, the Richmond Terminal, East Tennessee and Georgia, Virginia Midland, and Georgia companies.

Q. Were you not also identified with the Philadelphia and Reading Railroad Company in some way?—A. Yes; I was the foreign representative of the Philadelphia and Reading Railroad Company in Europe for the purpose of raising money for its needs, and also for introducing anthracite coal into Europe.

Q. Will you speak respecting your connection with the Philadelphia and Reading Railroad and the events of the years prior to 1893?—A. My connection with the Philadelphia and Reading Railroad arose out of the fact that I was invited to join a syndicate to purchase the control of the Philadelphia and Reading Railroad. This syndicate was formed at the instance of Mr. Franklin B. Gowen, who had been president of that company, but while it was being formed Mr. Gowen committed suicide here in Washington. The burden of carrying it on was then left with me, and I became chairman. We purchased a very large amount of the stock, a great deal more than a majority, and although the company was at that time controlled by a voting trust and the stock had no voting power, nevertheless the control drifted into our hands through a friendly feeling all around. Mr. Corbin, who was then president, resigned, and Mr. McLeod was made president. I found after I became familiar with the affairs that it would be advisable to reduce the road's indebtedness in the form in which it then existed—largely in the form of income bonds—by converting those income bonds into stock. I prepared the plan for the organization of a new company, which I called the Reading Company, which was to own both the Philadelphia and Reading Railroad Company and the Philadelphia and Reading Coal and Iron Company, and the holders of the income bonds who had shares of the Philadelphia and Reading Railroad Company were to receive shares in this Reading Company for their interests, and in this way we would eliminate the bonds. This plan received the approval of all the leading banking houses, and I may say that it is the plan substantially under which the present Reading Company was organized. I went with it to Europe in 1891 to see the European holders there; but during my absence Mr. McLeod thought it advisable to pay the interest on the income bonds, and of course when the interest was paid on the income bonds the income-bond holders were no longer willing to take stock for their holdings, and the plan then had to be abandoned, and I came back.

Q. May I ask you incidentally whether the interest on those bonds was earned?—A. It was not actually earned, as was subsequently proved, although it was shown to be earned on the books.

ENDEAVOR OF CERTAIN ROADS TO FORM AN ANTHRACITE-COAL COMBINATION.

After I came back from Europe I was asked to assist to bring about what was then called the anthracite-coal combination, and I was instrumental in making that combination by securing, through negotiations, the adherence of the New Jersey Central, Mr. McLeod in the meantime having secured the adherence of the Lehigh Valley; so the Philadelphia and Reading Railroad took control practically, although somewhat indirectly, of the New Jersey Central and also of the Lehigh Valley. This increased the coal holdings of the Philadelphia and Reading Railroad enormously, and required a great deal more additional money; so Mr. McLeod asked me to go to Europe again as foreign representative of the Reading Railroad and raise the necessary money there. This I did. I went to Europe and raised \$13,000,000 to be paid in cash, of which \$5,500,000 was to be paid in on the 1st of February, 1893, and the balance on options, but the understanding was that these options would be exercised as they came along. Much to my astonishment and amazement, after the bankers had paid \$5,500,000 cash on the 1st of February, the railroad was put into the hands of a receiver on the 20th of February; whereupon I returned from Europe and sent in my resignation. I then had some litigation respecting the matter, to have the thing investigated by the United States circuit court.

Q. (By Mr. PHILLIPS.) Was that money raised on bonds or on stock?—A. That was raised entirely on bonds.

Q. Were those bonds good?—A. They were good and they eventually proved good, because the bankers who had advanced the money finally obtained their money back with interest.

Q. The attempt was definitely made, then, in 1892, to effect a combination of all the anthracite roads?—A. Not all; no. The Pennsylvania was not supposed to come in,

nor the Erie, nor the New York, Ontario and Western, nor the Delaware and Hudson, nor the Delaware and Lackawanna, but it was believed that these companies would act in harmony with the Philadelphia and Reading.

Q. Have you any knowledge of a tendency toward consolidation of these anthracite-coal roads at the present time?—A. No; never heard of it beyond the fact that the Reading again acquired control of the Jersey Central through purchase of stock, but at one time previous to my experience with it, under Mr. Gowen's administration, it had done the same thing.

Q. It is not the first time?—A. This is the third time the Reading has control of the Jersey Central.

THE ANTHRACITE-COAL COMBINATION FAILED CHIEFLY BECAUSE IT RAISED PRICES.

Q. What has been the reason for the failure to absorb that road in the two prior instances?—A. In the first instance the Reading had borrowed money on the Jersey Central stock and was not able to retain it when the loans were called. In the second instance control was by means of a lease which was considered contrary to the laws of New Jersey, and was judicially dissolved. But the main reason why the combination failed was that there was not an understanding of the first principles of an operation of that kind, namely, that it must reduce prices and not increase them. The anthracite-coal combination was killed because prices were immediately put up. If they had acted on the contrary idea and relied upon their economies, withdrawal of concessions to agents, etc.—if they had given the public the benefit of that and had maintained the old prices, they would have made, in my estimation, very considerable profit, and there would have been no outcry against the combination.

Q. Mr. McLeod has testified before this commission that it was his intention to effect such economies as should be reflected in lower prices. Do we understand that you criticize the policy in that it did not so reduce the prices?—A. He did not do it, no matter what his intention was. Mr. McLeod's trouble was that he was carried away by the desire to control a great deal more than he could control. He acquired the Boston and Maine and the New York and New England, and that really brought on the ruin of the company.

CONSOLIDATION OF THE ANTHRACITE-COAL ROADS UNDESIRABLE AND PRACTICALLY IMPOSSIBLE.

Q. Do you see any advantages at the present time in the consolidation of the 6 or 7 roads which are now concerned in the anthracite-coal business—an advantage either to the investors or to the consumers, or both?—A. I think a combination of that kind would be very unwise.

Q. Speaking from your experience and what you knew from the inside history of previous attempts?—A. Very unwise.

Q. What dangers might threaten the investors or consumer?—A. I do not know how it would affect the consumer, because he is always protected to a very large extent by the competition of bituminous coal. I am speaking now, of course, of the consumer for industrial purposes, and unless the consumption for industrial purposes continues there will not be any profit in the business. So, although the consumer might, for a short time, as he was at that period, be discommoded, yet in the long run he will get his rights. The attempts to organize all these various interests under one head would be impracticable, and I do not see to what advantage it would lead.

THE PROPER VALUATION OF COAL LANDS AS A BASIS FOR CAPITALIZATION.

Q. Do you understand that at the present time the capitalization of many of these roads includes the entire value of the coal which is in the ground? I refer particularly to the Philadelphia and Reading Railroad.—A. No. I have calculated that the coal in the ground of the Philadelphia and Reading Railroad at that time was presumed to be about 5,000,000,000 tons. Now, if you put that at \$4 a ton selling price, it would be \$20,000,000,000. I am sure that was not included in the calculation. You have only to mention the figures to see how utterly impossible it would be.

Q. What is the basis upon which that road, as a typical coal road, is capitalized?—A. Now, mind you, the value of coal in the ground, as a general gross proposition, is very different from the net value. In the first place, you can only mine as much as the public will demand; in the meantime your interest goes on or your dividends go on. In the second place, you have to be sure that you can market it at prices which will be profitable. Now, we know that for long periods the marketing of

anthracite coal was unprofitable, so the only criterion you have of values of that character, very much like any other mine or like patents, is what people will pay for them. You send an appraiser around and he will say this land is worth so much. In other words, it is like a New York lot. A New York lot on Fifth avenue is based on the price people will pay for it. Just now they pay a great deal more for it than they did a few years ago, and perhaps in a few years they will pay a great deal less. It is an indefinite method, but it is the only way in which you can appraise things of that kind.

THE VALUE OF RAILROADS FLUCTUATES BUT THEIR CAPITALIZATION REMAINS UNCHANGED.

Q. Mr. Schwab made the statement this morning that the basis of the capitalization of the United States Steel Corporation was, in a measure, determined by the amount of ore in the ground. As I understand you, you criticize that policy as applied to coal?—A. In a measure it is correct. You pay a great deal more for land that has coal in it than land that has not; and what that measure is, how much you will allow for it, is largely a matter of popular sentiment prevailing at the time. You can not state a fixed price, for Mr. Gowen paid \$30,000,000 or \$40,000,000 for these lands, and I am sure they could be sold to-day for a very much higher price.

Q. In other words, the capitalization of those roads to-day is actually reflected in the amount of value which they possess?—A. Yes.

Q. The two are equal?—A. Equal, no; the value may be a great deal more or a great deal less than the capitalization. You see, values change. The capitalization remains the same, but values change. You take, for instance, the Atchison road. A few years ago it was bankrupt; now it is earning a large amount of money. It is substantially the same roadbed, practically the same rolling stock, but its value is quite different. The question of value, you know, is one of the most difficult in the whole range of political economy.

THE DANGER TO RAILROADS OF REGARDING LOANS TO OTHER ROADS AS ASSETS.

Q. Were the accounts of those coal roads accurately kept as between the mining companies and the transportation companies, so as to show the state of the business at the time that you knew it?—A. The accounts were accurately kept, but here is the difficulty which brought a great many railroads to grief. A railroad, for instance, buys up another road or leases it; that becomes a part of its system. The main line, perhaps—like the Pennsylvania Railroad—is some 400 miles long, and the whole system may be 7,000 or 8,000 miles. Now, the rest was brought in in some way; either leased or direct control purchased, or traffic arrangements made by which the traffic is controlled, etc. There are various ways. Now, the way a good many railroads were ruined was this: They acquired a piece of property—a railroad—and they found that it needed money to be developed, so they would loan money to that railroad, which was leased or controlled. Of course, the loan would stand on the books as an asset, and possibly as a surplus. Now, as time went on they would continue to loan this railroad and other railroads and so on, until, perhaps, they would have \$30,000,000 or \$40,000,000 loaned out to branch and leased lines of that character, and those amounts would stand on the books as surplus; but if they called on those railroads to pay up they could not do so. Now, if a panic came on or anything which prevented the railroads from borrowing money on the securities issued to them by these leased or controlled roads for these advances, then the railroad that had advanced money would go into default.

THE PHILADELPHIA AND READING RAILROAD COUNTED AS ASSETS PROFITS WHICH NEVER EXISTED.

In the case of the Philadelphia and Reading Railroad the situation was not only that it had leased roads of that character, but it also owned all the stock of the coal company. Now, the coal company of course was supposed to pay its regular rate of freight, and was charged with it on the books, but when the time came to settle in cash the Coal and Iron Company did not have all of the required cash. Those freights still stood on the books as earning, but the railroad required cash to meet its own demands. It could not realize on that asset standing on its books as an account receivable, and when the Coal and Iron Company was not able to pay, the railroad was not able to pay its charges. But all the time the official statement showed the freight as earnings.

Q. In other words, the coal was mined and the loss really fell upon the railroad, although originally incurred by the mining company?—A. Well, the mining company

paid the railroad company freight—at least was supposed to pay all the freight—and was charged on its books with it. It is like this: I have a right pocket and a left pocket, pocket A and pocket B. Now, there is no money in pocket B at all, and pocket B owes a lot of money to pocket A. Now, when I make my statement I refer to pocket A—that is my principal pocket—as making great earnings, but when it comes down to paying from pocket B there is nothing in pocket B; so a large part of the earnings of pocket A never existed in fact. They existed legally, you might say, but when pocket A did not earn enough to get along without pocket B's paying up, then the thing was exposed and there is a default. While the earnings were there on paper, they were not there in cash. The Coal and Iron Company failed to pay because it could not market its coal at a price that would yield enough profit to pay all the freight; then the trouble began.

MODE OF BOOKKEEPING AS BETWEEN RAILROADS AND THEIR SUBSIDIARY CORPORATIONS.

Q. Then the subsidiary corporations often made it possible to make fictitious returns and earnings?—A. Not exactly fictitious—I do not care to call them fictitious; it may have been the regular rate charged to everybody else—but misleading returns and earnings.

Q. Do you understand that any change in this method of accounting has taken place since 1893 as between the railroads and their subsidiary mining corporations?—A. I have had no experience. I knew those railroads at that time but I have had no experience since; but I imagine from the general credit which the railroads enjoy to-day compared to the credit which they enjoyed at that time that they must have improved.

A DANGEROUS PRINCIPLE TO CONVERT STOCKS INTO BONDS.

Q. Do you see any danger from the standpoint of general railroad finance in these various consolidations which have either taken place or are projected, by means of which one road acquires the stock of another and deposits it, issuing thereupon collateral trust bonds or other securities of that kind?—A. There is in principle always a danger to convert a stock, which has no liability except for bookkeeping purposes, into a charge. Of course, as long as things are well and companies grow, they pay the interest and it is all right; but if for any reason there should be a setback to the prosperity of the country and the interest is not earned, then we get back to a chaotic state of affairs such as existed 7 or 8 years ago.

Q. Do you understand that to be the system on which the absorption of the Chicago, Burlington and Quincy is projected, and by which the Central Railroad of New Jersey was purchased by the Philadelphia and Reading?—A. Yes; that is the system. Now, of course, in matters of business principle it is not proper to go too far. There may be saving circumstances which may make this a good operation, but that of course I do not know, as I am not sufficiently familiar with the details. Speaking generally, it is a mistake to convert stocks into bonds; it ought to be the other way. My tendency has always been the contrary—to convert bonds into stock.

IMPROVEMENT IN RAILROAD ADMINISTRATION—UNITED STATES RAILS THE BEST IN THE WORLD.

Q. Have you any reason to suppose that the financial administration of railroads is somewhat better to-day than it was in 1893, when you were particularly concerned with them?—A. I believe so; for one reason, on account of the great shake-up in 1893. Generally, you know, there is a reform after events of that character—such a large number of railroads went into the hands of receivers. But outside of that, through these reorganizations an enormous quantity of new money has gone into railroads and improved them materially. Take, for instance, the old Richmond Terminal, which is now the Southern Railroad. It was composed of a great number of small roads very indifferently constructed. A large amount of assessments was levied, and the combination of all these roads under the head of one railroad, the Southern Railroad, has produced a great change in the physical condition of those roads. Therefore, they can be operated very much cheaper and yield a profit where previously they would not. The same thing is true all over the country. I remember farther back, in 1886, the condition of most of the Southwestern roads particularly was wretched. I investigated one road, and I wrote that it was not any rougher than the Atlantic in an ordinary gale. That was about the condition. Take this same road, which is now the St. Louis and Southwestern; it is a fine road. Of course the stockholders have had to contribute. Enormous amounts of money were raised by assessments, and the result is that the condition of the railroads in the United States is the best in the world, where it used to be the worst.

Q. You spoke of having examined the roads abroad?—A. Everybody admits—I was in England last year—that the English roads are far outdistanced, although 10 or 15 years ago all we hoped for was to come up to the English standard.

PROPOSED BILL TO ENABLE THE INTERSTATE COMMERCE COMMISSION TO PROTECT RAILROAD INVESTORS.

Q. Does the law of the United States at the present time sufficiently safeguard the investor in the matter of railroad finance?—A. I do not think the law safeguards him at all, except the common law against fraud and larceny; I do not know whether there is any other law.

Q. Have you any suggestions to make respecting the enlargement of the powers of the Interstate Commerce Commission, or by any other means providing for such protection?—A. At the time when I investigated the affairs of the Reading Railroad—I made this investigation for the trustee of the bonds in 1893—I became very much interested in the subject from a good many points of view. I then drafted a bill, which was introduced in Congress by Mr. Strans, of New York, in the House, and by Mr. Cullom in the Senate, for extending the powers of the Interstate Commerce Commission to prevent frauds on stockholders; and among the provisions of the bill the one I relied on more than any other was an examination of railroads based on the method of examining banks—that is, that there should be a regular United States examination. There were other provisions about receiverships which I felt ought to be remedied. For instance, the old method always was that when the president had bad luck—to put it in a mild form—had bad luck so that the road went into the hands of a receiver, he was immediately appointed a receiver, on the ground that he was most familiar with the road. My ground was that if his familiarity brought on ruin, it was the best thing to have some other party who was not so familiar. There were various other provisions embodied in the bill at the time, and it was favorably considered among the members of the railroad committee, but action was postponed until it was too late, so nothing came of it.

ADVANTAGES OF A SYSTEMATIC GOVERNMENT INSPECTION OF RAILROAD ACCOUNTS.

Q. You regard as feasible, then, a systematic inspection of railroad accounts?—A. Just as easy as inspection of banks; there is no difference.

Q. You say that in the light of experience as a practical railroad financier?—A. The management is supposed to give the stockholders all the facts. All the railroad reports go into great detail. Why not have the reports examined by a United States examiner to see that they are correct? It is only carrying out what the management proposes to do anyhow.

Q. At the time of which you spoke, were these full and complete railroad reports accurate in the bookkeeping so as to show the state of the earnings?—A. They were accurate, but when you come to the question of the solvency of the debtors, how could you tell that from figures? If the Philadelphia and Reading Railroad advanced to the Atlantic City system \$1,000,000, it appeared on its books as an advance, as an asset of \$1,000,000 under an advance to a leased line. The reports will be correct as to figures. If the Philadelphia and Reading Railroad Company inserted among its earnings so much freight earned from the Philadelphia and Reading Coal and Iron Company, it would be correct as to figures, but yet extremely misleading as to facts.

Q. You would then have your examination cover not merely the correctness and verification of balances, but also include an actual examination of all securities owned by the road, and an examination as to the facts?—A. Yes; whether or not these various credits, these various advances, have any substantial value.

Q. Do you recognize any disadvantages in a systematic inspection, owing to the fact that it reveals the inner policy of the company, and might sometimes embarrass the management in carrying out incomplete projects?—A. Does it not reveal the inner policy of banks? We are supposed to have trustworthy men for examiners who will not reveal what is not proper to reveal.

INTERSTATE COMMERCE COMMISSION THE PROPER DEPOSITORY OF THIS POWER.

Q. Do you believe that the Interstate Commerce Commission, as independently organized, may safely be intrusted with power to conduct such a systematic examination?—A. That is where it should be intrusted.

Q. (By Mr. PHILLIPS.) Do you think that the decision of the Interstate Commerce Commission in any given case should be binding until it is reviewed by a higher court?—A. That is a very difficult legal question. I should not like to give an opinion on that.

Q. Is not the difficulty now in getting at a conclusion from the courts that it is so very tedious?—A. That is something concerning which I have not studied sufficiently to be able to give you any information.

THE ATTEMPT TO SECURE CONTROL OF THE NORTHERN PACIFIC RAILROAD.

Q. (By Mr. RIPLEY.) Have you followed at all closely the recent attempts to secure control of the Northern Pacific Railroad?—A. Of course I read a great deal about it in the papers.

Q. Are you an attorney?—A. Oh, yes; years ago I used to be an instructor in the Columbia Law School.

Q. The statement was made in the press that suit would be brought for an injunction to compel a settlement on a basis of 150 with those who had sold the stock short. Have you seen a statement of that and the grounds for it?—A. Yes. The ground for the injunction was that where there is an impossibility of performing a contract it can not be enforced. It is an old principle of the common law where there is an actual physical impossibility of performance.

Q. Have you any knowledge of a corner of this particular character at any previous time?—A. No; that is entirely novel.

Q. You have no further information than what is stated in the press respecting this?—A. No; I have not.

DIFFICULTIES IN THE WAY OF EXPORTING COAL AND THE QUESTION OF A SHIP SUBSIDY.

Q. You stated that you went abroad in the interest of the exportation of hard coal to Europe?—A. Yes; that was part of my mission.

Q. Have you any statement to make respecting that?—A. I thought that would be the best way of solving the difficulties of marketing anthracite coal in sufficient quantities, and I found there was a very large field; but the difficulty was entirely with the shipper. In other words, you sent out your load and there was no return freight compatible with profit—insufficient quantities, I mean, to insure a profit on the transaction. That was the whole trouble.

Q. The entire difficulty, then, in establishing a large export trade in coal is the difficulty of securing the return freight?—A. Yes.

Q. Have you any proposition to make respecting that?—A. You mean ship subsidy? Q. Yes, or otherwise.—A. While I am not an expert on that question, I know that a ship subsidy would have been very valuable for the export trade of our coal, because it would have given us a chance to send the coal over and rely on enough assistance from the subsidy to get back. That industry would be created immediately, I think.

UNDESIRABILITY OF LEGISLATION PROHIBITING RAILROADS FROM LEASING OR CONTROLLING OTHER ROADS.

Q. (By Mr. STIMSON.) Would you take a general position in favor of legislation against the control of stock of one railroad by another?—A. I think that would be a great mistake. I will just make a comparison. Take the Southern road, with which I am familiar. Formerly there was a lot of disjointed roads, very slow time, very poor cars, and very unsatisfactory in every respect. They came into this one system, the Southern road, and now you see fast service, excellent track, everything in the interest of the public. Of course, it is a very serious question how far that should go, but I do not think we need be afraid that it will go too far. You see now this very matter that you brought up, this question of the control of the Northern Pacific. The railroads of this country will not come into a single band; that is certain. There are too many people with their own ambitions to allow any single interest to obtain control of all. But how far it can go with profit to the country, and where it should stop, of course is a question very difficult to answer; but I am perfectly satisfied that it would be a mistake to prevent a railroad from controlling and leasing others that connect with it.

EXTENT TO WHICH THE RAILROADS CONTROL COAL LANDS AND THE MINING OF COAL.

Q. In my practice I had a client come to me with a large tract of bituminous coal lands for sale, and I was told by a great many people that they had to be sold to some of these combinations.—A. The quantity of bituminous coal land is so enormous that they really have relatively little market value. The anthracite lands are very difficult to buy. There are relatively few of the old individual holders left,

and if they had to sell them they would sell only to the railroad companies. It is not worth while to anybody else to buy.

Q. They can sell only to railroad companies?—A. Well, of course, a great many of the old large miners exist, the very large miners like Cox Brothers, but to go in and mine a small property, with the expense of mining and the railroad freight added, is not a thing that people would care to venture in very much. Those who have the business and experience will stay, but new people are not tempted.

Q. Do the railroad companies in general make any effort so to control the situation that coal can not be mined except in such lands as they choose to secure the lease off?—A. Well, there is what they call an understanding. They have always had an apportionment among the railroads that each company should carry so much. I do not know whether it is in effect now, but it was for years. This is necessary; otherwise the coal lands would be depleted at ruinous prices. The trouble is there is not enough demand. If there were enough demand for anthracite coal to take everything that is marketed there would be no trouble. Now, if export trade could be established, that would increase the demand and everybody could mine all he would like. As it is to-day the demand is quite restricted, relatively speaking.

POSSIBILITIES FOR ANTHRACITE COAL IN THE FOREIGN MARKET.

Q. Is there any market in England for anthracite?—A. Oh, I think there would be a large market in England, France, Germany, and Italy.

Q. They have no objections to it?—A. On the contrary, they favor it; they like it.

(Testimony closed.)

WASHINGTON, D. C., May 20, 1901.

TESTIMONY OF MR. WILLIAM R. WHEELER,

Representing Pacific Coast Jobbers' Association.

The special subcommittee met at 8.45 a. m., Mr. A. L. Harris presiding. At that time Mr. William R. Wheeler, of San Francisco, Cal., a wholesale hardware merchant, was introduced as a witness and, being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Mr. Wheeler, will you state your full name, your occupation, your address, and any other details about your representative position?—A. William R. Wheeler; wholesale hardware; address, 1215 Jones street, San Francisco. We have houses also in Sacramento and Los Angeles, so far as our business is concerned.

Q. What is your relation to the board of trade, and do you represent any commercial organization?—A. Yes; so far as the board of trade is concerned, my house is a member of it, as are all other wholesale houses. The board of trade in San Francisco, however, I would remark incidentally, is not of the same general character as boards of trade in general. It is merely an association of wholesale merchants who use it almost solely, in fact solely without any qualification, for the purpose of economizing the settlement of bankrupt estates. We employ two lawyers in the board of trade and have a legal department that handles all bankrupt estates, and by the concentration of the work into one set of hands and the joining of issues on the part of all the merchants in the case more is saved in the administration of the estate for the creditors than would otherwise be secured.

Q. Are you not here in some representative capacity before the Interstate Commerce Commission?—A. Yes; we have on the Pacific coast an organization known as the Pacific Coast Jobbers and Manufacturers' Association, which has a membership in all the Pacific coast cities from Washington and Puget Sound to Santiago.

Q. Will you state the railroad situation so far as California is concerned, and particularly the nature of the case now being prosecuted here before the Interstate Commerce Commission? Of what do the merchants complain in this case or in general in other ways?—A. The transcontinental railroads, in establishing their tariffs after the completion of the first transcontinental railway, and the same remark applies that I am about to make to all subsequent transcontinental railways as they were completed, found themselves face to face with the competition of the sea carrier between New York and San Francisco, and other Pacific coast termini of the roads serving San Francisco and other roads. How to meet this competition was a problem which presented itself to them. In order to do business between Atlantic seaboard cities and Pacific seaboard cities they were obliged to make rates to meet this sea competition after making due allowance for extra time in transit, marine insurance, liability to salt-water damage, and general inconvenience occasioned by

¹ See also testimony of Mr. J. C. Stubbs following.

the uncertainties of marine navigation or marine transportation. In meeting this competition from New York the railroads incurred the displeasure of certain inland cities. The roads serving the Middle West immediately insisted upon applying like sea competitive rates between Chicago and other Middle West cities and the Pacific coast, thus bringing about what are known as postage-stamp rates. They were careful, however, to confine the postage-stamp rates to their Eastern termini in permitting rates to be postage stamped west of the Missouri River.

Q. You may explain exactly what you mean by postage-stamp rates. Do you mean that the rate is the same, irrespective of distance, anywhere east of the Mississippi River?—A. Yes. The term "postage-stamp rates" takes its origin from the letter-carrying system of the Government. The purpose of this policy on the part of the Western roads was to bring business as near to their Eastern termini as possible—to bring the origin of business as near the Eastern termini as possible, thus securing to themselves the greatest possible amount of revenue out of the business. In the establishment of these sea competitive rates the transcontinental railways took due recognition of values, density, liability to damage, etc., when goods were shipped by sea, and made a tariff which practically confined sea competitive rates to the competition as it existed. It was the constant aim and effort of the transcontinental railways to control, and thereby minimize as far as possible, the competition of the sea carriers. In these efforts they were successful to such an extent that the merchants of San Francisco, to break the monopoly then existing, organized a steamship line on the Pacific to be run in connection with the Panama Railroad and its steamship line on the Atlantic, thus creating a through route from New York to San Francisco. The merchants of San Francisco, furthermore, subsidized, or encouraged by guaranties, the establishment of a rival line of clipper ships around Cape Horn. These actions brought about a violent competition between the railroads and the sea carriers and a bitter rate war ensued. In this rate war, as in all war measures, whether commercial or international, all recognized rational measures or systems previously established were broken down, and rates generally flattened out between the Atlantic and the Pacific—or between the territory east of the Missouri River and the Pacific coast cities—to such a degree as to show little or no difference between carload and less than carload lots, so as to maintain no difference between carload and less than carload rates, and to ignore values and proper elements which had heretofore entered into the establishment of sea competitive rates. This rate war continued, according to the best of my recollection, during 1893 and 1894, when the steamship line was abandoned and the Panama Railroad Company renewed its relations with the Pacific Mail Steamship Company. The conditions existing before the freight war, however, were not restored, so far as freight tariffs were concerned. Rates were advanced to some extent, but carload differentials existing before the freight war were not restored. During the period when these unnatural conditions prevailed the Middle West jobber was enabled to go into Pacific coast territory and secure an abnormally large share of business. In fact, he was making such inroads upon the business of the Pacific coast jobbers that the latter's share of profits upon investments was entirely inadequate.

As the freight-tariff conditions were particularly burdensome with regard to hardware and iron and steel products, the jobbing trade of the Pacific coast, through its organization, the Pacific Coast Hardware and Metal Association, entered a protest against the prevailing transcontinental freight tariff and recommended certain changes therein, all of which were based upon the precedents established by the transcontinental tariffs in effect before the freight war before mentioned. After several hearings which were granted to the Pacific coast hardware trade, at which were representatives of the Middle West hardware trade as well as the trade bodies, the transcontinental railroads, at a meeting held in May, 1898, at Milwaukee, issued a tariff, which, while it only in a measure restored the conditions existing before the freight war, was more generally satisfactory to their Pacific coast patrons. The Middle West jobber, having been educated by the abnormally low rates and the elimination of carload differentials consequent upon the freight war to look upon the Pacific coast as a part of his territory, immediately protested against the Milwaukee tariff. In fact, the Middle West jobber was claiming as a right what had been granted to him by the railroads as a war expedient.

The continued efforts of the Middle West jobber to tear down the Milwaukee tariff were successful in the case of the Great Northern and the Northern Pacific railways, those roads issuing a supplementary tariff, effective May 1, 1899, reducing carload differentials and ignoring in a large measure the elementary basis of a sea competitive tariff, but applying thereto sea competitive rates. This was followed by a vigorous protest from the Pacific coast jobbers. The delegation waited upon the tariff officials of said roads at St. Paul May 23 and 24, 1899. At this meeting a large representation from the Middle West was present. The Pacific coast delegation presented their argument and were replied to by the Middle West. As the Pacific coast people had anticipated, the traffic officials of these Northern railways declined

to recede from the position they had taken. This led the Middle West people to look for like action on the part of the roads leading into California, the tariffs up to this time having been very generally identical as to Pacific coast points. The California roads, however, paid no attention to the action of their Northern neighbors, but continued the operation of the Milwaukee tariff.

Failing to secure a departure therefrom by moral suasion or force of example of the Northern roads, the Middle West jobbers, through the St. Louis traffic bureau, began suit against the transcontinental railways to enforce the desired reformatations in the transcontinental freight tariff. Their complaint involves 3 issues:

First. They declare that rates should be graded; that is, that a lower rate should exist from St. Louis than from Chicago, and a lower rate from Chicago than from New York.

Second. That carload differentials should be minimized, or that there should be a very material reduction in carload differentials from those shown in the Milwaukee tariff.

Third. That blanket descriptions should be adopted. By blanket descriptions I mean that a variety of articles widely diverse in value, density, and liability to damage should be permitted to be packed into a case and a common rate applied to all, said rate being not in excess of sea competitive rates generally.

Q. The whole contest, then, is one between the Middle West and the Pacific coast jobbers?—A. Yes.

Q. Who can decide that controversy as a matter of fact to-day? That is to say, who can determine which of those two sets of jobbers shall do the business?—A. The Supreme Court of the United States.

Q. But until a decision by that court, does the power to make this adjustment rest absolutely with the railroads by their adjustment of rates?—A. It does; yes.

Q. Do you appreciate that in pushing a case before the Interstate Commerce Commission you may have to repeat it or carry it to the Supreme Court?—A. We do; yes.

Q. Would your organization, and do you think the merchants of California in general would, welcome an enlargement of the powers of the Interstate Commerce Commission?—A. They would.

Q. And that they would be willing to trust the issue to them?—A. Yes. I feel that the Interstate Commerce Commission—and in saying this I believe that I pretty generally reflect the sentiment of all with whom I have conversed upon the subject—should be given the power to enforce its rulings; not that the railroads should not have the right of appeal therefrom, but I would put the burden upon the railroads and not upon the Interstate Commerce Commission. As the law is to-day constituted, as I understand it, the Interstate Commerce Commission is obliged to go into the courts to enforce its own rulings. Now, it appears to me that their rulings would be, or should be, self-operative; that their rulings must be respected the same as a court's rulings; and if the railroads object to the rulings they should go into the courts and appeal therefrom, and not force the Interstate Commerce Commission to go into the courts to enforce its decisions.

Q. The railroads have maintained at times that there was an adequate protection for shippers because the interest of the railroads and the shippers was the same; that is to say, that rates properly adjusted would produce the maximum volume of business. From what you say I should judge that it is not always true that the interest of all the shippers is identical?—A. No.

Q. And that a railroad may practically put business into the hands of one part of the country as against another?—A. That is just it.

Q. By the adjustment of its rates?—A. I do not believe generally in destroying the geographical advantage of any city. It is that geographical advantage that builds the city up, to begin with, or that causes its foundation. It matters not whether it is actually a hamlet, a town, or a city. Every one of those owes its existence to some geographical advantage with relation to the surrounding country. It may be a hamlet that is located in the middle of a little productive valley—at a crossroads perhaps. It serves a certain radius. Or it may be a city like San Francisco, at the gateway, as we are pleased to term it, of the Pacific coast. The people who pioneered San Francisco did not go there because of the beauty of its location or because the climate was particularly attractive. They went because of its commercial possibilities. They recognized it as the entrepôt to the Pacific coast, and the wisdom of their action has been demonstrated. That was when goods moved by sea entirely. San Francisco became the gateway to the entire Pacific coast. Goods were distributed up the rivers or redistributed from San Francisco up the coast and down the coast and back into the interior by team, and finally local railways were built, which in turn became distributive agents, and in the course of time, as I have already said, the transcontinental railway was built.

Now, in San Francisco we believe that sea competitive rates should be confined to the points where the sea competition exists; and as I interpret the interstate-commerce law as a layman, it is very plain upon that point. The fourth section states

that no waiver of the long-and-short-haul clause may be made where circumstances are similar. It is the dissimilarity of circumstances that permits a waiver of the long-and-short-haul clause, and the dissimilarity of circumstances is that between San Francisco and New York exists God's highway, which any ship carrying the flag of this country may use as a free right of way there. It is a small investment to build a ship, comparatively speaking. That vessel can load at New York the product of the factories on the Atlantic seaboard and of the Middle West to be hauled to New York from Chicago. There they find water competition around to San Francisco. They do not find it at Chicago. The railroads, if they would carry business between the Atlantic seaboard and the Pacific seaboard, must meet this water rate. Chicago and St. Louis, ignoring the basis of this rate, say: "Here we are nearer San Francisco than you are there in New York. We are a shorter distance than you are; therefore we should have a lower rate than New York has."

Q. Which they do not have at the present time?—A. At the present time they have a postage-stamp rate. The railroads in a spirit of compromise, so to speak, while they say to Chicago that "Logically your rates should be higher than New York's to San Francisco; while you claim it should be lower, we claim it should be higher. You claim it should be lower by the share of the rate from New York to Chicago that should be cut out of the transcontinental rate in establishing the Chicago rate, giving you the benefit of your contiguity to San Francisco as against New York. We claim that at New York the basis of the rate is the sea competition, which is forced upon us, and that you should first pay the rate to New York, where you can avail yourself of that sea competition, which would increase your rate at Chicago over that of New York by this same cost between Chicago and New York." One wants it higher and the other wants it lower, so to speak, and they compromise by making it the same, or, in other words, extending the postage-stamp rate.

Q. As far as St. Paul?—A. As far as St. Paul and St. Louis and Minneapolis and Omaha and St. Joseph. Now, in the Denver decision, which in my opinion is one of the best decisions that the commission has ever rendered, they call attention to the inconsistency of applying sea competitive rates to points not possessed of sea competition; and while they specifically state that that is not an issue before them, they do state that the railroads having granted Chicago, St. Louis, and Kansas City sea competitive rates, or, in other words, that the railroads having departed from the sea, that the sea competitive rates to the coast must be consistent in their very inconsistency and not draw the line at the Missouri River, but must give Denver, Colo., the same sea competitive rate, and they must give it to Salt Lake; whereas the railroads have been drawing the line at the river, thus making the rate higher from Denver to San Francisco, and even from Salt Lake to San Francisco, than it was from Chicago or St. Louis or New York to San Francisco. That was all done in a self-serving spirit, as I have said before. The railroads terminating at the Missouri River wanted to create business at their eastern termini, and in that way maximize their net earnings.

Q. What now is the actual competition that exists? In other words, what goods go by water at the present time, and are there any goods which would not go by water under any other conditions?—A. There is a large volume of business going by water at the present time. That volume is increasing, and it consists of particularly heavy goods—hardware, groceries, and all commodities whose value is not excessively high.

Q. Does structural iron go that way?—A. Yes; structural iron. I am not in the structural-iron business, I would say, and I can not state that of my own personal knowledge; but I know of iron analogous to structural iron which does come there. I should say that there is no reason why it should not go by water. Anything wherein the value or liability to damage is not great can go by sea. Understand this, that in shipping by sea the value cuts a very considerable figure. In the first place, with a sailing vessel it means a matter of 4 months longer than by rail. Now, those goods are bought and paid for at the point of origin and that amount of capital is lying idle when it goes on a long voyage like that, and the interest has to be considered upon that amount of money as against the rail haul, which is shorter. In other words, you have to add to your actual sea freight the interest on the money for the longer time that the goods are in transit over what they are by rail. You have to add to your sea rate the marine insurance which does not obtain when shipped by rail. You have to add to your sea rate the liability to salt-water damage, which does not obtain when shipping by rail. Then you have got to add to your sea rate a certain percentage to offset the general convenience of bringing by rail over bringing by sea, getting your orders quickly. It is not a matter of putting this rate against that rate when you come to shipping by sea. That is what we demand the railroads should take into consideration and what the Middle West have requested them to ignore.

Q. To pass over that, what is the opinion of the California merchants respecting the consolidation of the Union Pacific and Southern Pacific railroads? Do they

regard it with favor or otherwise? Do they predict any effect upon rates or upon business in general?—A. I believe that the establishment of ocean-to-ocean railroad lines under one control, and it seems to me very evident that that is coming, and in the very near future, would be a good thing for the Pacific coast for this reason: If, for example, the Santa Fe Railroad was controlled or owned by or consolidated with the Pennsylvania system, thus forming an ocean-to-ocean road, then that line would confine its sea competitive rates between points where sea competition exists in order that they might not break up their intermediate and local hauls where they are removed from that sea competition.

Q. Do you mean, in other words, that they would get the long haul from New York to San Francisco on certain commodities instead of having it from Chicago?—A. Yes; not that they want the long haul at the lower rate or even the same rate as against Chicago, but they recognize the inconsistency of their position; they acknowledge that they are making this sea competitive rate apply from Chicago simply from a self-serving interest, and that it is inconsistent. They could afford to assume the consistent position, having a through line from ocean to ocean, and confine their sea competitive rates between the points where sea competition exists, and it would not be to their interest to give Chicago the benefit or arbitrary advantage of sea competitive rates. In other words, to make that clear, a Chicago railroad or a railroad whose eastern terminus is in Chicago wants to have all the goods it can originate in Chicago and build up the manufacturing of Chicago, draw it away from the Atlantic seaboard. Therefore, they give the Chicago manufacturer the benefit of the Atlantic seaboard manufacturer's geographical position. The Atlantic seaboard manufacturer has a natural advantage, which the Chicago manufacturer has not, to offset this relation, and the Chicago manufacturer has an advantage which the Atlantic manufacturer has not with reference to the Mississippi Valley territory. But the Chicago man, having already built up his business in the territory which is naturally his, wants to go farther and reach into the other fellow's territory out on the Pacific coast; and while he has not the geographical position which entitles him to it, it is arbitrarily bestowed upon him by the railroads serving Chicago, because the railroads serving Chicago say, "We have not any place in New York; we do not serve the man at New York; we can not get his haul, or if we do we only get a part of it; we have to pro rate with this other road; therefore we are not interested in building up New York. We are interested in building up Chicago." And if that same road had a line leading from New York to the Pacific coast then it would say, "Let each place stand upon its own bottom and for the trade that is tributary to it and not force the combination of trade to get territory to which that trade does not belong."

Q. (By Mr. RIPLEY.) That same argument, then, would make the people of the Pacific coast rather complacent over the union of the Great Northern and the Northern Pacific with the Chicago, Burlington and Quincy?—A. The Great Northern and Northern Pacific union with the Chicago, Burlington and Quincy, of course, gives those two roads the Burlington's own entrance into Chicago, St. Louis, Omaha, and Kansas City, as the Burlington serves all those cities. I do not know that it would make any material difference to us. Personally I would be glad to see those roads get control of a road leading to the Atlantic seaboard, because, on the theory that I have stated here, I believe it will work out our salvation. I do not want it to stop with the Burlington. It merely gives them a station. St. Paul and Duluth remaining their eastern termini, it increases their terminal points in the east by the addition of the Burlington's terminal points, that is all. Having acquired the Burlington, the next step will be, I believe, from the signs of the time, the acquisition by them of the Erie or some other trunk line, just as I believe that the Vanderbilt lines really in fact do control to-day an ocean-to-ocean line.

Q. You refer to the Union Pacific?—A. The Union Pacific and the Northwestern. The Union Pacific controlling the Southern Pacific, and the Vanderbilts controlling the Union Pacific and having the Northwestern, would give them an ocean-to-ocean line.

Q. Would the construction of an independent line by the Burlington to the Pacific coast have any bearing on this general situation? The project has been mentioned, and is, in fact, said to be at the bottom of this opposition of the Union Pacific to this union of the Chicago, Burlington and Quincy and the Great Northern and the Northern Pacific.—A. I have heard that so stated, and I think there is considerable reason to believe that it might be so. I do not know anything about it authoritatively. But, of course, the more railroads we have into that section of the country the more the country is developed and opened up. I am always pleased to see railroads constructed into territories, because the general effect is the opening up of the country. But, so far as freight rates are concerned, I sometimes think that it simply means one more road to divide up with. Therefore they say, "Boys, let us get together and pass them up a little. We can not afford to carry as cheaply as we did before. There is one more road to divide with."

Q. Do the merchants complain any more of commercial discriminations, rebates—any of those practices that usually prevail during rate wars? Do they exist at the present time, so far as you know, to any considerable extent?—A. In a rate war there is no occasion for rebates. They simply “sock” the rates right down so that they can not make any rebates; but it is when the war is off and rates are supposed to be maintained that the rebates come in, the secret rebates. We are opposed to rebates out there. I do not believe there is a shipper on the Pacific coast but that has at some time or other received rebates.

Q. They have been prevalent in the past, then?—A. They have been prevalent in the past. At the same time the thinking ones among the merchants were making every effort to prevent them. It was urged that the Canadian Pacific, which was carrying business into San Francisco by its line via Vancouver steamships down to San Francisco, thus making rather a roundabout line, by its claim of a 10 per cent differential—its enforcement, in fact, of a 10 per cent differential below those of the direct all-rail lines—was causing the all-rail lines to secretly cut. That was the excuse that was given us by the all-rail lines, and with that information before us, we got together in San Francisco and pledged ourselves not to ship by the Canadian Pacific. The people in the hardware and metal trade I refer to. You take away the iron and steel and grocery transportation and you take away the prop which doth sustain the house, so to speak. There was a publication extant showing the efforts of the San Francisco merchants. It all comes in as a part of the proceedings at the conference or at least the arbitration as between the transcontinental American railways and the Canadian Pacific at Chicago, which shows the attitude of the San Francisco merchants in that case. It is a matter of record.

We stuck by that agreement and did not ship by way of the Canadian Pacific road. It was merely a matter of the different people in the same line of business agreeing not to ship by that road. The result is that the Canadian Pacific is to-day out of business in San Francisco practically. They have a tariff, but of course they realize it is natural that they can not expect to carry business to San Francisco at the same rate the other lines do. It is out of their territory just as much as Victoria and Vancouver in British Columbia are out of the Southern Pacific's territory. Now, there was considerable self-sacrifice about that action, because it is pretty hard for a man to give up or pay 10 per cent or 11 per cent more on his freight when you reverse the basis. But it was done to prevent this rate cutting. The American railroads had alleged that that was the occasion of it, that they were not going to see the Canadian Pacific get business by making public a tariff showing a 10 per cent differential, while the American roads had agreed among themselves to maintain certain tariffs. They were not going to see the Canadian Pacific get business; that was all. Now, we removed the alleged cause by the voluntary action in San Francisco, and since that time there has been a great deal less cutting of rates, at any rate. We would be very glad to see some arrangement made, whether it be by pooling or otherwise.

I believe in legalized pooling, something to establish the stability of rates, exactly the same as the Government postal service is stable by the use of postage stamps. We know that our competitor is not sending any more for his postage stamps than we send for ours, and we know that he can not send his 4-pound package through the mails any cheaper than we can send ours. That is satisfactory. It puts us on the same footing, where we want to be. The only reason why a good merchant seeks a rebate is to put himself on the level of his competitor. He says, “That fellow is getting it; I know he is, and I have got to get it if I am going to stay here in business.” Now, if he knows that the other fellow is not getting it, the good merchant is not going to waste any time around the railroad office asking for rebates.

Q. (By Mr. A. L. HARRIS.) Would the Canadian Pacific go into any arrangement of that kind to prevent rate cutting?—A. Well, it was the Canadian Pacific's attitude that was the alleged cause at one time of rate cutting. The Canadian Pacific claimed that it was what the railroads call a differential road, that it had physical disabilities to overcome; that the road was longer, and that there was a transfer from road to sea to get the goods from San Francisco, and that the merchant from San Francisco would not ship by that line unless there was some advantage in it. I do not believe in the differential principle. I think it is all wrong. I think that each tub should stand on its own bottom, take the consequences of its geographical location, and take the goods that its location calls for on an equal basis, and not try to step into the other fellow's territory on an unequal basis.

Q. (By Mr. RIPLEY.) You have spoken of legalized pooling. How far, in your judgment, will these railroad consolidations that have taken place, particularly in the Western territory, do away with the necessity for that?—A. Only to the extent that any agreement is more apt to be kept if there are few parties to it than if there are a great number. In other words, the fewer the parties to an agreement there are the more liable it is to be adhered to—the less chance there is of some one jumping over the traces.

Q. (By Mr. A. L. HARRIS.) Would it be possible, in your opinion, for the Interstate Commerce Commission to approve freight rates and then see that they are maintained, and thereby prevent discrimination and rebates?—A. I think it would; yes.

Q. You think that would be not only possible but desirable?—A. I think it would be not alone possible but desirable. I think that when legalized pooling was proposed it was with reference to just some such arrangement as that of which I spoke. I think that whatever pool the railroads might enter into it should be under the control and direction and the supervision of the Interstate Commerce Commission. That is what I mean by legalized pooling. That would be the proper body for it to come before.

Q. Have you any complaint to make in regard to change in classification and thereby change in rates?—A. We have complaints to make. There is no tariff that was ever constructed, no railroad tariff, that is consistent. There are inconsistencies in all tariffs, and it is only by continually calling the attention of the railroads to these inconsistencies that their correction is secured. In the meantime others creep in. Some new rate is put into effect which is in itself inconsistent. You have to look out for that, and the result is there is a constant revision of tariffs going on. These transcontinental railways have a freight bureau through which these revisions are made. They have an official located in San Francisco, with quite an office force, to handle all these revisions.

Q. What is his name?—A. Mr. R. H. Countiss.

Q. That is called the San Francisco Freight Bureau?—A. No; it is the Transcontinental Freight Bureau. The Transcontinental Freight Bureau is an organization of what is known as the transcontinental railroads; but the transcontinental railroads, strictly speaking, are not transcontinental railroads. That is the name that applies to all roads west of the Missouri River; they are what are known as the transcontinental railways. Some of those roads, like the Santa Fe, and the Rock Island, and the Burlington, reach east of the Missouri as far as Chicago, and the office that deals with roads that do not reach east of Chicago is called the Transcontinental Freight Bureau. That is called the Transcontinental Bureau, and R. H. Countiss, No. 49 Second street, San Francisco, is the agent. These roads, to get around the trans-Missouri decision, stipulate that this tariff which contains individual rates, rules, routes, and regulations of each company, respectively, is subject to change by each company without the consent of any other company whose name appears hereon.

Q. In your judgement, if each road were not allowed to take such independent action, such an agreement would have to be given validity to be enforceable in a court of law, would it not?—A. Yes; as in this case. That is a gentleman's agreement. They hedged it about carefully, it is true, in order to evade the law, and they can go and prove that there is no combination. It is particularly stipulated that there is not, but under all there is a gentleman's agreement. It is on honor, which is oftentimes more binding than in case of a legalized agreement.

Q. But if one of the roads be without honor there is no way to enforce it?—A. No.

Q. And, in your judgment, to make such a contract enforceable in a court of law and before the Interstate Commerce Commission would conduce to stability of rates and uniformity of records?—A. Yes; most assuredly.

Q. (By Mr. A. L. HARRIS.) Would it be possible to have a national classification of freights, or articles, rather, and thereby to some extent avoid the complication that we now have of different classification districts?—A. Well, classification is a matter which is generally regulated by the relative volume of traffic in certain commodities in the respective districts. For example, the railroad tariff through the South in the territory covered by the Southern classification pays particular attention to cotton and to iron and steel from Birmingham, Ala., and to coal from the same district, and perhaps to other particular commodities of that district. The Western classification is made with a view to the traffic familiar to the territory west of the Mississippi River. The Eastern, or Official classification, as it is known, is made with a view to meet the requirements of the territory north of the Ohio and east of the Mississippi River. I believe that a national classification could and should be made. That would not prevent these particular localities from making exceptions to the national classification to suit the particular staple commodities that they move in large quantities, bulk, and volume.

Q. (By Mr. RIPLEY.) In other words, you refer to making special commodity rates?—A. Special commodity rates, as are made in each of those locations I have mentioned. There are exceptions to the Southern classification; there are exceptions to the Western classification; there are exceptions to the official classification. There is not a railroad operating in the respective territories covered by those classifications that does not publish its commodity tariff, which of itself and by itself contains exceptions to the classification under which they are operating. Now, that is just as easily done under national classification, in my opinion, where

there are the individual roads, as it is under these three classifications that now cover the territory.

Q. What is the nature of this transcontinental tariff?—A. It is a commodity tariff.

Q. Does it relate entirely to commodities?—A. Entirely to commodities. (Producing paper.) Just look at that in the west-bound tariff. Here are the class rates. I was going over to the Interstate Commerce Commission and had some matters to refer to there to day. Those are supplements. Now, there are your class rates governed by the current Western classification, terminal class rates. There is all there is to it. That is all there is to the class tariff that is governed by the Western classification. If an article is in the third class from Missouri River points it takes the rate of ——. Now, here are all your exceptions to that.

Q. (By Mr. A. L. HARRIS.) The exceptions are larger than the classifications?—A. The exceptions are the whole thing. They are forced by the competition. They have got to break away from the Western classification and meet conditions as they find them. They do not make any classification here, and the result is they have to take into consideration all the elements I have described in meeting the sea competitive tariff.

Q. (By Mr. RIPLEY.) There is no disposition for the sea-carrying trade to get into line with the railroads, as in the coastwise trade of the Atlantic?—A. There was a disposition, and that is what caused the alarm that was felt. We did not want to see our advantage nullified by giving like advantages to points not possessed of the geographical position we have, but I do not think there is any movement of that sort on foot now. There is a line of vessels established now to San Francisco, very large vessels of 8,000 and 12,000 tons register, so I am informed. There are four of 8,000 tons and three of 12,000 tons, belonging to what is known as the American-Hawaiian line, which is composed of the old sailing vessel proprietors, a consolidation of the people who were formerly running sailing ships around to San Francisco. They will give us by steam a regular service, sailing on the 1st of each and every month for San Francisco from New York. They expect to make the voyage in 60 days to San Francisco. That gives them a cargo to San Francisco. From San Francisco they go down to Honolulu, where they are sure of a cargo of sugar at all times, and that they take to New York.

Q. Would such a line as that participate at all in the subsidy under the provisions of the subsidy bill introduced in the last Congress?—A. I must confess that I am not sufficiently familiar with that subsidy bill. There were several amendments offered to it, but I am rather obscure now as to just what that bill was. If you will pardon me, one thing more concerning this competition by sea between New York and San Francisco. It is going to be the most potent of any feature yet established. There are objections to sailing vessels; merchants had objections to shipping by sailing vessels which do not prevail with these steamers. The principal objections to shipping by sailing vessels was not the long time in transit, but it was the uncertainty when the ship would get in. Now, that vessel might be only 4 months. She might be, as was the average, 5 months, and she might be 6 or 8 months, or even a year. She might start around Cape Horn and meet adverse winds and really come to San Francisco by way of the Cape of Good Hope, and yet arrive in good order; but it would be past the season for the goods; that was the great objection. It was not the length of time, because that is merely a matter of calculation. A merchant can sit down and allow for the difference in time, if he is sure that his allowance is based upon safe premises. Now, these steam vessels, constituting a new element in competition, do away with that uncertainty because steam is sure. These vessels go through the Straits of Magellan and arrive in San Francisco even with greater regularity or nearer their schedule time than the rail freight arrives. It is merely a matter of figuring 40 days longer. The average time of rail freight is about 20 days from the Atlantic seaboard, and this is 60 days. The merchant allows 40 days longer, and his goods are there. The railroads will find it the most potent competitive element they have ever yet had to contend with. They are vessels of large carrying capacity and low consumption of coal. Their rates are to-day scarcely higher than the sail rates prevailing immediately before the establishment of this war.

Q. Can you specify what a few of those rates are?—A. I can give you the range of them. They run from 40 cents per 100 pounds up to about 65 cents, according to the class of goods.

Q. What would be the rate, all rail, on the bulk of that class of goods comprised there?—A. It would be from 60 cents to \$3. The rail carriers endeavor to make a very low freight rate upon what is known as "bottom freight;" that is, the freight that is taken in the lower hold, such as bar iron, steel, nails, barbed wire, steel plates, billets, etc. I simply wanted to bring that before you as one of the elements of competition that has not heretofore existed, and which is only just upon the threshold, so to speak, of the transportation structure.

Q. (By Mr. A. L. HARRIS.) State if you please what the feeling of the Pacific slope is in regard to the Nicaraguan Canal.—A. The feeling is favorable to it. At first blush it might seem strange that a man doing business in San Francisco would favor a proposition which is going to bring Chicago, St. Louis, and New York even into closer competition with him than they are to-day. I say "Chicago and St. Louis" on the hypothesis that they would avail themselves of the short rail haul to New Orleans or Galveston, and overcome in that way their physical disabilities toward the use of the canal to get up the coast to San Francisco. Furthermore, the canal is going to make a gateway to the Orient, in my opinion, and San Francisco is about the only gateway as it is to-day.

Following the line of the least resistance, merchandise leaving St. Louis would go down the river, or go down along the river by rail, to New Orleans—and the river is the controlling influence in that rail rate, which makes it a matter of indifference whether it is shipped by river or by rail—and would be loaded upon vessels at New Orleans or Galveston, taken through the Nicaraguan Canal, and cross the Pacific Ocean, whereas to-day it necessarily goes through San Francisco to go there. But I believe at least we have got to weigh these matters as to the advantages and disadvantages. I believe the advantages outweigh the disadvantages; that to San Francisco herself, speaking selfishly, it would be a disadvantage; but we would have an open highway for common communication with the Atlantic seaboard—with all Europe as well—for our products, and quick transportation for our products; and, as in all cases, the water would be the controlling factor in the rail rates on such goods as are perishable, and that is what we produce in California pretty largely.

So far as our fruits are concerned, they are all perishable. Oranges, for instance, could be shipped by the Nicaragua Canal and through to New York by vessels. The fruits could be put into refrigerator vessels, the same as they are brought to New York to-day from South American ports, as I understand it, and it would minimize the freight rates upon those California products and therefore, in my opinion, increase the consumption and open up new markets, the reflected benefit going eventually to San Francisco. The more money that can be placed in the hands of the producer in California, the better it is for the State. There will be more money left in his hands if the freight rates on his products are reduced, because the market at this, that, or the other point would remain practically the same, regardless of the fluctuation in freight rates, if that market is controlled by foreign or other competition.

Q. (By Mr. RIPLEY.) So that every reduction of the freight rate would mean so much more for the producer?—A. Yes, as a general proposition. Sometimes not in the case of articles controlled by combinations—they take up the slack, as I say, and put that in their pockets. That is done sometimes.

As to the Oriental trade, perhaps I have covered one feature of that in the remarks I have just made about the Nicaragua Canal; but I believe in general that there is a great future for the United States in the Orient. The Chinese, who are a very conservative race, are just learning to use American flour as a substitute for rice. They are a very imitative people, and it is a case of follow the leader with them after the influential leaders, so to speak, have instituted a reformation; and instead of our shipping our wheat, as we are now and have been doing, to Liverpool, there to be ground into flour and distributed, we are and we will be in the future turning that wheat into flour and shipping it to the Orient, thus getting the benefit of the manufacturing process at home and improving our own market and industrial condition to that extent. It necessarily follows that the market for flour must be more profitable than the market for wheat; otherwise it would not be turned into flour and shipped to the Orient. It seems to me that there is an almost unlimited demand over there for flour. That is indicated by Mr. James J. Hill's preparations. I do not agree with him in his railroad theories at all times, but I think he is a man of a great deal of discernment. He has been building very large vessels, you know, to run to the Orient, anticipating an immense flour trade over there, and we have already got a good deal of that trade. Ships leave San Francisco loaded down with flour. We have something like 12 vessels a month, I think, that leave San Francisco for the Orient, whereas we used to have a few years ago only 2 or 3.

Q. There are some of those going with supplies to the Philippines, are there not?—A. I am referring to the Orient particularly. The Philippine business as yet has not opened up to a very great extent. There are a great number of transports going to the Philippines which are loaded with Government supplies, but there have not been what you might call any established trade relations with the Philippines as yet because of the generally unsatisfactory conditions, commercially speaking, there. No merchant likes to sell goods in a country where there is a war going on, and the cautious merchant does not do so unless he gets his money at home for it. He does not send a man to exploit trade until things are settled.

I think that with the settlement of our troubles over there that a great many San Francisco houses will exploit that trade, and see what can be done. Like all Spanish

countries, however, and a great many other foreign countries, the people have first to be educated up to using our products and using our utensils. That, I believe, will be accomplished really by the army we have over there. The natives see what the advantages are of American manufactures, American utensils, American products, both food and otherwise. Acquiring a taste for them and imitating the Americans there already in official life and in the army, the people begin to use what we have to sell. It really pioneers trade much more quickly than would be possible if we never had a war and sent over somebody to try and do business with those people. There would be no use in doing that.

Q. (By Mr. A. L. HARRIS.) Will our producers and manufacturers be compelled, to some extent, at least, to gratify the taste of the foreigner in extending the foreign trade?—A. Yes; I think that is something that our manufacturers should observe in their manufactures and our producers in their methods of packing and putting goods up for market. They should cater to the foreign people. That is one of the purposes of the Pacific Commercial Museum recently organized.

Q. (By Mr. RIPLEY.) Is that an adjunct of the Philadelphia Museum?—A. It is suggested by the Philadelphia Museum, and the Philadelphia Museum has been very courteous to us. Dr. Wilson and Mr. Harper have been out there. I enjoyed a very pleasant half day the other day with Dr. Wilson. Last Friday, before coming over here, he took me all through and explained all about the place. We have organized this museum on lines similar to theirs, and they have very generously and graciously offered us a large supply of duplicate samples. The gathering of these samples enables us to see what the tastes of these particular foreign markets are, and while in California we are not as yet much of a manufacturing community, at the same time in the putting up of our products and of such manufactures as we do put out we can cater to the tastes as exemplified by the exhibits and the information we receive. Incidentally, I believe that is the secret of the decadence of British trade and the advancement of German trade abroad. The British, with characteristic conservatism and bulldog tenacity, have insisted on the buyer taking what they gave him, but the Germans have gone around and said, "What do you want?"

Q. What do you manufacture in San Francisco? What local manufactures are springing up?—A. We manufacture clothing, boots and shoes, cigars, shot, cartridges, lead pipe, sheet lead, mining and milling machinery, harvesting machinery, agricultural implements, wagons and carriages. We roll bar iron and steel, manufacture tacks, wire, wire cables and rope and some nails. Manufacturing in the iron and steel lines is not in a very healthy condition out there.

Q. Are you hampered by the expensiveness of fuel?—A. We have been, but I believe that question is being solved in a large measure by the development of electrical power, and also cheap fuel obtained from the oil wells which are being developed all over the State. These are making oil cheap, and it is now being put into all the factories and furnaces, which reduces the cost of fuel very materially, it being estimated, I believe, that in heating or in steam-producing units $3\frac{1}{2}$ barrels of petroleum are equal to one ton of coal.

Q. Is the petroleum brought north in pipe lines?—A. No; not yet. We think it will be. It is brought to the sea coast in pipe lines in Southern California, some 80 miles down to the coast.

Q. (By Mr. A. L. HARRIS.) Do you consider that field almost inexhaustible?—A. Yes; it is.

Q. It covers a good deal of territory?—A. Yes; and the development is constantly going on.

Q. With that prospect in view, it will overcome the disabilities under which you labor now, in regard to manufacturing as far as fuel is concerned?—A. Yes; and where power is required, the electricity will do that for us. These two elements have both been simultaneously developed, you might say—almost simultaneously, the electrical power having antedated the other a year or two. The electrical power is being generated by the waters of the Sierra Nevada Mountains, and then conveyed by wire down into the valleys below, and is in that way produced at a very low cost. We can not afford to produce electricity by the use of coal or by the use of oil even, but producing by natural power and with the improvements made in saving loss in transmission, I think it is going to be a very important factor in running the small factories—in clothing factories, running the sewing machines, and in boot and shoe factories; also in machine shops for running the lathes and running individual machines.

Q. Have you any coal suitable for commercial and steam purposes within the Northwest territory?—A. Yes; there is very good steam coal about Seattle, in the Cascade Mountains, up in that neighborhood.

Q. Do the railroads use that at all?—A. Yes; the Southern Pacific gets its principal coal supply back of Tacoma, at a place they call Carbonado. They have colliers running regularly between Tacoma and San Francisco and Los Angeles, carrying coal for the roads.

Q. What effect, if any, is anticipated on the Pacific coast by the recent consolidation of all the iron and steel industries into the United States Steel Corporation?—A. That is a problem that I am not prepared to answer yet. We are all at sea; we do not know. I have asked that same question, I presume, of at least 20 gentlemen far more competent to answer it than I, and they did not attempt to reply. They are people I have met since I have been East—men that are right in touch with it.

Q. I referred particularly, of course, to the problem as it is presented on the Pacific coast. You have no local manufactures of sufficient importance to be really threatened to be absorbed by them. You have stated that the manufactures of that class are in a rather unhealthy condition.—A. Yes; because we have not the raw material at hand, and we have not had cheap fuel. If you remember, I stated that there were some nails manufactured there. The reason for qualifying that statement was that we used to manufacture a good many nails there. The California Wire Works manufactured nails. The Washington Woven Wire Manufacturing Company bought out the California, and in turn were bought out and became a part of the American Steel and Wire Company. Now they are closed up. The owners can produce cheaper in the East.

Q. It is shut down now?—A. The nail factory was shut down by the American Steel and Wire Company. That is about the only industry we have to be affected by the consolidation. The effect is about all done. I do not know that they have reduced their factory force, but they have put them into other work. They are now producing wire rope, and that is used in street railroads, mining, and hoisting, in the rigging of ships. While there are other companies that are more profitable, they have simply closed up the nail part of their plant.

Q. (By Mr. A. L. HARRIS.) You did not mention in your line of productions sugar refining, did you?—A. No; I did not. I did not mention flour, nor did I mention fruit canning. Those omissions were intentional, and perhaps I should have mentioned them. I look upon fruit canning as much manufacturing as flour making. You are putting fruit into merchantable shape the same as you are putting wheat into merchantable shape in the other way—into shape for consumption. You are also putting raw sugar into merchantable shape. All those things we manufacture there. Of course, our fruit-canning industry is large, as is our wine-making industry.

Q. If you have time, I wish you would touch upon those industries, at least briefly.—A. Well, I do not know that there is very much to say. I also failed to mention that we have woolen mills.

Q. (By Mr. RIPLEY.) Woolen mills?—A. Yes.

Q. For the consumption of the California product?—A. The California product, and they bring in wools from Nevada, of course, and the surrounding Pacific coast region.

Q. Any from Australia?—A. I can not tell. I am not sufficiently familiar with that business to know whether they do or not. I have talked some with wool men, and I know that they used to bring some Australian wool in. Whether they do to-day I could not say.

Q. As to the fruit canning, that industry, of course, is a large one out there?—A. That is one of our principal interests. That has a short season. It necessarily lasts only during the time that the fruit is in condition to be canned; but from an industrial standpoint it is fortunately at a time when the labor of girls and boys can be obtained. It is vacation time for them, and particularly in the country it is nothing unusual to see a whole family working in a cannery in the summer time. There are also canneries in San Francisco, the fruit being shipped down the river and brought round the bay to that city. The wineries are distributed pretty generally throughout the vine-growing districts. I think they are on a better foundation now than they have been before, and I understand the business is fairly profitable. It has not been so until recent years.

Q. (By Mr. A. L. HARRIS.) Is the recent reciprocity treaty with France in regard to the reduction of the duty on wine giving your people any concern?—A. Yes, I think it is; considerable. I think they protested very vigorously to our delegation in Congress.

Q. (By Mr. RIPLEY.) Does any considerable quantity of wine go to France to be reshipped to this country again?—A. A great deal, so I am informed. Understand me that I am not here as an expert on these things, because they are entirely foreign to my business, and this information is only what one who makes an attempt to keep in touch with the times and observes as he goes along picks up. Therefore, you can take it for what it is worth. I am informed that there is a great deal of wine shipped to France; a surprisingly large quantity of it.

Q. Have you a large raisin industry?—A. Yes.

Q. Have you any knowledge of the cooperative distribution of the raisin crop?—A. Yes; I think there is some such arrangement, as I understand it from the newspaper reports, as I get them. There is some such arrangement on the raisins as there is on prunes, that instead of the farmers all competing with one another to a ruinous

extent, they have pooled their issues and made one central agency for the marketing of their product. That is about what it amounts to, as I understand it.

Q. Has that been satisfactory?—A. Well, I might answer a good deal like Josh Whitcomb. Perhaps you remember in the play where his friend in New York, whom he was visiting, was inquiring about how the old folks of his boyhood were, and what had become of them, and he asked him after Simpson. Josh says, "Dead."

"Dead?"

"Yes."

"What was the complaint?"

"No complaint; everybody satisfied."

So, when you ask me if it is satisfactory, I say I have heard no complaints; I do not know. [Laughter.]

Q. Products like that which go abroad go by water, I suppose, or do they go across the country by rail?—A. They go across the country by rail.

Q. Do they have special export rates?—A. The canned goods for export are sent around from San Francisco in clipper sailing vessels to England. Raisins are, I believe, shipped in the same manner to a considerable extent. I do not know just how much of a foreign market there is for raisins; I am not informed as to that; I never have heard it emphasized. The canned-goods business has a very good foreign market. I know that there is a foreign market for canned goods. I could not say as to raisins; possibly there is not as good a foreign market for raisins, owing to the fact that they would compete with the Malaga raisins when they get into European ground. But there is a very good Eastern market here, coming overland by rail, because the raisin-growing sections are along the line of railroads, and it is easy to load them into the cars, the railroads making a rate which recognizes what might be done if they were shipped to San Francisco and loaded into vessels.

Q. Do you happen to know anything about the refrigerator companies that operate in the fruit business?—A. I only know that Armour & Company operate a line of refrigerator cars and also the E. T. Earl Company, and that recently the E. T. Earl Company sold their refrigerator cars to the Armour people. That, I believe, is the present status of the car business. Armour, I believe, is at the present time owner of the refrigerator cars, as I understand it. I think the Santa Fe line has a few refrigerator cars of its own.

Q. Have you ever heard that charges for the use of those cars were excessive?—A. I have heard such complaint made; yes.

Q. Have you any knowledge concerning it?—A. No; I have not. I would not be prepared to say and I would not be qualified to say whether they are excessive or not because I really know nothing directly about it. I think from what I can learn from conversations with railroad men that the time is not far distant when the railroads will own and control their own refrigerators and do away with these private lines, and their proposition seems to be the source of a good deal of friction.

Q. There has been apparently a good deal of complaint on the part of the people of California of unjust charges by the railroads in absolute figures and also the participation in local politics by the railroads to a remarkable degree. Is that political influence on the increase or decrease so far as you know?—A. As you gentlemen are aware, we have a new administration in San Francisco in railroad matters, and when I refer to railroad matters I speak exclusively of the Southern Pacific, it being the only road we had to do with until the advent of the Santa Fe, which is of a recent date. The Southern Pacific is in politics. I might say that there has not been an office within the gift of the people or subject to the appointment of the governor or the mayors of the various cities or any other officials that they have not reached out and tried to grab. They state, however, that under the present administration, which is that of Mr. Hayes, such things will not be. Time alone will prove the sincerity of that statement. We shall have to wait until Mr. Hayes has been a little longer in office to give him a chance to demonstrate its truth.

Q. (By Mr. A. L. HARRIS.) Now, I wish you would state in a general way what the industrial condition of California is. I might widen that a little by asking about the industrial condition of the Pacific slope at the present time, and your hopes and prospects.—A. I think the condition is generally good, and we feel encouraged by the attention that was drawn to our resources and possibilities incidentally by the Spanish-American war. The transportation of troops through San Francisco has been in itself an education to the individual members of these regiments, the individual soldiers. The volunteers I refer to particularly. They have returned to their homes and exploited perhaps the advantages as they saw them of the coast. There have been a great many thousand men, as you know, who have passed through in that way. Furthermore, the constant advertising the coast has received in the press reports of the movement of troops through San Francisco and the advertising we have got from the fact that we have built some battle ships that have made a pretty good record in this war, all serve to attract attention to the place and to bring it to the minds of people who really did not before apparently realize that there

was such a place as the Pacific coast. It has taught them that there is such a place. It has interested them in it, and this has been shown this past winter in the tourist travel out there. There has been a greater tourist travel than was ever known before, and I find on inquiry in the East that it has not been at the expense of Florida, because Florida has had a greater tourist travel than ever known before. The increased volume of travel to the coast, I believe, has been due to two reasons: First, the times have been pretty generally good throughout the country, the people could afford to travel; and, secondly, that their attention has been attracted to the coast by the amount of advertising it has received incidental to the Spanish-American war. All of that is a good thing for us. It attracts, it brings people who go back and talk about the country, and a percentage of them in time make investments there, or stay there to live.

Furthermore, under the present administration of the Southern Pacific Company, that company has made an effort to bring in colonists. They have made so-called colonist rates under which, for \$25, a man can go from the Missouri River to any point in California. There is no round-trip ticket sold; it is simply one fare for one way. That is why it is called a colonist rate. Neither does that rate prevail east-bound, as I understand it, from California. That has brought in a very large number of people, I understand. Of course, a great many simply avail themselves of the rate to come out and see the country. But it does good. It is a broad policy for the railroad to pursue.

Q. (By Mr. A. L. HARRIS.) Has the presence of your Chinese population any effect, good or bad, on conditions?—A. The Chinese question is one which to-day is not a particularly live one with us. We anticipate no difficulty in securing the reenactment of the exclusion act, which I believe is about to expire.

Q. You deem that desirable?—A. Most assuredly; yes. The number of Chinese that are there now compared with the general population is not increasing. The Caucasians are not menaced by them. We have no desire to drive out those that are there, but simply to stop more from coming, and it would be unfortunate if the exclusion act were not reenacted.

Q. Do your Chinese usually stay about the cities, or do they go out into the country, into the forests, or upon the farms?—A. They used to enter all lines of employment when immigration was unrestricted. There was scarcely a vocation that they did not take up; but as the Caucasian population increases and the Chinese decreases—because a great many Chinese have made what to them is a competency and have returned to China—there is an actual falling off in the Chinese population, and I think the census returns show that. I am speaking now simply from an idea I have of it, from what I see and hear and read, and I am not speaking from any figures that I have before me. But I believe that the census returns will show that there has been a falling off of the Chinese population in California. I know they will show that in San Francisco.

Q. (By Mr. RIPLEY.) How about the Japanese? Do you receive them?—A. Yes. I do not regard the Japanese with the same disfavor that I do the Chinese; and the disfavor with which we regard the Chinese is altogether a commercial one, for the reason that the Chinaman is conservative, and continues to wear Chinese clothes and to eat Chinese food, all of which enables him to live in the Chinese fashion, herded together like so many cattle. That mode of life enables him to undersell and accept a lower wage than the American workman. Furthermore, his earnings are sent back religiously to China, taking that much money out of the country, and the merchandise to meet his wants and requirements is brought from China to a large extent. He is not commercially a contributor to the upbuilding of this country. The Japanese, on the other hand, immediately adopts European garb on arrival here. He has a certain pride in his appearance, and he adopts and uses American foods. He is evidently anxious to become an American, at least to adopt all of our customs and do, while he is with the Romans, as the Romans do, so to speak; and in that way he is a contributor. He is not as objectionable, at any rate, as the Chinaman, because he keeps his money here and uses his money here.

From the standpoint of labor I do not know enough about what the Japanese are to be qualified to state. I have heard some complaints from the labor organizations of Japanese labor, and that is all I know of it; but it stands to reason that they certainly can not, as I see, from the commercial standpoint, be as objectionable. From the commercial standpoint, in no single instance does the objection obtain to the Japanese that does to the Chinese.

Q. (By Mr. A. L. HARRIS.) The prosperity that you speak of that obtains at the present time applies to agriculture as well as to the other industries?—A. I think so. Generally speaking, the farmers are prosperous. Of course we are dependent in California very largely upon our rains. This particular year we have had very abundant rains and well distributed, and the prospects are very excellent in that respect. We have seasons of drought there, where there is a partial, and in many districts a total, destruction of crops—total failure of crops. Generally speaking, the conditions

are prosperous, I believe, as prosperous as they can be; at least as prosperous as they are in any district. There is always complaint everywhere, you know; always dissatisfaction, and discordant and dissatisfied elements in society.

Q. Is your State laboring under any disabilities of any kind that can be cured in any way by legislation? If that be so, we will be glad to have you state it. I ask concerning anything in addition, of course, to what you have already stated in regard to the interstate commerce law.—A. That is about the only thing that I would feel competent to speak of, and the one thing that I am informed upon. I believe there should be some legislation accomplished in that direction, but I do not know what else there is.

There is one thing that I do not know but that could probably be accomplished within the War Department, although I am not certain, and that is as to the present system of purchasing Government supplies with relation to the Army in the Philippines, where the most of our troops are to-day. The Government, as I understand it, has a system whereby clothing, for example, is purchased and stored in Philadelphia. Bids are called for for the delivery at Philadelphia of so many thousand yards of cloth, or so many suits, or so many pairs of trousers, or so many pairs of shoes, so many forage caps and campaign hats. Philadelphia is the clothing depot. Jeffersonville, Ind., on the other hand, is the depot where camp equipment is stored; field ranges and tents, and also wagons for transportation, I believe. Bids are called for to deliver at Jeffersonville so many hundred tents, so many hundred field ranges, or so many pots, kettles, and pans for use in camp. I understand that Jefferson Barracks, Mo., is the cavalry and artillery storage depot for saddles, harness, halters, and everything of that sort. Bids are advertised for for goods in that line to be delivered at Jefferson Barracks, and so on. I will not attempt to go on to enumerate all, but there are various specified depots for specified things.

Now, in the same ratio that the number of troops in the Philippines bears to the whole United States Army—in fact, you might double that ratio, because troops in the field will consume and use double the amount of stuff that is used or consumed at a post—in that same ratio are these same goods shipped right through San Francisco over to the Philippines from these depots, and the San Francisco bidder is barred from all opportunity of doing any business with Uncle Sam for supplying the Philippines, even though he is right at the gateway through which these supplies pass. We can not bid upon hardware to be delivered in Jeffersonville; we can not bid upon clothing and boots and shoes to be delivered at Philadelphia, nor upon saddlery to be delivered at Jefferson Barracks. But that is the quartermaster's rule. He says, "That is the way we do, gentlemen; that is all there is to it."

Q. Which virtually shuts out your country?—A. Virtually shuts out San Francisco competition; yes. Now, we do not ask for a monopoly of that business by any means. But let the Government call for bids for goods to the extent that the service in the Philippines, Honolulu, China, and the Pacific coast posts may demand, goods of all kinds for delivery in San Francisco. That gives us a chance to bid upon them. It does not bar the man in Chicago from bidding upon the goods to be delivered in San Francisco also; nor does it bar the man in Philadelphia from bidding upon goods to be delivered in San Francisco. But where we are it is like making water run up hill. We have got to send these goods from San Francisco first, overcoming our inherent manufacturing disadvantages which I have already described. Then we have to ship them back to Philadelphia and pay the freight on them to Philadelphia and all these other points that I have described. After all that has been done they come right back to our door again.

Q. That is not very good economy?—A. No, we can not do it; we can not serve the Government in that way. We could serve the Government if we could deliver those goods at the quartermaster's depot in San Francisco, if the Government could establish storehouses and carry stocks of all the military supplies of every nature whatsoever, commissary stores as well as quartermaster's supplies, in San Francisco, and that seems to me to be the sensible and rational thing to do. I mention that since you asked me about other legislation, not knowing whether it is within the province of the Secretary of War to so arrange that or whether it requires Congressional action. It seems to me, at any rate, it should be the subject of Congressional inquiry why one section of the United States is discriminated against, for, whatever the intention may be, it amounts to discrimination. I do not accuse the army authorities of doing it with the purpose of discriminating; but we look at the results and judge of the intents and purposes. That is something which I hope may come within the province of this commission to advise Congress of. We could not and did not expect to participate in the supplies furnished in Cuba or Porto Rico when the seat of operations was over on this side. We recognized that our geographical position would not admit of it, and we were not able to do it; but we certainly feel we should have a fair chance when it comes to shipping the goods through our doors to the Philippines.

(Testimony closed.)

Whereupon, at 11.15 a. m., the special subcommittee adjourned until May 20, 1901, at 10 o'clock a. m.

WASHINGTON, D. C., May 21, 1901.

TESTIMONY OF MR. J. C. STUBBS,*Third Vice-President of the Southern Pacific Company.*

The special subcommission met at 10 a. m., Mr. A. L. Harris presiding. At that time Mr. J. C. Stubbs, of San Francisco, Cal., third vice-president of the Southern Pacific Company, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. A. L. HARRIS.) You may state your name, post-office address, and your occupation.—A. J. C. Stubbs; I live in San Francisco; I am at present third vice-president of the Southern Pacific Company.

Q. How long have you been connected with the Southern Pacific?—A. Since 1870. At one time it was the Central Pacific.

Q. You can give the relation between the two companies, past and present, giving the present territory covered by your company.—A. The Southern Pacific Company is a Kentucky corporation. Just what its chartered powers are I can not detail, but it has authority to own and operate railroads and to do sundry other things which railroad companies under ordinary charters can not do. It controls by ownership of a majority of the stock, as I understand it, the railroads which now form its two systems of roads, namely, the Atlantic system and the Pacific system, and there might be a subdivision of the latter under the title of the roads in Texas.

Q. (By Mr. DEFRAND.) What is the distinction between those Atlantic and Pacific systems?—A. (Producing map.) Originally the Atlantic system included all the lines east of El Paso, and all these roads were leased by the Southern Pacific, but the laws of Texas forbade the leasing of Texas roads, I believe, and make other requirements that necessitated the cancellation of the leases and the separate operation of Texas lines; so that the leases were canceled and the management was made to conform with the Texas law, since which time the Atlantic system as a term has been applied only to the lines east of the Texas and Louisiana State line. Lines within Texas have been comprehended in our phraseology under the term "Texas lines." The Pacific system embraces all the lines west of El Paso and west of Ogden and south of Portland. There is quite a number of roads that are embraced in those several systems. You can get a list of them from the annual report, whereas I would have to consult the report, perhaps, to name them.

Q. How long has it been since the Central Pacific was working in complete harmony with the Southern Pacific?—A. There never has been any other than a harmonious and cooperative relationship between them.

Q. Was that brought about by common ownership from the beginning?—A. By common control, not altogether by common ownership, I think. I think at one time the people who practically controlled the Southern Pacific Company did not control the Central Pacific as owners, that is, did not have within their control a majority of the stock of the Central Pacific.

Q. Just prior to the recent purchase or exchange of the stocks of the Central Pacific for those of the Southern Pacific, what was the formal relationship between the two companies?—A. The Southern Pacific Company leased the Central Pacific Company's roads.

Q. That was the case prior to the exchange?—A. Yes.

Q. How long since the prior lease was made?—A. I would not have it in my memory, but since about 1885, I think.

Q. And the present relationship between the two companies is what?—A. I can not tell you. It is a matter that I am not concerned in in my official duties, and I never have taken pains to inquire. There is a merger of interests there that I would have to coach myself on in order to explain, and I believe that you can get it from studying the annual reports better than I can tell you. I have no hesitation about giving you all I know about it, but it would not be satisfactory to you, and it would not be good testimony.

Q. (By Mr. A. L. HARRIS.) You may state, if you please, what the nature of the case is now pending before the Interstate Commerce Commission.—A. It is a long story to make it fully understood by laymen—those not interested—and I will perhaps have to be a little proxy in order to enable you to understand. In the first place, the fourth section of the interstate-commerce law impliedly recognizes that under a substantial difference in circumstances and conditions a higher rate for a shorter haul than that is contained within a longer haul may be justifiable, than for the same longer haul. The courts have decided in cases that involved that question, upholding or justifying the higher rate for the shorter haul, or, as it is popularly expressed, the lower rate for the longer haul. Usually, the Interstate Commerce

Commission limited the conditions and circumstances that would justify a lower rate for a longer haul to competition by foreign carriers or by sea carriers, which were not subject to the interstate-commerce law and not within the jurisdiction of the commission—that class of competition which they could not control and that class of carriers which was not subject to the interstate-commerce law as United States railroads are subject to it. The competition arising from such carriers they would construe as creating a sufficiency of difference in circumstances and conditions to justify a lower rate for the longer haul.

San Francisco, being a seaport, of course, had the advantage of sea competition as from New York and from all points in the East that were within reasonable reach of the sea-going or sea-transporting vessels by way of New York. As a result of that circumstance, the competition of the sea carriers between New York and San Francisco controls the rates; that is to say, the carriers can not get a compensatory rate, or what they may regard or can establish as a fully compensatory rate for their service from New York to San Francisco. All they can get is what the sea carrier will let them have; and the compensatory rate is that rate which will bear its full share or contribute its full share toward all expenses of transportation, including fixed charges such as interest and taxes and other expenses that do not change or fluctuate with the volume of traffic. The rates from New York to San Francisco being controlled by this competition, were not such rates—not compensatory rates in that sense—and the practice of the carriers between New York and San Francisco has been to meet sea competition just as far as it extended and no further. For example, taking the rate from New York to San Francisco as a basis, the rate from New York to an interior town in California would be as much higher than the rate from New York to San Francisco as would be made by adding the local rate from San Francisco back to the ultimate destination to the through rate from New York to San Francisco. It follows, we may say, practically, that the rates from New York to all points intermediate in the West have been higher than the rates from New York to San Francisco.

Q. How far back eastward does that go?—A. I can not tell you. It goes back until it runs into a reasonably compensatory rate there, wherever that may be.

Now then, there have interests grown up along the railroads and many a commercial community at intermediate points like Pittsburg and Chicago, and these railroads and these interests in the intermediate territory like Pittsburg, Chicago, St. Louis, St. Paul, etc., contend that they are entitled to a lower rate—for example, from Chicago to San Francisco—than is made from New York to San Francisco, notwithstanding the fact that New York is nearer San Francisco than Chicago is in point of cheapness of transportation, because these carriers by sea are the cheapest known carriers. But they claim that on account of their nearer proximity by rail the distance by rail should be the controlling factor in regulating rates, and therefore Chicago should take a lower rate to San Francisco than New York, no matter what the influences are upon the New York rate, or whether it is a compensatory rate or not. So certain merchants at Chicago and St. Louis have instituted a suit before the Interstate Commerce Commission to compel the graduation of these rates. The answer of the Southern Pacific and of the California merchants to their complaint is—

Q. (By Mr. A. L. HARRIS, interrupting.) Is that the only road that is involved in this controversy?—A. Oh, no; all the roads are involved—the Santa Fe and every other road that participates in the business. But the burden of the defense rests upon the Southern Pacific, because it is the most important interest and because it operates a through line from New York to San Francisco. It has no line to Chicago, while the other lines, like the Santa Fe, originate at Chicago. Their contention is that instead of Chicago having a higher rate to San Francisco than New York it should have a lower rate.

There is no more reason why there should be a lower rate from Chicago to San Francisco than there should be a lower rate from New York to Fresno, Cal. It is just changing it around. The one is an intermediate shipping point and the other is an intermediate receiving point, and the law should operate both ways. Everybody that is interested in a business over here justifies the higher rate to the intermediate point on the West coast, but because of the magnitude of the interests at Chicago and St. Louis and the tremendous pressure of commercial and political interests behind these roads, they want an exception made of the interior shipping point. We think the interior shipping point should be treated the same as the interior receiving point. We contend that all interests should be treated alike, that this principle that they seek to put in force here, if applied as a just and reasonable interpretation of the law would oblige it to be applied, would simply be ruinous to all of these roads, because it would bring down all their intermediate rates to the level of these compelled rates, these noncompensatory rates which are forced upon them by the active competition of seagoing carriers. This is one question that is involved.

Another question is as to the difference between carload rates for carload quanti-

ties and rates for less than carload quantities. There is an adjustment in California tariffs to-day which is about upon the same basis as similar adjustments in the majority of tariffs in the country. It operates to enable the merchants of San Francisco, Portland, Seattle, Tacoma, and Los Angeles, the jobbing and distributing centers on the Pacific coast, to import goods by carloads and then distribute back at less than carloads, precisely as the Chicago and St. Louis jobbers buy from the manufacturers in carloads and distribute into their territory in less than carloads. Now then, St. Louis and Chicago and other intermediate large jobbing centers, very aggressive and pushing, are reaching out into Pacific coast territory. They feel that the differentials between carloads and less than carload rates into that territory, while they are no greater upon the average than they are in their own territory or in the Middle West, like Colorado, is disadvantageous to them and an advantage to the San Francisco merchant, and they seek through the courts to compel the modification of those differentials so that they can distribute their goods there to the consumer as against the Pacific coast jobber.

Q. Could you state about the amount of the present differentials?—A. No; I can not. It differs.

Q. Or about the percentage?—A. No; it is arbitrary. I would like to take the tariff and go through it with you, but it would lumber up your records, and I can not deal here with anything but general statements. If you want the details of it, it will all be spread on the records of the Interstate Commerce Commission.

Q. I do not desire the whole of it, but I thought by way of illustration we could have it on one or two articles.—A. The differential between carloads and less than carloads will range all the way from 50 cents upwards, I suppose—the extreme is \$1.50 per hundred pounds—according to the rate.

Now, there is another feature of the case. Take the individual items of hardware. You know shelf hardware embraces a great many hundred different articles of general hardware, and the real movers in this complaint and the people who are pushing it and putting up the money for it are the Simmons Hardware Company of St. Louis, and Hibbard, Spencer & Bartlett company of Chicago, two of the largest hardware companies in the world. Simmons is probably the largest in the world, and Hibbard is a close second. So it is the hardware interests that are mostly interested. They want a number of articles that now take different rates to be rated the same. For the purpose of illustration, and without pretending to give you accurately the names of the articles they wish grouped under one rate, we will assume that hammers take one rate and hatchets another, and shovels still another, and planes another. They want those 4 items put under one rate. Why? So that when packed together in one package they would all go at one rate. While where they have different articles taking different rates packed together in one package now, the whole package is charged for at the rate given for the highest-rated article in the package. Now, you see at once the object of that proceeding is that they may make up an assorted package to get to the retail consumer out there.

With that explanation it would appear to be a fight between the Simmons Hardware Company of St. Louis and Hibbard, Spencer & Bartlett Company of Chicago, representing themselves chiefly but having the sympathy of certain other firms at St. Paul, Chicago, and St. Louis against the jobbers of Seattle, Tacoma, Portland, San Francisco, and Los Angeles (particularly the hardware and iron trade) for the Pacific coast trade.

Q. (By Mr. A. L. HARRIS.) Wherein does this case differ from what is known as the Chamber of Commerce case of Denver?—A. It differs only in its magnitude. It affects greater interests, covers more territory and a greater number of classes of business.

Q. The jobber at Denver in that case was trying to get a better rate for broken carload lots, was he?—A. No; the Denver case was one that came strictly within the long and short haul clause. It might fall wholly in the first subdivision of my testimony—that which comprehended graded rates. The Denver jobbers claimed that they should have a lower rate to points in California than were given to Missouri River points, and that rates from California, for example, to Denver should be lower than to the Missouri River. The case was tried and it was found that the exceptional circumstances and conditions were such as to justify a higher rate on sugar to Denver than to the Missouri from the Pacific coast. For west-bound business from Denver to California, the roads conceded the same rates to Denver as to the Missouri River—that is, the rates from Denver to San Francisco should not be higher than the rates from the Missouri River; but that was proffered in a spirit of compromise, simply because the amount involved was not worth quarreling over. But the question of differentials between carload and less than carload was not raised in that case, nor was the question of grouping a number of articles under one rate that would enable them to be packed together in one package. In those respects it differs from this St. Louis case, except that the Denver case involved very little business, while the St. Louis case covers a very large business.

¹ See testimony of Mr. Griffith, p. 851.

Q. (By Mr. DURAND.) Is there any difference in regard to the nature of the competition which the railroads pleaded as a reason for the differences in rates in this case? That is, was sea competition involved in the Denver case?—A. Sea competition was involved in that record to some extent; but, of course, the greater tonnage being shipped from the West to San Francisco, the sea competition has lost some of its force by the time it gets out there. Sea competition loses its force in an inverse ratio to the distance you go west from it. Seacoast competition is a vital factor and condition at Chicago, and goods have been taken to San Francisco via New York from Kansas City, and goods have been taken from San Francisco by sea and the Canadian Pacific and brought back as far as Dodge City on the Atchison road in Kansas.

Q. What was the ground for claiming the right to charge a higher rate or even an equal rate from Denver to the Pacific coast than the rate from Missouri River points?—A. It was simply this sea competition. The rates from New York were forced down by the sea, and rates from Chicago are affected by the sea competition as much as New York, except the cost of getting the goods from Chicago to New York, which is smaller, and so on, as you go west. Sea competition influences all the tariff as far west as the Missouri River. Now, suppose we stop at the Missouri River and admit that its force is expended there. That would make it easy, then, would it not, on the basis of the railroads being allowed a fully compensatory rate? It would not be fair to take the rate fixed at the Missouri River as the measure of the rate to be charged from Denver on a mileage basis. We held that the rate from the Missouri River was a fair rate to be applied from Denver. We accepted it, and it is the rate to-day, and the Denver shippers have accepted it.

Q. Was there any contention that from the Missouri River there was so much competition between the different railroad companies?—A. (Interrupting.) No; we have not raised that question, because the commission until recent court decisions has always refused to recognize either market competition or rail competition, but the Supreme Court has since recognized both, and I presume the commission will hereafter take a different view of it. Originally the stand was taken with respect to Denver on this ground, that if we reduced the rates from Denver then the rates would have to go down from all points, because Denver is not affected by the sea competition, and never has been. It might be said that its traffic practically moved under substantially the same circumstances and conditions as that of Salt Lake City, and traffic of all other towns that were similarly situated in respect to sea competition. We refused to recognize market competition; we refused to recognize railroad competition as a factor in determining rates under the fourth section of the law. Therefore we were obliged to hold the rates up from Denver in order to protect the revenue in other territories. When the Interstate Commerce Commission reviewed the complaint of the Colorado Fuel and Iron Company case they found it had a high rate from Denver. It was not a rate that the railroads wanted; it was not a rate that was fair and just and equitable to Denver. It was a rate that was compelled by our understanding of the construction that the Interstate Commerce Commission had given to the law. When the case was heard, much to our surprise the commission measured the rate from Denver by the rates from New York and from Chicago, thus giving Denver the benefit of sea competition. This ostensibly put the railroads in the ridiculous position of voluntarily maintaining a \$1.60 rate from Denver as against 60-cent rate from Chicago and New York. The rate from Chicago and New York was fixed by the sea. We did not reduce the rate from Denver, because if we had done so, according to the advice of counsel, we would thus have admitted sea competition as controlling at Denver, and if at Denver why not everywhere, which would have compelled us to reduce rates from all points. Further, we were advised that the reduction could not be limited to the products of the Colorado Fuel and Iron Company. It would have to be spread over all business, because the law prescribes that rates can not discriminate between different articles. It seems that our endeavor to comply with the law as we understood it put the Southern Pacific Company into an absurd position before the general public.

Q. (By Mr. A. L. HARRIS.) Is there any difference in policy between the Southern Pacific and the Great Northern or Northern Pacific with regard to either carload differentials or graded rates?—A. No; not as to practice with respect to graded rates, so far as I know. But, on one question in this case, yes. The Northern Pacific and the Great Northern originally carried the same tariff that is now carried to California. Upon petition of the Chicago and St. Louis people, they reduced the differential between carloads and less quantities and made it on a basis that was acceptable to the Chicago and St. Louis merchants. There is that difference. Now, the reason for that is this: The Great Northern and the Northern Pacific are, in a large measure, dependent upon eastern cities, like Chicago and St. Louis, etc., for their business. There is no considerable jobbing business at the western end of their lines. That is, there are no such houses of strength or magnitude of business on Puget Sound as there are at San Francisco. They simply elected between whether they would adopt the ideas of Chicago and the eastern houses or whether they would

adopt the ideas of the houses upon their western end, and they chose what they considered to be the strongest interest to protect, subordinating the interests of the weaker ones that needed protection. Of course, that is merely an expression of opinion.

Q. Do those rates seem to be satisfactory?—A. No.

Q. To Chicago and St. Louis?—A. Yes; they are to Chicago and St. Louis. I thought you were going to ask about Tacoma.

Q. (By Mr. DURAND.) Are Tacoma and Seattle taking an active part in this suit?—A. Yes; there are two Tacoma merchants and one Seattle merchant here, representatives of the largest houses.

Q. And what attitude do these two Northern roads take in the case—simply a neutral attitude, or are they actively favoring the changes or opposed to them?—A. They have got a tariff in, and their attitude is one of indifference, so far as I can observe, as to how this case goes. That is merely an opinion. I do not know that, as testimony, it is very valuable.

Q. What would be the effect of a decision that the existing differentials on the Southern Pacific, say, were justifiable? How would it affect the Northern roads?—A. It is not the differential of the Southern Pacific. It is the fair and through tariff, and all the transcontinental roads—the Burlington, the Rock Island, Union Pacific, and others—are interested. It is the fashion to put all the responsibility on the Southern Pacific. We are ready to admit the responsibility for this particular thing, but it should not be forgotten that the Santa Fe, the Burlington, and the Rock Island, and, for that matter, all the trunk lines, are just as much parties to this tariff as the Southern Pacific, and parties to these differentials.

Q. The question is, Will these Northern roads adjust themselves to these differentials, or can't you tell?—A. I can not tell. I can not tell what they will do.

Q. Naturally not; but the question might be raised as to whether there will be any change of the Interstate Commerce Commission directing a uniform differential to be pursued by all roads. Have they the authority to do that, or any inclination to do it?—A. It is questionable as to how far their authority extends. Of course, if it goes to the extent of making a rate or prescribing a rate, you know the Supreme Court is on record that the Interstate Commerce Commission has not the authority.

Q. It is rather a theoretical question anyway?—A. Yes.

Q. (By Mr. A. L. HARRIS.) Will you please describe the system of export and import rates in force and their bearing upon the jobbing trade of San Francisco?—A. There is not any system of rates in force. It is as good as you please. The steamships on the Asiatic side take freight for whatever they can get, and the railroads accept their proportion of the rate on an agreed division, whatever that may be. There is no published tariff. There are no agreements that are at all workable or enforceable. As far as its effect on the business of San Francisco is concerned, it has no effect whatever. San Francisco has never had the business and never can have it.

Q. You are in a different situation, then, from the Atlantic ports in that respect?—A. Yes; in one respect we are. The import business, except for the Pacific coast States, originally was centered in the hands of New York houses, Boston houses, Atlantic seaboard houses. They were the only importers; no interior man ever imported; and of course when it is once centered in any particular place it is pretty hard to change it. But there has been a rapid and large diminution in the proportion of the whole business of the interior brought in through the Atlantic coast ports, passing through the hands of the merchants of the Atlantic coast cities to the interior since the immediate-transportation act was enacted, which allows imported goods to go through the coast cities under lock and seal and duties, etc., settled at the interior point. There are now a number of interior ports of entry. Since that act the facilities of importation direct from foreign cities by interior cities like Buffalo, Chicago, Cincinnati, Cleveland, etc., has been increased, and many firms in those cities import direct without going through the New York, Boston, Baltimore, and Philadelphia houses, while formerly they did not import direct at all, but bought their goods in New York. Now, then, so far as San Francisco is concerned, it never distributed Asiatic goods to the territory east of the Rocky Mountains; could not do it because it had no railroad facilities; no means except wagons until 1870, you might say. The business was done via Suez or the Isthmus of Panama or from New York. The Atlantic houses distributed it back, and trade was centered there. When the overland roads, or the Pacific roads, were opened and they wished to participate in this business, they found it lodged in the hands of the New York merchants. They had to get the business from these New York people, and they had to make rates that would compete with the rates via Suez and around the Cape of Good Hope and via Panama; and in doing that they of course made through rates, which were lower than the local rates and than the rates of steamers which delivered at San Francisco from the Orient. But the railroads had no voice in the rates from Asiatic ports to San Francisco proper. Through the multiplication of steamship lines on the Pacific, and of the transcontinental railroad lines, and their fighting for this oriental busi-

ness as between themselves and against the Suez and Good Hope routes, rates have been at times lower from oriental ports to Chicago and New York than to San Francisco.

Q. Does that leave a sufficient profit to the railroad company when it gets as low as that, so that it amounts to anything at all—A. (Interrupting.) Well, I doubt very much whether there is much profit in it. The question of cost of carriage by rail is somewhat abstruse. With all railroads there is a volume of business that must be taken at certain rates without much regard to the cost of carriage. I refer to business which is the subject of competition. It may be market competition or competition by other carriers. Usually the measure of the rate obtainable for the carriage of such goods is what the competing carrier's charge would be. That must be equalized, or the business will seek the competing line. In such cases the carrier seeking the business is only concerned to see that he gets for his service something more than the actual cost of handling that particular traffic.

Ordinarily this cost would be the expense of taking up the freight, putting it aboard the cars, the clerical work of accounting attached to its handling, unloading and delivering it at destination. The carrier does not consider the numerous fixed charges or any elements of cost which does not vary with the volume of business handled. Somewhere in the neighborhood of 75 per cent of what is ordinarily termed operating expenses by railroad men does not vary materially with the fluctuation in the volume of business. Because of this, railroads always handle a considerable volume of competitive business, when it is necessary to do so, at rates which, by comparison with its ordinary rates, are very low. The business between the Orient and the United States would fall within this class of business, and with that explanation you will understand why I think the railroads have not carried any Asiatic business at a loss, although the profit from it may be small.

Q. (By Mr. DURAND.) Could you give any idea as to what proportion in a particular year—last year, for example—the Asiatic import business handled by the Southern Pacific Company bore to its total eastward haul?—A. I can not. I do not charge my mind with it; but I suppose we have never carried eastward to exceed 12,000 tons, and that would be a very small percentage of the whole business. I do not know whether there are any detailed statistics in the Annual Report or not. I do not carry those tonnage statistics in my mind. I have not a very good head for figures. I have never practiced that, because when I want to use them I can always turn and get them; but I guess we will let the answer stand, because the proportion of that particular business to the whole would make a very small percentage.

Q. (By Mr. A. L. HARRIS.) What is the nature of the differential allowed to the Canadian Pacific Railroad?—A. By the American lines?

Q. By the American lines.—A. None whatever; we fought that out.

Q. Has that been a disturbing element?—A. In the past?

Q. In the past.—A. A very great disturbing element.

Q. All the differences now are settled?—A. The Canadian Pacific—I think they were fair about it in the end. We tried to agree and did agree finally to arbitrate it. The result of it was that the American lines won. They objected a long time and refused to abide by the arbitration, but finally accepted it.

Q. Was there any rate cutting by the American trunk lines 2 or 3 years ago to meet that differential?—A. I can not answer of my own knowledge. I can say that so far as the transcontinental lines were concerned—and we generally mean by that term the roads west of the Missouri River—there was not; but the Canadian Pacific complained continually that, while their rates on their face showed a differential, the rates east of the Missouri River, and particularly east of Chicago, were never maintained, and that really they did not have the differential. Now, just how far they were justified in making that statement I do not know, but I suppose it is true there were sporadic instances of rate cutting arising constantly, and always have been.

Q. (By Mr. DURAND.) You stated, I believe, that to your knowledge there was not any such?—A. I could not state that there was any such of my knowledge. I have given you the rise of the rumor. It was part of the defense of their differential by the Canadian Pacific—that much was.

Q. (By Mr. A. L. HARRIS.) If it did exist then, it does not exist now to your knowledge?—A. I do not know of any rate cutting going on.

Q. (By Mr. DURAND.) Would you be in position to know?—A. I would not.

Q. With regard to your own road, I mean?—A. Yes, with regard to our own road I would. But the question was relative to the East by the trunk lines.

Q. Rates then made by the Canadian Pacific are precisely the same to the East and far Eastern points?—A. Yes; as the American lines, I understand.

Q. That is, from San Francisco?—A. They have been accused of cutting rates, but I never have found it to be true. I am constantly receiving charges against other lines, as I suppose other lines are receiving charges against us, but I think the con-

ditions as far as our traffic has been concerned have been unusually good in the last year. When I say "our traffic," I mean the transcontinental traffic.

Q. (By Mr. A. L. HARRIS.) Are present rates what you would call competitive rates?—A. They are always competitive. Conditions of competition always exist and always have, so far as the through business is concerned.

Q. What is the exact character of water competition at San Francisco?—A. There is the Panama Railroad running 3 or 4 steamers a month each way, New York to San Francisco. Between New York and San Francisco there are steamers owned by the American-Hawaiian Steamship Company of from 6,000 to 8,000 tons burden dispatched once a month via the Straits of Magellan from San Francisco. There are constant sailings of ships around Cape Horn. Just what the number is up for cargo now I could not tell, but I think at the present time the prospect and threat, so far as the railroad company's standpoint of competition is concerned, of competition by sea is greater than ever before.

Q. (By Mr. DURAND.) You mean in view of the proposed Nicaraguan Canal?—A. No; I mean in view of the building of steamships of large capacity, of small or relatively small coal consumption, and the demonstration that has been made that on account of their large tonnage and their relatively small coal consumption they can take cargoes from New York to San Francisco.

Q. (By Mr. A. L. HARRIS.) What class of freight do these steamers carry?—A. They are taking all classes of freight, mostly the lower classes; but there is no reason why they can not take everything. All the business that goes now, business of every class that goes now from New York to San Francisco, formerly went altogether by sea around Cape Horn or across the Isthmus of Panama, chiefly around Cape Horn on sailing vessels, with a voyage of 6 months.

Q. (By Mr. DURAND.) Are there not some classes of goods which on account of styles, perishable character, and so on, are needed sooner than that length of time would permit and so can not be shipped by sea?—A. Yes; but before there was any railroad—before 1870—those goods went by sea via Panama taking from 30 to 45 days from New York. There is nothing but perishable freight that can not go around that way, and if they are put to it, there is no reason why they can not ship perishable freight that way.

Q. Your company, the Southern Pacific, is interested in one at least of those water lines via Panama?—A. No.

Q. The Panama Pacific Mail?—A. The Pacific Mail, the western end of the line, from Panama up. It has not the making of the rates lately.

Q. (By Mr. A. L. HARRIS.) Is the Western classification satisfactory, or is there very much difference?—A. I do not think the Western classification is thoroughly satisfactory; that is, I do not think there is a road using the classification which, if it were able to adopt a classification for itself suitable to its own particular business without respect to any other business, would not make material changes in the Western classification; but it is a compromise in the views of hundreds in the deference to the public demand for uniformity of classification and for convenience, if there is any, in the interchange of traffic to the railroads themselves.

Q. Now, the second part of the question, in regard to commodity rates?—A. There never can be any classification adopted that will preclude the use or necessity of commodity rates. We will have to make commodity rates. In all my experience, and I have been in this business since 1868, there have been special tariffs, coal tariffs, lumber tariffs, salt tariffs, etc. They are commodity rates. As you enlarge the scope of your classification and extend its application over larger territory and over an increasing number of roads, you will multiply the commodities, because here is a road that wants to and does use the Western classification. But the Western classification does not provide for a commodity which is of very great importance to it and which is of minor importance to many other roads. It must be provided for by a commodity rate. The through business between the Atlantic States and the Pacific coast States is done almost wholly on the commodity tariff. That is because of the predominating or controlling influence of the sea carriage. It is commonly supposed, and I heard it stated up at the Commission yesterday, that sea carriers do not classify like railroads. On the contrary, they classify more. They will take tonnage, charging by weight or measurement, whichever makes the greater sum. Hence the rate per 100 pounds varies with every change in the density of that freight. Then the value of the goods effects a classification because the insurance on the goods, which, in the case of railroads, is included in the rates, is turned over to the underwriter. Every shipper by sea has to underwrite his goods, and the rate he pays per 100 pounds varies with every change in the value of the goods, so that if you should work it out you would find that there was a greater classification by sea-going vessels than there is with us; in fact, a weight and measurement tariff by sea amounts to a commodity tariff, the rate changing with almost every article as density and value change. If you were to express the rates—the ordinary rates—of a steamship or a clipper ship per 100 pounds, as against their

usual formula, you would find that you would have a different rate for every particular item, unless you should be fortunate enough to find two articles that were of the same density and the same value per 100 pounds. That is why we have found, in meeting the competition of the sea, that we must carry a very large commodity list. We can not classify because we can not get any more than sea competition will permit us to charge.

Q. (By Mr. DURAND.) Do all the transcontinental carriers, then, adopt pretty nearly the same commodity rates?—A. Yes, altogether.

Q. They agree?—A. Yes; the same through tariff is uniformly applied to all the lines. It is made by conference.

Q. (By Mr. A. L. HARRIS.) What will be the effect on operation of the acquisition of the Union Pacific by the Southern Pacific Railroad?—A. What will be the effect I can not answer. It ought to have no effect whatever. That is, the two institutions ought to be and probably will continue to be operated separately. That is merely an expression of opinion.

Q. (By Mr. DURAND.) Has there been any tendency in the past to have the practical consolidation of the Union Pacific and the Southern Pacific?—A. It is not a practical consolidation at all.

Q. Community of interest, then?—A. Hardly that.

Q. Has there been any tendency to divert traffic from the Central Pacific to the Southern Pacific because of the longer haul which the Southern has?—A. Oh, yes; in a certain sense.

Q. Will you explain about that?—A. That is said to have been done through the exercise of the control of the Central Pacific by the Southern Pacific. The Southern Pacific Company owned a line and operated a line from San Francisco to New York. It also owned or controlled the Central Pacific line to Ogden in connection with the Union Pacific, the Rio Grande lines, and others. These roads connecting with the Central Pacific at Ogden, not only the Union Pacific, but the Rio Grande Western and its connections, the Colorado Midland, the Chicago, Burlington and Quincy, the Chicago, Rock Island and Pacific, the Missouri Pacific, the Wabash, the Chicago and Northwestern, the Chicago, Milwaukee and St. Paul, the Illinois Central, all the trunk lines running from Chicago eastward, also the Northern Pacific connecting with us at Portland, the Great Northern, the Oregon Railway and Navigation Company. Every one of these companies has had and now has a well-equipped soliciting agency in San Francisco and in Los Angeles soliciting business for their lines. The Southern Pacific Company, since its control of the Central Pacific line, has not exercised any undue influence or authority in taking freight either one way or the other, but it has had its corps of men soliciting for the Sunset route, its long haul via New Orleans, precisely as the Union Pacific, and all the other companies I have named, have had their respective corps soliciting for the Ogden route and for the Portland route. Through these soliciting agencies the merchant said which way his freight should go, and it went the way the merchant so directed. The practice described furnishes the only foundation for the cry that has been floated about the Halls of Congress here that we were discriminating against the Central Pacific, and that the discrimination was having the effect of diminishing the value of the Government securities. It is all poppy cock; there is nothing in it and never was.

Q. Is there any traffic which the shippers do not care about, which you have the power to divert if you wish?—A. No, no. I suppose we do have the legal power, and we were advised that we had the legal power to direct the route which the freight shall follow, but as yet we have not exercised it, except in the case of oranges, and that only within a year.

Q. What is the arrangement you speak of about oranges at present?—A. Simply that we do claim and exercise the right of determining the route by which they shall go. That was in order to break up the rebate plan which was being worked. Shippers were holding up our railroad connections, saying that they would not give them any freight unless they put up from \$15 to \$20 a car. In other words, the practice is primarily for the purpose of enforcing the law and maintaining the tariff. We do not get a cent out of it. The Santa Fe does the same thing.

Q. Supposing that there should be in the future a pretty thorough community of interest between the Southern Pacific and the Union Pacific, would not more of the traffic go over the more direct route in the future than in the past?—A. You are asking me to discuss questions that are purely speculative, and might be in the nature of committing the owners of the road. I do not think I ought to express myself on that. I do not see how it would do any good.

Q. What is the exact nature of the transaction by which the Union Pacific acquires the Southern Pacific, stating the price paid for the securities, the effect upon the total capitalization of each road, etc.?—A. I do not know anything about it except what I get through the press.

Q. What would be the effect of the extension of the Chicago, Burlington and Quincy to the Pacific coast?—A. I can not say that it would have any further effect than

making one additional road for the community to support. I do not think it would build up any new industry or create any new business.

Q. The present volume of traffic does not demand it?—A. Any one of the lines crossing the continent to-day, with proper equipment and proper terminal facilities, improved roadbed, etc., can do all the business that all of them are now doing.

Q. Every additional road, in your opinion, would be only that much more expense for the shipper?—A. I think so. I think in the end the public has to pay these charges. There are sufficient roads now to introduce all the competition that the roads can possibly stand. There are none of them that I know of paying dividends except perhaps the Great Northern, and it is not doing it out of this transcontinental traffic.

Q. What will be the effect of Senator Clark's new road from Salt Lake City upon the rate situation?—A. I do not believe he is going to have one. I think the Union Pacific is going to build that road, and the effect of it will be simply to have one more road—simply divide the business of southern California with the Santa Fe and the El Paso routes. I do not know whether it will benefit the Union Pacific.

Q. What has been the movement of rates upon the trans-Pacific roads during the last 10 years? Have they been reduced, equalized, or in any case increased?—A. In the last 10 years, yes. The last 10 years would take us back—that would be since 1891, and the rates have been very considerably decreased since 1891.

Q. But in no case increased that you call to mind?—A. I think not; I do not think there is a single case of an increase since 1891. In my own time, though there have been violent reductions and violent fluctuations, but the standard to-day is very much less than it was this time in 1891, I think. The average rate is considerably less than it was this time in 1891.

Q. What is the effect upon the Union and Southern Pacific roads of the purchase of the Chicago, Burlington and Quincy by the Great Northern and Northern Pacific?—A. I do not think the Great Northern and the Northern Pacific have got the Chicago, Burlington and Quincy in that sense. I do not know any more about it, perhaps, than you do.

Q. Supposing there should be such?—A. I am not good authority on those things, and I want you to know that I am only expressing an opinion.

Q. Supposing there should be such a thoroughgoing community of interest between the Union Pacific, the Southern Pacific, and the Northern Pacific, would not those three roads then be in position to control rates aside from the matter of sea competition?—A. No, they will not be in a position to control rates, because the Great Northern will be out, and the Atchison, Topeka and Santa Fe, and the Texas Pacific, and all those lines will be out, and they will have to be consulted. No rate can become effective except at the risk of a light and great loss of revenue, except it is a rate that is agreeable to all competitors.

Q. I suppose there is a limited amount of traffic which would not be subject to the competition of these other routes?—A. Oh, well, then the common control of the roads you name would not affect that particular traffic. It would be strictly local to each particular road, and the common control would not affect it at all. If you want to know—if what you would like to draw out is whether I think that common control would have the effect of increasing the charges to the public, I freely express the opinion that it will not. I think that if there could be a control of that sort exercised in every natural division of the country so as to secure stability of rates and honest and efficient enforcement of the rules and rates as published it would be of great benefit to the public. I believe it is the only way under the present attitude of the public toward railroads that you can effectually squelch unjust discrimination, inequalities in rates, and continual fluctuations in rates.

Q. You do not think, then, that such a thoroughgoing harmony of interests between all the roads in a particular section would result in unduly high rates to the public?—A. No; you can not destroy the natural competition that exists; you can not possibly do it.

Q. What do you mean by natural competition? Do you mean between different sections of the world?—A. I mean between the different roads.

Q. But I was speaking of the possibility of a complete merger of interest.—A. Of all the roads in the country?

Q. Of all the roads in a given section, or west of the Missouri River.—A. No; the companies operating those roads are endeavoring to promote every industry and every class of commerce, build up the industries along the lines of their several roads, so that they should have the greatest tonnage, and they can not resist, can not stop it. The noticeable effect upon the community at large would be the stopping of preferential rates, the stopping of unusual, frequent, unnecessary, vicious, and hurtful fluctuations in rates. Now, I do not mean to say that you would not have a howl, but the howl would come from the fellow whose rake off was discontinued. I say that in all sincerity as an expert in this business of more than 30 years' experience, and I do not own any railroad stocks or bonds either.

Q. (By Mr. A. L. HARRIS.) Have you any suggestions to make as to increasing the power, in any particular, of the Interstate Commerce Commission, and especially as to their right to make or approve rates?—A. Yes; I have a suggestion, an opinion, to express, that they have all the power that they need to enforce the law to day if they would exercise it. I think it would be a dangerous thing to give them the rate-making power, but I think in their attitude toward the railroads, of fighting the legalization of pooling because the railroads will not consent to their having the rate-making power—I think that is to be condemned. I do not believe that the people of the United States who pay freights want this commission to make their rates. They can not do it.

Q. One great complaint that is made is the long time that intervenes between the filing of the complaint and the final adjudication of the case. Would you recommend that when a case is filed with the Interstate Commerce Commission it should be advanced on the docket as it goes into court, so that it could be disposed of quickly?—A. So far as my own particular judgment is concerned, founded on the experience I have had in cases before that commission, I see no reason why they should not come to a speedy conclusion or a decision—the quicker the better—and I would have no objection to any rule that had for its object simply to have the case disposed of upon its merits as soon as possible. I think that way with respect to every contention between private persons, as well as between corporations and parties.

Q. Is part of this delay by the commission on account of it being tardy in hearing?—A. I think not. So far as my experience goes they have been prompt enough. They have held up their decisions in some cases longer than I thought there was any necessity for, but I think, no doubt, they have a reason for it. I have in mind one particular case now, the differential case between carloads and less than carloads, in Texas. I do not know why that should not have been decided a year ago, so we would have some light in this case they are hearing now; but they are evidently holding that up until they get the hearing in this case, possibly because they want more light. You see it is a question that is very far-reaching. It will spread all over the country.

Q. Is it possible, and if possible is it practical, to have a national classification of freights?—A. No. Well, I would have to qualify my answer. I am not a believer in a uniform classification. We have practically now three classifications—the official classification in the trunk-line and New England territory; the Western classification for all territory west and northwest and southwest of Chicago and Texas, and I think the Southern classification in the Southeastern territory. In making those classifications the railroads have had to make considerable concessions from what would be a proper consideration for the conditions which would control classifications in individual cases. In going further than that, concessions will be multiplied, and they will be as often against the public as against the carrier. Commodity rates will also be increased in number, as I have already explained. We can not have a uniform classification without having thousands of commodity rates. Every road is going to have a number of different commodity rates. That will destroy the uniformity of classification. If you and I agree that as between our two roads we will join in a common classification, and then you say, Now, here is lumber; here is coal; here is iron or some other commodity or half a dozen commodities that are of very great importance to me, and under this classification their development and their movement will be retarded—they are of no importance whatever to the other road—I will put in commodity rates on them; and if then I offer a similar list of commodities that must be specially provided for—we would be doing just what all the roads in the country would do. Now, then, multiply those conditions and opportunities by the number of railroads in the United States and see the number of commodity rates that will be required, each differing with each road. What becomes of uniformity? It is a theoretical demand of no practical value, though it seems to have fastened itself on the commission here. There is no necessity for it, in my judgment.

Q. (By Mr. DURAND.) It is sometimes held, I think, that these numerous—we might almost say innumerable—adjustments that the railroads make in rates, in view of their conditions and their particular commodities which touch their territory and so on—that the result of all these conditions is to prevent a perfectly normal development of the resources of the country; that the railroad which happens to be in a given locality first tries to exploit the natural resources, even though they might not be so well fitted for immediate exploitation and so on. Does it seem to you that the absence of any uniform regulation of that sort tends in that direction?—A. If there is anything in what you say, and I do not believe there is, I do not see how uniformity of classification is going to help it. The rates determine the movement. There is no talk about making uniformity of rates. It is the greatest folly to me—the idea that this uniformity of classification is going to have the effect that is

claimed for it or have any such value that is worthy of consideration or worth talking about. It would seem to be absolutely ineffective, when you take into consideration my explanation as to commodity rates. It is a jack-o'-lantern, deceptive, a snare—something to fool the public with. That is all there is about it. Now, then, I do not believe that any railroad company retards an industry on its line. If any railroad company does do so, or unjustly discriminates against industries, there is not any penalty, in my judgment, that is too severe.

Q. How about the complaint of fruit shippers in California? There has been a good deal, has there not?—A. What complaint?

Q. To the effect that the rates are so high that they can not meet the competition of Florida?—A. I have heard no such complaint. The citrus fruit business has grown from nothing to about 20,000 carloads a year. How does that answer you? I have heard no complaint of that sort from the shippers in southern California. The complaint now is against the refrigeration charges, and against the railroads for not owning their own cars, but leasing them. Shippers want to dictate to us whether we shall hire a car or own it. There is a complaint as to whether we shall take the routing out of our hands and put it into their hands. The difference arises in the fact that the agent of the principal fruit growers' association wanted to lease or own refrigerator cars himself and snublet them to the railroads and be able to make something out of the refrigeration and mileage for use of the cars, and also be in a position to switch his cars from one line to another and hold up the railroads for rebates. That was all stopped by the Santa Fe and the Southern Pacific undertaking to route the freight. It is to determine these complaints—whether they are just—that the case was taken to the Interstate Commerce Commission. It has been tried and submitted to the commission and is now in their hands. They also complain about the demand on our part that they should load 13 tons to the car instead of 10 tons to the car. They allege that if 13 tons is loaded in the car there is not left sufficient air chamber for circulation and preservation of the fruit, which promotes decay. We are not satisfied that this is true, because for the most part 40-foot cars were used for 13 tons as against 36-foot cars for the 12 tons. We also found that instead of carrying 12 tons, as we thought, the size and weight of boxes had been increased, and instead of the average weight of 12 tons that we were charging for the load was 13 tons. I do not know but that we may concede that point. It will not be done until the case is decided by the commission, however.

Q. Has the California railroad commission exercised any direct control over local rates in California?—A. It has heard every complaint that has ever been made. It approves all tariffs.

Q. Then they have the absolute power to declare a rate?—A. That is what the constitution of the State says.

Q. Have they ever changed rates materially from those made by the railroads?—A. Well, I do not think that the Southern Pacific as a company would be willing to recognize, notwithstanding the constitution, that it had the power that the constitution pretends to give it, but still the commission has from time to time caused considerable reduction in tariffs. They undertook to make a reduction in grain rates, which we resisted before the courts and finally settled.

Q. Was that recently?—A. Yes; the settlement was made, I think, a little over 18 months ago.

Q. You mean it was settled by the court reaching a decision or by agreement?—A. Well, the court enjoined the commissioners, but the case never went to trial. We consented to a certain reduction in lieu of their order.

Q. That was the grain rates within the State?—A. Yes.

Q. On all the roads or on certain portions?—A. Well, it was on grain going to market, and it would be, on all the roads and on all the rates, sort of a blanket reduction of about .8 per cent, I think. I have forgotten what the settlement was. I think it has been a useful commission. It has not been anarchistic and confiscatory in its actions, and for that reason some of the people condemn it, but on the whole I think its course is satisfactory.

Q. Have you any idea how the rates are per ton per mile in California on low-grade freight, or on all classes of freight, for that matter—how they would compare with the transcontinental rates per ton-mile?—A. They ought not to be compared at all.

Q. Necessarily they ought to be different?—A. No; I never made a comparison—never made any such comparison.

Q. You might be able to give some valuable suggestions about the development of the Oriental trade and the acquisition of the Philippines?—A. I do not care to testify on that unless you want me to, because I think it is pure speculation as to what it is going to be, and I am sorry to say that while it is popularly supposed that there is going to be a vast increase of trade to San Francisco and the Pacific coast,

I do not share that view, and I do not care to discourage people by any testimony. From the railroad standpoint and from our standpoint I do not regard the building of the canal as an unmixed evil. I thought we could adjust ourselves to it; that so far as San Francisco is concerned it was going to do San Francisco more damage than anybody, so far as I know, except a very few people, and one of them, Senator Perkins's partner, conceived. The Nicaragua Canal is going to bring New York, New Orleans, and all these aggressive Eastern jobbing cities much nearer by water to Honolulu, the islands of the Pacific, the Philippines, the Orient, and Australasia, than they are now; and instead of increasing San Francisco's opportunities to enjoy that trade, or an increasing measure of the trade, it is going to diminish them, because it is going to increase the power of San Francisco's competitors, while it does not help her at all. So far as San Francisco's business proper is concerned, the transport of general merchandise which she takes, it is going over the railroads, no matter how many canals are built. There are too many railroads there; they are part of the natural features of the country, and they will be operated when we are all dead. They may be compelled to make rates that will put them in bankruptcy, over and over again, but every time they get out of bankruptcy they will be better able to beat the canal, and they are going to carry that business. While the canal may help San Francisco in such business as she has formerly exported to Europe, particularly grain, that is constantly diminishing in volume.

Q. May it not increase?—A. The advantage is very small compared with the disadvantages I have enumerated. That briefly and substantially expresses my views. They might be elaborated, but they would not give you any better idea.

Q. (By Mr. A. L. HARRIS.) What do you know, if anything, about the cooperative association among the fruit growers of California in shipping and marketing, where they ship and market their goods?—A. Well, there has been something like the prune growers' combination, as they call it; is that what you mean?

Q. Yes; that is what I had in mind.—A. That has been rather disastrous this year, I think. However, I believe, that something of that sort is necessary to the proper marketing of the goods. I believe it is necessary and I think it would be a great advantage to the growers of deciduous fruits. It would be an advantage to the orange growers, though they now have a form of association. It has been worked on raisins in Fresno quite successfully. The producers are said to have been their own worst enemies through lack of cooperation; that they were in the hands of the middlemen, who would work them and give them minimum prices for their goods. The effort has been to get them together and cooperate and employ good merchants to handle their association for them, and to give the manager authority to meet the market conditions. By this plan of organization they expected to stop the middlemen from taking undue advantage of them. I think it might be beneficial. It is said to have been in Fresno for the raisins, and I think it is bound to be so on the prunes. But it is hard, to get three or four thousand farmers to agree upon any cooperative plan or to trust any individual in handling a large business for them. With respect to oranges and green fruit some form of organization for cooperation is essential, because they are perishable; and the distribution of that fruit to Eastern markets ought to be under one head, so that if Chicago would take 20 cars a day no more than 20 cars per day would be sent there. If the capacity of New York is 25 cars per day it will be arranged that no more than 25 cars go there, and if Boston is 10 cars they will see to that in like manner. Now, in the past the vice of the business has been that everybody shipped as he pleased, and if John Jones heard that Sam Smith was shipping to Milwaukee he would say, "I guess that is the right thing to do," and he would send his fruit there also. The result would be that the Milwaukee market would be overstocked.

Q. (By Mr. DURAND.) To what extent is the system organized now—quite thoroughly?—A. In southern California they have their orange growers' union and it is said to be quite efficient. In northern California, so far as the deciduous fruits are concerned, they have no organization that I know of. They tried a plan some years ago, but it was not satisfactory. With raisins and, I believe, in southern California, with walnuts, a cooperative arrangement has been tried and has done well. The experiment this last season with the prunes was not successful. I think it is lack of management more than anything else.

Q. You think there has been no particular reason for complaint against the refrigerator car companies as such?—A. I would not like to say as to that. I have never made a study of it. Apparently refrigerator charges were pretty high. They claimed, and they made an excellent showing, too, before the commission that their charges afforded no more than a reasonable profit. While we are not responsible for those charges, and our effort is to get them down, I think there will be some reduction this year.

Q. Is it your judgment that it would be more desirable for the railroad companies that refrigerator cars should be owned by them?—A. Ordinarily I would say that

the railroad companies should own their own cars, but there are peculiar conditions affecting the use of refrigerator cars that make it doubtful as to whether it is best—chiefly that the movement of the fruit for which they are employed is confined comparatively to short seasons, and for the rest of the year there is no use for those cars. If there is an organized company owning refrigerator equipment whose cars can be leased during the season, or put into this service at reasonable rates and under just and equitable regulations so far as the carriers are concerned, then when the season is over the owners can find use for those cars in the Florida trade or in the berry trade of the South, thus keeping the total equipment employed the year around. Now, if that is true, and I am led to believe that it is true, such a company can handle the refrigerator cars and do the refrigerator work at a less cost than the railroad company.

And it ought to operate to the advantage of the growers or producer, provided the charges and the profits are only reasonable. Now, then, I did not answer as to the railroad. So far as the railroads are concerned it depends altogether on the price they would have to pay for running the cars. They might be made so high that they had better own them; but I think, from my experience, that so far as economy in management is concerned or expense of operating, it is in favor of leasing the cars rather than owning them, under the conditions I have just stated.

Q. Can you state the rate which you pay by way of lease?—A. Oh, I do not know why that should become public property.

Q. Some of the Eastern roads have intimated that there was a uniform rate.—A. The ordinary rate paid by Eastern roads is a cent a mile. It ranges from three-quarters of a cent to a cent a mile for the use of refrigerator cars; but we pay less.

Q. Can you compare the amount that the shipper has to pay for the use of the refrigerator car as such with the amount of freight he has to pay, stating the relative amount?—A. It differs. Our rate on green fruit is a flat rate—what we call a blanket rate or postage stamp rate, practically the same to Denver as to New York. The refrigerator charges necessarily, to be fair and equitable, are graduated rates. It takes less ice, I should say, to carry a car of fruit to Denver than to Omaha, and less to Omaha than to Chicago, and less to Chicago than to New York or than it does to New Orleans, owing to the difference in the climate and the cost of ice. I have not in mind what the rates are to the destination points. I would guess that they will range from \$50 to \$135 a car for refrigeration of deciduous fruit—not oranges. Oranges do not require as much ice. The railroad freight rate is \$1.25 per 100 pounds, for carloads. It has always struck me that, compared with the investment and labor, etc., the cheapest part of the service that the California fruit grower employs in getting his fruit from the tree to market is the transportation service done by the railroads, and I think so still.

(Testimony closed.)

Whereupon, at 11.55 a. m., the special subcommission adjourned without day.

NEW YORK, N. Y., May 22, 1901.

TESTIMONY OF MR. JACOB H. SCHIFF,

of Kuhn, Loeb & Co., Bankers, New York City.

The special subcommission of the Industrial Commission met in the rooms of the Fifth Avenue Hotel at 10.15 a. m., Mr. Clarke presiding. At that time Mr. Jacob H. Schiff, of the firm of Kuhn, Loeb & Co., appeared as a witness, and testified as follows:

Q. (By Mr. CLARKE.) Will you receive the oath?—A. Am I compelled to? I never like to swear, because I think my word is good enough, and I prefer not to swear.

Q. Then you make a solemn affirmation, do you? Will you please give your name and post-office address?—A. Jacob H. Schiff, 932 Fifth avenue, New York.

Q. What is your business?—A. I am partner in the banking firm of Kuhn, Loeb & Co.

Q. Have you had to do with the financing of corporations?—A. I have.

Q. Recently?—A. What do you mean by recently?

Q. Any time within the last 3 years?—A. I have; but not so much as, say, 5 or 6 years ago.

Q. Very well; go back to that, then. Can you give the commission a list of some of the principal corporations and transactions that your firm has aided in financing?—A. We have had leading interests in the reorganization of the Union Pacific Railroad, and to some extent of the Baltimore and Ohio Railroad. Those are two leading corporations.

Q. It is a matter of common knowledge that great movements are going on among the principal railroads at the present time, and we shall be glad to have you describe to us, so far as you feel that you can without embarrassment and without divulging business secrets, the methods that are employed and the objects that it is expected will be attained. Proceed, if you please, in your own way, and the commissioners will ask some questions as they may wish from time to time.—A. Primarily, I want to state that I am not a railroad man; that I am a financier, and that technical railroad questions I am unable to throw light upon. The movements to which you refer I assume are those that are generally understood as coming under the expression "community of interest." As I take it, this community of interest idea arose in the desire of the railroads, or the owners of railroads, to protect themselves against the demoralization, and, as a consequence, depression in the values of their properties, which was brought about by antipooling legislation. It is human nature that a producer and shipper wants at all times to get something better, to get ahead of his neighbor; so the practical consequence has been that when a shipper made a certain rate of transportation with the railroad company his neighbor went to the competing road and by straight or crooked means endeavored to get lower rates than his neighbor received. That naturally brought about demoralization of rates, and it damaged both the transportation interests and the producing interests. It is evident that there is little safety to the producer if he is not certain that his competitor pays exactly the same charge for transporting his goods or products than he pays himself. There is just as much danger to him as there is to the railroad if it does not get just exactly the same rate that the competing railroad receives. This unsettled condition produced a state of affairs which, in my opinion, has been more dangerous to the vital interests of the country than any benefits that could have possibly been derived from antipooling legislation. It demoralized both the shipper and transporter alike, and property of all kinds suffered by it; not only property suffered, but labor suffered. It is evident that when rates are depressed the railroads can not pay to the working forces the same compensation or remuneration that they can in times when they get full rates for their transportation.

This state of affairs brought about a gradual coming together of the railroad interests and induced them to buy into one another's properties. For instance, if I held stock of "A" company and you held stock in "B" company, and my shares were depressed in value because you were competing with me—each of us cutting the rates of the other—our interests would evidently be better served if you owned some of the stock in my company and I owned some of the stock in your company. In other words, if we had a community of interest. That is, in simple words, the process which has been going on on a large scale among the railroads, and which, in my opinion, while it is not completed yet, will naturally bring about some protection, as the way to perfect peace is always through war. I believe when brought to an entire completion, it will be a blessing to the laboring man, it will be a security to the shipper, and it will be a benefit to the owner of railroad property. I believe the community of interest will not only result in the community of interest between railroad property, but it will be community of interest between railroads, shippers, and labor.

Q. We shall be glad to have you tell us the methods of bringing about this community of interest so far as you may feel at liberty to do so.—A. I believe I have explained to you already; the business is simply carried out on a larger scale than in the illustration I gave. Without naming railroad companies, say if the New York and San Francisco Railroad Company, using a name to cover both extreme points, owned some stock in the Boston and Portland (Oregon) Railroad Company, both running in the same direction, if they owned stock in each other's lines they would be very careful before they did anything which would destroy the value of each other's property.

Q. Is it proposed to merge or consolidate these roads into one large company, after the manner of the consolidation of the steel companies, or is it proposed merely to have stock in one road held by a stockholder of another road?—A. I am quite certain nothing like the large consolidation is intended—nothing like such a consolidation is intended.

Q. The several companies will continue to operate their properties substantially as now?—A. That, I am quite certain, is their intention.

Q. Will there be any absorption by one company of another in this process?—A. Not that I am aware of.

Q. Will there be any agreement between these companies in reference to maintaining rates?—A. Not as far as I know; but, as I said to you before, as to railroad propositions proper I know nothing.

Q. Does the establishment of this community of interest necessitate the intervention of a syndicate?—A. Not necessarily.

Q. Does it involve a struggle for the transference of control from one party to another?—A. Not necessarily; but such might occur in single instances.

Q. If you feel at liberty to give us any illustrations of your idea of the process by which roads which have undergone this establishment of community of interest, we shall be pleased to hear you.

The WITNESS. I can not. As far as I know, most of these processes have been accomplished by direct acquisitions, either by the railroads or by their owners, of stock, not necessarily controlling interests, and I believe in most instances not actual controlling interests in other railroad corporations.

Q. What is your opinion as to the probability of the raising of rates after this community of interest has been effectually established?—A. While I have said to you that I am not a railroad man and that my opinion as to railroad matters itself is worth nothing, I believe it will result in the cheapening of transportation. The only thing that is sought, as far as I understand it, by the community of interest is not higher rates, but equal rates, steady rates.

Q. Is it the opinion of merchants and shippers generally that it is more important to them to have an opportunity by sharp figuring to get a lower rate than their neighbors have?—A. Every intelligent shipper I have ever discussed this question with has, without reserve, expressed his opinion that he would rather pay double the rate on transportation which he might be paying with steady rates than have to labor under a belief, as he must with unstable rates, that his competitor possibly gets a little cheaper rate than he does. Shippers, I think, in every section of the country will confirm that what they want to have is absolute certainty, uniform rates, no matter what they are; they want uniform rates first of all.

Q. Is it anticipated that there will be some popular apprehension of monopoly in the establishment of this community of interest?—A. Not if organizations like your commission treat the question in an intelligent manner, as no doubt you will treat it, and give the public the light; and not if those who can give information will give it without reserve. My own opinion is that if the public in general understands the question there can be no misapprehension and no fear as to the result.

Q. Will there be a willingness on the part of those owning the capital in railroads to have the railroads subject to public supervision that will be effectual for the protection of the peoples' rights?—A. I have not the least idea that this would be welcomed by every interest.

Q. Do you anticipate that this community of interest will be guarded so far as to bring into harmony substantially all of the railroads of the country?—A. That is hardly possible. What may be accomplished in years to come I can not foresee, but it is so big a proposition that it is hardly possible that the community of interest can be applied to every mile of railroad in this country.

Q. What is sought for at the present time is to bring into harmony certain great systems that have competed unfairly with each other?—A. It is just as you have stated.

Q. Those will embrace the trunk lines and the transcontinental lines North as well as South?—A. They are as likely to embrace the trunk lines and the transcontinental lines.

Q. To what extent is the shipping interest—the great ocean transportation lines—involved in this community of interest?—A. That is a subject I know very little about. What I could say is only from hearsay, and I would not give much for hearsay.

Q. You have been able to observe that something is going on in that direction, have you?—A. Only from what I have seen in the newspapers.

Q. Is it your opinion that the acquisition of certain ocean lines is in the interest of certain large railroads of this country?—A. I know nothing about that.

Q. (By Mr. FARQUHAR.) You spoke of the community of interest being practically subserved through the purchase of stock—the mutual purchase of stock in 2 roads. Now is it not a fact that within the last 3 years there have been practical evidences of this absorbing of the interests of roads?—A. I do not think that is the case.

Q. How would you state the position, as you very well know it, of the Pennsylvania system toward the Baltimore and Ohio?—A. The Pennsylvania Railroad does not, as far as I know, own to-day the controlling interest in the Baltimore and Ohio.

Q. Does not own the controlling interest?—A. No. The controlling interest, in my opinion, and I believe it has been so stated in legislation and in decisions of the courts, means a majority of the stock. A line has really no controlling interest so long as any one company owns less than 50 per cent in the other company. It does not actually own the controlling interest; and I am very certain that the Pennsylvania Railroad does not own a controlling interest in the Baltimore and Ohio.

Q. How does the directorate stand? Are the majority of the directors Pennsylvania system men or Baltimore and Ohio men?—A. I am quite certain that only the smallest percentage of the directors of the Baltimore and Ohio are in any way connected with the Pennsylvania Railroad system.

Q. Then, the cooperation of the Pennsylvania system with the Baltimore and Ohio as to rates has been reached, not by a Pennsylvania interest passing into the Balti-

more and Ohio on its directorate and so making peace as between the 2 roads?—A. I can not tell you that; I do not know that.

Q. Does that not naturally follow from the general phrase that you used, the community of interest?—A. Such is the intention—making peace, as you express it.

Q. Does this community of interest anticipate in any way the formation, the organization, or the financing of any transcontinental road, say, from the Mississippi or the Missouri River to the Pacific coast?—A. I have no idea what you refer to or what is in your mind.

Q. I refer to the question as to whether in the contest that has occurred between the Northern Pacific and the Union Pacific there is not involved possibly another transcontinental road or the extension of one of the trunk roads, like the Burlington, to the Pacific coast?—A. I am not aware of it at all.

Q. That has never been discussed in Wall street?—A. Not to my knowledge.

Q. Now, in the contest which has agitated the country and the people for the last month or two in respect to those two stocks—the Northern Pacific and the Union Pacific—is it the aim in that contest to make this same community of interest work between the two ultimately—between those who are financing and managing them?—A. I am not aware that there has been any contest. There may have been some Wall street speculation, of which I know nothing; but I am not aware that there has been any contest.

Q. How would you, as a financier, explain the fact of a single share of Northern Pacific stock going up to \$1,000 cash?—A. I can only explain it on the ground of somebody's having sold something he did not have, and when he wanted to get it back he could not get it back. Other investors have possibly bought perfectly bona fide a supply of stock for their own purposes. Gamblers who sold things they did not have and tried to get back what they had not possessed, found it was not there.

Q. Let us take a step farther. Do you know, or is it even a street rumor, a rumor at all, either in the London market or the American market of stocks, that one or the other of the parties, the Northern Pacific or the Union Pacific or the Missouri Pacific, in its extensions, intends to control two transcontinental roads if they can?—A. I know nothing about rumors. I never listen to rumors; nor do I know anything about one transcontinental line desiring to control any other.

Q. (By Mr. LITCHMAN.) Is not the idea prominent in this community of interest to establish a transcontinental line? Is not that one of the main objects of this community of interest and consolidation of interests that has been going on?—A. Not necessarily. The great systems of the country divide themselves into two divisions—the lines to and those beyond the Mississippi or Missouri River. I do not believe that the trunk lines, as they are generally called, have any desire whatever to extend their lines, either by combinations with other lines or by construction, beyond the North and South boundaries.

Q. Is it not the natural combination of these two interests, where the freight movement is east and west?—A. No. There is always, as far as I can see, a limit to what one system can handle, as I believe traffic questions in the different sections of the country are different; and I am convinced that the heads of large trunk-line systems on the one hand and of so-called Pacific roads or transcontinental roads on the other hand are very desirous of keeping apart, and very wise in doing so. For instance, the Union Pacific, which ends at Omaha and Kansas City, farther south, has never had any desire to cross the Missouri River or make any combinations which extend east of the Missouri River. It has always preferred to have every road—every trunk road that came to the Missouri River—come to it on equal terms and on an equal basis and use its facilities west of the river. The minute you extend east of the river you get into a hornet's nest.

Q. Your idea is that if they should have a line of their own they would immediately invite the competition which the community of interest has been desirous of remedying?—A. It would not invite competition; no. You can not serve too many masters.

Q. (By Mr. FARQUHAR.) Is it not a natural thing in railroad development and the acquisition of railroad properties to acquire even beyond the zone that you have mentioned, the Missouri River, for instance, where the terminals of the transcontinental lines are; for those who own big trunk lines to the East to extend and have under one control the roads beyond the Missouri River to the Pacific coast? Let me instance the Vanderbilt system: Is it not natural to suppose that the Vanderbilt system would now seek, under the stimulus of Asiatic trade and the Asiatic acquisitions of this country, to have control all the way from New York to Seattle or San Francisco?—A. Railroad problems are my weak point. What may be in the minds of those who guide the destinies of large railroad systems I do not know, but I hardly believe that any intention exists to deviate from the very wise policy of having a natural line about the center of the continent—a continental divide—across which neither those from the east nor those from the west shall go.

Q. Now, to carry the inquiry just a step farther, still referring to the community

of interest of which you have spoken so favorably here in the equalizing of rates, giving the purchaser and shipper, the consumer and the transporter equal rights, would it not naturally follow that in seeking that community of interest it would be right and proper for the owners of the great eastern trunk lines—I said the Vanderbilt, we will say in a measure the Gould system, the Wabash system, the Pennsylvania system, and even the Southern system—would it not be natural that they would acquire in that very community of interest and the purchase of stocks of other companies ultimately the control of a transcontinental line?—A. Not necessarily and not likely, in my opinion; but I can only express an opinion. I believe that these questions, much as I would like to answer them, when put to me will not lead to anything. I can only give vague opinions, which are not worth anything.

Q. (By Mr. LITCHMAN.) In the combination of these roads through the community of interest, what is your opinion in relation to the capitalization, whether it has been proper or excessive?—A. I do not believe that there is such a thing as excessive capitalization. It may be to the inexperienced, naked eye; but if you will take the market value of the stocks and bonds of different systems you will find how, finally, the actual market value adapts itself in one company to the market value of another company which may have an entirely different capitalization. In other words, while the "A" road may be capitalized at \$50,000 a mile, and the "B" road may be capitalized at only \$25,000 a mile, parallel lines let us say, you will find the \$25,000 capitalization in the market will probably sell for just as much as the \$50,000 capitalization.

Q. You think the market discriminates in over capitalization so-called?—A. The investor does. It is just like a natural law that works silently. The market value of competing lines exactly adapts itself to the relative level of each other's capitalization.

Q. Does not that estimate of value depend somewhat and even largely upon honest accounting on the part of the railroads themselves?—A. Well, you must always assume that people are honest.

Q. How far would you approve what is called the system of public accounting or public examination of accounts to secure that honesty?—A. Those are such large problems that I would not wish to give an off-hand reply to questions touching them.

Q. You see no objection, however, in having some guarantee that the information given of the standing of a railroad shall be accurate?—A. I believe that any dishonest action should be made punishable by law. As it is, I believe we do not need laws so much as we need to have our laws properly enforced.

Q. Is it not your experience or within your knowledge that there have been instances of dividends being declared that were not earned?—A. With reference to the corporations with which I am connected, I know that no dividend has ever been declared that has not been earned. Nor do I know as a fact, if you asked me the question, I could not point out a board of directors who have declared dividends that have not been earned.

Q. Do you not think that it has been done?—A. I believe, in general, directors act upon the figures before them. I believe that very generally directors are perfectly honest when they declare dividends.

Q. How far would you go in making the responsibility of the director personal for any misstatement of that kind?—A. There would be some difficulty in making the director personally responsible except for gross frauds, just as you could not make any one responsible for any negligence, except gross negligence.

Q. It is a matter of common notoriety that, in some corporations, what I have stated has been done; that dividends have been declared that are not earned. Now, where these corporations have their stock on sale in the open market and innocent purchasers buy on the strength of the reports made, ought there not to be some means of protecting these people when these reports are found to have been false?—A. Personally, I think it very wrong to declare a dividend that has not been actually earned, or for which a reserve does not exist. In conservatively managed railroads the earnings of one year are never paid out as an entirety. A railroad may earn 6 per cent and declare only 4 per cent, putting 2 per cent aside for a rainy day. I should not think it wrong if, in the following year, the railroad earned only 3 per cent and appropriated 1 per cent out of the excess from the previous year to keep its dividends uniform. But I would consider it wrong where a railroad company declared a dividend and practically had to create new capital to pay it.

Q. It would also, of course, be wrong for a railroad to declare a dividend one year and almost immediately afterward go into the hands of a receiver.—A. Decidedly wrong.

Q. (By Mr. FARQUHAR.) Practically in Wall street the worth of a stock is its earning power, is it not?—A. Yes.

Q. That is the financial rule of the street, is it not?—A. That is not only true in Wall street, but it is also true all over the world. The value of property is in the first instance determined by what it can produce. Every other value given is speculative.

If a road does overissue stock on presumptive earnings or extensions or by a vote of the board of directors is not that water practically eliminated by the rating that the market puts on the stock itself?—A. Almost always.

Q. Always?—A. Almost always.

Q. In other words, do not practically the financiers of Wall street squeeze the water out of the fictitious stock?—A. I do not know what you mean by the financiers of Wall street.

Q. I mean those who handle the finances of the road—all the railroad stocks and shares of the country.—A. I believe, as a rule, there are a very few companies or boards of directors that can increase their capital stock without a vote of the stockholders. So, if as you say, the stock is unjustly increased it is done by the owners of the property and not by the boards of directors.

Q. The point is this, that in the main the owners of large blocks of shares of a road can control all the lesser stockholders, and usually do.—A. Not as a rule.

Q. As a rule, is it not a fact that the motives and purposes of the road and the extending of its stock is controlled by the strong shareholders?—A. I believe every intelligent shareholder nowadays acts independently, and if anything is proposed by what you call the larger shareholders that is not approved by the smaller shareholders, they make themselves very readily and very forcibly heard.

Q. (By Mr. LITCHMAN.) What is your opinion of stock dividends?—A. As a general proposition I do not believe that stock dividends are advisable, but there may be exceptions to this if the stock dividend represents cash value or earnings actually retained in the course of years from the shareholders. For instance, if a road in the course of 10 years has earned an average of 8 per cent per annum, which in 10 years would be 80 per cent, and has paid its stockholders at the rate of 4 per cent per annum which would be 40 per cent, and for some reason has kept the remainder as a reserve, and acquired new property with it, I can see no good reason why the shareholder should not have a just claim for that cash which has been retained from him, in some form, either in cash or new stock.

Q. In the case of new stock it becomes a perpetual burden on the public, does it not?—A. It does not involve a perpetual burden. If you or I take our money to day and build a railroad and for that investment issue stock—

Q. (Interrupting.) But the laws of the different States restrict the building of railroads, and special privileges are thereby conferred upon the railroads already in existence, are they not?—A. That does not exactly meet the case. For instance, if I own to-day a line of road from New York to Albany, and want to build a branch, say, from Albany to Saratoga, and if, instead of issuing new capital, I take my earnings or the earnings of the shareholders of the company to build that new road with, I should be justified, after that road is completed, in returning to the shareholders their money which has been used for new capital in the form of new shares.

Q. That is true. Now, supposing the road from New York to Albany is already built and the road from Albany to Saratoga is already built, and each has been capitalized to a fair capitalization on the cost of building; if you combine those two roads and add as much more stock, so that the stock of the combined two roads is double what it was originally, would you consider that a just proposition to the public?—A. It all depends. It is impossible to answer the question, because so many questions of value enter into it. I could not answer offhand except as a general proposition.

Q. How far ought there to be a return to the public at large (from whom the franchise comes) in the shape of lowering the passenger rate and the freight rate?—A. So far as I understand it, transportation rates in general will adapt themselves, also by a natural law, to the prevailing rate of interest. If other investments, on an average, return 4 per cent, railroad capital actually spent, through some silently working law, can not be made to return more than 4 per cent, no matter what you do to force it. When railroads had to pay 7 per cent and 8 per cent 20 or 30 years ago for their capital, freight rates were more than double what they are now. Now, where railroads have to pay 3½ per cent and 4 per cent and 4½ per cent for their capital, freight rates are about one-half.

Q. There has not been much change in passenger rates.—A. Yes, there has; they have been changed very materially.

Q. It may be on long hauls, but not very much, say from New York to Buffalo, in many years.—A. I know very little about railroad matters, but so far as I know passenger rates, per mile, have gone down just about one-half.

Q. The State of New York fixes on the New York Central Railroad a maximum rate of 2 cents. That is a part of its charter.—A. Yes.

Q. The point is this: If by over-capitalization the New York Central Railroad doubles its capital, of course it may only pay a 4 per cent dividend or a 5 per cent or a 6 per cent dividend on the double capital; yet if it was required to restrict its payment on the single amount of capital it might result, might it not, in the reduction of the passenger rate as well as the freight rate?—A. Not likely. If the State

of New York permits the New York Central, as it does, to charge 2 cents, naturally it is the tendency of the railroad to maintain the rate at 2 cents as long as it can. But in fact, it does not. The New York Central transports passengers to-day at considerably less than 2 cents per mile.

Q. (By Mr. KENNEDY.) I would like to ask you if there is any probability or danger of this community of interest in railroads running into industrial combinations, such, for instance, as the United States Steel Corporation, and that company or corporation receiving favors on account of this community of interest which would be detrimental to the independent iron and steel manufacturers?—A. Personally I have no experience in industrial finances. My firm has not occupied itself with them, and I can give you very little information.

Q. (By Mr. RIPLEY.) Did not your firm underwrite a part of the securities issued for the United States Steel Corporation, for the American Bridge Company, the National Tube Company, and others?—A. Community of interest exists among bankers too. Bankers as a rule are very good neighbors, and we meet each other and combine capital when we have large financial transactions—larger than our resources can handle; we ask others to unite their resources with ours to handle a given concern under our management. That is what is generally termed a syndicate, and such exist very generally. Now, while my firm, as I said before, as a rule does not occupy itself with industrial financing that does not exclude it from taking an interest in the financing of industrial undertakings, when the financing is managed by others. Your question is perfectly well understood. If large bankers who financed the undertakings which you have named invited our firm, we no doubt to a very moderate amount accepted the invitation, but we had nothing to do with the details or the management.

Q. Did you know of the principle on which the United States Steel Corporation was financed, or did you see the statement respecting the basis of that capitalization which Mr. Schwab made before this commission?—A. I read Mr. Schwab's statement very hastily and the comments on it, but I do not know anything of the details of the financing.

Q. You said some time ago that the capitalization of a road is at once seen in the price of the securities. Is it not, however, recognized among bankers that you can sometimes double the amount of securities without thereby cutting the price in half? Will not investors sometimes pay a little more than half in the case of capitalization doubled?—A. Very exceptionally. There may be instances. Human minds differ, and you may for some reason believe that there are possibilities and probabilities in a certain company, from which opinion I may differ; but that means speculation, and that has nothing to do with the real value. Hence the real value always finds its just level, as water finds its level.

Q. I was referring particularly to the case of the Chicago and Alton road.¹ Your firm financed the capitalization of that road a few years ago?—A. It did not. The Chicago and Alton was simply a readjustment. It was not a reorganization, but a readjustment. It was an old-fashioned organization which had become so heavy that it was impossible to move it to expand the possibilities of the road, and the stockholders simply got together and decided they would readjust the finances of the company.

Q. Your firm had to do with the readjustment?—A. Our firm were large stockholders.

Q. What was the amount of capital of that road before and after the readjustment?—A. I can not give you those figures. I can only give you the facts showing that, independently of the large capitalization, the charges for dividends and interest in the new corporation do not vary, I believe, 5 per cent from the charges and dividends of the old corporation.

Q. The capital was increased, was it not, from something like \$30,000,000 to something over \$100,000,000, including stock and bonds?—A. I am not aware of that.

Q. I wish you could recall the figures in that case—I mean approximately—simply to serve as an illustration of this principle you have mentioned?—A. What I can very clearly remember is that under the old financing the charges for dividends and interest were something like \$2,600,000, I believe, and under the new scheme of finances which the stockholders adopted they were something like \$2,700,000, notwithstanding the fact that something like \$10,000,000 new money had come into the road.

Q. The total values of stock and bonds was very largely increased, was it not?—A. They were increased, but the dividends which for 30 years had been at 7 per cent were reduced to 4 per cent, which is nearly a cutting in half.

Q. The point I wanted to bring out was whether there was any increase in the burden on the public which they had to make up in rates by reason of this large increase of stocks and bonds?—A. I think that point I have very definitely answered by telling you that the Chicago and Alton Company, which paid, under the old arrangement for very unsatisfactory service to the public, something like \$2,600,000 to its

¹ Compare testimony of Mr. T. F. Woodlock, p. 458.

bond and share holders, to-day for very much more efficient service, brought about by putting something like \$10,000,000 into the company, pays perhaps \$2,700,000.

Q. It pays 4 per cent now instead of 7 per cent as formerly?—A. Yes.

Q. Is there not a constant temptation to increase that rate of dividend from 4 per cent up to 6 per cent; in other words, to regard 6 per cent as a normal return on that capital?—A. There is no more temptation to increase from 4 to 6 than existed before to increase the old dividend from 7 to 10.

Q. Might it not excite public comment very much more largely to increase the rate of dividend from 7 to 10 than to increase it from 4 to 5, or from 4 to 6?—A. Not necessarily.

Q. In the case of the acquisition of the securities of one road by another, is there ever danger that that purchase may be made at a high figure, which is for the time speculative perhaps, and that that may be afterwards fixed in the capitalization of the two roads exactly as Mr. Litchman suggested in his question?—A. That depends upon the good judgment of railroad managers. The fact is that where the acquisitions have been made during the past year or two they have been made on much lower figures than now exist, because railroad managers have been farsighted.

Q. Was there not a statement made yesterday officially that the remaining \$60,000,000 of bonds of the Union Pacific road out of the \$100,000,000 authorized were to be issued?—A. I saw some such statement in the morning papers.

Q. The statement was likewise made that that issue was to secure the purchase of stock in the Northern Pacific road by the Union Pacific interests. Have you any knowledge as to that?—A. I believe such a statement was made in the papers.

Q. Have you any knowledge concerning it? Your firm was concerned in the operation, was it not?—A. Will you repeat the question?

Q. I say have you any knowledge concerning that matter? Are there any statements which you are willing to make? The point I wish to bring out is as to whether in the case of the purchase of stock of one road by another that purchase may be made at perhaps a temporarily excessive figure and afterwards fixed in the capitalization of the road. To apply it to this particular case, suppose that \$60,000,000 worth of bonds of the Union Pacific road— A. (Interrupting.) Let me interrupt you. That is a leading question, which I prefer not to answer.

Q. (By Mr. FARQUHAR.) Could you give us a general idea about the proportionate amount of American securities that are held in Europe and in this country?—A. It is very difficult. Nobody can estimate that proportion correctly. To attempt to do it would be merely a guess. I believe that to day the amount of American securities held in Europe is extremely small; and the greatest protection to the welfare and prosperity of this country that can exist, the great strength of the country, lies in the fact that to-day Europe holds very few of our railroad securities.

Q. In those great transactions which occurred a few weeks ago in Wall street, where your clearing house made returns of over \$600,000,000 a day, is it a fact known in financial circles that the parties to those great transactions had all the capital and money back of them to sustain and hold the stocks even at the great rises that were made?—A. Wall street in the sense in which you no doubt mean it—the stock exchange—is something entirely different from what we should term the banking business. Large banking houses have only to do with Wall street in so far as it represents a market for securities. If my firm or any other large firm wishes to buy stock, it has to go into the stock exchange, or Wall street as you term it, to buy it; but that is the end of it. Speculation is something different. We pay for the stocks and bonds we buy and use them for the purpose for which we want them. The enormous rise in values which has lately taken place has to a great extent been the result of market speculation. People got insane and went into what is popularly termed Wall street and bought on margins, and naturally something had to occur, as it always does, to bring down these unreasonably inflated prices, and it did occur.

Q. Is it not a fact that, even with the great rise in stocks, ranging from 5 up to 40 and 50 points, there was American money back of that rise to sustain and hold them, and that American wealth and money back of it kept Wall street from a Black Friday during this last 3 weeks?—A. I do not know what you would call a Black Friday.

Q. Because there was no money back of the Black Friday it went down.—A. American money and American wealth and prosperity keep and will keep prices to their inherent natural level. Legitimate capital and legitimate prosperity can not and never will be used to build up a level of prices which is not justified.

Q. I am very glad you made that answer. I would like to hear you, if it were not quite late now, on two questions—first of all, the banker's profit and the men who are the conservators of American capital and speculation, wherein the safety of even the purchaser of stocks consists in the fact that the American banker, even in the same panic that took hold of Wall street a few years ago, came to their aid with millions and held the market and kept stock owners from ruin.—A. The American banker did not come to the aid of the speculator or help the market, as you call it. The American banker saved, as he always has done and always will do, the legitimate owners of securities from being compelled to sacrifice them at any price.

Q. You have had a long experience in banking, and especially your firm here, and a great experience in foreign exchange and the balances in respect to gold, etc. Is it not astonishing to you to see the amount of American wealth and American money far over and beyond the 2½ billions of circulating medium that in the last 2½ years have come in through industrials and through railroads and through general stock investments? Where has all this capital been for the last 10 years?—A. That capital has been partly in the earth—gold and silver that has been taken out. Partly it has been created by the creation of wealth. Wealth when created must have something to represent it. What does represent it is the bank note. The bank note or the paper currency simply mobilizes immobilized wealth. It is for this reason that government circulation, in my opinion, is unjustified, for government does not produce anything, and should therefore not be the maker of the vehicle of wealth circulation. The makers of the vehicle of wealth circulation—currency—ought to be those who represent the producers of wealth—the banks.

Q. (By Mr. KENNEDY.) Are you a believer in and an advocate of government ownership of railroads and telegraph lines?—A. I do not think that our Government is adapted to any centralization of power such as would be necessary to the ownership of the railroads; but that is simply a personal opinion and of no value.

Q. (By Mr. TOMPKINS.) In what way would you suggest they should be controlled? Now that power is growing daily to be more and more in a few hands, in what way would you suggest that these utilities be controlled for the benefit of the people? Is it better that they should be in a few hands than under Government control?—A. I believe that the silent laws of nature are better correctives than any written laws can ever become; but it is the right of government, and especially of a government by the people, to legitimately regulate those concerns that exist as its servants.

Q. Do you think it would be desirable for the Government to undertake a control of the railroads similar to that it now exercises over the banks?—A. I have not given this matter sufficient thought to answer that question.

Q. (By Senator KYE.) One of the best laws known to economics and most beneficial to the public is the law of competition. Do you think the law of competition is going to be preserved?—A. Undoubtedly. Capital is becoming so strong and so easily obtained that the moment compensation for any service is demanded at a rate in excess of that at which it can be produced, competition will set in.

Q. Suppose the transcontinental roads were to be consolidated; it is quite an enterprise to build a parallel line to preserve competition?—A. If the transcontinental lines were ever to be consolidated, which I very much doubt will ever happen in this generation (I do not know what will happen in the next), it would be the most certain way of immediately bringing about the construction of another line.

Q. (By Mr. CLARKE.) In your own opinion, is wealth being consolidated in a few hands, or is there constantly a larger distribution of wealth with the increase of wealth?—A. I believe that to-day there are more wealthy people in proportion to population than there have ever before been in the history of this country.

Q. Do you anticipate that the consolidation of companies or the establishment of communities of interest will tend to concentrate wealth, or will have the opposite effect?—A. I believe that the condition of affairs as it now exists will contribute to a larger distribution of wealth than has ever before existed.

(Testimony closed.)

WASHINGTON, D. C., June 15, 1901.

TESTIMONY OF MR. U. N. BETHELL,¹

General Manager New York Telephone Company.

The commission met at 11.02 a. m., Vice-Chairman Phillips presiding. At that time Mr. U. N. Bethell, general manager New York Telephone Company, 15 Dey street, New York, appeared as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. PHILLIPS.) Will you give your name and address?—A. U. N. Bethell; 15 Dey street, New York.

Q. What is your present position?—A. General manager of the New York Telephone Company.

Q. What business were you engaged in before you took this position?—A. For a time I was a Government clerk in Washington, and at the same time a law student. Soon after my admission to the bar I went into the telephone business, first in the legal and financial departments and later in the operating department.

Q. How long have you been connected with this telephone business?—A. Since about 1889.

¹See also for various statements criticised by this witness the testimony of Mr. Parsons, pp. 173-179; also supplementary statement of Mr. Parsons in this volume, post.

Q. Now, I have no doubt that you came prepared to make a statement in regard to the telephone business, and the commission would be pleased to have you proceed in your own way to make such a statement.—A. I shall first tell you briefly of the development of the telephone industry in New York City, the rates that are charged, the principles embodied in the rate plans, and something of the profits involved in the business; and then, if time permit and the commission desire, I shall give you some facts relative to the telephone industry in foreign countries; confining myself chiefly to the European countries, first, those where there is government or municipal ownership, and then those where the business is conducted by private enterprise.

First, as to New York: The New York telephone system is now by far the largest in the world, and represents the greatest per capita development among cities of 1,000,000 or more in the world. The growth in recent years has been exceedingly rapid, and the number of stations in the system now amounts to more than 62,600. In speaking of New York it may be proper to say that I shall use the words "New York" to mean that portion of New York City as now constituted, comprising the boroughs of Manhattan and the Bronx. That is old New York City, which is generally known as New York to day. The New York company covers a much larger territory than New York City, but I wish, for the sake of clearness, to speak first of the conditions in New York City, because that will show you the conditions in a great city. The telephone business was begun there practically in 1878, and the period from that time to the present may be divided into two parts, the early period running from 1878 to 1894. At the end of the early period, 16 years, there was a total of about 11,600 stations, and during the later period, from 1894 to the present time, 7 years, there was a gain of 51,000. I do not wish to give the impression that the gain during that early period of the development of the telephone industry in New York City did not compare favorably with developments in other parts of the world; I think it did. But I wish, by presenting these figures, to show you graphically what a tremendous development has occurred in the last few years, and that statements made about the telephone industry a few years ago are not at all to be relied upon at the present time.

Q. (By Mr. LITCHMAN.) Where you speak of stations, you speak of places where the telephone is installed, do you?—A. I speak of the station as a telephone installed—that is, a set of instruments from which one may talk to another person, using a similar set of instruments at another place. Now, this growth has been exceedingly rapid during the last 3 years, the gain during that time being more than 37,500; and during the last 2 months the gain averaged almost 2,000 a month. A very conservative estimate of the conditions in New York at the end of this year will perhaps place the number of stations at over 72,000, probably nearer 75,000. Now, it is interesting to note the causes of this rapid, unparalleled development. First of the causes, I should say, is efficient service; and then a growing recognition of the utility of the telephone in conducting various commercial and social transactions; and, chief of all, the rates, including the principle that is embodied in the rate plans, and the actual reductions in rates that have been made.

In speaking of the efficient service, I will briefly outline what has been done in the way of providing plant from time to time. The policy of the company has been to adopt improvements whenever their worth has been demonstrated, practically regardless of cost. As illustrating this, I would say that during the earlier years, in New York as elsewhere, all wires were overhead, and single wires were used. That is, earth was used as a part of the circuit. The New York Telephone Company had a very extensive overhead plant. In the development of the art it was found that the proper thing for best service was a metallic circuit; that is, two wires connecting each station to the central office. Without such construction it would be almost impossible to handle long-distance traffic, and every station in New York for several years has been so connected and so equipped and so maintained that talking from it could be successfully carried on to the most remote points; so that the subscriber in his residence and the small shopkeeper talk to remote points with just as much facility and ease as a banker or broker or the largest subscriber in the system. New York was among the first to undertake this great work, and for many years has had an exclusively metallic-circuit system. When I speak of conditions in Europe I shall show that in a great many places overhead single wires are still in use; thus showing the continuance of methods in some larger European cities which we began to abandon in New York away back in the eighties, and completely abandoned many years ago. This great change in the method of working involved a reconstruction of the entire plant, covering a number of years—from 1887, approximately, to 1893. The overhead lines were sacrificed, the poles were cut down, and the wires were sold for junk. Iron wires actually brought nothing. We may say the whole line plant was thrown away, and this plant represented on the books an amount perhaps in excess of \$1,500,000. The underground cables that were first put in to replace the overhead wires, the types adopted being new and untried, were, many of them, faulty, and worked unsatisfactorily. That was a very expensive experiment, before satisfactory cables were obtained. A large switchboard at one of the company's central offices had just been completed at a cost of \$180,000, for single-wire working. Through

this change in the art it was necessary to modify it at an additional cost of \$80,000 before it could be used for metallic-circuit working. I only mention these facts to illustrate with what rapidity the changes in the art have taken place, and to what great expense telephone companies are required to go in a great city if they keep pace with the development. In the past 12 years some of the company's exchanges have been reconstructed three times. What we now view as the most important change was the introduction of the common-battery system about 3 years ago. That required the substitution of an entirely new equipment at all of the central offices and at all stations to put the system on an up-to-date plan of working. Now, in order to do that, the company abandoned a plant, that is, a central office and station plant that was perhaps sufficient to serve a system of 30,000 stations. This work has been of such magnitude that 3 years have been consumed in carrying it out. The final work is nearing completion, and before September the Manhattan system will be working on the new basis. Another thing that I wish to mention in passing is, that the gain in 3 years of 37,500 stations does not mean as much, taken as a single fact, as when you connect that gain with the fact that to make it, it has been necessary to connect about 62,500 stations, the difference between the two, or about 25,000, being disconnected through people going off. The net gain was 37,500 in the 3 years. Very recently a European expert wrote that New York has not only the largest, but technically the best, system in the world.

Now I come to speak of rates, and I shall divide the period between the commencement of the business and the present time, for our convenience, into two periods, substantially the same as those mentioned when I was speaking of the growth.

Q. (By Mr. FARQUHAR.) When you abandoned the system there, did you adopt the conduit for all your wires?—A. Yes.

Q. All over the system of New York?—A. What system?

Q. That is, the system of the sunk wire.—A. Underground?

Q. Yes.—A. Oh, yes.

Q. Is that system all over the Manhattan and Bronx?—A. Not over all the Manhattan and Bronx. That is all over Manhattan, and a very large part of the work is underground in the Bronx. When it was decided to change from an overhead to an underground system, laws were enacted by the State legislature prescribing the methods that should be followed. First, naturally, the densely populated, telephonically speaking, parts of the city were to be dealt with, and as rapidly as possible the work was to be extended to all parts of the city. At the present time there is not a pole line in Manhattan, outside of a very small section north of One hundred and thirtieth or One hundred and fortieth streets, excepting one main trunk line used for long-distance wires.

Q. Was this provision that was made by legislation made only for your own wires or were there any municipal wires placed in your conduit?—A. Municipal wires?

Q. Yes.—A. The legislation provided for the building of subways for all wires; but wires bearing low-tension and high-tension currents were not put in the same subways or on the same side of the street.

Q. Can you give the commission any idea how much it cost your company to make that change by throwing away the old system? You said a million and a half in one case, but in the installation of the new system how much was the cost of that?—A. Well, I do not believe that from memory I could separate that figure from the rest of the accounts, but perhaps I may be able to give you a clearer idea when I come to talk of the profits of the business.

Q. (By Mr. LITCHMAN.) Are those conduits established by your own company?—A. No; those subways were constructed and owned by a separate company.

Q. Under a franchise from the city?—A. It was pursuant to the act of the State legislature.

Q. Well, the city would have to grant the right of location, would it not?—A. Oh, yes; there was a board of electrical commissioners appointed under whose supervision the work was carried out. The functions of the board afterwards passed to other officials and are now lodged in a commissioner.

Q. (By Mr. FARQUHAR.) This commission was to form a subway system for the city of New York for all wires, was it not?—A. Yes. The work of the commission, as I remember it, as outlined in the several acts passed, was to invite the submission of plans and to adopt some general comprehensive scheme for transforming as rapidly as possible the overhead into an underground system.

Q. (By Mr. LITCHMAN.) I would like to know something about this particular corporation which controls the conduits or subways.—A. I am not connected with that company in any way, and the information I have given you is simply through a knowledge of the law, which is open to anyone.

Q. (By Mr. PHILLIPS.) Are the offices of the one company connected with the other company?—A. Some individuals are officers in both companies.

Q. (By Mr. FARQUHAR.) Is the subway company a separate corporation from the telephone company?—A. Yes.

Q. Totally separate?—A. Yes. There are two distinct corporations. The affairs

of the two concerns are conducted separately. There is a financial or stock interest between the two. As fully as I can state it, the relation is shown by these facts: It became necessary to bury the wires, because of their great number and also because there was a widespread popular dissatisfaction with the conditions, the streets being full of poles carrying all kinds of wires belonging to various companies. It was desired to provide a general plan for all wire users. But burying wires was a new experiment, and capital hesitated; it did not want to go into it, and the people connected with the telephone industry put up most of the capital, as I understand it, and made it possible to carry out a general and comprehensive plan of putting the wires underground. There was nothing in the entire transaction that was not in every way creditable to the telephone interests.

Q. Then it was a corporation formed to work in harmony with the Bell Telephone Company?—A. They have worked harmoniously, and the public has not suffered because of that, but, on the contrary, has benefited largely by it. Some of the other occupants of the subways may also have been interested, but to what extent, if any, I do not know.

Q. What other occupants of the subways are there?—A. Companies operating telegraph lines and electric lines of various sorts.

Q. (By Mr. PHILLIPS.) Electric lighting?—A. Electric-lighting wires carrying high-tension currents are in an entirely different subway system.

Q. (By Mr. LITCHMAN.) An electric-light wire, I understand, carries too high a voltage?—A. They generally carry too high a voltage to occupy the same subway with telephone wires.

Q. (By Mr. FARQUHAR.) Are not municipal wires put through the same subway?—A. The fire department and police department wires are in the same subways.

Q. Was there anything in the charter of the subway company providing that any competing company might have the right to lay wires?—A. The subways are open to all on equal terms under general laws. There is nothing exclusive about it.

Q. Proceed in your own way.—A. I was about to speak concerning rates. Now, during this early period, when single wires were used, the rates were all flat. By flat rates I mean that all subscribers having the same general character of equipment paid the same amount, whether they used the service much or little. In the early times, the business was commenced by renting the telephone, and the idea of renting telephone having once gained a footing remained for a long time. When the business grew and became large, that idea was replaced by another idea—the correct one—that the company's business was to render a public service, not to rent a telephone. During the very early days, the flat rates ranged from \$60 to \$150 a year for single-wire service, and later, when metallic-circuit service was introduced, they ranged from \$120 to \$240 a year. There never was a time when all New York subscribers paid \$240 a year. There were lower rates; for example, \$180 for residence service, \$150 for party lines, \$114 for a second line, and various other rates; but the business flat rate was \$240. That being the rate most generally used became known as the New York rate; and even at the present time some students of telephone matters will speak of the New York rate as being \$240 a year. This is especially true, I may say, of magazine and newspaper writers outside of New York City who have not kept posted as to the changes that have occurred.

The great growth which I have spoken of commenced in 1894, and it was in that year that the New York company adopted an entirely different plan of charging for telephone service in New York City. We call it the message-rate plan, because the message, instead of the station, is taken as the basic unit in making the rate. It is a very simple plan. The subscriber pays for the service rendered in his particular case. There is a minimum charge, for which the subscriber may send a stated number of messages, with additional charges for additional messages, the amount per message decreasing as the number of messages increases. Practically, the wholesale principle that applies in ordinary business transactions is applied. The rates in New York now range from \$24 a year up for exchange service. There are other lower rates for supplemental stations as low as \$8 and \$12 a year; but for the primary connection, by which the subscriber puts himself in relation with the other subscribers in the system, the lowest rate is \$24 per year.

Q. Is there any competition in the city?—A. There never has been any competition in New York City. In Manhattan, where there are about 60,000 stations, the rate ranges from \$60 a year up; that is to say, for \$60 a year the subscriber has the right to send 600 messages to any and all parts of Manhattan.

Q. (By Mr. FARQUHAR.) Will you state what this \$8 rate is—what the subscriber is entitled to?—A. In just a moment. There is no maximum rate; but the charges for additional messages ranging from 6 cents down to 3 cents are so arranged that the traffic-carrying capacity of a line in New York practically limits the total rate in most cases to approximately \$240 per year. It would be fair to say, therefore, that, excluding exceptional cases, the rates in Manhattan range from \$60 to \$240 a year, according to the amount of service that each man receives. There are other rates

for special conditions. For instance, there may be a demand for a particular kind of service in a particular place. Take Harlem. Harlem is a city within a city. It has its own theaters, newspapers, banking institutions, and everything that goes to make up a city—a very large city, too. There is considerable local sentiment. It is center for a large number of people whose transactions are within Harlem. In our constant endeavor to give the public every rate that they may possibly ask for, we have introduced a rate in Harlem under which the subscriber pays 5 cents for a Harlem message and 10 cents for a message to any other part of Manhattan or the Bronx, guaranteeing only \$3.25 a month, or \$39 a year from the combined business. This message-rate plan has been worked out also in a way peculiarly adaptable to large business concerns. In the old times when a large business house would try to transact its business over one telephone, the result was that the telephones were constantly reported "busy," traffic was impeded, and the service was bad. A man will give precedence to the message that he wants to send, over the message that somebody else wants to send to him. By trying to do the business over one line many subscribers practically close their doors to would-be customers or people who want to transact business with them. Now, to obviate this, we worked out, in connection with the message-rate plan, a scheme under which a small switch board is located on the subscribers' premises, and in the various parts of his building, wherever he may desire them, telephones are located. The rate for these telephones is \$12 a year each. This local switch board is in turn connected with the general system by trunk lines running to the nearest central office. These trunk lines are paid for at the rate of \$36 a year. The subscriber guarantees 3,600 messages a year, and may send all of the messages that he pleases for 5 cents each, or \$3 a hundred, which, considering that you have the message and the reply, is actually cheaper than postage. This has proved tremendously popular among the larger merchants and great institutions, newspapers and banks, and with the steamship companies and railroad companies. At the present time the company is operating more than 1,200 such private branch exchanges.

Q. (By Mr. C. J. HARRIS.) How many telephones would be on some of these exchanges? How high would be the largest number?—A. They run from 2, 3, or 4 up to 180. Now, in that connection I will take up your question about the \$8 rate. I said there were rates as low as \$8 to \$12 for supplemental stations. In hotels the rates for stations in connection with the private branch exchange are from \$8 to \$12 per year per station. There is another class of business, called interior service, even at lower rates, which I will speak of later on. To this message-rate system, or this plan of charging for what you get, I attribute largely the remarkable growth that has occurred in recent years.

Q. Is there no trouble in keeping count of the number of messages sent?—A. There is always trouble in all kinds of business, but it is not insurmountable. As to the fairness of the principle, the question was carefully considered by a committee of the New York legislature some time ago, and it reported as follows: "With a fair minimum rate as an equivalent for the possession and right to use the telephone, and a reasonable scale of prices for connections, if used, the toll system seems to have for both customer and company marked advantages over the flat rate." This whole subject was taken up by an English Parliamentary committee, and I will read you an extract from the Blue Book later. The plan has also been adopted by the German and Danish parliaments and recommended by the management of the Amsterdam municipal telephone undertaking, but not adopted. I shall give you the particulars of that when I come to speak of Amsterdam. It has been adopted also by the Government in Switzerland, and in Stockholm it has been followed by the private company, and the private company has far outstripped the Government in competition, which has offered flat rates only. But this message-rate principle has been more generally adopted in the United States than anywhere else in the world, and, so far as results are concerned, in the way of development of the telephone industry the conditions are more satisfactory in the United States than elsewhere.

Q. (By Mr. FARQUHAR.) Would it trouble you just here to explain the unfairness of the flat system in comparison with the message system?—A. Inasmuch as I do that incidentally to the presentation of these several reports of foreign governments, I would like to leave that until later. In a system where you have a flat rate, you can only compare that rate, other conditions being equal, with the average rate in a system where you have a graduated scale of rates. On the first of this year the average rate in the city of New York was \$87.62; now it is safe to say that it is \$85. This includes all stations, even the \$240 flat-rate stations, except pay stations, of which there are about 4,000 in Manhattan. The rate is 10 cents for a message from any one of these stations to any part of Manhattan, of which 8 cents goes to the company.

There is great misapprehension about this \$240 flat rate, as I intimated before. When the new rates were introduced the subscribers went very rapidly from the \$240 class over to the new rates, because they could save money by it and get all the

service they wanted for a much less sum of money. The company never abolished it, but the public has practically abandoned it. At the present time, at this rate, there are less than 1,400 stations out of a total of 62,600, or less than 2½ per cent, so that it becomes practically a negligible quantity. I take it that the rapid development of the telephone business in New York City shows tolerably clearly that the rates and service are generally satisfactory to the public. Those rates and the service furnished have attracted a larger degree of the public patronage than has been attracted by any other telephone company, whether operated by government, municipal, or private enterprise, in any other city of the same class in the whole world.

Another very significant fact is the absence of any general demand for a revision or reduction of rates. Some years ago when the flat-rate system was in vogue, a number of gentlemen (with the very best of motives but with a great deal of misinformation) went year after year to the New York legislature seeking some sort of relief from the burdens which they felt the public was carrying. They urged bills under different names and titles year after year, but all of these were so framed as to perpetuate the old flat-rate principle. I do not care to thrash out that old straw, except to say that, during the last 2 or 3 years, the conditions have changed so entirely that no business association from New York and no individual subscriber, so far as I know, has gone to the legislature to ask legislation of any sort on the telephone question. Formerly a number of important commercial bodies in New York interested themselves in the question, and we sat down with them and talked the matter over in a plain, common-sense, business-like way. Finding that we were solving a very difficult problem as rapidly as it could be solved, they concluded to leave the matter in our hands; and I think it perfectly fair to say that now many of those gentlemen, as some of them have already done in writing, would admit that, if what they urged a few years ago had been enacted into law, disaster to the telephone industry in New York and great public inconvenience would have followed.

Q. Well, were not those associations in New York, like the board of trade and transportation and others, justified, under your \$240 rate and its inequalities, in going to the legislature for remedy? Of course, when the rate fell, there was no necessity for agitation or further pursuing of these plans.—A. The \$240 rate was not an excessively high rate under those conditions. It was a particularly unfortunate rate; but, up to that time, the whole efforts of the management had been directed toward the upbuilding of a proper plant to render efficient service in New York; and, while there was some justification for public dissatisfaction, the remedy offered by the board of trade and transportation and others associated with them would have made the conditions far worse even than they were at that time. I think that is generally admitted now, because they were urging a flat rate throughout New York. The flat rate that they chiefly urged was \$125. At the very time they were urging that flat rate, the average message rate in New York was less than that amount. But there is always some dissatisfaction, because the public interest is best served by the operation of only one telephone system in a given area; that is, by the maintenance of a monopoly. That dissatisfaction is, as experience shows, always aggravated by competition. The causes of that dissatisfaction are erroneous ideas as to the profits of the business and misinformation as to the rates elsewhere, especially those abroad.

Q. You made a statement there as to monopoly and the necessity of unity in the operating of the telephone. Will you state what the disadvantages are of 2 lines, 2 companies, even under the same rates, to any business man?—A. I shall show you those disadvantages very graphically when I come to speak of Stockholm, because there we have the Government and a private company operating, and the disadvantages are clearly shown in the conditions existing in Stockholm.

Generally speaking, however, they are 2 systems doing the work of 1, frequently double rates to many subscribers, and an amount of annoyance and exasperation to the general public which must be experienced to be fully appreciated.

Now, as to the question of profits. The legislative committee that I spoke of a few moments ago, appointed by the New York legislature, which made a report in 1888, took notice of this abandonment of properties that I have spoken of, through the doing away with the overhead wires, and they placed the loss through that abandonment at three-fifths of the company's net earnings from its organization. They presented figures which, taking that loss into account, showed remaining net earnings for 7 years—that is the period covered by their investigation—to be less than 10 per cent per year. As I remember it, the exact figure worked out was 9.66 per cent. A great deal of misinformation has been spread abroad through figures, based on that report, which did not take into account the committee's statement respecting the losses, and which, therefore, were entirely misleading.

Q. (By Mr. LITCHMAN.) Do you mean to say that it was 9.66 per cent over and above the expense that you went to to install the new system?—A. Oh, no; the cost

of installing the new system certainly had nothing to do with the figures which I am speaking of. The net earnings of the company up to the time of this report were first ascertained. This committee decided that the loss through the abandonment of the old property, not the investment in the new property, would sweep away three-fifths of the net earnings accumulated up to that time, and the remaining net earnings, after that three-fifths had been swept away, figured out a percentage on the investment, as shown in the report, of less than 10 per cent per year. Is that clear?

Q. No, it is not; because I do not now understand whether you mean that after charging off the expense of this new installation the company was able to make a little less than a dividend of 10 per cent.—A. I am speaking of the period prior to 1888. Any money that the company laid out in the way of the investment after that date has no connection with the figure that I am talking about.

Q. (By Mr. C. J. HARRIS.) Why do you not put it in this way? I understand that the company would have paid less than 10 per cent with a proper deduction for depreciation which has to be taken into account.—A. That is exactly the idea.

Q. (By Mr. LITCHMAN.) It was not clear to me whether you meant that the cost of the abandonment came out of this little less than 10 per cent earnings, or whether it was paid out of the surplus that had been accumulated previously and held for possibly just such contingencies.—A. That is it; that is exactly the case; but the future or subsequent investment does not figure in that at all.

Q. Well, that would come out of your cost of construction, would it not—your new system?—A. The subsequent investment was made through funds raised in other ways.

Q. I understand. And the funds raised in other ways came either through the issue of interest-bearing bonds, which had to be paid, or through stock that was added?—A. Quite so; and I am coming to that period. I am dealing now with the period up to 1888.

Q. The cost of the abandonment of the old plant up to 1888 was compensated to the company out of the reserve or accumulated earnings. Is that a fair statement?—A. The legislative committee so reported. That committee made a very exhaustive report of conditions all over the State of New York; and I may say in passing that it reported as to every place except Troy (and in Troy it found some unusual conditions) that no telephone company had made unusual profits, and that some of them had lost money. It also reported that nowhere in the State had it found that excessive salaries were paid to officers.

Q. In figuring that did the legislative committee take up the question of capitalization? Let me go further and suggest this thought: If the capitalization, let us say, were \$5,000,000 on a certain plant, and the dividend earned was 10 per cent, it would seem a fair dividend; but if there was an overcapitalization of \$2,500,000, then the real earning would be 20 per cent.—A. Well, I take it that the legislative committee, being made up of competent men, if it had found what it believed to be an overcapitalization, would not have made the report in those general terms, because it could not say, under the conditions that you refer to, that exorbitant earnings had not been made. I would say, as to the New York company, that the committee's report did take into consideration the investment made.

The New York company paid no dividends from 1888 to 1896. Since 1896 it has paid 6 per cent per annum. A far more significant figure than that is the percentage of expenses to earnings. The percentage of expenses to earnings for some time has been about 65 to 67 per cent; during the first 4 months of this year the actual figure was 65.3 per cent. This percentage indicates only conservative management. Any larger percentage would be unsafe, and it would not be possible, with a much larger percentage, to get capital to make extensions to meet the public demands. I think that does not require any particular argument.

Now, I pass to the question of wages, which I wish to speak of briefly. The New York company has in New York City 3,615 employees, or approximately that number, at the present time. The pay roll of the company for its New York force amounts to more than \$40,000 a week, exclusive of officers' salaries. When Professor Parsons, whose testimony I have read, was testifying before this commission, he said when he came to this point that abominably low wages were paid to telephone operators and that in this country they were little, if any, greater than in Europe. Now, on the contrary, the New York Telephone Company pays very liberal wages. The hours are reasonable, and the conditions with which it surrounds its employees are the best, I believe, that any telephone operators in the whole world enjoy. The company has made a point of getting employees of a high character, and to that end has adopted a high scale of wages and in every way has sought to make its service attractive. It goes to a very large expense in providing retiring rooms, sitting them up properly for the comfort of operators when they are off duty, reading rooms, locker rooms, and resting rooms, where, if a girl is tired, she may lie down and rest for a time; and dining rooms, where the company furnishes tea, coffee, and milk without charge. A short time ago Mr. Lockwood Kipling, the English artist, father

of Rudyard Kipling, was in New York and came to look over the telephone office as a place of general interest. He went all through it, saw the girls at work, and made remarks on the provisions for ventilation and for the comfort of the girls when at work. Then he went through the operators' quarters, which have been provided for their occupancy when off duty. Of course, he also took an interest in the mechanical contrivances. He said, "I wish I could understand the whole thing, but I do not. But what I admire most is the humane way in which you treat your employees."

Q. (By Mr. LITCHMAN.) You say that the wages are \$40,000 a week?—A. The wages are more than \$40,000 a week.

Q. How many operatives or employees does that cover?—A. That covers, as I say, about 3,615. I can not give you the exact number of males and females, respectively, but I will do that if you would like to have it.

Q. That approximates \$12 a week on an average?—A. Yes; I have not figured it out.

Q. Not quite \$12 a week?—A. I would say, however, that the New York wages are from 50 to 150 per cent higher than the London wages, and the average is about double, and that New York wages are very materially higher than continental wages. Trained operators in Europe get from about \$2 to \$6 a week. The trained operator in New York is paid from \$8 to \$12 a week. When a girl is first employed she serves a period of apprenticeship, learning the business, and we pay her a nominal sum—about \$3 a week while she is learning. As soon as she is able to go to work she is advanced, and again when she is able to occupy a position at the board, when skilled, the pay is from \$8 to \$12 per week. There are female employees in the switch rooms getting \$15 or \$17 a week, wages such as are paid nowhere in the European countries. For linemen, wiremen, inspectors, and mechanics generally the European average is about \$6 a week, possibly a little higher, but not much. In New York similar grades are paid from \$12 to \$21 a week.

Q. (By Mr. KENNEDY.) You say in Europe. Now, you are making a comparison of Europe with New York?—A. Of European conditions in particular.

Q. Are you picking out the great cities in Europe to make that comparison, or is it all over Europe?—A. I am giving wages paid in European cities.

Q. (By Mr. FARQUHAR.) Does the wage question enter into the details you have for European countries?—A. Yes.

Q. Each country separately?—A. Yes.

Q. When you speak of this general average, how high a class of service comes into that—clerks and salaried officers, or are you speaking only of operatives and employees proper?—A. I am speaking now of the operators, linemen, wiremen, and mechanics generally. Foremen are paid from \$7 to \$9 in Europe; in New York, from \$18 to \$25 a week. Now, in the higher grades the differences are even greater than these. An exchange manager in New York is paid as high as perhaps the highest engineering officer in some of the European telephone systems. The hours of labor for men are 8 hours a day in New York; in Europe you will find that 10 hours generally constitutes a day's work. Taking the employees as a whole, some work 7 hours, some 9, but the great body of the employees work 8 hours a day.

Q. (By Mr. LITCHMAN.) Do the girls at the boards work 8 hours a day?—A. The girls at the boards have various shifts. The service is maintained at all hours, Sundays and holidays, all the year round. One of our rules is that the operator who works on Sunday shall have a day of rest, with pay, in lieu of the Sunday on which she works, in order that she may have at least 52 days of rest during the year, exclusive of her vacation.

Q. (By Mr. LITCHMAN.) Now, that brings up another point. Is your weekly computation on the basis of 6 days a week or is it on a basis of 7?—A. There is extra pay for Sunday and overtime. Our men are all paid extra for overtime. A man working over 8 hours a day gets extra. It is regular time, and time and a half time under different conditions.

Q. Is it true that you run the switchboards on substantially 3 shifts a day of 8 hours each?—A. Well, that is not quite true.

Q. One will lap over another, I presume, so that the work continues?—A. Yes; the work is continuous, but there are not 3 regular shifts.

Q. I understand that; I understand what you have in mind.—A. There is a night force and a day force, and the arrangements are such that operators going on early in the morning go off early in the afternoon, and those going on later in the morning remain later in the afternoon. They have an hour at noon, and there are 2 rest periods—one in the morning, the other in the afternoon. The actual employment ranges from 8 to 84 hours a day.

Q. When does your day shift come on?—A. The telephone traffic is peculiar. It is very light during the night. In the early hours of the morning it does not amount to much, but at 10 o'clock or 11 o'clock it goes up with a bound. It goes down again at noon, during the lunch hour, when people leave their business places for a time,

and then again in the afternoon at 2 or 3 o'clock it goes up to a very high pitch, and off again toward evening. We must have more operators on duty during the busy hours than during the slack hours; and these facts are taken into account by the managers who regulate the hours of operators.

During my connection with the company we never have had a strike or a labor trouble of any sort that I am aware of. We endeavor to anticipate every demand that might reasonably be made, and as a result we have never had a grievance presented from any body of employees. On a few occasions some of our men have, in a proper way, presented some request or other, and we have, on looking into the matter, considered it proper to grant the request. No one, when once employed by us, can be dismissed except for cause, and then only with the approval of an officer of the company.

Q. Now, one question further in relation to the effect of the work upon the girls—that is, upon their nervous system. Have you noticed any effect of that kind?—A. We have very few resignations, except when a girl gets married or gets a better position. By better positions I mean that, through the building up of private branch exchange systems, which I have spoken of, a demand for a high class of telephone operatives has been created in New York. In one of our exchange districts—nearest the Battery—there are more skilled telephone operators getting good salaries with business houses on private branch exchanges than there are in the central office. A new demand for labor has been created. It is well paid and well treated. That has made a great draft upon our operating force.

Answering your point more directly, I may say that a short time ago, during one of these epidemic scares, the board of health of New York sent an inspector to look through the various central offices to see the conditions under which the operatives worked and examine the girls physically, in order that there might be no danger of a spread of contagious disease should one develop. He reported officially that he found all the conditions under which the operators worked most excellent, and that he found no ill health among any of the operators.

I was speaking of the causes of such popular dissatisfaction with telephone matters as exists, and referred to misinformation about rates and conditions in foreign countries as one such cause. There are many obvious difficulties in the way of making fair comparisons. Perhaps the most misleading practice—unfortunately a very common practice—is that of comparing the respective conditions and rates in places widely differing in size. We need not consider the proposition, as it is frequently stated, that in rendering telephone service the cost per station increases as the number of stations increases. Stated in that way, the proposition is a very difficult one. What we really should consider may more properly be stated in this way: The amount to be paid per year or month by a telephone subscriber in a large city should properly be more than that to be paid by the subscriber in a small town. This is particularly true when the station is taken as the unit of charge, and the correctness of the proposition is very generally accepted.

The almost universal practice by private companies and governments, except Switzerland and Sweden, is to charge more for telephone service in a large town than in a small one. It is practiced everywhere throughout the United States, England, France, Belgium, Austria-Hungary, Germany, and elsewhere. All proposed legislation on telephone matters, so far as I know, has been framed in recognition of the principle. The German parliamentary report contains an indorsement of the correctness of this principle. There is an indorsement of it in the Amsterdam report, where the municipality conducts the enterprise. This custom is also followed generally in the United States. It is not followed in Switzerland and in Sweden for special reasons. In Sweden the Government charges even a lower rate in a large town than in a small one, because it is in competition in the large town with a private undertaking, and it is not in competition in the smaller places. In Switzerland, where there are few large cities, the entire state is treated practically as one exchange system, with a uniform rate throughout.

Trondjhem, a little town away up in Norway, was referred to in testimony given before this commission as being a remarkable instance of the results of cooperative or municipal telephone management. The Trondjhem system is at present owned by the Norwegian Government and shows a very slow development, much inferior to that of many places of similar size in this country. Trondjhem has a population of 30,000 and at the first of this year had only 1,175 telephone stations, the gain during the last year being 75 telephone stations, or 6.8 per cent. On either side of the American continent you can find places much smaller than Trondjhem and places that are about the same size where the telephone development is very much greater and the increase in the use of the telephone very much more rapid. I shall only mention one in my own territory. Take the town of Larchmont. We have per 100 inhabitants 18 telephones, against Trondjhem's 3.8. We have in Spokane, Fresno, and San Jose, on the Pacific coast, respectively, 10.3, 12.4, and 12.6 per

cent, against Trondjhem's 3.8; so that it is not necessary to go to Norway to find illustrations of large development in small places.

Another thing I think I ought to refer to in this connection: The rate of the expense of operating a certain telephone system in the Interior Department was spoken of before this commission. Now, in connection with the legislative work at Albany, which I spoke of a few minutes ago, I had occasion to look into that Interior Department service at one time. I found that the system was confined to a few buildings, those occupied by the Interior Department and its branches, all near together and connected with a very few wires—a very cheap system. The Government, however, invested, as I remember it, \$6,000 in that plant. The witness stated that the Department substituted its own for 65 Bell telephones previously used, and that the Department had been paying \$600 a year to an operator. After the change he says the operating cost was \$6.43 per station, a total of \$417.95, and that the total cost, including interest, depreciation, and repairs, was \$10.25 per station; that is, \$248.30 for interest, depreciation, and repairs. The investment being \$6,000, interest alone at 4 per cent would amount to \$240 per year, leaving \$8.30 for depreciation and repairs. As to depreciation, I shall show in a moment how short lived the system was. As to repairs, I think it perfectly safe to say that the services of one man were engaged almost exclusively in trying to keep the plant in repair. But why go further in this analysis? The figures appear to be ridiculous, but should we accept them as correct, what then? In New York we have interior systems which we furnish and maintain for rates ranging from \$6 to \$12 a year per station, the subscriber paying the cost of installing the necessary wires on his premises. The operator or clerk who attends to the switching is the subscriber's employee, but that item of expense is more than offset by the salary of the repair man in the Interior Department case. On the question of depreciation it is proper to ask, What became of the Interior Department system? In official reports, which are open to anyone's inspection, it was declared that during the 2 years it was tried not 1 day—that is the way the officer put it—not 1 day was the service satisfactory; and he declared that after 2 years' trial it was worse than the old messenger system which they had previously had for communication between the Departments, and recommended that unless it could be put in first-class condition it be abandoned; and it was abandoned.

Summing up his testimony on this point, the witness said: "About \$10 for what used to cost \$7.5 under the old Bell régime, the cost under private ownership being sevenfold more than under public ownership." You will note that he says "what used to cost," notwithstanding the fact that in one case he deals with a small, compact, and inefficient system, and in the other with a telephone service extending over this entire "city of magnificent distances." It seems hardly possible that one who holds the views respecting the difference between the costs of furnishing telephone service in large and small places could be so misled as to make these assertions in a serious discussion. If a student of these questions is so misled, what may we expect from the ordinary layman?

I shall pass on without attempting to demonstrate why the rate in a large city should be greater than in a small city, because of the almost universal acceptance of the proposition, unless it is desired that I do so. Much information on the point, I may say, will come out incidentally in the extracts from parliamentary reports and papers of that kind in connection with my statement on European conditions.

Q. (By Mr. KENNEDY.) Have you any official correspondence from the Department covering that point?—A. I will give you the official papers covering this point. (See Exhibit A at end of testimony.)

Now, just a word about the character of the service furnished in New York. It is possible for the service in a given area to be cheap at \$150 and dear at \$50, according to the character of the service furnished. I have already explained the policy of the New York company with respect to the introduction of improvements. The plant is maintained at all times so that the service is absolutely permanent and reliable. We have a method of testing the rapidity of operating, under which certain tests are made, without the operator's knowledge, of the time taken between the subscriber's signal and the answer of the operator, and the other periods of time through the entire conversation or through the entire message. Now, for the last 3 or 4 years, those tests have shown that the average time elapsing between the giving of the subscriber's signal and the answer averages, from month to month, from 3 to 5 seconds. In only one case during the last year and a half did the average go over 5 seconds, and it was then less than 5.5. This, I think, shows a rapidity of operating that should be, and I believe is, entirely satisfactory to the New York public. There are exceptions, of course, but, in the main, service is entirely satisfactory on that point. Mr. Cedergrén, the manager of the Stockholm company, who has succeeded in outstripping the Government in his competition with it, occasionally comes to New York, and he has on more than one occasion given the New York service the highest of praise. Mr. Martin, a very competent expert, and editor of *The Electrical World and Engineer*, recently, in one of his editorial articles, com-

pared the New York and European service, and showed that the New York service was far superior to that which he had found anywhere in Europe. Now, in many European cities the grounded circuits are still in use. That has a great effect upon service; and the service is so faulty and unreliable through lack of discipline that it is not relied upon except in minor matters. I will say that in some of these cases, as I shall point out, the inferior service is perhaps not so much the fault of the management—as in London or Glasgow, for example—as it is the result of municipal interference. Take London, for instance. The company has sought for a great many years to put its wires underground, because there has come to be such a multitude of wires that it can not properly take care of the service with overhead lines. But they have to deal with 42 vestries there. One vestry will permit them to go underground and perhaps the next adjoining one will refuse permission to go underground, and so they have no comprehensive system at all; and it is part underground and part overhead; and the service is consequently admittedly very bad.

In comparing New York conditions with European conditions, you must also consider whether the service is self-sustaining or not, and you must consider the relative purchasing power of money, the varying conditions of living and wages. In many of the governmental systems they pay nothing for rights of way. No rents are charged up against the telephone service, and in Paris the entire cable system is in the sewers, for which no charge is made. As I have already pointed out, a flat rate is fairly comparable, even when all other conditions are the same, only with the average rate, when you have a flat rate in one place and a message rate or graduated scale in another place. Thus it will be seen that because of the complexity of the matter and the great differences obtaining between different places the greatest caution is necessary in making comparisons. There is no common factor—no common denominator—to make the problem simple or easy of solution.

Q. (By Mr. LITCHMAN.) I would like to ask you if you have any data covering any city now where there are rival exchanges, and can give a comparison with the rate charged by the Bell Telephone Company before, and the rate charged after the establishment of the rival telephone company?—A. In my own territory we have had opposition in 3 or 4 towns of considerable size. There has been no opposition in New York City; but in the suburban towns there has been opposition. We operate 21 towns outside of New York, and there has been opposition in 4 of them. We have not put, in those places where there is opposition, any rates or given any service that we have not given to every other town of like size and circumstances in the territory, and our systems have grown and practically wiped out the opposition systems in each of the towns referred to.

Q. (By Mr. FARQUHAR.) What towns do you refer to?—A. I refer to Mount Vernon, New Rochelle, Sing Sing, and Nyack.

Q. (By Mr. C. J. HARRIS.) You say you have done this without putting down the rates and cutting as against these other companies?—A. We have never introduced in any of those places a rate that we have not given to the whole territory under like circumstances.

Now, in speaking of European conditions, to avoid confusion, I shall express all money values in American equivalents, because there are so many differing values in coins that it would be very difficult to follow; and in mentioning the populations of various places I shall make my statements in even thousands. Perhaps I ought to say one word about the sources of my information. I have twice visited Europe personally for the purpose of looking into the telephone conditions there, and in the fall of 1899 I visited the countries of France, Belgium, Switzerland, Austria-Hungary, Germany, Holland, Denmark, Sweden, and England and obtained information from public documents and reliable sources on the ground. Statistics for the first of this year have been obtained from official sources by correspondence. I shall not make any statements of fact, at least I shall try not to make any statements of fact, that are based on private information. Everything is based on public documents, information that is available and open to anyone, or on personal observation.

Now, as to France. A company operated the telephone industry in France until 1889, and since that time it has been a Government monopoly. The development is practically nothing outside of Paris, and there are more telephones in New York than in the whole of France. At the beginning of 1901 the population of Paris was 2,536,000, with 33,000 telephones, about 50 per cent of the total in France. Only 4 other cities had more than 1,000 stations. In mentioning these I shall compare them as I pass along with an American city, so that you can see the relative development in the two countries. Lyons, population, 466,000; telephones, 2,267. Cleveland, population, 285,000; telephones, 8,492. Marseilles, population, 442,000; telephones, 2,151. Cincinnati, population, 325,000; telephones, 9,142. Bordeaux, population, 256,000; telephones, 2,009. Milwaukee, population, 285,000; telephones, 8,492. Lille, population, 216,000; telephones, 1,064. Louisville, population, 204,000; telephones, 5,049.

There is a very large development relatively in Paris which is due, in a great measure, to the inferiority in other means of communication. The rates are not relatively low. The Paris system is technically far behind the times. There are a few modern appliances, but much of the old apparatus used by the company before the Government took hold of the business is still in service. Of places where the telephone is under Government control it is fair to say that, except possibly in Belgium, one can not find a less efficient service in any large European city than is found in Paris. The fact that the subscriber buys his own instrument, and that the Government has approved 500 types of instruments, from which the subscriber may select any one, will give some indication of the possible character of the service. There is a very lax discipline because of the employees all being civil-service employees. The only way of maintaining discipline is to go through a very tedious and long process, which prevents the heads of the departments from taking any action whatever. The provincial conditions outside of Paris, technically speaking, are much worse, even, than in Paris. As to rates: In Paris the company charged \$120 a year; the Government has charged and now charges a flat rate, business and residence alike, of \$80 a year. The rate will be reduced in 1902, in accordance with a law recently passed, to \$60 a year, if the requisite plant can be provided by that time. I refer to this because it is already announced in many quarters that a reduction to \$60 has already been made. The subscriber bears the cost of the instrument, plus a part of the cost of the line, because, in Paris, the subscriber must pay for the line from the underground cable, which is in the sewer, to the station; and, if he is beyond the fortifications, he must pay for the whole cost of construction beyond that point. In towns outside of Paris the rates range from \$30 to \$40. But I shall offer nothing to show that those rates are considered high, considering the purchasing power of money in those places and the character of the service furnished, except the figures that I have already referred to, showing the absolute lack of development in those parts. In Paris Government buildings are occupied by the telephone administration, and so far as the published accounts show no rents are charged for that occupancy. They pay nothing for rights of way, because their lines are in the sewers; and, for the same reason, they are free from the cost of subways, which, in almost all other large cities, is a very heavy expense. Their cables are all laid in trenches right in the sewers. The men draw them down through, carry them, and place them in the trenches, and they can do it very quickly and very easily and very cheaply.

As to wages in France. The operators get about \$6 a week, and the linemen and mechanics \$7.20 to \$8.50, with 10 hours as a day. They keep no separate telephone accounts, so it is impossible to say whether it is self-sustaining or not; but, considering the low wages and the freedom from usual charges, the Paris rate is relatively much higher than the New York rate of \$85. And, considering the extra charges and the amount and character of the service, the Paris rate, plus extras, is absolutely higher than the New York rate.

Passing on to Belgium. The industry there was conducted by a company up to 1889 or 1890; since then by a Government monopoly. The first of this year, in all of Belgium, there were 14,920 telephones, or about one-fourth of New York alone. In Brussels, with a population of 560,000, there were 4,525 telephones; in Antwerp, population 278,000, there were 2,802 telephones—about the most meager development in any European or American city.

In general, the plant which was installed by the company before the Government took over the business in 1890 is still in use. The central office equipment is completely out of date, and almost worn out. They erected a building at Brussels, which was unoccupied for several years, on account of delay in deciding upon what style of equipment to put in. Single wires or grounded circuits are generally in use, although work is under way for installing a metallic circuit. In general, the service, plant, and methods are one with those that were abandoned in the American cities in the 80s. The company rates were adhered to as to the grounded circuits, but the rates were raised for metallic service. In Brussels and Antwerp the grounded circuit rate is \$50 and the metallic circuit \$70. Elsewhere, outside of the two cities of Brussels and Antwerp, the rates range from \$25 a year for ground circuit, and for the metallic circuit, \$54 up. That these are considered high rates is shown by the amount of patronage that has been developed. Operators get from \$1.90 to \$2.77 per week. They pay nothing for rights of way. The plant is starved and run down. Belgium is a cheap country, especially with respect to labor, as nearly everyone knows who has visited there. In all the cities dogs are beasts of burden; in the country districts women till the fields, and in the cities they clean the streets and perform other kinds of hard labor such as in this country would nowhere be assigned to women to do. The telephone accounts are not separately kept or published; but the assertion that it pays its way would not be surprising. The rates are, relatively, kept so high, and the systems are kept so small, and the expenditure for their maintenance and for furnishing service are so inadequate, that it would probably be fair to assume that the Government does make some sort of a showing in its accounts.

But of course, in considering this, the general conditions of development, and the facilities afforded the general public, should be taken into consideration.

Q. (By Mr. LITCHMAN.) Are you comparing a limited rate in one country with a limited rate in the other, or an unlimited rate in one country with a limited rate in the other?—A. I am comparing the unlimited rate—that is, the flat rate, wherever it exists, with the average rate where there are various rates, in the other place. I am not comparing the minimum rate where there is a general scale, with the unlimited rate in any other place. I think that is a fair way of making the comparison.

Q. (By Mr. FARQUHAR.) What New York rate are you taking?—A. I am taking the \$85 rate. That is the average rate of all stations excepting the pay stations.

Q. (By Mr. LITCHMAN.) Is not that for all intents and purposes an unlimited rate?—A. I shall discuss that a little more fully when I come to London, because there the conditions are more favorable to such a discussion.

Q. (By Mr. C. J. HARRIS.) You have just said that in Belgium the telephone system pays the Government. Do they pay fixed charges on the money invested and allow for depreciation and all that when they say it pays? Are you familiar with that?—A. I did not mean to say that the Government says it does pay. I meant to say that, in view of all the conditions, I should not dispute a statement that it did pay, although no such statement has been made, because they do not keep their accounts separately. The postal, telegraph, and telephone accounts are all merged together, so that no one knows what the conduct of the telephone industry costs them, or whether or not they make the allowance, in their accountings, that you inquire about. The rates are relatively high, the systems small, the wages low, and the plants, through a lack of reasonable expenditures, are kept in very poor condition. Under these circumstances they ought to be able to show a profit.

In closing about Belgium, I would say that, as to the telephone development, nowhere in Europe or America has private management, whatever its embarrassments or burdens, made anything like so poor a showing as has been made by the Belgian Government.

Switzerland does not properly come within the scope of my talk, which is about large cities chiefly; but Switzerland is such an interesting country, telephonically speaking, and it is so often referred to by writers on telephone subjects, that I shall, in passing, say a few words about the conditions there.

The population of the whole country in 1900 was 3,300,000. Of telephones there were 85,864. There are no places comparable to New York as to size and general conditions. Zurich is the largest place, with a population of 152,000, and it has 6,000 telephones. There were private companies operating in some of the large towns at first, but these were bought out by the Government, and there is now a Government monopoly all over the State. The rates are uniform in the various parts of the country, without any regard to the difference in size of places. The subscriber pays for the first year \$20, for the second year \$14, and for the third year and subsequent years \$8. Now those rates are frequently quoted as being inclusive for telephone service in these Swiss cities, but those are the charges only for the privilege of having a telephone, what you might call the charge for maintenance and keep-up, the privilege of belonging to the State's telephone club, so to speak. But every time you use the telephone you pay an additional charge. That additional charge is 1 cent for local messages. Take 400 messages at 1 cent each and that makes \$4. That added to \$20 is \$24, which is the annual charge during the first year for 400 messages. Now, in our Westchester towns that I have spoken of we have a rate of \$24 for 400 messages, and we give a vastly superior service to that furnished in these Swiss towns. That is not all, because, in the Swiss towns, mileage is charged, and in the larger cities the extra charges amount to as high as \$150.

I will read two brief extracts from a report, made in 1899, by the director of the municipal telephone system in Amsterdam to the aldermen of public works on a proposed revision of the telephone tariff. Respecting the Swiss rates, he says:

"In Switzerland the fixed subscription after the first 2 years is, to be sure, only 40 francs (\$8), but this amount is charged for only such connections as are situated within 2 kilometers' distance from the central exchange. Whereas, for connection beyond this distance—and there are many like this in Switzerland—an extra fee is charged of no less than 4.50 francs per 100 meters. A subscriber, for instance, who resides 5 kilometers distant from the head office, as also might be the case here in this town (Amsterdam), pays in Switzerland a fixed subscription of $40 + 30 \times 4.50$, or 175 francs (\$35) per year."

Thus far he is speaking only of the fixed subscription, which does not include the right to send a single message without additional payment. As to the additional charges for messages, this is what he says:

"In the whole of Switzerland the price for local calls is 5 centimes (1 cent) for all subscribers, no matter whether they make much or little use of their telephone. Subscribers who, for instance, make 10, 30 to 50 local calls per working day—and such subscribers in the systems of Basel and Zurich are not uncommon—pay, there-

fore, above the fixed subscription of the average of 70 francs (\$14) a year, respectively, 150, 450 to 750 francs (\$30, \$90 to \$150) a year for their local calls."

Very often, therefore, we have misleading information about Switzerland, because we are given only a part of the truth about those rates.

In many American towns and cities, I think, more and better service can be had for less money than in these Swiss towns. The plant there is cheap and inferior. Grounded circuits are still in use and the equipment is antiquated. There has been a very small outlay for maintenance. They pay nothing for rights of way, except in a very few cases, because of a practice established by the company which the Government has not been able to break entirely away from. The post-office collects their accounts, and wages are low. Skilled operators are paid \$4, wiremen and chief operators, in large central offices, \$7; linemen, etc., \$4.20 to \$6; foremen, \$6.50 to \$8.40 per week.

As illustrating the cheapness of things there: On the Geneva street railway where work was going on in 1899, when I was there, the workmen were paid 8 cents an hour, which, with steady employment and 10 hours per day, would make \$1.80 per week. The Swiss people are frugal to a degree undreamed of anywhere in this country, and all classes of labor are very poorly paid.

Q. (By Mr. LITCHMAN.) I was going to ask you whether this same discrepancy in wages did not apply to other industries as well as to the telephone?—A. I think it does, as indicated by the instance cited.

We come to a very interesting matter—the financial results in Switzerland. The telephone receipts in 1899 were \$1,007,011 (there they keep the accounts separately), and their expenses were \$1,251,803, a deficiency of \$247,792. The expenses were practically 125 per cent of the earnings. That would mean the worse kind of bankruptcy if it were a private concern.

Now, suppose for a moment that you consider these expenses as adequate. In order to do that you would have to ignore the very inefficient service and low wages. But, considering these expenses as fair and reasonable for the service furnished, the earnings would be less than one-half what commercial safety would require.

It is not very difficult to fix responsibility for these conditions in Switzerland. The technical staff is in no way to blame. The rates and plant have been brought down to the present conditions against their repeated recommendations. The telephone has practically been a political plaything in Switzerland, and, possibly with the very best intentions, in response to popular demands the service has been starved and the rates have been run down until the whole business is on a most unprofitable basis. Now, the department is facing the necessity of putting in metallic circuits in order to render service that will be at all acceptable. That will involve a tremendous outlay and an increased annual expense for maintaining the better service when already there is a deficiency, and the raising of rates is practically impossible.

The commission then took a recess until 2 o'clock p. m.

At 2.10 p. m. the commission reconvened, and the testimony of Mr. Bethel was resumed, as follows:

Q. (By Mr. C. J. HARRIS.) You might resume where you left off this morning.—A. When we left off this morning I had just finished talking about Switzerland, where, under Government ownership, with rates that ranged perhaps as high as in American cities of the same size, and with a very inadequate expenditure in the way of maintenance, an out-of-date plant, inferior service, and low wages to employees, the telephone operations during 1899 had shown that the expenses were 125 per cent of the earnings. Now, with just a few words about Austria-Hungary, I shall pass on to Germany.

In Austria several private companies conducted the business until 1894 and 1895. Since then the Government has, after purchasing the plants of the companies, operated the business as a Government monopoly. Practically the same conditions as to relative development in the large cities and in the small cities holds here as was pointed out in the case of France and Belgium. That is, nearly all of the development is to be found in the greater cities—in Austria, chiefly in Vienna, and in Hungary, chiefly in Budapest.

The Vienna plant was bought by the Government from the company, on a valuation fixed by experts, in 1894, the Government taking possession on the 1st of January, 1895. As shown by the public documents covering the history of the case, it cost the Government \$1,600,000. There were then between 7,000 and 8,000 stations. This is equivalent to \$200 or more per telephone station. Either through rapid changes in the art, or because the plant taken over from the company was out of date, the Government soon after began the construction of a new plant. They put up two very handsome buildings and laid out a comprehensive underground system, and provided the offices with new equipment throughout, so that in 1899 there was very little, if any, of the old plant which it had taken over from the com-

pany still in use. The Government, up to that time, had expended \$1,200,000 on its plant.

The number of stations in Vienna at the first of this year was 13,326, and in all Austria there were 31,902. Vienna's population is 1,635,000. Chicago, practically the same size, had more than twice as many telephones.

The Vienna rate was \$40 when the company operated it, and that rate has been continued by the Government. Elsewhere in Austria there is an installation charge or entrance fee, as they call it, of \$40 per kilometer (per five eighths of a mile), plus \$20 per year. The rates are thus relatively high enough to prevent any development, as has actually been shown, in the State outside of Vienna. They pay nothing for rights of way in Vienna. The wages are low. Operators receive from \$1.80 to \$3.40 per week; linemen, etc., about \$5 per week.

In the official documents relating to the transfer of the property from the company to the Government it was stated by the company that, should it continue the business, in order to protect its stockholders and creditors it would be necessary to raise the rate, which was then \$40.

In Vienna the telephone has been a particularly unfortunate victim of Government ownership, for reasons not connected at all with mismanagement and not involving any misguided action on the part of the legislators. You are all familiar with the political troubles that have grown out of the race question there. For several years there was no session of their Parliament and no appropriations made to the telephone business. The telephone business is peculiar, in that it requires constant additions to its capital account or it must stand still. It is not like a railroad, where the track is built and finished, and you have your investment, and the rest may go on operating expenses. You must have a constant and continuous addition to the capital account or growth must stop. That is exactly what happened in Vienna, through no fault in the telephone management or of anyone in particular, but through the conditions I have stated. Their funds failed them and they had a large waiting list and general dissatisfaction resulted.

There is another striking case illustrating that same point—not in Europe, but in Japan. There in Tokyo, where there is Government ownership, growth was not exactly suspended, but the Government was not able to take care of the business that was offered—was not able to furnish the facilities that the public demanded—and applications were dealt with in the order in which they were received. So there arose speculation in the rights of priority for connection, and those rights sold as high in some cases as 7 times the annual subscription for the telephone.

In Hungary there is no development, outside of Budapest, worth speaking of. In Budapest there are 5,796 telephones, with a population of 729,000. With the exception of two Russian cities, Moscow and Warsaw, Budapest has the lowest development in Europe or America among cities of from 500,000 to 1,000,000 inhabitants. Several American cities of one-half the size have twice the number of telephones. That is four times the development.

The people in Budapest are considered very progressive. Their city has been almost entirely reconstructed in recent years. They have put up some magnificent buildings, and they had the first electric underground railroad in the world. As to the telephone, however, their plant is antiquated, their service is inferior, and their rates are the same as in Vienna. That these rates are relatively high or that the service is exceedingly poor is fairly shown by the lack of development. The wages are even lower than in Vienna. They pay no rights of way, and, as a rather significant example of the powers that the Government reserves to itself, I may say that it has licensed a private company (the Telephone Newspaper Company) to string its wires throughout the city, attaching them to the public buildings and to private property without any compensation whatever to the owners.

I come now to the subject of Germany. Patents were never allowed for the telephone, and the Government has monopolized the telephone business from the beginning and operated it as a part of the postal and telegraph business. There has been a very large development in Germany, especially in large cities which have been favored by the German rate policy. Until very recently they have had uniform rates through the Empire; that is, the same rate in a great city as in a small city. This policy was changed by law in 1899, and since the adoption of new rates in 1900 there has been some growth in the smaller places, but relatively the conditions have not changed much. There are 720 telephone centers in Germany; and Berlin alone has 25 per cent of the total stations. Nine large cities have 52.5 per cent of the telephones, leaving 47.5 per cent to 711 other cities and towns. At the beginning of this year Berlin had 47,586 telephones, against 54,647 in New York, the population being approximately the same. The 1900 census figures give New York a little larger population than the last available census figures give Berlin, but I have seen, in places that may be considered reliable, statements as to the population of Berlin which make the two cities practically the same.

Q. When you speak of the population of Berlin and New York do you mean Man-

hattan Island or Greater New York?—A. In all this testimony I am speaking of New York as comprising the boroughs of Manhattan and the Bronx—the old New York, not the greater city.

A point that has often been overlooked when considering the Berlin service is that the service was rendered, until 1899, only from 7 o'clock in the morning until 10 o'clock in the evening. Since 1899 they have been rendering a night service, but they charge extra for calls made during the hours from 10 o'clock at night until 7 o'clock in the morning.

The lines are largely single wire, and a very large percentage of them still overhead. The same policy with respect to wires has not been pursued in Berlin as in New York. That is to say, they have supplemented their overhead wires by the underground plan, because the wires became so numerous that they could not carry them overhead; but they have not replaced, in a general and comprehensive way, the overhead system with the underground system.

In Berlin, too, the subscriber does a great deal of operating; that is to say, he calls the central office with which he is connected, and he must then work his own way from that central office to the next, and so on; whereas, in New York, we so supervise every call that the subscriber has nothing to do but give his order; and then the operators take care of it until the two people are put into communication. On the whole, I think the Berlin service is hardly comparable with the New York service, but I do not mean to say it is not satisfactory to the Berlin public.

Now, this uniform rate that I spoke of as holding through the Empire, until April 1, 1900, was \$37.50. At that time, flat rates, varying from \$16 to \$45, and minimum message rates from \$20 to \$30 were put into force. All rates now vary with the size of the town. The administration had many times reported to the German Parliament that the Berlin system did not pay, and various rate propositions were considered. As a result of that, in 1899 they enacted a law putting into force these rates I have mentioned. The Berlin rate was increased 20 per cent. Of the total number of subscribers throughout the whole Empire, 67.8 per cent (over two-thirds of them) were increased, 26.8 per cent were decreased (that was in the small towns), and 6.4 per cent were not changed. Thus the recommendations that had been made by the technical staff from time to time were followed.

The postal, telegraph, and telephone accounts are all merged together. No separate accounts are kept for the telephone service. Berlin is proverbially a cheap city. Wages, rents, and almost all other items that enter into the cost of furnishing a telephone service range from 2 to 4 times as high in New York as in Berlin.

Q. (By Mr. C. J. HARRIS.) I would like to know whether, in these running expenses, they allow anything for the capital invested in building these lines?—A. I think no one can answer that from any official documents, because the accounts for the 3 departments are all merged together and no separate accounts are kept for the telephone operations. But the fact that the administration reported to the Parliament that the rates did not pay, and that the Parliament, after consideration of the matter, raised the rates, seems to me ample justification for saying that the rates were not profitable in Berlin. That is the rate we so generally hear about, and it is the rate that writers on the subject usually use.

The fact that the public patronage or development is less in Berlin than in New York shows that the service and the rates are not more reasonable, from the German standpoint, than are the New York service and rate, from the standpoint of the New Yorker. Considering the character and amount of service, and the purchasing power of money in the two places, the rates in New York are lower than in Berlin.

Now, as to the responsibility for this inferior service, so far as grounded circuit lines are concerned. The technical staff has frequently urged the adoption of the metallic circuit, but this recommendation was disapproved of by the ministers, who would not spend the money, because they thought it was spending money on an unproductive industry. But at last, in 1899, \$1,000,000 was appropriated to begin the work of changing from the grounded circuit to the metallic circuit, and that work is now going on.

Night service was not rendered at all until considered by Parliament, and was commenced on November 1, 1899, and then only on the payment of extra charges.

A revision of rates was repeatedly urged. The unfairness of the uniform rate and its unprofitableness in great cities, such as Berlin and Hamburg, were frequently urged. This shows a tardy and incomplete response to the recommendations of the technical staff.

I will read a portion of the report of the commission to revise rates. It bears on some questions asked this morning as to the message rate plan. This is an extract from the report of the commission to revise rates, 1899. (Reading:)

"The present mode of charge for telephones, according to which all subscribers to the telephone system of the Imperial Post and Telegraph Administration have to pay the same annual sum of \$37.50, regardless of the size of the town or telephone

area and of the amount of use of the service, has for years past given rise to complaints on the part of the public, and to numerous questions in Parliament.

"The justice of the complaints, from the point of view of the telephone users, can not be denied, the conditions existing in the various towns being so different that a uniform tariff can not be considered a right one. It is justly felt that it is not fair that subscribers in Berlin and Hamburg, who can communicate with 30,000 and 12,000 telephones, respectively, should have no more to pay than the inhabitants of a town with 50 or 100 subscribers.

"A juster division of the present charges, which will maintain the revenue at its present rate, is, therefore, the problem to be solved in a sensible reform of the telephone tariff, which does not alone consider the success of the moment. And, in fact, it will be found possible to comply with most of the wishes expressed if the expenses of the telephone service are divided more among the subscribers in proportion to the use and advantages derived than has hitherto been the case. The relief given to subscribers in small places might be considerable if it is determined to make the larger and more promising places pay a little higher scale.

"The most just method is to readjust the charges so that each subscriber shall pay according to use. There would thus be different rates, not only in different towns and systems, but also between different subscribers in the same place.

"The expenses of the telephone system increase not only absolutely but also relatively, in proportion to the increasing extension, inasmuch as, especially in the larger towns, the increase in the number of subscribers augments the expense of each single subscriber, on account of the installations of the exchanges becoming ever more complicated."

You will see that thus far the report not only indorses the message-rate system as a proper system but gives reasons for adopting it. (Reading:)

"A general adoption of the proposal, however, is impossible on account of practical difficulties. It would only be possible if reliable automatic counting apparatus existed, which would afford a perfect protection against tampering on the part of the subscribers.

"The public is used to a fixed rate, and experience shows that, in most cases, they prefer a rate which they may know beforehand to payment by calls, the recording of which might cause them trouble and inconvenience."

Thus, after indorsing the message-rate principle, they declared its adoption impossible because of practical difficulties which have been completely overcome, not only in the United States, but also in some European places, and for the reason that it might be unpopular they compromised by adopting new flat rates—to vary with the size of the system—and supplementary message rates, notwithstanding the alleged practical difficulties.

Only a word about Bavaria. It is, of course, a part of the German Empire, but its telephone system is operated separately by the Bavarian telegraph department. They have the same rates and the same policy as to rates as exist in other parts of Germany. The general conditions are about the same. Munich has 8,500 telephones, Nuremberg 3,500. Seventy-one other centers have only 6,000 or 7,000 altogether. The technical staff has been a little more successful in having its recommendations adopted, and consequently the plant and the service in Munich are somewhat better than in Berlin.

Holland is particularly interesting because of the municipal ownership in its 2 leading cities of Amsterdam and Rotterdam. A private company conducted the industry in these cities until 1896, when they obtained franchises from the State for 25 years. Viewed superficially and narrowly, it may be said that at Amsterdam the municipality on taking over the business reduced the rate, improved the service, in 3 years increased the number of stations by 50 per cent, and made a profit. Let us go further with a view to ascertaining the whole truth if possible.

The reduction in rate was insignificant in amount, and moreover it was a mere shifting of taxation. The company's rate was \$47.20 per year; the municipality's \$36 at residences and business places for the exclusive use of the subscriber and \$46 for hotels, restaurants, and places accessible to the public, plus in each case an installation charge of \$10. Taking this last item into account, it will be seen that the reduction was on the whole very slight, and that in certain cases there was an actual increase. But there is another fact that must be taken into consideration. Under its franchise the company was required to pay the city 21 per cent of its gross receipts, which going into the communal treasury operated to lessen taxes in other directions. In 1894, the last full year of the company's concession, the percentage amounted to \$17,125.20. In 1898, notwithstanding the large increase in the number of subscribers, the communal treasury received from the telephone industry \$20,000.

The slight increase, it may be safely stated, was more than offset by the increase in the community's general expenses due to its telephone operations, to say nothing of the use of public buildings for supporting wires and fixtures for which no charges were made. Hence the communal treasury suffered by the change; in other words, whatever reduction was made benefited telephone subscribers at the expense of the general taxpayer. Therefore the municipality is entitled to no credit for an alleged reduction of rate.

Touching the question of reasonableness, it is very significant that at The Hague, the telephone industry is conducted by private enterprise at a rate of \$24 a year. In other European cities where private companies operate there are larger systems and lower rates than in Amsterdam.

The service is unquestionably better now than it was under the company's administration. But the present service is not so much a superior service as the former was an inferior service. Measured by other and fairer standards the present service loses its preeminence. What always happens under a limited franchise happened in Amsterdam. The telephone business in a way peculiar to itself calls for constant additions to capital account, and thus far in its history has called for constant and extraordinary outlays for reconstruction and substitutions. Hoping to undertake the business itself, the municipality opposed an extension of the company's franchise and was successful. Having no assurance of life, the company made no extensions or improvements. It did nothing to develop the business; there was no growth—only 1,700 stations in 1896. The municipality offered for the company's plant an amount equivalent to \$47 per station. This being refused, the municipality built a new plant, its investment being at the end of 1898 equivalent to \$182.80 per station. With its new plant and with a skillful and enterprising manager an improvement in the service was inevitable, an improvement which was particularly noticeable to those who had suffered under the previous miserable condition, due largely to the obstructive tactics of the municipality. But the Amsterdam service is by no means as efficient as that rendered by private companies in the Scandinavian countries, for example, or in this country. The feature that most condemns it is its insignificant scope—its entire inadequacy for so large a city.

This brings us to the question of development. Fifty per cent in 3 years sounds large, but if you remember the starting point it means but little. Compared with that in cities of the same rank in this country or even in Europe, where private companies operate, the Amsterdam development is absolutely insignificant. At the first of this year Amsterdam, with a population of 513,000, had 4,462 telephones. There are 61 American and European cities having a population of 200,000 or more. Arranged in the order of telephone development, Amsterdam stands 58 in the list. Among the cities of its class (from 500,000 to 1,000,000) Amsterdam stands at the very bottom of the list, with the exception of Budapest and Brussels, in both of which cities there is Government control, and of the 2 Russian cities of Moscow and Warsaw.

Let us compare Amsterdam with an American city and then with an English city. Amsterdam and Boston are fairly comparable. They are about the same size, Boston being a little bit larger. Both are seaports; both cities of commercial importance and activity. I have already given you the figures of Amsterdam. There are 4,462 telephones there, or 8.7 per 1,000 of population. Boston, with a population of 560,000, had 23,780 telephones, or 42.3 per 1,000 of population against Amsterdam's 8.7.

Now, comparing Amsterdam with Manchester, England. Manchester has 543,902 population and 10,647 telephones; or, per 1,000 of population, 19.6 telephones against Amsterdam's 8.7; and Liverpool has 20.1 against Amsterdam's 8.7. So it is not necessary to take an American city to show that the development is higher under private enterprise. Even as compared with European cities under private enterprise the development in Amsterdam is exceedingly low.

Q. (By Mr. CLARKE.) How does the suburban population of Amsterdam compare with that of Boston?—A. The point you mention is a very important one. Municipal boundaries and telephone-exchange boundaries are not coextensive. Around every great city the suburban places are of consequence and usually the very center of their business and social life is in the city. The municipality can serve only within its own area, or else conduct a business beyond its borders where it has no jurisdiction. Amsterdam's activity is practically confined within the municipal limits, and, as a result of that, the development in the suburbs is practically nothing, while the development in the suburbs of Boston and of New York is greater even, relatively speaking, than the development in the cities themselves. This limitation on its activities, considering the peculiarities of the telephone business, is one that I think is entitled to the greatest weight in considering this question of municipal ownership.

Q. (By Mr. LITCHMAN.) Have you entered upon the question at all so as to show a comparison between the strictly city traffic and the suburban traffic—that is, the

city within itself and the traffic between the city and suburbs, taking a city like Boston or New York?—A. I do not quite understand.

Q. I understood your testimony to be that the telephone service in the United States is appreciably affected by the service between the city and the suburb, the development of the suburbs being such that new lines were constructed rapidly for service between the suburbs and the city.—A. Quite so.

Q. I wanted to know whether you had carried it far enough to make the comparison between the suburban service and the city proper.—A. I have here a report of the mayor and aldermen of Amsterdam concerning the action taken by them, and their report on the effect of the telephone industry there. It appears in this report that there is practically no development whatever except within the very heart and center of Amsterdam, because their rates are considered so high in such territory as is included within their concession outside of the heart of the city that there is no development. Now, in New York City and its suburbs (including the cities within 35 or 40 miles of the New York city hall, the towns along the Jersey coast in Monmouth County and those on Long Island) there are over 100,000 stations. I think these facts show the relative development between the two places.

Q. My question went one step further, and that was to ask if you had any data which would show how large a proportion that suburban service was of your entire service?—A. You mean what proportion of the telephones are in the suburban territory? I have stated already that there are 60,000 telephones in New York and over a hundred thousand in the whole territory.

Q. You mean by the whole territory Greater New York or that under your jurisdiction?—A. I am speaking now of Greater New York and those portions of New York State, New Jersey, and Connecticut within 33 or 34 miles of New York City—the Jersey coast towns and the Long Island towns.

Q. And New York City proper has about 60 per cent?—A. Sixty per cent of the total, but you may remember that I cited this morning the case of Larchmont, where the development is about 20 per cent. There is a telephone for every 5 people—practically one for every family; and the same, or a little less, percentage runs through all these towns, none of them being so small as is found in New York proper.

Q. Is the suburban traffic considered profitable, or is it carried on as a necessity as a feeder to the main plant?—A. I think no one can tell exactly what any particular branch of the business costs. It is so complex that you can only estimate it and form your own opinion. A half a dozen men might have half a dozen opinions on the subject. The aim in fixing rates is to make each community carry its own burden as nearly as possible and pay a fair share of the general expenses of administration. The same may be said of the several kinds of business—the trunk-line business and the exchange-line business. Of course there may be places which for the general good must be served whether at a loss or not. They are essential parts of the system; the territory is developed as a whole; every part of it is provided with reasonable facilities.

I was speaking about the conduct of the telephone business by the municipality. Another point worth mentioning here is that Rotterdam and Amsterdam are both cities of great importance and activity. They lie close together, half an hour apart by rail, have frequent trains daily, and their entire interests are closely tied together; yet because of no central control, because each municipality is proceeding for itself, there are different styles of equipment, different engineering methods are followed, different rates are offered to the public, and the general practices are different.

I have spoken of the reduction in rate, the improvement in service, and the increase in the number of stations; there is but one point left—that is profits. The concession accepted from the Government, it should be mentioned in the first place, shows that a profit accruing to the communal treasury must not be depended upon from the telephone service. The stations are concentrated in the center of the city, close to the central office, and the system is very small, as already shown. The traffic is light, because there are so few places which the subscriber can reach. The statistics for 1897 show that one-half the subscribers sent on an average only 500 messages during the year. Labor, rents, etc., cost but little in Amsterdam. Operators are paid from \$2 to \$4 per week; linemen and mechanics, \$6.40 to \$8 per week—10 hours a day. The salaries and wages of the entire Amsterdam staff in 1898 were but little more than twice as much as the New York company expended in the same year for tea, coffee, and milk furnished its operators at no cost to them and the wages of waitresses employed in serving them. The entire Amsterdam rent roll was less than the rent paid by the New York company for quarters for its operators when off duty at one of its offices—not one of the large offices, but one of moderate size; one serving about the same number of stations as there were in Amsterdam. As indicating in general the cheapness of labor there, I may say that shop girls work-

ing from 8 a. m. to 10 p. m. have an average pay of \$2 per week; policemen and firemen, \$4.80 to \$5 per week; and for unskilled labor, \$4 per week is considered good pay.

The cost per station for the year, including working expenses, interest, and depreciation, was less than the New York company's outlay per station for labor alone. In 1899 a majority of the committee for the management of the communal industries formally recommended, after a careful analysis and study of the telephone accounts made with a view to the modification of the telephone tariffs, that the existing rates be continued for large users, and that a slight reduction (\$6 a year) be made to those sending 500 or less messages per year, with an extra charge of 4 cents for each message in excess of 500. A minority of the committee recommended the maintenance of a uniform rate, two members advising the trifling reduction of \$4 a year, and one strongly opposing any reduction whatever, because the costs per subscriber were already too high to warrant it, and it was anticipated that they would increase rather than decrease in subsequent years. This member forcibly remarked that a reduction would totally or partially wipe out the amount contributed by the telephone industry to the general fund of the community, and for this he could see no single sensible ground.

The mayor and aldermen determined that no reduction whatever should be made. I shall read an extract from their report to the town council:

"The fact must not be lost sight of that the working expenses per subscriber, as the trade accounts show, were higher last year than during the preceding year, and that the average expenses for construction were also considerably increased. Whether these expenses have already reached their maximum can not safely be stated; there is ground rather to think that they will further increase during the next few years. Contrary to what one observes with other businesses, with the telephone the expenses do not decrease in proportion of the increased number of subscribers, as every new subscriber requires new capital charges, on which interest has to be paid and on which depreciation has to be written off; and, further, the expenses of the service are not only increased by the amount which is required for attending to the new subscriber, but also with the additional cost incurred on behalf of the older subscribers. How large this amount will be is difficult to say at present, but this is certain, that by an increase in the number of subscribers the number of combinations to be made on the multiple switchboards will increase to such an extent that an increase of the service expenses per subscriber must naturally result. The question whether it would be desirable under these circumstances to decide upon a reduction of the telephone tariff we undoubtedly think we ought to answer in the negative. There can be no question of a reduction of any importance, whereas a small reduction would cause so great a loss to the communal revenue as to be out of all proportion to the small advantage which would accrue to the subscribers."

The so-called profits therefore are represented by payments made to the communal treasury, which, so far as one can tell, may or may not have been consumed by administration expenses incident to the telephone industry. If so, then there were no profits. If not, the profits were a charge upon the industry for the benefit of other municipal industries operated at a loss. In any event, the so-called profits were to a large degree fictitious and misleading.

I spoke of the energy with which the telephone plant was provided by the municipality when it was at war with the company. That was largely due to the enterprise of one man, a retired army officer, who pitched into the work and with great zeal built a plant and had it ready to operate within a year. If you should go into his central offices now, you would find them neat and clean, because Holland is proverbially clean. The manager, appreciating that the development was exceedingly low and that the conditions did not compare favorably with what was being done in the rest of the world, obtained authority to visit other places. He went to Stockholm, Copenhagen, Berlin, and Switzerland, the object being to determine what was being done in the way of message rates in these places. He made a very elaborate report and a very interesting one, in which he, summing up, showed there were no difficulties with the message-rate system on account of the necessity of counting the calls. On this subject he reported general unanimity in all the countries he had visited, and said that the question of introducing message rates need not be dismissed on account of the difficulty attached to the counting of the calls. He recommended a message-rate system and an installation charge, then a maintenance charge and a traffic charge. He said: "The whole tariff has been arranged in such a manner as through cheapness and fairness to render the development as quick and the service as efficient as can possibly be done." Speaking of the existing rates, he says: "The high telephone tariff and the irrational and unfair arrangement thereof blocks the way to proper development." Then he pointed out that a modification of the plan of charging was just as essential as a reduction in the rates themselves. Now, let us see what happened to his report. It was made to the

committee for the management of communal affairs. After a very long time and after careful consideration, apparently, a majority of that committee, as already stated, reported that they considered it fair to divide the subscribers into two classes, and to retain the existing rates for large users and the message rate, with the minimum of 500 messages, at \$30, plus 4 cents a call for the remainder. Now, the statistics of 1897 show that one-half of their subscribers averaged 500 calls a year and one-half about 2,500. They said that by the report of the director it was proved that there was no objection to the counting of calls, and that if message rates were adopted there would be a reduction of rate to a good many of the present subscribers and the telephone would become a boon to a large additional number of inhabitants. That is exactly what the message rate has done in New York—reduced the rate to a very large number of subscribers and been a boon to an additional number of inhabitants.

Q. (By Mr. FARQUHAR.) That is the motto, pay for what you get?—A. Pay for what you get. Now, some of the committee objected to this because the working cost per subscriber would be increased by adding new subscribers. Some thought that the rate to heavy users should be raised. This was objected to by others because for the present rate an unlimited number of calls was already allowed. They therefore thought that no change should be made. The majority, however, recommended that the ordinary subscribers, excluding hotels and like places, should be given the choice between the existing rate for unlimited use and this message rate of \$30 for 500 calls plus 4 cents per call, which is not only relatively, but I may fairly say absolutely, as high a rate as is charged in American cities for the same amount of service.

Q. (By Mr. LITCHMAN.) Is not the charge in American cities 10 cents a message?—A. No; the charges in New York City range from 6 cents to 3 cents. We are talking about the message-rate plan and not the public rate. Now, I have given you what the majority wanted to do on that committee. A minority could not agree to this at all, and its chief objection was that there was no automatic counting device, hence the calls must be counted at the exchange. The subscriber should have the right to complain, but finally he should be subject to the decision of the administration. Therefore, on this account the telephone in Amsterdam would become in the highest degree unpopular. The minority also reported that, no matter what was done elsewhere, it must be borne in mind that they were legislating for Amsterdam and that the Amsterdam people would not submit to official rules. So the minority recommended a uniform rate. Now, two members of the minority favored a reduction of the existing rate, and the three members could not agree upon a rate.

Now, with all these varying views presented, when the matter came before the mayor and aldermen of Amsterdam, after discussion, they decided to leave matters as they were, so that, while the technical staff desired to reduce rates and enlarge the facilities which the public required, and to develop the business, which the figures quoted show needed development very badly, its recommendations were all disapproved, chiefly, as is shown by the extracts from the report I read, because of the fear if the recommendations were approved the results would not prove popular. I think they were mistaken in that, because quite the contrary is proved wherever the companies have struck out to develop the business, and have provided the facilities that the public demands at rates that are fixed on a graduated scale.

At Rotterdam the rates range from \$26.40 to \$38.40 per year, plus an installation charge of \$8. In 1896 there were 1,000 telephones, and at the first of this year 3,089—making, with a population of 309,000, about ten telephones per 1,000—only a little better development than that of Amsterdam. In this entire record and in the whole telephone history of Amsterdam, considered in the light of the conditions that have prevailed and the results that have been accomplished in other cities of the same rank both in Europe and America, there is not a single fact, whether it relates to rates, scope or character of service, development, economy of administration, or the general welfare of the community, that argues for the municipal ownership and management of the telephone industry.

I shall pass now to Great Britain. The telephone was early held by the courts to come under the telegraph act of 1869, which made the telegraph a Government monopoly. The postmaster-general having, under this decision, the exclusive right to operate the telephones in Great Britain, and being unwilling or unprepared to directly exploit the new and doubtful enterprise, granted licenses to various private companies, limiting the operations of each to a specified area, and providing for the payment of a royalty to the Government of 10 per cent of the gross receipts. All of these licenses were made to expire in 1911.

The restriction to specified areas by preventing interurban communication proved most unsatisfactory, and in 1894 other licenses, which removed all restrictions and limitations as to the area in which the licensee company could operate, were granted. These new licenses were also made to expire in 1911. As a result, trunk lines were

very rapidly built between the several telephone centers, and the business in trunk-line traffic grew up.

Now, for a time the post-office endeavored to establish competing systems. You must remember that the Government was operating the telegraph and it feared that the telephone would make inroads on its revenues. It was a growing means of communication. So it started competition, but met with no success, notwithstanding the fact that it was taking 10 per cent out of its rival's earnings as a royalty. In Newcastle, the only place where the Government has had an exchange of any considerable size, the Government exchange was established before that of the company, but it has never had more than 650 subscribers, while the company's exchange in that place had, the first of this year, 3,748 stations. In Leicester the Government exchange had at one time several hundred subscribers. It now has none, while that of the private company has 2,305. In all other towns the Government's competing exchanges have entirely disappeared.

The next step in the history resulted in an amalgamation. For some time after 1884 there was a considerable telephone development, and it soon became clear that to get the best results there must be uniformity of system, similarity of method, concentration of administration and management, and complete intercommunication between all subscribers. The outcome of this was amalgamation and the formation, in 1889, of the National Telephone Company, which is now operating all over Great Britain. One of the first results of this amalgamation—although, as I said, none of the amalgamated companies had been in competition with another—was a reduction in rates practically to one-half of the former figures.

It is interesting to say right there that concentration under private management produces better results than under Government management, as is illustrated by a little incident in connection with the Swiss railroads. When the Government was planning to take over the railroad there it was urged as one important point in favor of the work that whereas there were three headquarters of the various roads which were to be taken over and three main offices, under the Government management there would be but one, and that consequently, through this concentration, economy would result. Owing to the pressure brought to bear upon the representatives by the various cities interested, however, the final result was the establishment of four headquarters and main offices instead of three.

Q. (By Mr. FARQUHAR.) How do you account for that great reduction as soon as this National Company had control of all the lines?—A. I account for it by the fact that there were economies through concentrated management and uniformity of methods and through doing business on a larger scale. Perhaps some of it was attributable to a reduction which had really gone on from the beginning through the development of the telephone business.

Q. That is, in efficiency of the operatives themselves?—A. Yes; to some extent through such increased efficiency, but more particularly to better knowledge as the result of experience on the part of engineers and managers.

Q. Did I understand there that the reduction was one-half?—A. One-half; yes.

Q. I think the commission would like to know how it was possible for that reduction.—A. I will give you my authority for the statement. I was mentioning the policy of the Government adopted in 1892. It was apparently designed to further safeguard its telegraph revenues, and led to the purchase of the telephone trunk lines. Now, in certain places, especially in London and Glasgow, as I have intimated, the local authorities persistently refused to permit the substitution of underground for overhead wires, and the company was therefore unable to render efficient and satisfactory service. The numerous complaints due to these conditions led, in 1895, to the appointment of a select committee of the House of Commons to consider the whole question of local telephone service. This committee took a very large amount of evidence, but did not make a formal report. The chairman (the then postmaster-general), however, submitted a draft report condemning the granting of telephone licenses to municipalities.

In 1897 another inquiry was made by a special commissioner at Glasgow, the municipality there desiring to compete with the company. The report of the special commissioner was against the municipality, and its action in refusing facilities was characterized as unreasonable and unjustifiable.

In 1898 there was still another inquiry by a select committee, presided over by the secretary to the treasury. In the report of this committee the main idea seemed to be that during the remaining years of the company's license (you remember, it expires in 1911) the State should endeavor to break down the company's business by competition. As a result of this, in 1899 the English Parliament voted the necessary funds to enable the Government to begin its competition in London—voted £2,000,000—and empowered the postmaster-general to grant licenses to municipalities. There was, however, this element of fairness in that law. It was stipulated that whenever the postmaster-general licensed a competitor the National Company's

license should be extended for a like time. The post-office is now constructing its plant, and will probably begin rendering service in London before the end of this year. Licenses have been granted to some municipalities. Glasgow has already opened an exchange, but the movement has not yet proceeded far enough to produce any results.

Q. (By Mr. FARQUHAR) Was it dissatisfaction in respect to the rates which caused this legislation on the part of the British Parliament, or the lack of service, or what?—A. Well, both. The service was exceedingly bad, for reasons I have stated, and although the English rates are always said to be very low by people comparing with us, there was just as much dissatisfaction there, and far more, in fact, than there has ever been over here. You will find that to be true almost everywhere, because the general public has actually known so little about the details of the telephone business that they have erroneous opinions as to the amount of profits involved. I think that holds there as well as anywhere else. Now, this competition in London will not be on equal terms. The post-office possesses statutory powers to run its wires, which the company does not possess. It can afford postal facilities to its subscribers and deny them to the company's subscribers, and it is taking 10 per cent of its rival's receipts. Now, under these same conditions, as I have already pointed out, the private company has in several cases outstripped the Government in its previous efforts to compete, and according to the announcement made by officers of the company at its recent annual meeting, it seems to be going forward cheerfully. Its stockholders have voted funds and there is to be an interesting telephone war in London. The result of it all will be a waste of capital and great public inconvenience. Just exactly what the final outcome will be no one can tell.

I have taken a great deal of this information about London from the various reports of the committees that I have referred to, and I have taken some data from a communication in the London Times. What the writer of that communication, in summing up, called "the mistakes of Government respecting the telephone," were summarized as follows:

1. It refused at the outset to acquire the patents.
2. It impeded and harassed the companies in developing the enterprise.
3. It favored the idea of unlimited competition, which failed.
4. It acquired a portion only of the companies' undertakings—namely, the trunk lines—instead of the whole system.
5. It has always refused the companies adequate powers for running wires, although two committees of Parliament have recommended that such powers be granted.
6. It has now reverted to the old policy of obstruction, coupled with an unfair competition.

After this summary the writer adds:

"The company is conducting a public service—the growth of barely 20 years—which, in volume of business, is more than five times greater than the postal telegraph service of the State, and the wonder is, not that it has done so little, but that under all the circumstances it has done so much."

Now a similar policy with respect to other branches of the electrical industry has been followed in England. As to this, the Evening Post of New York, said, editorially, day before yesterday:

"Mr. Arthur Chamberlain declared yesterday, in a speech at the meeting of a large manufacturing concern, that preeminence in electrical industry had gone to the United States, because it had been strangled in England by the mischievous activity of the home office and the local boards. Many facts supporting this contention are brought out in a recent communication in the London Times."

While speaking on this general subject I desire to make a few references respecting the present attitude of intelligent public opinion in England.

In an article entitled "Official obstruction of electric progress," published in the Nineteenth Century for February last, Prof. J. A. Fleming, D. Sc., F. R. S., after stating at length the story of the relations of the post-office and the telephone, says: "The whole behavior of the post-office toward private enterprise in telephony during the last 20 years has been marked by inconsistency, ineptitude, and want of prevision. * * * Its procedure so far gives no warrant for expecting a farseeing and successful business policy. * * * The chief complaint against the telephone company has always been its high charges to users, and the difficulty in getting connection. The first is partly due to the imposition of the 10 per cent royalty, which is really a government tax on telephony, and the second is partly a result of the opposition of the post-office to the telephone company's efforts to secure proper rights of way leaves. * * * The total royalty paid by the National Telephone Company and its predecessors up to the 30th of September, 1900, has been £1,081,490. * * * Hence, the business which the postal-telegraph department does not itself conduct, but only taxes, yields it a handsome profit; the business which it was formed to

carry out is conducted at a loss. * * * The most effective method of afflicting any department of applied science with creeping paralysis is to constitute it a government monopoly."

After reviewing the English electric lighting acts Professor Fleming states that when he "explained to Mr. Edison the nature of the legislative shackles that had been applied to the business of electric supply in England, that distinguished inventor exclaimed, 'Why, they've throttled it!'" In the same way, he says, the tramways enterprise has been simply crippled, and adds: "We find now that we have to go for much of our knowledge and for many of our materials and machines to the experienced inventors and manufacturers in the United States. They are past masters in the art; we are just learning the business." The lack of development in these industries is charged almost entirely by the distinguished writer to purchase clauses in the several acts, such as Professor Parsons suggested in his testimony for adoption in this country. Speaking of municipal opposition to the supply of electric energy in bulk, as it is called, he says: "Private businesses have to take all the risks of injury by competition or improvements, and the fittest survive. But when a municipal corporation goes into business with a capital borrowed on its rates, its tendency is to oppose all progress which may conflict with its own immediate profits, and to cry out for a protection to municipal trading not granted to private enterprise."

Summing up he says: "One answer, therefore, that is suggested to the question why electric invention goes slowly in Great Britain, is that the legislation of the last 30 years has put the control of its results largely into the hands of imperial and municipal officials. * * * Hence, if electrical invention is not to languish in Great Britain, some reforms seem necessary. Public opinion must be brought to bear more strongly through the press and Parliament upon the administration of imperial and local governmental departments, which are in the practical control of electrical monopolies. The conduct of municipal bodies to new electrical enterprises must be continually criticised."

At a recent meeting of the Institution of Electrical Engineers a paper was read by Mr. William L. Madgen, in which he says: "Every article on the subject (electricity) in the magazines and daily press, and they have been many, appears to bewail the backwardness of this country in electrical enterprises, * * * and it seems full time that steps should be taken to place the responsibility for our backwardness where it belongs. * * * We have no feeling but cordial good will for those friends abroad who have made our visit so pleasant and instructive, but the reflections of many of us on our return have been those of indignation at the obstacles set in the path of our industry by the governing bodies of this country and of resentment at the wretched waste of energy and enterprise which they have occasioned. * * * It (the lack of progress) is due in the first place to silly legislation by Parliament and to obstruction by the numerous local authorities intrusted with arbitrary powers. In the second place, it is due to a class of quasi officials and their associates to whose direct monetary advantage it is that an opposition should be entered to every project in which they are not employed. There may be contributory causes, but to these and others that flow from them our chief difficulties may be assigned."

In this paper and the discussion which followed its reading, as reported in the journal of the institution for April last, there is a full and lucid exposition of this whole question, including electric lighting, traction, power, and the telephone. Men justly eminent throughout civilization for their scientific attainments—the very men who should be and doubtless are best informed on the subject—took part in that discussion.

Time will not permit me to read extracts from this report. It shows throughout an intense feeling of humiliation over the condition of the various branches of the electrical industry in England and a practical unanimity on the question of responsibility, fixing it upon unwise legislation—along the exact lines which Professor Parsons recommends for this country—and municipal obstruction. Mr. Atherley Jones, M. P., present by invitation, took occasion to say: "We have perhaps coddled our municipalities a little too much. We have recognized by recent legislation that the chessboard system—if I may use the expression—of local government is not that which, in certain directions, is best suited to serve the public benefit. * * * We find that one of the greatest hindrances, probably, to the development of electrical enterprise, in traction or in lighting, has been the veto, which can be exercised by local authorities over the private enterprise. That, I think, will be removed."

A member of the institution, an officer of the National Telephone Company, said: "I have been fighting the opposition (Government) for many years and I have never yet been beaten on equal terms, and I have never been beaten on unequal terms—very unequal terms in many cases. The whole point of the matter is, thus, equality. * * * The history of the telephone branch of electrical engineering is a history of one long fight by the companies to be allowed to serve the public." He then states this history very fully.

Replying to this speaker the head of the engineering branch of the Government's telegraph and telephone department used these significant words: " * * * "In acting as the post-office has it is really protecting the rights of the Government under the telegraph acts. Those acts were passed as the result of a public demand pressed on the Government, and they were carried by Parliament in response to those demands. Any subsequent action, whether the action of the committee of the House of Commons, of the House of Commons, or of the post-office itself, is the result, generally speaking, of public pressure." He said nothing whatever in justification of the action of the post-office except that it was "to meet the demands of the public."

Thus it will be observed that among intelligent Englishmen the sad results of imperial and municipal control of the electrical industry, in all its branches, are clearly recognized and that already strong forces have been set in motion to remove the shackles placed upon it by misguided public opinion.

Now, on the whole, considering these handicaps that I have mentioned, the development in Great Britain has been far in excess of that attained on the Continent under government or municipal ownership. On January 1, 1901, London, with a population of 5,633,000, had 41,111 telephones; that is, 7 per thousand; New York, with a population of 2,050,000, had 51,647; per thousand, 26. Among European cities of its class London's development is exceeded only by that of Berlin, and in Berlin we saw how the rate policy of the Government had developed the business at the expense of the other imperial revenues.

The rates, generally speaking, in England, are flat. The Parliamentary committee in 1898, reported in favor of message rates. I will read an extract from the evidence of Mr. W. E. L. Gaine, before the select committee of the House. He is general manager of the National Telephone Company. He says: "I think we have been wrong [in adopting flat rates] from the very commencement; and nearly every other country has been wrong. America has rectified this. In New York, in particular, they have been very successful in bringing the message rate into operation."

This committee took a great deal of evidence and made a very voluminous report. It gathered information from the consular service reports from practically all over the world respecting telephone conditions, and it said respecting message rates:

"The present subscription system, with the subscriber's right of unlimited user, means this: That persons who are rich enough to pay a fixed annual sum and who use the telephone sufficiently often to find such a payment advantageous to themselves, whose correspondents also pay a similar sum and use the service with similar frequency, can alone or almost alone avail themselves of this mode of communication. It is just as if the post-office should decide to dispatch telegrams only from persons paying an annual subscription, and to allow such persons on payment of their subscriptions to dispatch without further charge any number of telegrams, requiring at the same time that telegrams should be addressed only to persons connected with the post-office telegraphs by private wires.

"Mr. Gaine, the general manager of the National Telephone Company, admitted to your committee that the system of limiting the service almost wholly to subscribers and giving to each subscriber an unlimited use—a system which is universal in this country and is adopted to a large extent abroad—has been based from the first on a wrong principle."

The London rates, as I said, are flat. The rates are, direct line, business \$100; residence \$60 a year, with discounts for long-term contracts. In comparing, I shall use the rates under one-year contracts. The payments are annual, in advance, in London; in New York, monthly, in advance. The National Company has a very large fund which it carries forward from time to time as rentals paid in advance. Its annual statement at the close of last year showed \$3,840,000 carried forward in that account. The exact amount for London is not stated, but the interest on such a fund would be an item worth considering in any comparison. I have no means of telling exactly what the average rate in London is, but taking their published statements, showing the number of stations they have, the number of lines they have in service, and taking their published tariff books, as near as I can get at it, the average rate in London—and I think it is a very conservative statement—approximates \$72. Now, as I have shown you, the average rate in New York is \$85. The one item of wages alone, inasmuch as our wages exceed theirs, on an average, by 100 per cent, is enough in itself to account for the difference between these average rates. There is another important point. One might urge that with a flat rate, an unlimited user, as you put it, the subscriber gets more for his money than where the message rate is applied; and that, therefore, in London for \$72 the man would be getting more than he would in New York for \$85. Now, unquestionably, imposing a charge on each message limits the number of messages that are sent. That is human nature. It eliminates, generally speaking, all frivolous conversation, the unimportant use of the telephone to make appointments for to-morrow or to discuss the episodes of last night, and so on; and there is a reduction, perhaps, of 20 to 30 per cent in the average traffic, where each talk is charged for. That is offset by an

excellence of service, which makes the service relied upon for most important transactions. In New York, for instance, most important transactions—transactions in stocks and important matters of all sorts—are transacted by telephone, without any hesitation whatever. The service is so permanent, reliable, and quick, that it is very generally relied on. Now, the London service is not so generally relied on, because of its inferiority, which is due, I repeat, in my opinion, largely to the municipal refusal to permit them to put in a plant that is absolutely necessary to render efficient service, and also due to the fact that their system is smaller than ours. I have already given you figures showing that our system is larger than theirs. We find that the greater reliability of the service and the larger system draw out just as much traffic per station as they have in London, the figures showing that the average traffic in the two places is about the same. Therefore, you have about the same amount of traffic in New York that you have in London, in the one place for \$85 and in the other place for \$72. I think the comparison very favorable to New York.

Q. (By Mr. LITCHMAN.) When you say you have the same service, do you mean that there are the same number of persons per telephone in London as in New York?—A. I say that the number of talks per station is just as great in New York as in London, notwithstanding that in New York we charge for each talk, while in London the charge is the same whether the talks are many or few. I am offering these facts to show that while the average rate in the two places does not differ very much, the average man in New York gets just as much service as the average man in London.

Q. By Mr. KENNEDY.) While you are making a comparison of that sort, I would like to ask you if you have prepared a comparison in regard to long-distance rates. I see that there are some remarkable statements in testimony here in regard to long-distance rates.—A. I have endeavored to confine myself to the conditions in the large cities, so far as possible, and while I think that the differences in conditions would account for any apparent differences in long-distance rates, I think I should leave that for Mr. Hall, who I understand will cover that in his testimony.

Q. It has been stated before this commission that long-distance rates are lower in Europe than in this country. It was stated that from New York to Philadelphia, 137 miles, the day rate is \$1.25 for 5 minutes, while in England, the rate would be 48 cents for the same distance; in France, 30 cents. That is a remarkable disparity in rates.—A. Yes; it is a remarkable apparent disparity. I do not know that the figures are correct. As I say, I have not undertaken to discuss this question of long-distance traffic, for the reason stated. I am not connected with the long-distance company in any way whatever, and, as I understand it, Mr. Hall is to give you full information on that point. From my observations, however, both in Europe and in this country, I think a careful inquiry into the question would satisfy any reasonable person that the differences between the two countries are more apparent than real, as I am showing you on the question of exchange rates.

Q. (By Mr. CLARKE.) Are you able to state how many private companies were amalgamated to form the National Telephone Company?—A. I do not know that.

Q. Was there any objection raised among the people to the formation of the National Telephone Company, on the ground that it was in the nature of what we call a trust?—A. Not that I ever heard of.

Q. Have there been any public evils or bad consequences from the formation of that company?—A. Not that I have observed, as brought out in any of these parliamentary inquiries, unless you would say that the general dissatisfaction with the rates and service in Great Britain, which led to the enactment of the law of 1899, could be so construed.

Q. Suppose the Government were not competing with this company, is it your opinion that the company would make its rates as reasonable as they are now?—A. I hardly know what the company would do, because I am not connected with its management, but I think a wise policy on the part of the company would be to make rates just as good as those it now offers, if not considerably better. I agree with the parliamentary committee entirely as to the wisdom of having a message plan in London. The company's rates were adopted before the Government's competition was commenced. Let me make another comparison, though, before I leave the question of London rates, because we so often hear of great discrepancies between New York and London rates. The London flat business rate, annual contract, is \$100. Now, that is for a direct-line station, eliminating all extras, all supplementals. Now, our New York measured-service direct-line average rate was \$102 at the beginning of the year. There are more measured-service direct lines in New York than there are direct lines in London, so that there we have another comparison favorable to New York.

Q. (By Mr. LITCHMAN.) Will you kindly explain that a little more definitely? I do not understand what you mean by direct line.—A. We call a direct line one that is exclusively for the use of a particular subscriber. If a line runs direct from your station to the central office, and no other subscriber's station is attached to that line, we call that a direct line.

Q. (By Mr. FARQUHAR.) Is there a large increase in the acquirement of these direct lines now by subscribers?—A. A large increase?

Q. Yes; demand for direct line.—A. Our growth consists almost entirely of direct lines in New York. On the question of wages, Mr. Forbes, president of the National Telephone Company, testified before the select committee of the House of Commons, in 1895, that the wages of the company's operators varied from 5 shillings (for understudies) up to 17 shillings per week; lady superintendents about 2 guineas per week; wiremen 6 shillings a day. The testimony taken at the Glasgow inquiry in 1897 showed the average pay per week for the National Telephone Company's operators in that city to be 9s. 4d. The London wages may have been increased since 1895, but considering the ruling rates then and now for all classes of labor in London, it is safe to say that the increase, if any, can not have been great. These rates of pay, with a reasonable allowance for increases, compared with those already mentioned for New York, show that the statement that New York wages average double those in London is very conservative.

Considering the extent to which labor enters into the cost of service, differences in wages, rents, transportation costs, etc., there should be a greater difference, perhaps, between the New York and London rate in favor of New York; but, in fairness, London is entitled to a consideration of the fact that it pays a heavy royalty of 10 per cent to the Government, and that the cost of the service is largely increased by the obstructive policy of the municipal government. Much that in New York we are enabled out of our earnings to pay to labor in the way of wages goes in London to the Government in the shape of royalty, or is wasted through opposition of the municipality.

In the Scandinavian cities we have a demonstration of what can be accomplished, even on European soil, by private enterprise, notwithstanding the embarrassments of governmental and municipal interference and opposition. The situation in these cities has been greatly misunderstood by those who have not studied it very carefully. Copenhagen and suburbs is operated by a private company. Copenhagen is one of the best telephoned cities in Europe. It has a population of 312,859; it has 15,311 telephones, or 49 per thousand. San Francisco, however, with a population of 342,782, has 21,321 telephones, or 62 per thousand. All these are first of the year figures. The service and facilities here are far in advance of all Continental countries, except Sweden. In Copenhagen the residence rate is \$27; business rates, \$32.40 to \$48.60 per year; message rates, \$13 per year, up. Skilled operators are paid from \$2 to a little over \$3 per week; linemen, about \$5.70 per week. So far as the plant is concerned, Copenhagen is chiefly on the single overhead-wire plan. It is now being gradually changed to metallic circuit, underground. The central office plant is somewhat out of date, but plans for a new building and new equipments are now under way.

Notwithstanding these excellent conditions under private ownership, the Government in 1898 assumed control of the telephone business, and licensed the company for 20 years longer, reserving the power to fix the rates every 5 years. In 1899, the Government fixed the rates which I have mentioned, and these are slightly lower than the rates which obtained prior to that time. To compensate the company for this reduction, the Government relieved it of the payment of a compensation to the municipality previously paid; freed it from all rights-of-way charges, even in the case of owners of private property; gave it protection from all users of high-tension currents; and, in some ways, gave the company the same advantages that usually accrue to a European State.

By comparing these facts with those stated as to other European places, we see that the best conditions thus far commented on exist at Copenhagen, where until very recently the industry was left to private enterprise with but little interference. Moreover, considering the relative purchasing power of money in the cities of even rank in this country and in Copenhagen, the rates in the Danish city are relatively as high as those in the American cities.

Sweden.—The Swedish Government has no monopoly by law of either telegraphs or telephones, but has the advantage of exclusive rights over State highways. Except in Stockholm, the industry is now conducted by the State exclusively.

Stockholm has the largest development among cities of its class in Europe or America, except, possibly, San Francisco. On January 1, 1901, with a population of 320,000, it had 22,000 telephones, or over 69 per thousand. The San Francisco figure I have already mentioned, but San Francisco has since been making such rapid strides that now it is perhaps ahead of Stockholm.

Q. (By Mr. LITCHMAN.) Do I understand you that Stockholm has not a public system?—A. There is a public system and a private system, which have been in active competition since 1890. The business is chiefly in the hands of the private company, its stations numbering at least two to the State's one. Usually the development in Stockholm is attributed to the Government, and generally popular writers, by ignoring the existence of the private company and by referring only to the State,

lead the public far from the truth. Even Professor Parsons, a student of the subject, as I understand his testimony, seems to have only confused information about the conditions. As I remember it, he speaks of the conditions as if they were produced by the State; anyone reading his testimony would get that impression. There has been very active competition between the private management and the State. The State has no monopoly under the law, but it has obtained control of the business in all parts of Sweden, except in Stockholm and its suburbs. It controls the interurban lines, and it has been in very strong competition with the private company in Stockholm.

On visiting Stockholm one is impressed by the beauty of the city, the substantial character of its buildings, the activity of its people, and above all by the cheapness of things. On this matter of cheapness I shall present a few details to serve as illustrations. The present American minister at Stockholm, Mr. W. W. Thomas, who has spent the greater part of 40 years in Sweden representing our Government in various capacities, has written a book on Sweden and the Swedes, from which I shall read a few extracts:

"The Swedes in the cities live in flats. You will find few families in Stockholm occupying a whole house. . . . Many bachelors and some families, too, in Stockholm, dine at the restaurants, of which there are many in the city, and all of them good. Special arrangements may be made by the month, which are very cheap. . . . The Swedish servant girls are admittedly the best in the world.

They are kind, obliging, polite, neat, skillful, and seem to have their employer's interests at heart. They usually do the marketing, and will procure much more with the money given them than you could get for yourself. They buy vegetables, fruits, meats, and fish on the open squares and market places, not infrequently at first hand from the country people, and cheerfully lug home their 20 or 30 pounds of purchases in large brown baskets. They work, too, for what would seem to us in America to be very small wages. The average pay of a first girl or cook in the cities of Sweden is 75 cents a week, and of a housemaid 50 cents. They expect, also, to receive a present of 10 crowns (\$2.70) and a new dress at Christmas and 10 crowns at midsummer; and besides, they receive a little gratuity now and again from guests who visit the house, but nothing more. The servant girls do not hire out by the week, as with us. They engage by the year, or possibly for 6 months, but rarely for a shorter time. . . . I once visited a friend, a captain in the Swedish army, in the interior of Sweden. His wife was an invalid, and his establishment was conducted by a most excellent housekeeper. Her salary, I found out, was 100 crowns (\$27) a year."

Speaking of insuring his furniture for a year at 50 cents per \$1,000, a premium of one-twentieth of 1 per cent, he comments that he had insured his office furniture, in what we call a first-class brick building in America, a few months before at 1 per cent per annum, exactly 20 times the Swedish rate, and adds: "This was a revelation in insurance. The subject was interesting. I looked further into it. I found the premium on first-class buildings, though higher than on personal property, was only 75 cents on \$1,000 a year. However, by paying \$17.50 on \$1,000 you may insure your house forever, and not only the particular house now standing, but all first-class houses that may be built on the same lot to replace it and its successors to the end of time; that is, the sum an American pays to insure his dwelling for 2 years will enable a Swede to insure his Stockholm house forever. . . . The Swedes are very economical and careful of everything. Skim milk is regularly carried through the city in bottles and sold. The blood of slaughtered animals is saved and used in making soups and puddings."

Speaking of physicians, whom he characterizes as skillful, highly educated, and most honorable gentlemen, he says they "do not make out or send in any bill to their patients. What you pay your doctor is entirely optional with yourself." The custom, Mr. Thomas states, is to send for a year's services an amount ranging from \$27 to \$135, according to the position of the family in society.

In a personal conversation, Mr. Thomas informed me that the pay of a policeman in Stockholm was \$21.60 a month, and that of a private in the Swedish army was 10 öre (2.7 cents) a day, with subsistence and uniform. The legal cab fare in Stockholm is from 13½ cents upward, according to distance, while in New York the minimum charge is 50 cents. The legal fare for a ride of 4 miles in Stockholm is 53 cents, and in New York \$2.

In "Railroad Transportation" President Hadley refers to Sweden as "the only country whose railroads have cost anything like as low a figure" as \$30,000 per mile, and says "land, labor, and material are all exceedingly cheap." In the telephone company's service skilled operators are paid from \$1.95 to \$2.92 per week; linemen and mechanics about \$6, and foremen about \$8.30 per week.

The company has in its entire territory in and around Stockholm 27,247 stations and 573 employees; i. e., one employee for 47 stations. In New York the figures mentioned work out one employee for 17 stations. These figures are very significant.

In view of these various facts showing the conditions of living and the cheapness of things in general, we should expect under normal conditions to find telephone rates that to us would appear to be very low. But the conditions are not normal. The bitter competition between the private company and the Government has created conditions which make it quite unsafe to take any rates that we may find in Stockholm as a criterion of what should be expected elsewhere, even were it possible to make due allowances for any differences that might affect the relative costs of rendering the service. On this point I quote from the official report of the director of the municipal telephone industry at Amsterdam, made in September, 1898, after a thorough investigation of the subject on the ground: "It is plain that the extraordinary development of the telephone at Stockholm is the result of the sacrifices which are made by the Kingdom as well as by the Allmänna Company, and we may also add that, according to the statement of Mr. Hultman, the shares of the company are held principally by the wealthy director, Mr. Ericsson, the manufacturer, who, after past years of profitable enterprise, would now be satisfied with little or no interest, in order to sustain the battle with the Government. For telephone enterprises which have to find the money themselves, and have to work, as a rule, at the same time under less favorable local conditions, the unique position of the telephone at Stockholm can hardly be cited as an example."

That the rates are too low even for Sweden, and that competition works in all ways unfavorably, are shown by the following extract (taken from the report of the select committee of the British House of Commons, 1895) from a letter to Sir William Preece, then engineer in chief of the British telegraphs, from Mr. Storckenfeldt, then and now director-general of the Swedish telegraphs:

"The private telephone company in Stockholm has obtained the right to work telephones within a distance of 70 kilometers radius from Stockholm, but may not extend operations outside of this circle. This concession does not, however, exclude the State from likewise working telephones in the same district. In consequence a competition has arisen which works in all ways unfavorably, and which has also entailed the result that the fees have been brought down far below the proper ones. Even for Swedish circumstances the fees are quite unreasonable, quite too cheap."

This is a frank acknowledgment. What the Government loses in Stockholm it can make up elsewhere. Contrary to the rule generally followed, it charges more for service at Malmö—for example—a much smaller city, than at Stockholm. Besides, it has the State's revenues from other sources to fall back upon if necessary. The intensity with which this Stockholm telephone war is carried on in absolute disregard of the public interest is shown by the fact that since Mr. Storckenfeldt's letter was written a still further reduction in the Government's rates has been made. The Amsterdam director reported: "The Riks-telefon has again lowered its tariff to 50 kronor (\$13.50), with 50 kronor entrance fee for places within the 2-kilometer distance from its head exchange; places farther distant pay an increase of 10 kronor per year and of 25 kronor entrance fee for every farther distance of 500 meters. According to a communication by Director Hultman, the Government in the dispute with the Allmänna is satisfied with paying the working expenses without calculating interest and redemption of capital, which is amalgamated with the capital of the telegraph." The company's rates are also very fully and clearly stated by this gentleman, and I will read them from his report: "The telephone tariff of the Allmänna is consequently reduced to 100, 80, 60, 45, and 36 kronor (approximately from \$27 to \$10) per year for different classes of subscribers. The first three classes pay an entrance fee of 50 kronor (\$13.50), the two last of only 10 kronor. Only the subscribers of the highest class have an unlimited right of user; the others are more or less limited in the service. Of the second class every two, and of the third class every three, have a mutual common line to one of the three head exchanges. The subscribers of the fourth (business) and of the fifth (residence) class are connected to one of the five subexchanges, and are allowed to call only those of the first class in an unlimited manner, but otherwise are not allowed to make more than 100 free calls during one quarter. Each call over this number costs 10 öre (2.7 cents)."

Although a krone will go practically as far in Stockholm as a dollar in an American city of equal rank, these rates appear to be low. Mr. Storckenfeldt said even when they were higher that they were unreasonably low even for Swedish conditions. But to a very large number of subscribers they are not as low as they at first seem, and here is a fine illustration of one of the disadvantages of two systems operating in one city. I quote again from the report of the Amsterdam director:

"When considering the situation from the standpoint of the subscriber, one must not lose sight of the fact that persons who wish to speak by telephone with all the subscribers, send and receive telegrams, and keep up intercommunal calls, have to connect themselves with the Riks-telefon, as well as with the Allmänna Company, and then have to pay at least 100 + 50 kronor (\$40.50) a year, with a minimum of 50 + 50 kronor (\$27.50) as entrance fee. Further, every call between the subscribers of the Allmänna and the subscribers of the Riks-telefon costs also 10 öre (2.7 cents)."

There are not 1,000 or more subscribers who are required to take both telephones, and the number of intercommunications amounted last year, according to the Allmanna's report, to 1,099,837. The combined rates and the extra charges, to say nothing of the great annoyance and vexation incident to the duplication of instruments, to a very large percentage of telephone users in Stockholm amount to a very considerable sum. The rates, therefore, under these conditions are not at all what at first glance they seem to be. Under competition, therefore, as seen in this Stockholm case, there is a waste of capital and energy, the public is annoyed, in many cases overcharged, and, in a way, badly served because of a fight in which it has no interest. Thus far the company has had the best of the fight so far as victory may be measured by the amount of public patronage, having now, as already stated, about twice as many stations as the Government.

Q. (By Mr. FARQUHAR.) How far has that increase been affected by the necessity of getting a grant through some legislative body?—A. The private company has not had to have a legislative grant. Anyone is free to conduct the business in Sweden.

Q. Under what control is the State plant?—A. The State plant is operated by the State telegraph and post department, which has an exclusive right of way over State highways and on Crown property. The municipality of Stockholm has strongly supported the private company.

Q. How far has that support to the private company operated as a deterrent to the extension of the public system?—A. It may have so operated to some extent, but I hardly think it has. If the Government could get the business it could take care of it by overhead wires. Its system is not too large for that. The municipality has said to the Government, "So long as you impose unequal terms on your competitor, the private company, we shall not give you underground privileges within the municipality." So far as I know, only in this way has it aided the company. The State may run its lines overhead to any extent, but it can not go underground without the consent of the municipality. The attitude of the municipality and the distribution of the public patronage between the two competitors does not sustain Professor Parsons in his statement that under public ownership the "civic interest" of the people increases the service and that the people patronize their own institutions to a far greater extent than they do private institutions. This is the only case in the world, so far as the telephone business is concerned, where the people have had an opportunity to bestow their patronage as they prefer upon a public or private enterprise, both going concerns.

When some 2,000 or more stations—those used by the Government itself and those which it furnishes free or in exchange for the privilege of attaching its wires to private property—are eliminated, it will be seen that the Government gets a very small share of the patronage. Even those who do take its service are not entirely free to choose between the two enterprises. By discriminating against the company's subscribers in the use of its long-distance lines, imposing an extra charge on every long-distance message originating at a company station, it forces a number of people to take its service merely to avoid these extra charges. This accounts for many duplicates, that is, both services at one place. At Amsterdam the public and the press were opposed to the taking over of the telephone business by the municipality. The facts in that case, especially the meager development, do not justify Professor Parsons's generalization.

The company, forced to economize in every direction, has pressed wages down to the lowest possible point. The relations between the management and the force, to say the least, have been strained, and there are occasional ruptures. At one time an operators' strike caused a practical suspension of business to the immeasurable inconvenience of the public. The company's financing has been declared by competent English experts to be unsound, and such as would be absolutely illegal in England. It has paid dividends regularly, but only on a small part of the capital invested in the business; this of course at the expense of the underpaid employees, the plant which has not been adequately maintained, and proper reserves which have not been provided.

When speaking of conditions in various cities under State or municipal management I have referred to the results obtained in these Scandinavian cities under private management. I have appreciated that an allowance should be made for the abnormal conditions at Stockholm. Were this done the facts as modified, it is reasonable to believe, would at least equal those at Copenhagen; and these are quite sufficient to justify my statements. Further, it may be pertinent to point out that with such a modification San Francisco, an American city fairly comparable as to size and general conditions with Stockholm, would stand far ahead of the Swedish capital in the order of merit.

The enterprising general manager of the Allmanna Company has kept well informed about telephone conditions in all parts of the world. He has recently made arrangements to conduct the telephone industry in two of the leading cities of Russia. He visits this country occasionally. I referred this morning to the fact that he had on

several occasions spoken most favorably of our New York conditions. I have here two letters from him. In one, written 3 years ago, he says:

"We are going to build quite a new central exchange, and it is very likely that the directors of the company may consider it necessary for me to see the new arrangements for central exchanges in your country, always so ahead of everything." He is ahead of everything in Europe, and that is his remark at that time. Just 3 years later, in February, 1901, I received a letter from him from Moscow. These are private letters, but I do not think I abuse his confidence at all or that he would object to my using them in this way. He says: "We have not, I am sorry to say, the same faculty of working quickly as the sons of the New World. You ask me when I am going to pay your country a visit. To that question I can answer, in 2 or 3 months. I wish before starting the great new business in Russia to see and learn from the enormous progress of telephone matters in America since we last met."

I have hastily run over the whole of Europe, showing that the cheapest and poorest conditions obtain through Government and municipal ownership; that the next best conditions are obtained under private ownership with Government control; and that the best conditions are obtained where there is the least restricted private ownership. That is the case of Stockholm. The private company has outstripped the Government against odds. In not one of the cases where there is Government or municipal ownership have we found adequate facilities, efficient service, reasonable rates, and a self-sustaining system. Speaking generally, now, for the whole of Europe and America, there are 20 American and 44 European cities with 200,000 or more population. In the American group, per thousand of population there are 21 telephones; in the European group, 13 telephones; almost 2 to 1 in favor of American cities. Among cities of 1,000,000 or more, New York stands at the top, with twice as many telephones per capita as any city in its class except Berlin; and I have explained the causes of development in Berlin. Of the cities from 500,000 to 1,000,000, Boston is at the top, with more than twice as many as any European city except Hamburg, and almost twice as many as Hamburg. Of the cities that run from 200,000 to 500,000, Stockholm is at the top, with San Francisco a close second. It is possible that San Francisco may now be ahead. At the date named (January 1, 1901) San Francisco had 21,231, as against 22,000 in Stockholm. The European small towns have shown a most insignificant development, and the American small towns a very great development. In all these figures I have not included the independent telephone companies, for the reason that I have not wished to present any figures showing duplicate systems. The independent companies claim to have a very large development, and however much of truth there may be in the claim, it only strengthens the case in favor of America.

President Hadley, in "Railroad Transportation," calls attention to a difference between American and European ideas which I think worth remembering in this connection. He says: "There is one respect in which England and America are like one another, but sharply different from France, Germany, or other European countries. It is in the way in which people in general are disposed to regard Governmental interference. The English and American maxim is that whatever can be done without Government should be thus done. The continental principle is that whatever can be done by Government should be. It has become a commonplace saying that our Anglo-American idea of liberty is not developed in continental Europe. When a Frenchman speaks of liberty, it is not so much freedom from interference with his own movements that he seeks as the right and power to interfere with other people's movements. What he really wants is political power. A party may call itself Liberal or Republican; but when it gets into power it governs about as strictly as its predecessor. Sometimes there is a monarchy, sometimes a democracy; but there is always a bureaucracy, a government by officeholders."

When we consider that difference in ideas and at the same time remember that the telephone development under private ownership in the United States is so far ahead of that in Europe under governmental and municipal ownership, we may safely conclude that the best possible results will be obtained by leaving the industry to private enterprise.

Q. (By Mr. LITCHMAN.) What has been the effect in those cities and States where independent telephone companies have been established upon the charges of the Bell Telephone Company?—A. I answered that question in respect to my territory by saying that there were 4 towns where we have had opposition, and that we have not put in in those 4 towns any rates which we have not put in in towns of similar size and circumstances elsewhere in the territory.

Q. Now, how is it about the city of Detroit?—A. The city of Detroit has a very peculiar history. I was quite familiar with the conditions there at one time. I do not know that I could give you the exact conditions at the present moment, but I understand that there was great dissatisfaction there and that the competition created worse conditions than existed previously.

Q. How about the State of Indiana which has a telephone system covering pretty nearly the whole State, called the New Telephone, if I remember correctly?—A. I do not know the details of such a system. I saw a press statement yesterday respecting the telephone development in Indiana, showing that there was a very large independent development there, but as to the exact details I do not know.

Q. Is it not a fact that when that exchange was established there was a decrease in the rate charged by the Bell Telephone Company?—A. I do not know that there was.

Q. You are more familiar with matters in your own territory. I did not know but as a matter of general knowledge you might know respecting it.—A. No.

Q. In these figures that you have given of stations, etc., in this country in comparison with cities in Europe and everywhere else, are you giving the figures of your own business or have you taken in any independent figures?—A. I have taken the Bell figures only. As I said, so far as comparisons between this country and Europe are concerned, the showing for this country would be better if we included the independent figures. But I have not thought it advisable to consider any duplicates.

Q. (By Mr. KENNEDY.) I have a question which Professor Jenks, of Cornell University, desires to be submitted to you, and it is this: If in Ithaca, N. Y., the telephone rate charged by the Bell company is \$24 per year for single unlimited service, long distance phone, and \$15 a year secures unlimited service with but 3 phones on a line, how much less is your cost in Ithaca, a city of 12,000 inhabitants, than in Washington or Boston, and why?—A. I can only say as to that, that having nothing to do with Ithaca or Washington or Boston it is impossible for me to use exact figures; but, speaking generally, I can do little more than repeat what I said this morning about the difference in cost of furnishing service in a large city and in a small town. I shall not undertake to demonstrate that it costs more per any unit of measure to render telephone service in a large city than in a small town, but just make a few suggestions that may make it a little clearer to you. In the first place it must be remembered that we are talking about rendering a service, not about selling or renting or manufacturing things that can be stored and sold piecemeal or in bulk at will. And then that more than half the operating expenses go for labor; the various figures I have given you show that wages, as well as rents, and many other items that enter into the question are higher—much higher—in the great city than in the small town. Take a small town with an overhead plant with lines generally less than 1 mile long. Any talk involves only 2 miles of wire, as a rule. Usually beyond that point there is a mileage charge. The operation of connecting two stations together is very simple; the labor involved is very slight. Now, go to the other extreme and take a great city where you have 60 times the number of telephones. You do not have 60 multiples or 60 duplicates of the place where you had 1,000 phones, because the whole 60,000 must be so provided with plant and switching facilities that on demand of anyone that particular one may be connected with any other one. These 60 groups of thousands must be so tied together with trunk lines and plant that is not represented by any factor at all in your small exchange, and this switching must be done by operators that perform labor which is not performed at all in your small exchange. Therefore in a large exchange you require many fold more labor and more plant to accomplish a particular thing than you had in the small exchange.

Another thing: In the large exchange there is necessarily a very large surplus plant. In your underground work you must use cables of standard size. If your standard is 100 wires or 50 wires, you may have to take 100 wires where you need only 51, or you may have to take 50 wires where you need only 20; so that you have always quite a large surplus plant, which you do not have in the small place, and interest and depreciation run on that surplus plant all the time. There are surplus subways for the same reasons and for the additional reason that when once the street is opened ample conduits for future growth must be laid, for you can not be always taking up the streets. In the large place you have a great investment lying idle during the slack hours of the night and a large part of the day. Your plant must be right up to the highest requirement of the busiest 5 minutes of the day. In the city the work of the 24 hours is concentrated within narrow limits, a few hours in the afternoon—2 or 3 hours—and a few hours in the morning. In the small place it is spread out over the whole 12 hours—that is, more generally spread out. Now, in the small place, if you talk with another man, you are monopolizing a wire which can not be over 2 miles long—relatively a cheap wire. If you are at the Battery and talk to a man in Harlem, your message does not flow along the line with a lot of other messages following it, as street cars full of passengers run over a track, but you take the entire plant, the entire wire, from the Battery to Harlem and you monopolize that entire wire. Not another single man can get on it while your conversation is going on. So that the message in the great city is not the equal of the message in the small town. The cost of the one is insignificant as compared with the cost of the other.

I appreciate that that argument might, without some correcting force coming in somewhere, carry you to a point where you would say that the more business you get the worse off you are; and that has been frequently urged. But the message-rate principal brought in that correcting factor in New York, and we abandoned the station as the unit of measuring things and took the message instead. Now, the message in the great city costs you vastly more than the message in the small city, but the volume of traffic tends to equalize that thing, to bring down the cost in the great city, because you have got more business to handle.

Then, again, you must remember that every message occupies your whole line. You can not send your traffic over the line as you do on a railroad. If you had one railroad track and your traffic got beyond the capacity of that track, you would keep that track going at its full capacity and you would put another track alongside of it, and another and another; but in a comprehensive telephone system the limitations upon the traffic-carrying capacity of the single line are such that you can not go on as in the case of a railroad. Now, in a place like New York City, with short business hours, you can send comparatively few messages over a line; that is, as compared with the number that you might send if you were distributing them over the whole 12 hours.

And another thing, the traffic must be so limited that when one man wants to talk with any other one among the 60,000 he must get that one within a reasonable time. It is not as if you were sending your traffic from one terminal to another terminal and providing only enough tracks to shoot it through. But you have 60,000 people and each one must have the potentiality of an immediate connection with any other of the 60,000. If you should overload your lines, the result would be that a great many of the lines would be busy and your service would be inferior.

Q. (By Mr. LITCHMAN.) In the management of the New York exchange has the increase in the cost of maintenance and management been proportionate to the growth and extension of the plant? And then, supplementary to that, which may explain that question, is there any point where a percentage of the service may be added without increasing the cost of maintenance and management?—A. There is a great difference of opinion as to the principles upon which charges shall be made. My own personal opinion is that, in railroad transportation, for example, the point is never reached where you can carry additional traffic for nothing. So in the handling of telephone traffic you never reach a point where you can carry more traffic for nothing.

Q. There are certain fixed charges, are there not, in the management of the business?—A. Yes.

Q. And are not those fixed charges the same whatever the amount of business you may do, assuming that you do any business at all, of course? For instance, you have to have a superintendent, do you not?—A. Yes.

Q. You have to have a manager of your exchange?—A. Yes.

Q. And you have to have a certain number of girls employed; you have to have a certain size of switchboard; you have to have a certain number of wires; you have to have a certain number of connections. Now, I want to get at, if I can, within what limits this is elastic, permitting a certain amount of loading without increasing the number of girls, without increasing the size of the switchboard, without increasing the superintendents and management, and so on. The object of my question is to meet exactly that point which you raised a few moments ago, that the paradox is sometimes made, taking the argument of the telephone company, that the more business you do the nearer you are to bankruptcy. Now, I want to find out where the happy medium is between doing too much and too little business, if there is such. For instance, in the steel line we understand that a steel mill run at its full capacity can be run more economically than if it is run two thirds time, and that frequently steel mills run full time and sell their surplus in foreign countries because of that fact. I understand that to a limited degree that may apply here, and I wanted to find out how far it might apply here.—A. Of course that same line of reasoning does not apply here, because we are not producing a product that can be stored. Our product is a service rendered. Now, unquestionably, if you have your plant and your skeleton organization, such as you have defined it, you can within certain limits add work at very little additional cost; but when you dispose of that additional service at very little charge you deprive yourself of earnings that would enable you to reduce other charges and further extend the benefits of your system to the general public. One man would think the one course preferable, perhaps, and another the other. You suggest that there is a product that might be sold at a very low figure; in other words, that certain messages to very heavy users could be sold at a very low price.

Q. That is not the point I am trying to get at at all. What I am trying to get at is whether, after your plant is established, there is not a certain amount of loading of the plant which makes it possible, perhaps, for the plant to be run at its full

capacity and which, for all practical purposes, costs nothing, and whether there is not a point where that loading can be made for the benefit of all the subscribers and will secure a reduction of the rate to each?—A. Of course, that is what we are aiming at, and have been aiming at. Our endeavor, ever since 1894, I may say, has been to so arrange our rates as to afford the largest benefits to the public and give them the best facilities. But there is one that you must keep in mind, and that is the limit to the carrying capacity of a telephone line—not as a single line between two points, but as part of a very complicated and very extensive system of lines, any two of which may have to be connected at any moment. One might use his telephone 50 or more times a day, but such use is only possible when the line over which such a number of messages is sent is connected with other lines not used to that extent. That line is so fully occupied by outward messages that few, if any, incoming messages can be handled over it. Practically it is "busy" to all inquirers. It is obvious that all lines could not be used to any such extent; an attempt to so use them would necessarily result in complete failure. If a large part of the lines were so used the service would be inferior and unsatisfactory. Incidentally the costs would be vastly increased because of the futile use of plant and labor in performing the work to ascertain that the line wanted is busy. For example, a subscriber in Harlem, let us say, wants to reach a downtown point. He gives his order. The Harlem operator and the trunk line operator do practically as much work to ascertain that the downtown man is "busy" as they would do to put the call through. The waste of labor and plant would be enormous. The average use per line would doubtless be increased by lower rates. It has been increased by lower rates, and the New York system may to-day be capable of carrying more traffic than it does carry without detriment to the service, but these facts may show you that the problem is not a simple one. A common statement by those who have not had experience in the matter is that by reducing the rates by half the business would be increased at least fourfold, and the net profits to the company would be increased. If this were true, self interest alone would lead the telephone company to so reduce its rates at once. Professor Parsons says in his testimony that a proper rate for any large city should be \$30 a year. I assume that he means this as the proper rate for unlimited use—a flat rate. I have already shown you that wages alone in New York exceed that amount per station. Were such a rate fair in New York the New York Telephone Company could not hold the field, and ought not to hold it.

To show you that our rates are fairly well arranged to bring out the results you speak of, I may say that in Manhattan we begin at \$60 for 600 messages; then run the additional message rate down from 6 to 3 cents per message, along a graduated scale under which at a point within the average traffic carrying capacity of the line, we reach about \$240. (See Exhibit B at end of testimony.) Now there are a great many people who can not get on with only one line; their business requires more than that; and our rates are so arranged that when the traffic overloads the line we can give a private branch exchange, with two lines and with two stations without change of rate. By the operation of the rate itself we avoid the busy-line trouble, which, until a short time ago, was the greatest source of annoyance that we had. I will insert a card showing these rates at the various points.

I have spoken of the \$60 rate. There is an additional charge for the exclusive use of the line of \$15 or less, the idea being that two moderate users can use the line together. Our system is such that we can signal one without signaling the other, so that the service is first class. But if a man wants the line exclusively and sends only 600 messages, he pays \$15 extra, but that extra charge is gradually worked out of the schedule and disappears. At 2,100 messages they are all the same.

Q. Is there any free service to the city of New York?—A. Not that I can think of. The city pays for its service. There may be a little, here and there a line given to the police or fire department as a courtesy, but, speaking generally, the city pays for its telephones.

Q. Have you any means of estimating the cost per telephone?—A. The cost of service per telephone?

Q. Yes.—A. Well, I think that is hardly a useful figure where you have the complexity of a message rate, because your station is not the unit at all. We do not fix the cost that way.

Q. Your cost, whatever it is, has to include the royalties to the parent company?—A. We pay no royalties to the parent company.

Q. Do you not pay royalties to the Bell Telephone Company?—A. No. We rent our instruments from the Bell Telephone Company and pay a rental.

Q. Is not that a royalty?—A. No; I think not.

Q. You do not buy the instruments?—A. No; we rent them, and they furnish us efficient instruments. If they go wrong, as they frequently do, they are returned to them, and they replace them with others perfectly good. I think we pay only a fair rental, considering the value we get from that transaction, but nothing in the way of royalties.

Q. Is yours one of the companies that the Bell Telephone Company owns 51 per cent off?—A. Speaking from general knowledge, I think it owns at least that; but I am not a stockholder of either company.

Q. (By Mr. KENNEDY.) Do you follow in any way the practice of the Western Union Telegraph Company in giving favors to politicians and public officials—in giving franks to them?—A. The State of New York, in adopting its new constitution not long ago, prevented the giving of franks to any public official, and since the adoption of that constitution no frank has ever been issued to a public official that I am aware of.

Q. Would that part of the constitution interfere with the Bell Telephone Company's giving free telephone service to an official or politician of the State of New York?—A. Yes.

Q. Or the city of New York?—A. Not only free service, but any discrimination in favor of that officer. So far as I know, no such discrimination has ever been made.

Q. (By Mr. FARQUHAR.) Does the newspaper press of New York receive any special favors in respect to rates?—A. We have no newspaper rates. The larger papers take the private branch-exchange service and pay the regular rates. I have a letter here from the New York Journal. (Reading:) "We have found the branch exchange to be of the greatest possible service in the business of publishing a newspaper. We make constant use of the telephone for intercommunication between our various departments, and we have no doubt that this use of the system effects a saving in the conduct of our business equal to the whole expense of maintaining the exchange."

And that is absolutely regular rates in every respect.

Q. (By Mr. KENNEDY.) The case of Grand Rapids, Wis., was referred to in testimony given before this commission. It was stated that under a cooperative plan, which the people have there now, the actual cost to a subscriber is \$3 a year for a residence phone and \$18 a year for a business phone, and that, prior to that arrangement, the charge by the Bell Telephone Company was \$36 a year for a residence phone and \$48 a year for a business phone. I should like to ask you if the difference between \$3 a year and \$18 a year, and \$36 a year and \$48 a year, in your opinion, represented clean profits to the Bell Telephone Company?—A. Well, I can only say, as to that, that I will leave it to your good judgment as to whether or not any telephone service could be furnished by any company anywhere at \$3 a year which pursued methods of accounting that would throw into its accounts all the items of expense. But even if you have a cooperative concern where everybody pitches in and does everything that is needed to be done, that is, if the cooperators furnish the phones and put them up, and do all the work and charge nothing for the time, even then it would be difficult to conceive of any efficient service at \$3 a year.

Q. (By Mr. LITCHMAN.) As far as you know, are the charges for rental of telephones by the Bell company the same to all exchanges throughout the United States?—A. That I do not know.

Q. (By Mr. KENNEDY.) The statement is made that in England you can send telegrams free over the telephone. Does that mean that the charge is the same for a telegram that is sent over the telegraph wires and over the telephone wires?—A. I do not know just what is meant.

Q. What do you know about it?—A. In New York, for instance, anyone may call either of the telegraph companies and send a telegram by making previous arrangements with the telegraph company for keeping an account there without any additional charge for the telephone service involved, over and above what he is otherwise charged.

Q. What he is otherwise charged by the telephone company?—A. For any other business. For instance, to make the comparison absolutely fair, let us take one of our old-time stations where a man paid \$240 a year for all the service he got or could get over one wire. Now, suppose he arranged with the Western Union company or the Postal company for sending telegrams over the telephone. He might call those offices as many times as he pleased and he was not charged anything in addition for it.

Q. I would like to ask you if there is any monopoly in the telephone service of the country, or whether there can be any?—A. Well, that is a very large question, quite beyond me. I do not know that I understand exactly. All things are possible.

Q. Well, you have a monopoly of the system on Manhattan Island, have you, at the present time?—A. We are the only telephone company conducting the telephone business on Manhattan Island.

Q. Therefore, you have a monopoly of the telephone service on Manhattan Island?—A. Yes.

Q. Well, the Bell Telephone Company has competitors, I judge, in other parts of the country?—A. Oh, yes.

Q. In Indiana and Wisconsin and even some places in your territory? I should like to ask you whether they have the same facilities for the business that you have, in instruments and patents and everything?—A. We are all equal before the law, as I

understand it, and if one or the other has patents—and they both claim to have—it has those possessions under the law of the land and it is entitled to what they are worth; but I know of no inequalities.

Q. I want to know whether an independent company would be free to go into the city of New York or the city of Washington and set up in opposition to the Bell Telephone Company—if that company has a monopoly in any way that would prevent an independent company from doing it. Is there anything in the way of an independent company going into the city of New York?—A. Why, yes; there are 60,000 telephone subscribers getting efficient telephone service at reasonable rates from a company which is continually working to extend its system and to increase its popularity among its subscribers. But so far as any legal restriction upon any other company's coming into the field is concerned, if it complies with the laws of the State of New York and with the regulations of the municipality, I know of nothing to keep it out. We are competing on strictly business grounds.

Q. The statement has been made that the more you reduce the rates the greater will be the use of the telephone; and it seems that the independent companies, wherever they have come in opposition to the Bell Telephone Company, have reduced the rates and increased the service. I wondered if that would not be the effect in New York.—A. The general statement that the more you reduce the rates the greater will be the use of the service is quite true. That has been our experience in New York. The great reductions and modifications in rates which we have made from time to time have produced a most wonderful growth and extension of the telephone system, increased the use of the service, and made it more valuable to the public in every way. You may remember that when speaking this morning of the unparalleled growth in our system during the last 6 or 8 years I attributed it chiefly to our repeated modifications and reductions of rates. But there is a limit beyond which you can not go and survive. I have shown that in rendering service in New York at the present rates the operating expenses take about 65 per cent of the gross earnings, indicating only a safe and conservative management. If the percentage were greater than that, you could not get capital to make the extensions required by the public. I have also attempted to show that, as compared with rates in other quarters of the globe, considering what we give for the money and what they give for the money, our rates are reasonable; and that the fact that New York has the greatest per capita development among cities of its kind and class in the world shows that the public is pretty well satisfied with the service and the rates. You must always bear in mind the suggestion I made a moment ago as to the limit upon the capacity of your plant.

Q. Is there a growing mutuality or community of interest between the telephone system and the Western Union Telegraph system?—A. Why, the Western Union Company transmits messages, and the telephone company is, generally speaking, in the same business. We are both competing for public patronage, but we do an entirely different class of business. It is not possible to compare the two kinds of business.

Q. Is there any community of interest or ownership between the two—the same men on both boards of directors, for instance?—A. I am not a director of the company, but from general newspaper reports you know as well or perhaps better than I do that some gentlemen are on both boards. That is a public fact.

Q. (By Mr. PHILLIPS.) Do you or do you not know the directors of the company you represent?—A. I know them. I can supply the names. It is a matter of public record.

Q. Is long-distance telephoning displacing to any appreciable degree the business of the telegraph companies?—A. I have no exact information on that. I think the result usually is that if you provide the public with facilities they use them. If you throw a bridge across a stream, you compete in a certain sense with the ferry; but if you watch closely you will find that the ferry and bridge will both do more business than before.

Q. (By Mr. LITCHMAN.) Your company at the present time is a subordinate company of the American Telephone and Telegraph Company, is it not?—A. I do not know what the legal relations are.

Q. I asked the question to lead up to the question whether, as far as you know, the American Telephone and Telegraph Company is doing any telegraph business?—A. I do not know.

Q. (By Mr. KENNEDY.) Have you any information as to whether the long-distance telephone of the Bell Company is, in any degree, cutting into the profits of the telegraph companies?—A. I have no knowledge on that subject at all.

Q. Have you ever heard any complaint under that head from the telegraph people?—A. No. If they have any complaints to make they probably would not make them to me.

Q. Is there ever any violation of secrecy in the use of the telephone service? Do

you have any complaints on that head?—A. The State of New York has enacted laws on that subject making it a misdemeanor, I think, to divulge telephone messages, and I have never had any complaint of that kind. Perhaps it is proper to say that once in a great while some subscriber thinks that his conversation has been listened to and used; but I should say that during my experience I have not heard, on an average, two such complaints in a year; and upon investigation I have never found that any such divulging of the secrets of subscribers has occurred.

Q. (By Mr. LITCHMAN.) Does not your system provide a safeguard against interruption by an outsider while conversation is going on?—A. Oh, if the wire were on a housetop, a man might go there and attach instruments to it and listen.

Q. I mean in the ordinary course of business. Take your wires in conduits.—A. There would be no means for anyone to tap them.

Q. No; I understand. But if there were two or three persons on the same wire—what you call unlimited service, but no direct wire—would it be possible for either of the other two to break in while one was using the wire, or do you have an attachment by which that is impossible?—A. A lockout?

Q. That is what I mean.—A. No; we do not have any of those things, because we have very few party lines in service. Nearly all of ours are direct.
(Testimony closed.)

EXHIBIT A.

CORRESPONDENCE RELATING TO TELEPHONE SYSTEM IN THE DEPARTMENT OF THE INTERIOR.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
Washington, D. C., January 1, 1898.

The SECRETARY OF THE INTERIOR.

SIR: I beg leave to invite your attention to the Departmental telephonic system. So far as this office is concerned, during the 2 years that have passed since its installation, there has not been an entire day when it gave satisfactory service throughout the building. It has been a daily source of vexation, and has caused more inconvenience than the old method of sending messengers to convey communications. At times it seems to work fairly well, but there are occasions when in the midst of a conversation it will suddenly suspend.

Frequent complaints have gone from this office to the Department, and efforts have been made to correct the difficulties, but sometimes the repairer would scarcely depart before the same trouble, or worse, would be discovered.

Unless it can be made into a system that will perform proper service, I have the honor to request that it be entirely removed.

Very respectfully,

CHAS. D. WALCOTT, *Director*.

DEPARTMENT OF THE INTERIOR,
UNITED STATES GEOLOGICAL SURVEY,
September 28, 1898.

DEAR COLONEL RIZER: The telephone on the fifth floor of the Survey building is absolutely worthless. Much time is lost in trying to use it, and generally a messenger is sent from the telephone room with the message that our instrument can not manage. Can not something be done to improve or replace the thing?

Yours, truly,

F. W. CLARK, *Chief Chemist*.

[Indorsement.]

SEPTEMBER 28, 1898.

Respectfully forwarded to the chief clerk, Interior Department.

This complaint will apply with equal force to every Departmental telephone in the Survey building, and it has been repeatedly made ever since the inauguration of the system.

I again urge the installation of a practical system.

H. C. RIZER, *Chief Clerk*.

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE,
Washington, D. C., October 19, 1897.

The SECRETARY OF THE INTERIOR.

SIR: I have to call your attention to the workings of the Department telephone service, which is totally unsatisfactory and unreliable, and that although frequent repairs and attempts are made to remedy the difficulties they appear to result in no practical improvement.

It is respectfully requested that some better system be adopted to afford a more satisfactory method of communication with the various branches of the Department now reached only by this inefficient system.

Very respectfully,

BINGER HERMANN, *Commissioner.*

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., September 28, 1897.

Mr. E. M. DAWSON,
Chief Clerk, Department of the Interior, Washington, D. C.

SIR: I beg leave to call your attention to the fact that the telephone in room 33 is in very bad condition. It has not been in good shape for the past 5 or 6 weeks, and for the last few days it has been found necessary to resort to the telephone in an adjoining room. This telephone is perhaps used more than any other in this office, and the repeated efforts on the part of the electrician of the building to repair it have not met with success. I must ask that, unless it can be put in better shape than it is now, it be removed from the room entirely, as in its present condition it is simply an aggravation.

Very respectfully,

GEO. L. MORTON, *Chief Clerk.*

DEPARTMENT OF THE INTERIOR,
BUREAU OF PENSIONS, OFFICE OF THE COMMISSIONER,
Washington, August 2, 1898.

The SECRETARY OF THE INTERIOR.

SIR: For some time past we have had numerous complaints concerning our local telephone service. I called upon the chiefs of divisions, and I have the honor to submit herewith reports from each for your consideration.

Very respectfully,

H. CLAY EVANS, *Commissioner.*

(This letter from the Commissioner of Pensions is accompanied by reports from 15 chiefs of divisions, in which the telephone service is said to be "very unsatisfactory," "absolutely worthless," "practically useless," "a source of continual annoyance," etc. In none of these reports is the service favorably mentioned.)

DEPARTMENT OF THE INTERIOR,
OFFICE OF INDIAN AFFAIRS,
Washington, August 16, 1898.

Hon. E. M. DAWSON,
Chief Clerk of the Interior Department.

SIR: I regret exceedingly to inform you that the telephones in this Bureau are a continual source of annoyance, much of the time out of order, and always unsatisfactory, both as to speaking and hearing.

I inclose a letter of complaint from my chiefs of division. I sincerely trust that you may be able to supply us with a better service.

Very respectfully,

W. A. JONES, *Commissioner.*

(This letter from the Commissioner of Indian Affairs is accompanied by a report from 4 chiefs of divisions, in which the following statement is made:

"These telephones were put in some 2 or 3 years ago, the object being, as given out at the time, to facilitate communication between the several divisions of this Bureau of the Department. They are a lamentable failure. They never have been entirely satisfactory. Even when first put in, and it was supposed they were then at their best, they were a source of annoyance on account of their erratic behavior.

They have constantly grown worse, until now their work is so uncertain and irregular as to be of little or no value; much of the time they will not work at all. "We do not know where the difficulty lies, but naturally infer that it is in the thing itself. Be that as it may, for any purpose of our divisions they are entirely worthless, and it would be a relief if they were removed.")

EXHIBIT B.

NEW YORK TELEPHONE COMPANY—EXCHANGE RATES—MANHATTAN AND THE BRONX.

MANHATTAN.

(a) Message rates, direct line, and two-party line.

Local messages to be sent in 1 year.	Annual rate to be paid monthly in advance		Additional local messages, each
	Direct line.	Two-party line.	
600	\$75	\$60	<i>Cents</i> 8
800	87	75	8
1,000	99	87	8
1,200	111	99	7
1,500	126	117	7
1,800	141	135	6
2,100	153	153	6
2,400	165	5
2,700	174	5
3,000	183	5
3,300	192	5
3,600	201	5
3,900	210	5
4,200	219	5
4,500	228	5

For convenience in accounting, contracts will be taken at the above figures only; but in making adjustments, when the number of messages sent is less than the number paid for, the entire schedule (which advances by steps of 100 from 600 to 4,500 messages for direct lines and from 600 to 2,100 for two-party lines) will be taken into consideration.

(b) Auxiliary station.

A station auxiliary to a message-rate station on the same premises with the main station, but connected by a separate direct line, will be furnished at \$48 per annum, all messages to be accounted for as if sent from the main station. Both lines will be designated by one drop number and will be adapted for use as a "double track." A subscriber employing an auxiliary station may contract for messages under the direct-line schedule up to 4,500, and beyond that number in groups of 400 at \$3 per hundred, the contract in any case, however, not to be for more than 4,500 local messages for each line contracted for. Additional messages 4 cents each.

(c) Private branch exchange schedule.

[For a private branch exchange, on Manhattan Island, south of One hundred and eighty-first street.]

Item.	Annual rate.
Local switchboard, transmitter, and telephone at same.....	\$36.00
Each line to the central office.....	36.00
Each station on the premises.....	12.00
Each station elsewhere (plus a mileage charge, varying with length of line).....	12.00
The right to send 3,600 local messages in one year.....	108.00
Additional local messages, 4 cents each, or \$3 per hundred if contracted for in advance.	

¹ At hotels and apartment houses this rate is from \$3 to \$12, according to the number of stations contracted for.

Contracts will be taken or renewed only at the above figures, or figures reached by advancing from 3,600 by steps of 400; but in making adjustments at the end of the

contract year, when the number of messages sent is less than the number paid for, the entire schedule (which advances from 3,600 by steps of 400), will be taken into consideration.

(d) *Harlem rate.*

"Harlem," comprising Manhattan Island between 110th and 140th streets; a "Harlem" message being a message to any other station connected with an exchange of the company in "Harlem," and a Manhattan or Bronx message being counted as two "Harlem" messages.

Harlem messages, each..... \$0.05
Minimum monthly charge..... 3.25

Two-station line; individual signaling; contract term, six months.

For the exclusive use of the line an additional charge of \$1.25 per month.

THE BRONX.

(e) *Flat rates—Business or residence.*

[A local message being a message to any other station connected with an exchange of the company in the borough of The Bronx]

Direct line..... Per year. \$90.00
Two-station line..... 75.00

(f) *Message rates—Business or residence.*

[A local message being a message to any other station connected with an exchange of the company in the borough of The Bronx]

Local messages to be sent in 1 year.	Annual rate to be paid monthly in advance		Additional local messages, each.
	Direct line.	Two-party line.	
500	\$48	\$39	7
600	54	45	7
700	60	51	6
800	65	56	6
900	70	61	6
1,000	75	5

(g) *Melrose two-borough rate—Business or residence.*

[A local message being a message from a station connected with the Melrose exchange to a station connected with any exchange of the company in the borough of Manhattan or the borough of The Bronx.]

600 local messages, per year..... \$90.00
Additional local messages, each..... 10

(h) *Message rates—Residence only.*

[A local message being a message to any other station connected with an exchange of the company in the borough of The Bronx.]

Three or more station line:
400 local messages, per year..... \$30.00
Additional local messages, each..... .07

(i) *Flat rates—Residence only.*

[A local message being a message to any other station connected with the same exchange.]

Direct line..... Per year. \$48.00
Two-station line..... 36.00
Three or more station line..... 24.00

(j) *Commission pay stations (Manhattan and The Bronx).*

Subscribers operating public pay stations will charge the established tolls and pay the company 80 per cent of all tolls received, the subscriber to retain, however, not more than 5 cents on any one message.

STATEMENT OF EDWARD J. HALL,

Vice-President and General Manager of the American Telephone and Telegraph Company.

The telephone first received general public notice at the Centennial Exposition held in Philadelphia in 1876, and immediately following this, attempts were made to develop its commercial use.

At the outset its possibilities were appreciated dimly, if at all, and with the crude instruments and electrical appliances then available its range of communication was extremely limited.

At first agents were appointed by the Bell Company to rent telephones and bells for the equipment of short private lines; that is, lines connecting a man's office with his factory, or his house with his stable. Each customer built his own line, usually employing the agent who rented the telephones for that purpose, and the agent's income was derived from the profit on this construction and a commission on the rental charged for equipment.

Very shortly it became evident that it would be an advantage to the owners of these lines if they could be interconnected at some central point, constituting what is now known as a telephone exchange. When this had been arranged for, applications began to come in from customers who desired to be connected with the exchange, but did not care to build their own lines for that purpose, preferring to have them furnished by the agent at an annual rental. Such use as was made by individuals of public highways was, of course, unlawful, and no substantial business could have been built up on this basis, making it necessary that quasi-public corporations should be formed for this purpose.

The construction of these exchanges on any considerable scale throughout the country also called for an investment of capital, which neither the Bell Company nor its agents could furnish, and steps were therefore taken to organize local companies everywhere, each company having exclusive exchange rights within the area allotted to it, and the Bell Company reserving to itself, or to other licensees, the right to connect exchanges with each other by trunk lines.

As would naturally be expected, some of the companies thus organized were progressive and energetic and others were not, so that in some places the public was well served (so far as the crude methods then in use made that possible) while in others it was badly served, and the business inadequately developed.

So long as the service was purely local this had no generally bad effect, but when intercommunication between exchange areas was attempted many difficulties naturally resulted. To meet the demand for this intercommunication the Bell Company (not itself undertaking to construct and operate lines) issued licenses for lines connecting these small local companies, sometimes to parties not holding exchange licenses but usually to such licensees, and naturally to the most progressive of them.

The difficulty of maintaining satisfactory interconnecting line service under such conditions led to the purchase of many of the local interests by companies organized on a larger scale to operate over wider areas. This process brought about many improvements both in the better construction and operation of the interconnecting lines and also in the local exchanges, which of necessity had to be reconstructed and improved in order to make communication over longer distances practicable. At that time the state of the art made it impossible, under the most favorable conditions, to talk satisfactorily between points any considerable distance apart, but fairly good service was given between the larger exchanges and their suburban tributary points.

Up to 1885 the apparatus in use was adapted wholly to grounded circuits, and the use of iron and steel wire was universal. Lines were constructed on poles or roofs of buildings. The use of hard-drawn copper wire, which has made transmission over great distances possible, was unknown, but the possibility of its use had been suggested as a means of establishing real long-distance service.

For the purpose of testing this idea an experimental circuit of hard-drawn copper wire was tried, and the result was so promising that early in 1885 the American Telephone and Telegraph Company (which has since been popularly known as the "Long Distance Company") was organized and the construction of a commercial line between New York and Philadelphia at once commenced.

It was 2 years after this before the experimental line was ready for public service, and that period was filled with trials and discouragements before a successful result was finally achieved.

It was determined to try the experiment on a large scale, and heavy poles, 45 feet in length (an unusual size at that time), were erected. Upon these poles 24 hard-drawn copper wires were strung, the method of handling and connecting this wire in use to-day being substantially worked out at that time. It was believed that by using these wires in metallic-circuit pairs inductive disturbances would be eliminated, but when the line was finished it was found that conversation on any one of

the circuits could be readily overheard on any of the others, and that the line would be a commercial failure unless this could be overcome.

Skillful inventors were asked to work on this problem, and after much study and many experiments a successful solution of the problem was finally reached.

Another serious difficulty was encountered in transferring the current from the metallic-circuit trunk lines to the grounded-circuit wires which were then used by the local exchanges. A method and apparatus for this purpose were worked out, as it was the purpose of the company from the outset not to undertake the method which largely prevails in other countries—of requiring users of the lines to come to special toll offices at the terminal points. It was not thought that the American business man would take kindly to this waste of time; and it is believed that this policy, then established, has had much to do with the great development of trunk lines in this country as compared with any other in the world.

About this period, and following on for the next few years, a number of causes were at work leading finally to the introduction of the metallic-circuit service in the local exchanges, which, to accomplish this, were obliged to go through another era of plant reconstruction.

Wires had multiplied to such an extent that a general demand arose to have them put under ground where they were heavily massed in the business centers around the large exchanges, and the rapid development of high-tension currents for electric-lighting and street-railway purposes tended to seriously impair and, in some cases, make almost imperative the service given in the local exchanges over single wires using the ground for a return.

Inventors were again called upon to devise cables suitable for use under ground, and cables have been so far perfected that to day, for short distances, they are as satisfactory as the old overhead wires, and are generally used where wires would otherwise be massed on poles in the principal streets of our cities. Unfortunately, cables are very detrimental to the efficiency of transmission over long-distance lines, and every effort is made to eliminate them in the long-distance service, except in the short section from the terminal exchange to the customer's station.

At this point I might call your attention to the fact that constant and rapid changes in the extent and character of service furnished and the continuous reconstruction of the plant demanded by the changes in conditions to which I have referred, and by the perishable nature of the materials and apparatus employed, have made the question of rates for service one of great complexity for the managers of telephone companies.

At the outset rates were made by men who necessarily had had no experience in the business, and in many cases they made prices below the actual cost of service, and even when they fixed prices which adequately provided for existing conditions the increase in size and cost of exchanges soon tended to make a fixed flat rate unprofitable.

The result of this was that many of the companies were losing money and advances in rates became absolutely necessary. It was natural that these advances should meet with resistance from their customers and become in many States a matter of legislative consideration and investigation.

As a result of this study of the subject and the knowledge acquired by longer experience, both parties have come to a better understanding. What helped more than anything else to bring this about was the recognition by telephone managers of the fact that the true unit of charge is the message, and the recognition by the customer that it was reasonable and just that he should pay in proportion to service rendered. This makes it the interest of the exchange manager to furnish the best possible service in order to promote traffic, and satisfies the small users—who always constitute the great majority—that they are not called upon to pay an unnecessarily high price for their service in order that great corporations and business houses may have service at cost or below. So-called flat rates are reasonably equitable in smaller places, where the conditions as to facilities and traffic are fairly uniform, but they have no place in the service of a large city where these conditions do not prevail.

Trunk-line rates have shown less variation because they were originally started on the correct principle of charging by the message. Originally the rates established were usually about 1 cent per mile for the time actually consumed in conversation, with an allowance of 5 minutes for each message. It having been found that many messages actually consumed less time than this, a substantial reduction in the rate was made by reducing the initial message period to 3 minutes and making a proportionate reduction in rates, so that the prevailing rate to-day in this country is substantially three-fifths of a cent per mile for a conversation of 3 minutes, with a proportionate increase for use in excess of that time.

Stated in another way: The trunk-line customer pays one-fifth of a cent per mile for each minute of conversation, but is required to guarantee a use of at least 3 minutes.

The development of all classes of telephone service in this country so greatly

exceeds that of foreign countries that it is a fair assumption that service and charges are comparatively more acceptable to the people here. Speaking generally, the charges for service are higher here than in Europe, but there are so many differences in conditions, both as to character and amount of service furnished, and as to the cost of construction and operation, that it is almost impossible to make a fair comparison. The greatest single factor is the low cost of labor in Europe compared with its cost here. I understand that this has been fully presented to you by other witnesses, and I will not go into details which would be largely a repetition of testimony already received.

I want to say a word more on this subject, and that is that in relation to charges for long-distance service many of the figures reported from other countries are misleading; as, for instance, in Germany, between points where the message charge would be, say 25 cents, it is necessary, if one desires prompt service, to make what is called an "urgent call," for which the charge is three times the regular rate. In Sweden, for prompt service, or for service at fixed hours, double rates are charged, while in Holland the regular schedule is doubled between noon and 4 p. m.

In general the number of trunk lines provided in Europe is very limited, and a customer has no idea when he will be served unless he offers in advance to pay two or three times the tariff rate.

The service is also subjected to many embarrassing restrictions; as, for instance, in England a customer at a public station is absolutely limited to a 3-minute conversation, no matter how much he may desire to continue it, and this rule also prevails in other countries. The small size of many of these countries as compared with our own, and their greater density of population, are also very important factors in the consideration of any traffic problem.

What may be called the present era of telephonic development in this country really commenced with the opening of the long-distance line between New York and Philadelphia on the 1st of January, 1871. In 1886 and 1887 lines were commenced from New York to Boston and New York to Buffalo, and since that time there has been a constant extension and development both of lines and of the apparatus necessary for their operation, until at the present time the American Telephone and Telegraph Company and 38 associated companies, forming what is known as the Bell system, now furnish local exchange service to about 900,000 stations and trunk-line service over nearly 700,000 miles of wire.

The capital stock of the American Telephone and Telegraph Company has been increased from time to time as its part in this development has required, both for the construction of long-distance lines and the purchase of telephones, telephonic apparatus, real estate, and stocks representing investment in telephone property.

The following table shows the capital outstanding from time to time, the amount outstanding July 1 being held by over 8,000 stockholders, or, to be exact, by 8,120:

Mar. 3, 1885.....	\$100,000	Jan. 1, 1894.....	\$7,250,000
Jan. 1, 1886.....	100,000	1895.....	7,500,000
1887.....	100,000	1896.....	12,000,000
1888.....	100,000	1897.....	20,000,000
1889.....	2,500,000	1898.....	20,000,000
1890.....	4,000,000	1899.....	20,000,000
1891.....	4,750,000	1900.....	70,975,500
1892.....	5,000,000	1901.....	89,100,500
1893.....	5,000,000	July 1, 1901.....	94,237,500

The increase between 1899 and 1900 was partially due to the purchase of the property of the American Bell Telephone Company.

The authorized capital has been increased to \$150,000,000, and stock to the amount of \$20,709,000 has been offered for subscription at par. In addition, collateral trust 4 per cent bonds have been sold to the amount of \$15,000,000, of which \$5,000,000 have been sold during this year, and are, therefore, not included in the last annual report, which I present with and make a part of this statement.

This report gives full details as to the assets and liabilities of this company, its receipts and expenses, together with full information as to the plant, and operating statistics of this and its associated companies.

Respectfully submitted.

EDWD. J. HALL,
Vice-President and General Manager.

NEW YORK, July 15, 1901.

STATE OF NEW YORK, County of New York, ss:

On the 15th day of July, 1901, personally appeared Edward J. Hall, to me known, and known to me to be the vice-president and general manager of the American Telephone and Telegraph Company, and made oath that the foregoing statement by him subscribed is true to the best of his knowledge and belief, before me.

[SEAL.]

HARRY H. BRIGHAM,
Notary Public, New York County.

EXHIBIT A.

ANNUAL REPORT OF THE AMERICAN TELEPHONE AND TELEGRAPH COMPANY
FOR THE YEAR ENDING DECEMBER 31, 1900.OFFICE OF AMERICAN TELEPHONE AND TELEGRAPH COMPANY,
New York, March 26, 1901.*To the stockholders:*

It is my painful duty to record the great loss which this company has sustained by the death of Mr. John E. Hudson, October 1, 1900. He had held the office of president of this company since 1887. Immediately upon the organization of the American Bell Telephone Company in 1880 Mr. Hudson became its official attorney. Afterwards he was successively its general manager, vice-president, and general manager, and after 1889 its president. In all these relations he displayed exceptional ability and sound judgment. He gained the respect and confidence of all who were associated with him, as well as of the public, and contributed in large measure to the successful development of the corporation of which he was so long president.

The output of telephones from 1891 to the first of the current year and the various statistics of the companies operating under our licenses are exhibited in a consolidated form in the tables which follow:

Instruments in the hands of licensees, under rental.

[The figures in lower line show increase from year to year.]

* Not including herein earnings of the American Telephone and Telegraph Company, which will be found in the comparative statement of revenue and expenses appended hereto.

EXCHANGE CONNECTIONS.

The estimated number of exchange connections daily in the United States, made up from actual count in most of the exchanges, is 5,668,986, or a total per year of about 1,825,000,000.

The number of daily calls per station varies in different exchanges from 1 to 15.9, the average throughout the United States being 7.1.

The average cost to the subscriber varies, according to the size of the exchange and character of the service, from less than 1 to 9 cents per connection.

The tables of mileage include the long-distance toll system owned and operated by this company. This system consisted on the 1st of January, 1901, of 12,427.63 miles of pole line and cable, and 167,410.39 miles of wire, connecting 359 offices, a gain during the year of 420.80 miles of pole line and cable, 17,030 miles of wire, and 36 offices.

The following comparative statement shows the number of exchange stations of the companies with which the long-distance lines directly connect, and which furnish the terminals of that system:

	Number of stations.	Connected by metallic circuit.	
		Stations.	Per cent.
January 1, 1900.....	557,979	311,129	55.76
January 1, 1901.....	697,674	438,222	62.81
Increase	139,695	127,093	7.05

The investment in line construction, equipment, and supplies for this system up to December 31, 1900, amounted to \$16,152,020.72. The gross revenue from the toll traffic upon these lines shows an increase of 13.45 per cent over the amount earned in 1899.

At the close of the year 1899 the property and business of the American Bell Telephone Company, except its holdings in the stock of this company, were taken over by this company.

The revenue statement appended to this report exhibits, therefore, as there stated, the result of operations of the combined properties for the entire year 1900, as compared with the total of revenues and expenses of both companies in 1899.

The exchange of shares under the circular of the American Bell Telephone Company dated April 18, 1900, by the terms of which 2 shares of the stock of the American Telephone and Telegraph Company were given for each share of the American Bell Telephone Company, has been substantially completed.

By a circular dated April 18, 1900, this company offered for subscription by its shareholders 1 new share for each 5 shares held by them after the exchange before referred to.

Of the total number of shares so offered (103,545), 103,018 were subscribed for and 52,175 shares were issued on August 1, 1900, and 50,843 shares on January 15, 1901; those remaining (527 shares) were sold by auction and issued in February, 1901.

Collateral trust 4 per cent bonds to the amount of \$10,000,000 were sold during the year.

The past year has been one of marked progress in the development of the business, the increase in number of exchange subscribers having exceeded that recorded in any previous year.

During the last three years the number of exchange stations has increased from 384,000 to more than 800,000. This remarkable growth has been due in great measure to the adaptation of improved methods of construction and operation to the needs of subscribers.

The general adoption of the measured-service system and metallic-circuit party lines, with corresponding lower rates, has attracted many thousands of subscribers, both business and residence, who were previously deterred by the higher cost of other classes of service.

All this has been brought about, moreover, without impairment of the quality of service. As a whole, the standard of construction and efficiency of service has been steadily advanced throughout the country.

In the larger exchanges the old type of multiple switchboards is fast being replaced by relay boards equipped with electric-lamp signals and central battery plant, installed in buildings specially designed for the purpose and owned by the companies.

Material progress has been made also in underground construction, so that at the close of the year 705,000 miles, or more than half the entire mileage of exchange conductors, were operated under the surface of streets.

Most of the gain of exchange stations consists of those connected by metallic circuits. At the end of 1900 there were 538,000 of that class, making an increase of 154,000 during the year.

It is doubtless true that in certain localities rates too low to cover current expenses and necessary allowance for renewal have been offered to meet similar rates offered by competitors. We believe, however, such conditions can not be lasting, and the growth throughout the country as a whole has been of a healthy and substantial character.

The expenditure to provide for extensions of the business throughout the country has been larger than that of any previous year. The new construction completed in 1900 by this company and the companies operating under our licenses amounted to \$28,862,970.85. Of this sum, \$21,914,542.94 was expended upon exchange construction and equipment, and \$6,948,427.91 upon toll lines. In addition to the above, \$2,349,103.28 was invested in real estate, to be utilized for exchanges and company offices. The entire expenditure for construction, including real estate, to the close of the last year has been \$168,474,517.83.

Estimates already made indicate that the extensions of operating plant during the current year will require further expenditure on a large scale.

The year just passed rounds out the quarter century, within which is compassed the discovery and application of the art of transmitting speech by telephone. A brief review of the development and growth of this new industry, which has become so important a factor in commercial and social life, seems appropriate at this time.

Twenty-five years ago the wonderful invention of Professor Bell was made known to the world. Twenty-three years ago the first telephone exchange in the world was established in the United States, and from that beginning has been built up the great system of exchanges, and the network of connecting lines over which conversation can be held between points over a thousand miles apart.

Twenty years ago there were 47,880 telephone subscribers in the United States, and 29,714 miles of wire in use for telephonic purposes. At the end of last year there were 800,880 exchange stations equipped with our instruments, and 1,961,801 miles of wire were employed for exchange and toll line service.

The United States has from the beginning held the leading place among nations in respect not only of the extensive development of the business, but in the employment of modern and improved appliances, tending to greater efficiency of service.

In connection with the record of development of telephone service in this country, some comparison of the systems of foreign countries is of interest.

The latest reports that can be obtained, part of which are for the year 1899, others to the close of 1900, show the countries next in order to the United States, as respects the development of telephone service, to be the German Empire, having 229,391 stations; Great Britain, 171,660; Sweden, 73,500; France, 59,927; Switzerland, 38,864; Austria, 32,255; Russia, 31,376; Norway, 29,446.

As before stated, there were, at the close of last year, more than 800,000 stations connected with the exchanges of our license companies, which exceeds the aggregate number of subscribers in all the countries of continental Europe.

In addition to this, there were over 40,000 private-line stations equipped with our telephones.

The number of exchange and toll line connections in the United States now reaches almost two thousand millions yearly.

The suits of The American Bell Telephone Company v. National Telephone Manufacturing Company et al., and of The American Bell Telephone Company v. Century Telephone Company et al., brought under the Berliner patent in the circuit court of the United States for the district of Massachusetts, were argued before Judge Brown in November, 1899. On February 27, 1901, Judge Brown filed a decision for the defendants in each case. An appeal will be taken to the circuit court of appeals.

For the directors.

ALEXANDER COCHRANE,
President pro tem.

BALTIMORE, MD., July 23, 1901.

SUPPLEMENTARY STATEMENT OF DANIEL H. HAYNE,²*General Solicitor Merchants and Miners Transportation Company.**To the honorable the members of the Industrial Commission, Washington, D. C.*

SIRS: With a view of simplifying the proposed acts which I inclosed to you in my letter of March 3, I would recommend that an additional act be adopted by Congress to specifically cover the crime of "buying, receiving, or selling any money, goods, bank notes, or other things which may be the subject of larceny, and which have been feloniously taken or stolen," and thus eliminating this feature from the two acts as heretofore proposed.

¹ Of this amount \$1,282,277.25 is for the dividends payable January 15, 1901, to stockholders of record December 31, 1900.

² See this volume, p. 423.

With a view of making this suggestion as simple as possible, I would recommend that the two previous amendments to R. S. 4596 and R. S. 5356 which occur in my former testimony be eliminated, and the following put in their place, for such action as your commission and the Government authorities may desire to adopt:

AN ACT To amend section forty-five hundred and ninety-six of the Revised Statutes of the United States, relating to offenses and punishments.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That subsection eight of section forty-five hundred and ninety-six of the Revised Statutes of the United States be, and the same is, amended to read as follows:

"SECTION 4596, subsection 8. For willfully damaging the vessel, or embezzling or willfully damaging any of the stores or cargo, or taking or carrying away, with intent to steal or purloin, the personal goods of another, by forfeiture out of his wages, of a sum equal in amount to the loss thereby sustained, and also, at the discretion of the court, by imprisonment for not more than twelve months."

AN ACT To amend section fifty-three hundred and fifty-six of the Revised Statutes of the United States, relating to crimes arising within the maritime and territorial jurisdiction of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section fifty-three hundred and fifty-six of the Revised Statutes of the United States be, and the same is, amended to read as follows:

"SECTION 5356. Every person who, upon the high seas, or in any place under the exclusive jurisdiction of the United States, or upon waters within the maritime jurisdiction of the United States, takes and carries away, with intent to steal or purloin, the personal goods of another, shall be punished by a fine of not more than one thousand dollars, or by imprisonment not more than one year, or by both such fine and imprisonment."

AN ACT To amend section fifty-three hundred and fifty-seven of the Revised Statutes of the United States, relating to crimes arising within the maritime and territorial jurisdiction of the United States.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That section fifty-three hundred and fifty-seven of the Revised Statutes of the United States be, and the same is, amended to read as follows:

"SECTION 5357. Every person who, upon the high seas, or in any place under the exclusive jurisdiction of the United States, or upon waters within the maritime jurisdiction of the United States, buys, receives, or conceals any money, goods, bank notes, or other things which may be the subject of larceny, and which has been feloniously taken or stolen from any other person, knowing the same to have been taken or stolen, shall be punished by a fine of not more than one thousand dollars and by imprisonment at hard labor not more than three years."

Respectfully submitted.

DAN'L H. HAYNE,
General Solicitor.

BOSTON, MASS., February 20, 1901.

TESTIMONY OF HON. CHARLES FRANCIS ADAMS.

Former Chairman Massachusetts Railroad Commission.

The special subcommission met in the rooms of the Home Market Club at 10.07 a. m., Mr. Clarke presiding. At 11.40 a. m. Hon. Charles Francis Adams, of Boston, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. CLARKE.) You may give your name and post-office address to the stenographer.—A. Charles F. Adams; 23 Fort Street, Boston.

Q. Have you been chairman of the Massachusetts board of railroad commissioners?—A. When the board was formed, in 1869, I was one of the original appointees, and I became chairman, I think, in 1872, and remained chairman until 1879. I then retired from the board and have had no connection with it since that time. In 1897 Governor Wolcott appointed me as chairman of a commission to investigate the subject of the relations between street-railway companies and municipalities. The other members of the commission were Mr. W. W. Crapo, of New Bedford, and Mr. E. B. Hayes, of Lynn. We made an examination of the whole subject of street railways as they then existed and their relations with municipalities; and our report was submitted in February, 1898, to the Legislature of Massachusetts, which report

is now on file; and, in accordance with recommendations then made, a general act was passed modifying largely the relations of street-railway companies, as they are called, to municipalities and this law now regulates that subject in Massachusetts.

Q. Will you please proceed in your own way to give your ideas of the most recent application of electricity to street-railroad purposes and suggest such changes in laws or the granting of franchises as may occur to you for the protection of the public?—A. The subject is rather a large one, and I do not immediately see how it bears very closely upon your inquiry. The essential feature in the situation is, so far as I am concerned, that the report to which I have referred, made by the commission in 1898 and the legislation passed in accordance therewith is no longer applicable to existing conditions. Here in Massachusetts—I do not know how it is in other States; I dare say their laws are more elastic—but here in Massachusetts to-day all our legislation, so far as street-railway companies are concerned, is based upon a condition of affairs that has ceased to exist, and the legislation needs overhauling. Our report has already become ancient history and, I hold, has little if any bearing on conditions existing to-day. Accordingly, so far as it goes, it is deceptive. I think we have set up a false guide, and a guide which, as considering myself largely responsible for that report, I have already indicated to our authorities is rapidly carrying our Commonwealth and municipalities into a position of a good deal of difficulty, from which hereafter they will be forced to extricate themselves at much expense and by a very violent effort. That is to say, the legislation in Massachusetts is based upon the fundamental principle that a street railway is nothing but an improved line of omnibuses, or a street-railway company is nothing but a company to operate an improved line of omnibuses over a special pavement which they are authorized to lay, in combination with other pavement, in the streets of our towns and cities. Accordingly our whole principle has been to turn that business over to what might be called local management, and each municipality is supposed to regulate its pavement and to regulate the line of omnibuses just as they did in the old days. Our legislation—our whole organization of these companies, is based on this principle. It is very much as if, for instance, the great railroad companies in the State, of which we now have but three in the Commonwealth—the New York, New Haven and Hartford, the Boston and Maine, and New York Central—were left to the regulation of every town or city through which they pass, and had to look for their franchises to the governments of those municipalities. It is only a question of degree, and the street-railway corporation, as we call it, has burst through town limits. Sometimes we have street-railway corporations which go through at least a dozen different municipalities and operate roads which are getting up now to 50 miles; and moreover they have long since ceased to use horses, the motive power with which they originally began. They have introduced a new motor—electricity—and the fact is, therefore, to-day we have in this State not the old street railway and the steam railroad, but we have the steam railroad and the electric railroad. The motive power is the only difference between the two, except that the electric railroad is allowed to do what the steam railroad is not; that is, it is allowed to lay its tracks in the public thoroughfare and to operate its cars with new motor. All conditions have changed in regard to speed, and they are rapidly changing with regard to the methods of doing business. So far our legislators and town authorities have not wakened up. The community does not realize the fact that these new conditions are now in their infancy; that the introduction of electricity has entirely changed the character of the street-railway company and is really introducing a subordinate system of railroads; and they have got to be treated as railroads, because the time is not remote, as is obvious when these street railways have got to be operated at a rate of speed which hitherto has been incompatible with the joint use of the street with other conveyances. That is, they have got to be operated, in order to carry on the business which they have, at a rate of 20 or 40 miles an hour, and no longer at the rate of 10 miles an hour, which was excessive speed when the cars were drawn by horses.

It is also obvious that, in order to perform their functions, they have got to run very large cars close together; not in consecutive trains perhaps, but as they do now in our subway. Not only that, but they have got to carry freight and perform a wholly new set of functions. They have to do this in order to fulfill their mission and accomplish the purpose for which they were organized. In other words, we are going to have in the not very remote future a subsidiary railroad system. The steam-railway system will operate over great distances, and handle business of large volume, requiring most elaborate terminal arrangements, a movement which can only be conducted by steam and by trains of great size doing the more remote or through business—that is, a business extending anywhere from 50 miles to 10,000 miles, and which we may call a through or wholesale business.

We are now seeing established a subsidiary railroad system operated by electricity and accommodating up to 50 miles. Our present legislation does not provide for it, but we are going through an experience which will ultimately lead to general legislation. It requires no great observing power to see the form it is going to take—

the form of elevated roads or subways in the large cities, such as Boston or New York. This whole evolution is now about 10 years old.

As a dynamic force it has not amounted to much until within the last 10 years. The growth has recently been very great, and so was the growth of the railroad system in its early days. Compared with what it is going to be in the year 1950, the electric or subsidiary railroad system is now just about where the railroad system was in 1845, 10 years after it got a firm hold in this country. Its appliances and its methods are all tentative and elementary. They are going to be developed to an extent beyond anything which we can now realize. We have no data upon which to work. We can only say that it is going to grow until, in proportion to the first 10 years of its existence, it will be something as surprising as the railroad development so surprising in itself. It will be, as I have said, in the form of subways or elevated roads. The traffic will then have to be separated at great expense. It will be subject to very severe municipal regulations, as it is in these cities now, where the cars go from the subway or the elevated road out into the country districts. In the country districts, instead of running on streets as it does now, it will get off the highways at the earliest possible moment on to a private right of way. It will do so for its own convenience and economy, and in order that it may not be subject to the restrictions as regards speed in operation, to which it is necessarily subjected in the narrow streets. The community will inevitably insist, and the corporations will desire, that the railway lines shall be upon streets especially designed for that purpose—broad thoroughfares, avenues of 125 to 150 feet, with provision made for both forms of transportation, and where, without interfering with the regular vehicle transportation, the electrics can run at great rates of speed, carry freight, etc., and perform their functions with a reasonable degree of convenience.

They are now trying to break through these obstructions in a blind sort of way. The tendency now is to go to the legislature and get some form of special legislation. There is a conflict existing between the street railway, as it has got to be, and the steam railroad. The steam railroad views the electric railroad with great suspicion as likely to interfere with its traffic. Our whole legislation is tending to-day, and is likely to involve the community at no remote period, in a position from which they will have to extricate themselves exactly in the way in which the railroad has extricated itself from the position in which it originally started. Now in every one of our great cities they are endeavoring at enormous cost to separate the traffic, and so put themselves in a position to perform their functions without great friction and extreme cost.

We have been studying the thing all over the country. Here in Boston we have been grappling with the question of separating grade crossings. We originally permitted them without any idea they were going to be a source of serious inconvenience; but they became intolerable, and we are separating them, at enormous cost to the municipality and railroads.

Take such a line as the Boston and Providence. Every person who remembers that road in its early days knows it ran through a region which has now become crowded, and the question is to elevate the track, which has been done at a prodigious cost to both the community and the railroad. To render it possible to conduct the two forms of travel without interfering with each other, the street railway will have to do the same thing in an aggravated degree. The present situation will become intolerable, and the traffic will have to be separated.

In Syracuse, Rochester, and other cities the separation of the highway from the railroad traffic has involved engineering feats of great difficulty and enormous cost. Perhaps the most striking case in the country is the work done recently by the Pennsylvania Railroad Company in Jersey City; and I take it that the most difficult problem in the country in that respect is that now presented in Chicago, where they have got to separate the traffic, no matter what it costs and no matter what engineering feats it may require.

I am not now prepared to formulate any system. It is a difficult problem. I merely say that the report of our commission, though only 3 years old, owing to the immense development of electricity that has taken place and the change of conditions, so far as it is any guide at all, is a false guide; and it is rapidly getting our communities into a snarl from which they will extricate themselves at some future time with great difficulty and at very large expense. This was not our fault. We made as good a report as was possible under the circumstances as they then existed. The difficulty is that those who have the shaping of our legislation have not awakened to the fact that a new power has come into existence which requires radically different treatment. They must go back in legislation and build from a new foundation. The day for treating an electric railroad like a line of omnibuses running on tracks laid down in the streets is gone, and gone forever; and the sooner they wake up to that fact and frame their legislation to meet the new conditions the better it will be for all concerned in the not remote future.

That is all I have to say. I can only add that if the legislature should ask me to-day what changes I had to propose in existing legislation, I should answer, "I am not prepared to say." It would require probably a year's study of the situation, just as before. Our commission, 3 years ago, was organized in June, reported in January, and the bill was passed in May. Therefore its work occupied just 1 year. If that same problem were to be placed in the hands of another commission to-day, to draft suitable legislation to meet existing conditions, it would require a study by specialists and men who had given much attention to the subject for about 6 months to make report, and it would then require another 6 months to shape the necessary legislation.

It is not easy to frame legislation in a way to commend itself to the interests and judgment of existing corporations. They are very jealous. They do not take hold of new ideas very readily. They look with great suspicion on innovations. They always ask how they are going to affect them. It is accordingly very difficult, as we all know, to frame legislation which will be effective, and at the same time practical.

Q. (By Mr. CLARKE.) Are the electric railroad companies of Massachusetts organized under special charters?—A. No; under a general law, but they have to obtain their franchises from each municipality; and each municipality to-day is imposing new conditions, and very properly. They are asked to give the use of their streets, and in many cases the exclusive use of streets. Therefore they exercise their ingenuity in devising new and difficult conditions which are becoming more and more restrictive so far as operation is concerned, and which the corporations are more and more anxious to avoid.

Of course the original desire of the corporation was to get the right of way given it for nothing. The railroad corporations, their competitors, had to purchase their rights of way at great cost. The franchise cost nothing at first. The company simply laid down a track, but the tracks so interfered with traffic that that half of the highway could only be used for the street railway. It then became necessary as the community increased in population, etc., to widen that highway. Then they found, as here in Boston, that they had given the half of the street to the railroad company, and were expected to widen the street to accommodate the increased traffic at their own expense. Of course that condition could not long continue. The community felt that the railroad company should bear a portion of the expense or even the whole of it, and therefore there came to be more and more conditions imposed as to speed, as to rate of fare to be charged, as to carrying school children at half price, as to the expense incurred in widening thoroughfares, as to one thing and another, until we are rapidly coming to the point where it will be felt that it is necessary to separate the traffic, just as in the case of the steam railroad. That is looming up before us.

In the West they are far ahead of us in this respect, because in the West these lines now run for miles and miles on private right of way through the country. They are accommodating themselves to the facts more rapidly than we, and saving themselves the great future expense which we are incurring.

Q. When you speak of the separation of the traffic, do you mean at the crossings of the railroad and the highway?—A. No; that will never cause any great difficulty. It will take care of itself, because it will be to the interest of the railroad to stop at crossings to take on and let off passengers. The traffic is of such a nature that, having no stations, or only a very few at terminal points, the question of local crossings will regulate itself without trouble.

Q. Do you know of the company formed to build an electric road for high speed between Boston and Worcester?—A. Yes; I know something of it, but not of the details.

Q. Do you know of the conditions imposed by the city of Newton for the franchise of that company?—A. No; I do not. There is hardly a town in the Commonwealth that is not struggling now over this question. My attention was first drawn to it by the town of Lincoln, on the Fitchburg Railroad. That is a country residence town; so much so that there is only one shop in it, a little country store, and no other place of business. It has only some 1,200 inhabitants. Two electric roads wanted to go through. Their representatives said very frankly that they wanted to pass through Lincoln to get to Concord; they wanted to run through Lincoln at a speed of 30 miles an hour; we were to give them a right of way for nothing on one of our thoroughfares to be used for an electric railroad, although the Fitchburg road, which ran through the town, had bought its right of way at an enormous expense and incurred all the expenses incident to a steam railroad. That immediately brought up the question of conditions. They were of every character, from the amount to be paid for the right of way, and the conditions the company was to enter into to protect and widen it, and accommodate it to the business, to the number of times they would stop, to the rates of fare they would charge—every conceivable condition. I presume it is the same thing in Newton.

All that is part and parcel of the old theory under which the street railroad is supposed to be a horse-car line and merely a matter of local interest, whereas this

very railroad you are speaking of (the one to Worcester), I take it, runs through a dozen towns. It has to face the regulations and the selectmen of a half dozen towns and satisfy all. I hold it is impossible.

Q. What is the distance?—A. It is 44 miles. They have got to stop frequently, and when they get to a crowded neighborhood they have to run 10 miles an hour, or whatever it is, so that when you take out the stops and the places where, for safety, they must run at a low rate of speed, there is no escape from a great speed elsewhere.

Q. As a practical railroad man, do you think that a single car, however heavy, can be run at the rate of 20 or 30 miles an hour with safety.—A. I do not know anything to prevent it. They are getting these cars up to a weight wholly different from the old car. The old car certainly could not so run. It would be off the track at every turn. But they are getting to a solidity of track not in any way different from the railroad. The permanent way is of the most solid character. I do not remember how many tons their cars weigh. I am not informed in that portion of the details of the electric business, but my impression is they are getting their cars up to a weight of 20 and 30 tons. Are they not?

Q. I am not aware of the weight of the car, but at whatever weight it will be lighter than a steam railroad train with a heavy locomotive and heavy cars which are held together by the Miller compression buffer with 80,000 pounds pressure between each car, will it not?—A. They are undoubtedly lighter, but with a weighted car of 15 or 20 tons and with a good permanent way you can run pretty fast. I must add that so far as the running of an electric road in its present form is concerned I do not profess to be an expert. There are already roads that run trains of cars. To Nantasket Beach there is a regular railroad operated by electricity. The distinction between the steam railroad to-day and the street or electric railroad is shadowy. It is merely a change of motive power; otherwise they are the same.

Q. You have been president of the Union Pacific Railway Company?—A. Yes; 10 years ago.

Q. You have traveled very extensively and are familiar with railroads in Europe and you have been the author of books on railroads?—A. They are all antiquated. Very few scientific books are worth anything after 5 years, science moves rapidly in these days. Except the report of the commission of 3 years ago, I have written nothing for 10 years whatever.

Q. Have you seen the street railroads in Glasgow which are operated by the municipality?—A. I have.

Q. What is your opinion of that system compared with our American system?—A. That Glasgow system of which you hear so much is nothing but a very imperfect American system—acknowledged to be such. The manager of it does not profess anything else. I had a great deal of talk with him. It is all rubbish what you hear of the systems in Europe. So far as they are good, they are built by American companies and on American lines, subject to such restrictions as the European communities have seen fit to impose. There is not a system in Europe that I have seen or have any knowledge of which would, for instance, bear any comparison with the system we have here in Boston to-day.

Q. What is the fare on that system in Glasgow?—A. I do not know what the minimum is; I think it is a penny—2 cents. It is according to distance, as I recollect it. You state where you are going and they punch your ticket, and you pay a penny or a penny and a half, 2 pence, and so on. The system is not adapted to our needs here.

One of the most curious facts connected with our railroad system here in Boston is what is known in summer as pleasure travel. The people living in town get into these electric cars and for 5 cents are taken out and given an exchange ticket on another line, and for 10 cents they can ride 15 or 20 miles and pass the entire evening. That is wholly unknown abroad, so far as I know.

Q. It is rather new here.—A. Here it is a system which has grown up under our American methods. We went into it very elaborately in the report I have referred to. The European principalities are very restrictive; they have been so afraid of being cheated—they are so afraid some one is going to get the advantage of them that they cheat themselves, and will not give an opportunity for that development which is essential to any enterprise. All the companies want is to get their money back, and they get it back by giving the poorest of accommodation and managing their traffic, so far as I am familiar with it, in the most niggardly way. They give a better management than the original systems of tramways to which the people there are accustomed, but as compared with what you see in American cities, I assure you there has been more rubbish and misstatement and misinformation talked on that subject than on any other subject my attention was ever drawn to. And when I went abroad and looked into it with the idea that I could learn something I speedily came to the conclusion that there was absolutely nothing for us to learn in Europe; so far as they had anything up to date it was purely American, American appliances put in by American companies. And I have no question if the theorists

who talk on this subject had made the investigation which I have made, and had done it with the intention of arriving at the facts and not supporting a theory, they would state the same thing—that we have nothing whatever to learn on that subject from Europe.

Q. Now that we have touched this subject of municipal ownership of street-railroad accommodations, are you willing to express an opinion as to the desirability of the Government taking over the entire railroad systems?—A. I think it is humbug. I do not want to talk about it. It seems to me pure trash and I do not care to discuss it. The Government has as much as it can do now. If you want to have \$250,000,000 more of a pension list, all you have to do is to go into something of that sort. If others wish to discuss it they can; to me its discussion is a waste of time.

Q. You know something of government owned and operated railroads in Europe?—A. I have no respect for them whatever, compared with our railroads in this country. The best railroads in Europe are the English railroads—by far the best—and those are left to private enterprise, and are handled accordingly. I have no faith whatever in government ownership of industrial enterprises. If left alone individual ownership will beat the government every time.

Q. We should like very much to receive your opinion on the pending consolidation of great railroads in this country, if you have formed an opinion?—A. I see nothing whatever to interfere with it. I expressed my views on that question years ago, and see no reason to change them. It is a thing that should be left to work out its own results in its own way with as little hampering as possible. It has worked far in that direction since I have had to do with railroads in Massachusetts. We have only three corporations now. The talk of monopoly has died out. It is found that a large corporation, while its political power is undoubtedly great, has proportionately increased responsibility, and it is far easier to handle it, and it gives better and more satisfactory service, than a number of small corporations that you can not put your finger on. As I say, here in Massachusetts, all the jealousy of great railroad corporations has disappeared, and it has disappeared largely in view of the fact that the people get better service, more satisfactory results, from the consolidated concern, and the dangers which were apprehended do not exist.

What I have said has taken a far wider range than I anticipated when I came in, and I state frankly that the whole subject, except in connection with street railways, has not occupied my attention for 10 years. I do not propose to give any attention to it again. It is a subject I am tired of, and am ready to leave to others. Therefore, upon everything except as to street railways and their relation to municipalities, I speak subject to correction and from impression.

Q. (By Mr. LITCHMAN.) Have you any changes in legislation to suggest that you think would be applicable to the line of thought you have presented this morning?—A. I have nothing to propose. That would be a matter for careful study. I do not myself believe in changing legislation precipitately. Such changes ought to be carefully matured. The difficulty is we toss legislation together. If we had far less legislation we would be much better off. If this matter is going to be handled, it ought to be handled with great deliberation and on a thorough understanding of the situation. And you can be very sure—absolutely sure—that whatever is formulated has got to pass through an ordeal of criticism, first from the existing street railways and then from the steam railroads. This is always the case, and, I suppose, necessary.

Q. Do you think an electric railroad could be incorporated under the general railroad act of Massachusetts?—A. I do not see why not. I am not aware of anything in the act which prescribes that the road has to be operated by steam. I do not believe, for instance, that the Cohasset Railroad had any special act. It simply adopted electricity as its motive power, instead of steam.

Q. That would carry with it the right of eminent domain—the right of taking land under eminent domain?—A. I should have to look at the law carefully before I answered that question, more carefully than I am now disposed to do. I should not care to express an opinion. I am very sure of one thing—in order to secure satisfactory results we will have to have a great deal of new legislation.

Here the testimony of Mr. Adams was closed. Later an informal conversation took place between Mr. Adams and Mr. Stimson, in the midst of which the stenographer was instructed to take it down, Mr. Litchman introducing the subject, as follows:

Mr. LITCHMAN. Mr. Stimson was asking if the local franchises were permanent, and Mr. Adams was making a statement on the subject which was important.

The WITNESS. The franchise of Massachusetts street railways has always been an indefinite franchise, granted by the localities through their streets, and subject to revocation at any time at the arbitrary judgment of the local authorities. A more absurd tenure could not be imagined, and one would not expect that any large investment of capital could have been developed under such a ridiculous practice; and yet, on the whole, that illogical, absurd tenure of franchise has worked better in its results than any other system yet devised. We went into this subject very

elaborately in the report, of which I shall be happy to send you a copy. Contrary to our whole impression, when we entered on our investigations, we were agreed that better and more satisfactory results, politically and economically, had been produced under the Massachusetts form of franchise than under any other we had heard of.

In many of our Western States the renewal of franchises has been one of the most crying causes of municipal corruption. These renewals are always coming up, and every time they come up there are allegations of corruption, and bargain and sale, which are, to say the least, scandalous. What there is in it I do not know, and it is none of my business; but that system of renewing franchises has not worked well—I mean the system of limited-time franchises, subject to renewal.

Q. (By Mr. CLARKE.) Is it not the law in Massachusetts that the selectmen of the town in granting franchises do not act as officers of the town, but as officers of the Commonwealth?—A. I believe that is the theory of the law, but it works badly, as you well know. It works badly simply because they are no longer granting a permit to run a line of omnibuses on Washington street, which used to be the case formerly; but they are now called in to exercise a partial jurisdiction. The tendency of legislation has been to leave the granting of franchises nominally as a local option, but to give more and more an appeal to the railroad commissioners in case of difficulty. We have found a way (and it is not a bad way at all; it is a very good way) of working legislation to practical results without much regard to theory; and I distinctly say it is, on the whole, the best system of street railway legislation there is.

Q. As a matter of fact, do not the people of the several municipalities take so much interest in this that they bring to bear upon the selectmen or the city councils, as the case may be, the pressure of public opinion?—A. Oh, yes. I think there is a great deal to be said in favor of the system, and if I believed that the electric railroads could go on operating forever under the joint use of the highway, etc., I should not be disposed to change the system any more than we changed it 3 years ago. We changed it but little. We then took just the position you suggest, and left well enough alone. The only thing that I say now is that a new force has developed, which has burst through its swaddling clothes, and can not be confined much longer. All that brought me here to-day is to call the attention of the community to the fact that the infant is getting to be a pretty big man and his present clothes will not hold him much longer. He has got to have a new suit; that is what it comes to.

Q. (By Mr. F. J. SIMSON.) Have you formed an opinion that this new legislation should prohibit local authorities from granting franchises on public highways?—A. I believe that matter should be left to regulate itself. If they choose to put railroads in the highways, let them put them there, and they will soon find—both the people and the railroad—that it is to the interest of neither party that they should be there. The thing I am clear about is so to expand legislation as to permit the separating of highways and street railroads, instead of which the authorities are now compelled to put the railroads on the highways and nowhere else. I should make our legislation more elastic, so that these electric railroads would have more power to develop, instead of being, as they now are, men forced into the clothes of a child.

(Testimony closed.)

WASHINGTON, D. C., March 6, 1900.

TESTIMONY OF MR. VAL FITZPATRICK,

Third vice grand master, Brotherhood of Railroad Trainmen.

The commission met at 1.45 p. m., Chairman Kyle presiding. Mr. Val Fitzpatrick, third vice grand master, Brotherhood of Railroad Trainmen, Cleveland, Ohio, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Senator KYLE.) You may give your full name and address and your business to the reporter.—A. Val Fitzpatrick; third vice grand master of the Brotherhood of Railroad Trainmen.

Q. That is, of the United States?—A. United States and Canada.

Q. Where is your residence?—A. Columbus, Ohio. The head office of the organization is at Cleveland, Ohio.

Q. You are conversant with this Reading Railroad trouble, are you?—A. Yes.

Q. Will you state as briefly as you can to the members of the commission what there is of it, beginning at its inception and coming down to the present time?—A. I would like to submit or make a statement of the character of the organization. I would like to state that the Brotherhood of Railroad Trainmen, through its grand

master, filed certain charges with the Industrial Commission against the Philadelphia and Reading Railroad. The character of the organization is best stated in its preamble, which was formulated at the instituting of the Brotherhood of Railroad Trainmen, and which, I might say, has never been changed from that day to this, which is upward of 17 years. The preamble reads:

"PREAMBLE.

"To unite the railroad trainmen; to promote their general welfare and advance their interests, social, moral, and intellectual; to protect their families by the exercise of a systematic benevolence, very needful in a calling so hazardous as ours, this fraternity has been organized.

"Persuaded that it is for the interests both of our members and their employers that a good understanding should at all times exist between the two, it will be the constant endeavor of this organization to establish mutual confidence and create and maintain harmonious relations.

"Such are the aims and purposes of the Brotherhood of Railroad Trainmen."

The chief features of our organization are: First, education. We believe that it is easier to reason with men of education than it is to do business with men who are ignorant of those things that confront them in their employment. The wages and hours of labor are also a consideration. We have lost no opportunities to see to it that the men receive a fair compensation for their labor, and its equivalent in hours of labor.

Q. Was that not the chief object in the formation of your organization?—A. No; I might say it was not the chief object of the formation of our organization. The chief object in the formation of our organization was to insure the lives of its members and protect their dependents. To that end last year the Brotherhood of Railroad Trainmen have distributed among widows, orphans, and their disabled members \$675,000.

Q. You found, however, that your interests could be best served by organization of that kind as regards the wages paid and hours of labor, and so on?—A. The wages and hours of labor were an after consideration. The manner in which the organization proceeds to take up those questions pertaining to rules, hours of labor, and rates of pay can best be given by reading that part of its constitution, which goes to show that we have no agitators, or no one going over the country hunting trouble; that if any grievances arise they spring from the individual members. Rule No. 5 of the general rules of the constitution of the brotherhood reads:

"CONSIDERATION OF GRIEVANCES.

"No. 5. Any member considering that he has been unjustly dealt with by his employer, or that he is otherwise aggrieved, shall make a statement of the grievance in writing, securing the signature thereto of a majority of the members of the lodge employed on that division, and present the same at a meeting of the lodge. The lodge shall then determine, by a majority vote of the members present, employees of the division, whether to sustain or reject the grievance. Should the grievance be sustained the local grievance committee shall lay the matter before the train master, superintendent, or other proper officer, and use every means to effect a satisfactory settlement and report their action and all things pertaining to the case to the lodge. If the result is not satisfactory it may be referred to the general grievance committee for further action."

By following out this manner of procedure it takes a grievance out of the hands of the man who is aggrieved and places it in the hands of conservative men, men who are not in anywise interested, and who are more competent to decide whether there is a just grievance or not. It then comes before the executive officers. Before entering into a conflict the grievance has got to be submitted in writing, in circular form, to the membership. They have to decide whether there is sufficient grievances; or, in other words, whether they can enter into a conflict. Then it must pass the approval of the grand master, or his duly accredited representative. In 16 years and 7 months the Brotherhood of Railroad Trainmen have been engaged in 2 conflicts; in other words, in 2 strikes. I believe this will go to show that the organization is conservative, and that its policy is largely one of conciliation and arbitration. I might state that these 2 conflicts were settled by committees of arbitration.

Q. What years were these?—A. I think one, the first, was in 1892; the second was in 1894.

Q. Neither settled under the new bill passed by Congress a couple of years ago in your behalf?—A. No, sir.

Q. That was a bill particularly pushed for your organization, was it not?—A. Yes.

Q. The arbitration bill?—A. Yes.

Q. I remember your organization appearing before us by your representatives.—
A. Yes.

Q. And it was considered a very good bill?—A. Yes.

Q. I think your representative stated that in case that bill became a law strikes would be reduced to a minimum, and there would be practically none of them at all.—A. I think it has had some effect in reducing the number of strikes.

Q. You may state, then, before you go further, the number of railroad employees that are included in your organization.—A. The membership of the Brotherhood at the present time will number over 38,000.

Q. And the kinds of employees?—A. They are principally switchmen, brakemen, and conductors.

Q. There is a separate organization then for firemen and engineers?—A. Yes, and there is a separate organization for conductors also, but we have quite a number in our organization who have been promoted from the position of brakeman to conductorship and still maintain membership in their Brotherhood.

Q. Do you affiliate with the Brotherhood of Locomotive Firemen and Engineers in any way?—A. Yes; we do. We are closely associated with them. In fact, not only with the organizations of railroad employees, but I believe we are closely associated with all labor organizations.

Q. Exactly; but in a little different sense you are associated with those you speak of?—A. Yes; our interests are so close that it brings it closer together than it would other organizations; the relations are different. On January 14, 1900, I organized a lodge of the Brotherhood of Railroad Trainmen at Shamokin, Pa.

Q. (By Senator KYLE.) They have never had an organization of that kind there before?—A. No, sir.

Q. But you have organizations of your order along the line of the Reading road, have you?—A. Yes, sir.

Q. (By Mr. RATCHFORD.) Before you pass from the general explanation as to the purposes of your organization I should like to ask a question or two. You spoke of \$675,000 being distributed among the membership last year?—A. Yes.

Q. I should like to understand how this money is raised and what is the purpose in distributing it?—A. The manner in which the money is raised is as an assessment on the membership levied from time to time.

Q. A voluntary assessment?—A. Yes, sir. It is a condition of membership. It is levied for each month. This falls into a fund known as the beneficiary fund, from which we pay all claims that arise in that department, such as death and disability from whatever cause; it may be incurable consumption, locomotor ataxia which railroad men are frequently afflicted with, or an injury in their employment which incapacitates them to earn a livelihood.

Q. Is there any out-of-work benefit?—A. The subordinate lodges regulate that; that is within the province of the subordinate lodge.

Q. Well, now, this fund is what is known to your organization as the insurance fund, is it?—A. Yes.

Q. Have the railroad companies insurance funds also, of their own making?—A. No, not generally; it is confined to a few. The principal roads that I know of are the Chicago, Burlington and Quincy; the Baltimore and Ohio; Pennsylvania; and, I understand, the Southern Pacific are going to inaugurate the insurance features this year, sometime early in this year. Those are about the only large systems that I can recall at the present time.

Q. Well, is this insurance, known as the company's plan of insurance, generally agreeable to the railway employees?—A. I believe you mean the so-called voluntary reliefs of the railroad companies?

Q. No; I do not mean that. I mean the insurance that is gotten up by the company and managed by the company. They may call it voluntary, but we have testimony before this commission, I believe, showing that it is the reverse of voluntary.—A. I met last year upward of 15,000 railroad men who are connected with our organization and other organizations in the train service, and I have failed to find a single one that has approved of the plan or working of the railway insurance associations.

Q. (By Senator KYLE.) Will you explain to the commission the methods of the railway companies.—A. In employing men they must pass a doctor's examination, and after they are given employment they are placed upon the rolls of the relief association. They have no jurisdiction over that part of the matter. I might say they have no jurisdiction in discontinuing their payments. As long as they remain in the service of the company they have got to keep on paying these assessments.

Q. You mean a certain amount is extracted from their salaries?—A. Yes.

Q. (By Representative OTJEN.) In other words, it is not a voluntary payment?—
A. The men do not so consider it.

Q. (By Mr. RATCHFORD.) Employment as a railroad brakeman is conditioned upon membership in that association, is it not?—A. Yes; that is my understanding of the manner in which they work.

Q. Has that system the effect of exempting railway companies from liability in case of accident or death to the employee?—A. Yes; and the numerous decisions which have been rendered by the courts throughout the country are the best evidence of that. I believe they can be found in Mr. Carroll D. Wright's bulletin from time to time.

Q. (By Senator KYLE.) The employees do not sign an agreement, do they, when they become employees of the company that they will accept this insurance in lieu of all other claims against the companies for injuries?—A. Yes; I think, if my memory serves me right, that is one of the conditions.

Q. (By Mr. KENNEDY.) Is there such a voluntary relief association on the Reading system?—A. I believe there is.

Q. You do not know?—A. I am not positive of that, but I am inclined to believe there is a voluntary relief association there.

Q. (By Mr. RATCHFORD.) The question was with reference to employees waiving their claims for liability in case of accident or death, and the question leading up to that was whether or not they sign a paper in becoming members of this so-called insurance, waiving such claims.—A. Yes; I consider that by them joining the relief association they waive all right to recover for personal injuries or otherwise.

Q. Can you present this commission now, or at your convenience, a paper such as is presented to an employee asking him to waive such claims, by any railway company?—A. I believe I can; yes.

Q. We will be glad to have it.—A. I will try to furnish you that paper.

By Mr. KENNEDY. I suggest you go into the Reading trouble now.

Q. (By Senator KYLE.) Yes, proceed. You spoke about having organized on January 14.—A. January 14 of the present year I organized a lodge at Shamokin, Pa., and on my arrival in Shamokin I found quite a number of the proposed applicants had been discharged on account of their being about to become members of the organization. I might state that some of these men belonged to the Brotherhood in a city distant from Shamokin. Their membership was never known by the officials. It was discovered that some of these men were the prime movers in instituting this lodge. A few days before my arrival they were dismissed from the service of the Philadelphia and Reading.

Q. Will you please state to the commission the nearest city to Shamokin where there is a lodge of this order?—A. The nearest is Sunbury.

Q. How far away?—A. About 12 miles.

Q. On the same railway division?—A. Yes.

Q. So the same railway officers are in charge of the employees both at Shamokin and Sunbury?—A. I believe so, unless it would be a divisional point.

Q. Well, do these men object to the men joining their order at Sunbury?—A. Well, I do not know of any objections prior to the 14th of January, but I presume the reason why there was not any discipline or dismissal from the company sooner was the fact that they did not know that these men belonged to the Brotherhood, and they quietly went up to Sunbury and became members of the institution.

Q. Now, the lodge at Sunbury—where is the next lodge along the railway?—A. The next is Williamsport.

Q. How far is that away?—A. I believe about 45 miles from Sunbury; 55 or 60 miles from Shamokin.

Q. In the same division still, is it?—A. That is the terminus of the Philadelphia and Reading, I believe.

Q. Now, state how many lodges there are along the route of the Reading road?—A. I presume there are about 15—12 or 15.

Q. And how long is it since the first one was established?—A. The first lodge was established, I believe I can safely say, in 1885 or 1886.

Q. So that the lodges have been established practically 15 years along that road?—A. Yes.

Q. And the officers in charge of the road have been practically the same officers, have they, for a number of years?—A. I believe their general officers have been about the same; but there have been quite a number of changes among the division officers.

Q. Well, have you had complaints heretofore that men were discharged because of their affiliation with one of these orders?—A. Yes; we have had quite a number of such complaints for the past 10 years.

Q. So that you have reason to believe in your own mind that these men were discharged prior to your going to Shamokin because they contemplated organizing a lodge there?—A. Yes.

Q. Now, if you will, state to the commission your reasons for so believing. Of course, we want to get at the facts here.—A. My reason for believing this is that the men who were discharged called upon their division officers—trainmasters, yardmasters, and superintendents—and asked them to assign a cause for their dismissal. These officers declined to talk. They simply said to the men, "We haven't anything to say to you at all. You are discharged, and that is all there is to it. We do

Q. I remember your organization appearing before us by your representatives.—
A. Yes.

Q. And it was considered a very good bill?—A. Yes.

Q. I think your representative stated that in case that bill became a law strikes would be reduced to a minimum, and there would be practically none of them at all.—A. I think it has had some effect in reducing the number of strikes.

Q. You may state, then, before you go further, the number of railroad employees that are included in your organization.—A. The membership of the Brotherhood at the present time will number over 38,000.

Q. And the kinds of employees?—A. They are principally switchmen, brakemen, and conductors.

Q. There is a separate organization then for firemen and engineers?—A. Yes, and there is a separate organization for conductors also, but we have quite a number in our organization who have been promoted from the position of brakeman to conductorship and still maintain membership in their Brotherhood.

Q. Do you affiliate with the Brotherhood of Locomotive Firemen and Engineers in any way?—A. Yes; we do. We are closely associated with them. In fact, not only with the organizations of railroad employees, but I believe we are closely associated with all labor organizations.

Q. Exactly; but in a little different sense you are associated with those you speak of?—A. Yes; our interests are so close that it brings it closer together than it would other organizations; the relations are different. On January 11, 1900, I organized a lodge of the Brotherhood of Railroad Trainmen at Shamokin, Pa.

Q. (By Senator KYLE.) They have never had an organization of that kind there before?—A. No, sir.

Q. But you have organizations of your order along the line of the Reading road, have you?—A. Yes, sir.

Q. (By Mr. RATCHFORD.) Before you pass from the general explanation as to the purposes of your organization I should like to ask a question or two. You spoke of \$675,000 being distributed among the membership last year?—A. Yes.

Q. I should like to understand how this money is raised and what is the purpose in distributing it?—A. The manner in which the money is raised is as an assessment on the membership levied from time to time.

Q. A voluntary assessment?—A. Yes, sir. It is a condition of membership. It is levied for each month. This falls into a fund known as the beneficiary fund, from which we pay all claims that arise in that department, such as death and disability from whatever cause; it may be incurable consumption, locomotor ataxia which railroad men are frequently afflicted with, or an injury in their employment which incapacitates them to earn a livelihood.

Q. Is there any out-of-work benefit?—A. The subordinate lodges regulate that; that is within the province of the subordinate lodge.

Q. Well, now, this fund is what is known to your organization as the insurance fund, is it?—A. Yes.

Q. Have the railroad companies insurance funds also, of their own making?—A. No, not generally; it is confined to a few. The principal roads that I know of are the Chicago, Burlington and Quincy; the Baltimore and Ohio; Pennsylvania; and, I understand, the Southern Pacific are going to inaugurate the insurance features this year, sometime early in this year. Those are about the only large systems that I can recall at the present time.

Q. Well, is this insurance, known as the company's plan of insurance, generally agreeable to the railway employees?—A. I believe you mean the so-called voluntary reliefs of the railroad companies?

Q. No; I do not mean that. I mean the insurance that is gotten up by the company and managed by the company. They may call it voluntary, but we have testimony before this commission, I believe, showing that it is the reverse of voluntary.—A. I met last year upward of 15,000 railroad men who are connected with our organization and other organizations in the train service, and I have failed to find a single one that has approved of the plan or working of the railway insurance associations.

Q. (By Senator KYLE.) Will you explain to the commission the methods of the railway companies.—A. In employing men they must pass a doctor's examination, and after they are given employment they are placed upon the rolls of the relief association. They have no jurisdiction over that part of the matter. I might say they have no jurisdiction in discontinuing their payments. As long as they remain in the service of the company they have got to keep on paying these assessments.

Q. You mean a certain amount is extracted from their salaries?—A. Yes.

Q. (By Representative OTJEN.) In other words, it is not a voluntary payment.—
A. The men do not so consider it.

Q. (By Mr. RATCHFORD.) Employment as a railroad brakeman is conditioned upon membership in that association, is it not?—A. Yes; that is my understanding of the manner in which they work.

Q. Has that system the effect of exempting railway companies from liability in case of accident or death to the employee?—A. Yes; and the numerous decisions which have been rendered by the courts throughout the country are the best evidence of that. I believe they can be found in Mr. Carroll D. Wright's bulletin from time to time.

Q. (By Senator KYLE.) The employees do not sign an agreement, do they, when they become employees of the company that they will accept this insurance in lieu of all other claims against the companies for injuries?—A. Yes; I think, if my memory serves me right, that is one of the conditions.

Q. (By Mr. KENNEDY.) Is there such a voluntary relief association on the Reading system?—A. I believe there is.

Q. You do not know?—A. I am not positive of that, but I am inclined to believe there is a voluntary relief association there.

Q. (By Mr. RATCHFORD.) The question was with reference to employees waiving their claims for liability in case of accident or death, and the question leading up to that was whether or not they sign a paper in becoming members of this so-called insurance, waiving such claims.—A. Yes; I consider that by them joining the relief association they waive all right to recover for personal injuries or otherwise.

Q. Can you present this commission now, or at your convenience, a paper such as is presented to an employee asking him to waive such claims, by any railway company?—A. I believe I can; yes.

Q. We will be glad to have it.—A. I will try to furnish you that paper.

By Mr. KENNEDY. I suggest you go into the Reading trouble now.

Q. (By Senator KYLE.) Yes, proceed. You spoke about having organized on January 14.—A. January 14 of the present year I organized a lodge at Shamokin, Pa., and on my arrival in Shamokin I found quite a number of the proposed applicants had been discharged on account of their being about to become members of the organization. I might state that some of these men belonged to the Brotherhood in a city distant from Shamokin. Their membership was never known by the officials. It was discovered that some of these men were the prime movers in instituting this lodge. A few days before my arrival they were dismissed from the service of the Philadelphia and Reading.

Q. Will you please state to the commission the nearest city to Shamokin where there is a lodge of this order?—A. The nearest is Sunbury.

Q. How far away?—A. About 12 miles.

Q. On the same railway division?—A. Yes.

Q. So the same railway officers are in charge of the employees both at Shamokin and Sunbury?—A. I believe so, unless it would be a divisional point.

Q. Well, do these men object to the men joining their order at Sunbury?—A. Well, I do not know of any objections prior to the 14th of January, but I presume the reason why there was not any discipline or dismissal from the company sooner was the fact that they did not know that these men belonged to the Brotherhood, and they quietly went up to Sunbury and became members of the institution.

Q. Now, the lodge at Sunbury—where is the next lodge along the railway?—A. The next is Williamsport.

Q. How far is that away?—A. I believe about 45 miles from Sunbury; 55 or 60 miles from Shamokin.

Q. In the same division still, is it?—A. That is the terminus of the Philadelphia and Reading; I believe.

Q. Now, state how many lodges there are along the route of the Reading road?—A. I presume there are about 15—12 or 15.

Q. And how long is it since the first one was established?—A. The first lodge was established, I believe I can safely say, in 1885 or 1886.

Q. So that the lodges have been established practically 15 years along that road?—A. Yes.

Q. And the officers in charge of the road have been practically the same officers, have they, for a number of years?—A. I believe their general officers have been about the same; but there have been quite a number of changes among the division officers.

Q. Well, have you had complaints heretofore that men were discharged because of their affiliation with one of these orders?—A. Yes; we have had quite a number of such complaints for the past 10 years.

Q. So that you have reason to believe in your own mind that these men were discharged prior to your going to Shamokin because they contemplated organizing a lodge there?—A. Yes.

Q. Now, if you will, state to the commission your reasons for so believing. Of course, we want to get at the facts here.—A. My reason for believing this is that the men who were discharged called upon their division officers—trainmasters, yardmasters, and superintendents—and asked them to assign a cause for their dismissal. These officers declined to talk. They simply said to the men, "We haven't anything to say to you at all. You are discharged, and that is all there is to it. We do

not wish to assign any reasons or talk with you on the matter at all." When I found that such was the case—that the men were discharged for belonging to the Brotherhood—I felt that we were in no position to protect them.

Q. Did the officers state these men were discharged because they were contemplating joining the lodge?—A. I will tell you just exactly what has been done at each place, and the facts as I know them at Shamokin. There was no reason assigned further than "We do not want you in the service of the company."

Q. (By Representative OTJEN.) How many were discharged?—A. There were about 8, I believe—6 or 8.

Q. They had been members of the order before?—A. Yes. There were only 2 that were not members of the organization. There were about 4 members of the organization at the time they were dismissed; but all were proposed members of this new lodge.

Q. Do you have any organization there?—A. Yes.

Q. Is it in existence to-day?—A. Yes.

Q. Are members of it working on the Reading system?—A. No, sir. There may be a few under cover—older memberships in secrecy. When I found out that the officers of the Philadelphia and Reading were objecting to the organization of a lodge there, I felt a reluctance about proceeding to organize them, as I knew the men would lose their employment.

Q. (By Senator KYLE.) You say "when you found it out." How did you find it out?—A. I found out through the men. They told me they had called upon the division officers and asked for the cause of their dismissal. They would not assign any reason at all. They told them that their service was not any longer needed.

Q. And it is simply an inference on your part, is it?—A. Yes; and the attitude of the Philadelphia and Reading in the past led me to believe that it was on account of their membership in the Brotherhood of Railroad Trainmen.

Q. Now, you are getting at what led you to believe that fact. Their relations in the past, you say?—A. The orders which they issued some 8, 10, or 12 years ago, when they made it a condition of employment that no man should belong to a labor organization. And while the road was in the hands of a receiver, under Judge Paxson, our organization went into court to establish the right of belonging to our Brotherhood and at the same time working for the receivers of that company. When I found that they were objecting to our organization being instituted along their system, and that we were in no position to protect the men when they became members of our organization, I thought the best thing to do for themselves and their families was not to organize a lodge of the Brotherhood in Shamokin, and I so advised them. But after earnest soliciting on their part, and when they showed a determination to go ahead with the organization regardless of the officials of the Philadelphia and Reading, I could not deny them the right to become members of the organization. On February 8 I received a telegram from the grand master advising me to go to Philadelphia and counsel with our members in that city employed on the Philadelphia and Reading Railroad. On my arrival there I found that about 60 of those men had prepared to inaugurate a strike independent of any organization, simply on their own account. I counseled with those men and advised them that it would not be the proper thing to do; showed them wherein it might be injurious to them, as well as to the interests of the Philadelphia and Reading, and that there would probably be another way in which we could get around this and secure justice for them. They finally consented to remain at work, those that were working, and those that were dismissed we would try to secure employment for them by some other means. I believe there were upwards of 10 discharged. One of the gentlemen is here at present.

Q. (By Representative OTJEN.) At Philadelphia?—A. Yes; one or two of the gentlemen are present. But those 10 men that were discharged produced letters showing that for faithfulness and diligence in the discharge of their duty they were complimented very highly by the yardmaster, trainmaster, and superintendent. In fact, these men that were discharged were the very best men, in my judgment, employed on the Philadelphia and Reading Railroad. We took particular pains to ascertain whether they had been guilty of destroying any property, or whether they were intemperate or incompetent, and we found in every case that the men were thoroughly competent, sober, and industrious men, had first-class records as employees. Some of these men had the matter up personally with the general superintendent, and the general superintendent said to them very plainly that they were discharged on account of affiliating with the Brotherhood of Railroad Trainmen.

Q. (By Senator KYLE.) This discharge took place when?—A. Along about the 1st of February.

Q. Reverting to the Shamokin affair, now. Did the discharge take place there before the lodge was organized, or after?—A. Just before; a few days before.

Q. Just before?—A. Yes.

Q. Well, now, what reasons can you give the commission, if any, why the Philadelphia and Reading would oppose the organization of a lodge at Shamokin, even to

the extent of discharging its employees, and at the same time permit a lodge or lodges to exist in other cities along its lines?—A. If I have left the impression that these lodges exist along the line of the Philadelphia and Reading, composed principally of Reading men, it is wrong. These lodges that exist along the lines of the Philadelphia and Reading Railroad are composed principally of Pennsylvania Railroad men, with a few Philadelphia and Reading men in every lodge.

Q. (By Mr. KENNEDY.) At junction points on the system?—A. Yes.

Q. (By Senator KYLE.) And the members employed by the Reading are under cover, you think, mostly?—A. Yes; there is a gentleman here from Reading who could testify before this commission and show that they do meet in haylofts, cellars, and dark rooms, one place and another, in order to escape the sleuths of the Philadelphia and Reading Railroad.

Q. (By Mr. RATCHFORD.) Have the Philadelphia and Reading officials cooperated at any time with your organization or had business with it?—A. It never had any occasion to meet or do business with our organization. We have never had any difficulty. I might say, talking more plainly, that the organization has never had any grievance presented to it by the men employed on the Philadelphia and Reading Railroad.

Q. (By Representative OTJEN.) Until the present one?—A. Yes.

Q. (By Mr. RATCHFORD.) You say that your organization never had any grievance presented to it until the present one by the men employed on the Philadelphia and Reading Railroad. Was that because of the good treatment accorded the men by the company, or because there was no organization there—little or no organization—among your men?—A. Well, it is due largely to the fact that there is no organization there, and the company has the men under complete submission.

Q. (By Mr. KENNEDY.) You mean they have had no grievance since the receivership of the company. You said, I believe, they had trouble then?—A. At the time of the receivership; that was a matter taken into court.

Q. (By Senator KYLE.) But you found out at the time that you had this trouble in the court that the company was opposed, and bitterly opposed, to the organization of lodges along their road?—A. Yes; and the records of the court will bear that statement out.

Q. And they made a statement here about the 1st of February, at the time the men were discharged, that you were speaking about, that they were still opposed to the organization of lodges, and that these men were discharged because of their connection with these lodges?—A. Yes.

Q. (By Mr. KENNEDY.) Do you know whether Judge Paxson is in any way connected with the management of the Philadelphia and Reading at this time?—A. His name does not appear on the official list as given in the Official Guide. As to his being in any wise connected with it, I can not say. He might possibly be a director or counselor, or advisor of some description.

I might say, in concluding, that these men are not only pleading for their liberties and rights to belong to organizations so long as they come within the bounds of the laws of the land, but they are also making their plea for their right to work. I have received letters from a great number of these men since they have lost their employment on the Philadelphia and Reading Railroad, and all of these letters show that wherever they go they are asked the question: Where did you work last, and what were you dismissed for? And when they make their statement that they were discharged for nothing, apparently nothing, so far as they know, other than to belong to a labor organization, the officials refuse to permit them to go to work until they refer back to the road from whence they came. After it is discovered that the officials of the Philadelphia and Reading Railroad disapproved of their working anywhere else, they are told that they are not needed. Some of these men have traveled since last January from 3,000 to 6,000 miles trying to find work.

Q. Do you mean to say they are placed on the blacklist, so to speak?—A. Yes.

Q. By all the railroads of the United States?—A. No. The rule of railroads is this in employing men: To make them give reference. Now, we do not wish to leave the impression here that all railroad officials are opposed to our organization, and would be guilty of blacklisting a man because he asserted his rights to belong to an organization that was for his protection. A great many of the officials, regardless of what kind of recommendation comes back from the Philadelphia and Reading, or any other road, if the man were a sober and industrious man, would be pretty apt to give him employment, but unfortunately for these men they have been traveling right along certain lines that adhere strictly to this rule—that the man must have a clear record before he can be employed on their lines. Some of these men have been injured in the service of the Philadelphia and Reading. Some of them have lost a hand, and some have lost a foot. Some have impaired their health on account of long hours and all kinds of weather. They have, as I said before, in their possession letters and statements showing that their service has always been satisfactory. In fact, they are the very best employees—the very best in their service.

Q. Now, when these men were discharged, the last men you mentioned, it was said to them that they were discharged because they were members of the Railroad Trainmen's Association?—A. Yes.

Q. And for no other reason?—A. That is apparent, yes.

Q. (By Senator KYLE.) You said a moment ago that these Philadelphia men were told they were discharged by the railroad because of their connection with your organization, or with your lodges?—A. Well, yes. They have told me at Philadelphia that they were discharged on account of their membership in the Brotherhood of Railroad Trainmen.

Q. I understood you to say they were told by the railroad officials that they were discharged for that reason?—A. That is correct.

Q. Simply because of their connection with the organization?—A. Yes, sir.

Q. (By Representative OTJEN.) Are these men here?—A. One of them is here.

Q. (By Senator KYLE.) And the railroad failed to give a certificate as to character as regards faithfulness and anything else?—A. Some of them have them in their possession.

Q. They have got to produce some sort of a certificate from former employers before they can get employment on some other railroad?—A. Yes; but this is an exchange through officials. The man must immediately have a recommendation in his pocket, but it is worthless with a great many corporations. It must pass back and forth through the officials—the official of one railroad in communication with another.

Q. (By Mr. RATCHFORD.) Have you not a law in the State of Pennsylvania which in substance provides that workmen shall not be discriminated against by the employer for their connection with a labor union?—A. That law has been declared unconstitutional by Judge Gunster, I believe.

Q. How recently has it been declared unconstitutional? Do you remember?—A. Last September or October.

Q. (By Mr. KENNEDY.) An appeal is pending now?—A. Yes; there was an appeal taken. I believe it is pending. I do not know just the status of the appeal.

I would like to read, in answer to Mr. Ratchford's question about these voluntary relief associations [reading]:

"And, in consideration of the contribution to be made to the relief fund of the said association by the Philadelphia and Reading Railroad Company, and its successors, and of the agreement of the several associated companies in respect of any deficit in the relief fund for benefits in their respective employees, I hereby agree that the acceptance of benefits from the said relief fund, or from said association for injury or death, shall operate as a release of all claims or damages against said company, my employer, and against any of said associated companies by which I may hereafter be employed, arising from such injury or death, which could be made by or through me, and that I or my legal representative will execute or, where necessary, procure to be executed such further instrument as may be necessary formally to evidence such acquittance."

Q. (By Mr. RATCHFORD.) What is that you are reading? Is it an agreement or is it rules?—A. These are the rules covering the Philadelphia and Reading Relief Association.

Q. As promulgated by the officials of the railroad?—A. Yes.

Q. The practice of the employees of the road is to sign them in accepting employment?—A. Yes. It is virtually a condition of employment, just as an applicant is required to go before their doctors and pass an examination before he can be employed. A great many of these companies to-day have the latter rule in force. If a man's measurements and weight and height do not all correspond, and if he be not sound in limb, he can not get employment.

Q. (By Representative OTJEN.) Are you sure that these employees are obliged to accept these benefits unless they want to?—A. My understanding is that they will have to accept benefits or leave the service of the company.

Q. That is, on these roads that have these associations, practically all the men belong to the association?—A. Yes.

Q. Is it understood among railroad men that they will not have a good standing in their employment if they do not join these so-called voluntary relief associations?—A. Well, I am at a loss to know how to answer that question, because you will find so very few who do not belong to the relief association that it would be hard to determine that question.

Q. (By Senator KYLE.) I understood you to state a moment ago that they could not become employees at all unless they were examined and became members of this department?—A. Yes; that is correct.

Q. Well, you can proceed now to make out your cause of complaint. We have got so far as the Philadelphia matter, where 10 men were discharged; having passed the Shamokin matter where 8 men were discharged, I believe, making 18 in all.—A. We received statements from quite a number of the members of our organization

asking us to in some way give them relief, and we knew that it was impossible to approach the officers of that company, asking for the rights of the men to belong to organizations, and, inasmuch as there was created by Congress an Industrial Commission to inquire into industrial matters, we concluded that the best thing to do was to bring it before this commission.

Q. You mean to say by that that you made no attempt whatever to reach the railroad officials in regard to this matter?—A. No, sir. We never tried to reach them as an organization. The men did. We advised the men to call on their division officers, and general officers, if necessary and if they could do so, and ask for a hearing of their case, and for the cause of their dismissal.

Q. So your reason, then, for appearing before the commission here, or desiring to appear, is because 18 of your men have been discharged without just cause, as you think?—A. Yes.

Q. And for the cause that you have interpreted—that they are members of the several lodges along your line?—A. Yes, and that we believe that relief should be afforded these men in some way or other by the provision of a law or enactment of a law.

Q. Can you state of your own knowledge that the railway officials would have received you and discussed these matters as an organization? They might possibly refuse to treat with these men individually, or a committee locally of the men, but are you sure they would refuse to receive you and 2 or 3 of your associates?—A. Yes. Their attitude to organization in the past leads me to believe that they positively would not permit me to approach them as an officer of an organization or otherwise as an individual.

Q. How many such railroads are there in the United States that refuse to do that?—A. Only one—that is the Philadelphia and Reading.

Q. And you never asked them to treat with you?—A. My predecessors, Mr. Wilkison, and, I believe, though I am not quite positive, Mr. Morrissey, now grand master of the Brotherhood of Railroad Trainmen, tried to approach the president and superintendent of one or two companies, and found they could not do so.

Q. Who is the president of this company and the vice-presidents and general manager?—A. Well, I do not know who is the president now. I think Mr. Vorhees was president at that time.

Q. And the superintendents you speak about?—A. I do not know their names.

Q. And the general manager?—A. The general superintendent's name is Mr. Swigard.

Q. (By Mr. KENNEDY.) You state as conclusive that if they would not give satisfaction to the individual members who have been discharged they would not tolerate interference on the part of leaders of the organization?—A. I felt that when they refused to entertain a committee of the employees, to listen to an honest complaint, it would not be of any benefit to the men for this organization to make an appeal in their behalf. I believe that it was on the 5th or 6th of February that the committee appeared at the general superintendent's office and asked him if he would not permit them to discuss the dismissal of themselves, and of 4 or 5 or 6 others, and he stated that he did not want to have anything to do with it—this is what they told me—that he would not discuss any proposition with them; that he had discharged them, and that stood. The chairman of the committee made the remark to him: "We will strike at your freight service," meaning that they would strike, or that they would try to establish a boycott on the Philadelphia and Reading. That had no effect on him whatever. He simply refused to do any business with them and refused to discuss the proposition with this committee.

Q. (By Senator KYLE.) And yet, he keeps in his employ how many members of organized labor, in your judgment?—A. Do you want to get them all discharged?

Senator KYLE. No. You do not need to state their names, but in round numbers.—A. I might say that we have at the present time a very conservative estimate—about 200 men employed on the Philadelphia and Reading Railroad, members of the Brotherhood of Railroad Trainmen.

Q. (By Representative OTJEN.) About how many employees are there on the Pennsylvania and Reading?—A. I have no way of knowing, but I should judge upward of about 3,500 who are eligible to our organization.

Q. (By Mr. KENNEDY.) Are the engineers on that system members of the Brotherhood of Locomotive Engineers?—A. I know some of them are.

Q. Are the firemen members of the Brotherhood of Fireman?—A. Some of them, yes.

Q. Some conductors belong to the Conductors' Brotherhood?—A. Yes.

Q. Do you know whether the company is aware of that fact?—A. Well, I do not think it is. I do not think the officers know that the men belong to the respective organizations.

Q. (By Senator KYLE.) There are 200, you think, in your Brotherhood of Trainmen that are still employed by your company; 18 men have been discharged, and 8

of them you suppose were discharged because of their connection with your order?—A. Yes.

Q. Ten of them, upon statements of the men themselves, were discharged because they were members of the order?—A. Yes.

Q. Is it possible that these 10 men spoken of last could have been mistaken as to the cause of their dismissal?—A. No; I do not think they could be mistaken, for the reason that these men had been in the service from 3 to 9 years in the capacity of brakemen and conductors, and their work was always of the very highest character; they had caused very little damage to property; they were always there when called upon to go out in any and all kinds of weather, and at any time during the day or night. Usually those are the kind of men railroad corporations are looking for, and they would much rather keep a man of that kind in their employ than to take an inexperienced man. There must have been some cause for discharging these men, and if it was for neglect of duty, or destruction of property, the officers would not hesitate to say so. Inasmuch as they refused to give them any consideration whatever other than to say, "We do not want you in our service," it is very good evidence that there is some hidden motive, which they were afraid to make known.

Q. (By Mr. RATCHFORD.) Were those men that you speak of all discharged at about the same time, or were they discharged singly, one by one?—A. They were all discharged within a few days of each other. Probably 10 days would cover the time at the very furthest.

Q. Ten days would cover the discharge of the 18 members, would it?—A. Yes. I might state that some men have been discharged that we have no record of. There is Williamsport, and there have been quite a number of men discharged in Newburyport who have gone away and found employment somewhere else.

Q. Were those men members of your organization?—A. Yes.

Q. Have you any knowledge of any discharges in which the discharged employee was not a member of your organization?—A. Not a single one. We have taken particular pains to ascertain whether any man that was not a member of the organization was discharged in the same mysterious manner that these men were discharged, and we can not cite any single instance or any single case.

Q. (By Mr. KENNEDY.) Is it customary in the railway service in giving dismissals, with the immediate cause of necessary reductions in the force, to give letters of recommendation that will enable them to get service on another line?—A. Generally speaking, that is the rule.

Q. Will a superintendent who has to discharge a man because of a necessary reduction in the force, that man being satisfactory in every way, refuse to give him such a letter if he asks for it?—A. No; he will not refuse to give a letter. As a general proposition, the superintendent of his own accord sends a letter to the employee at the time the reduction is made, notifying him that on account of depression in business his service will not be any longer required.

Q. Now, you say some of those men who have been discharged have such letters in their possession. Did they procure those letters prior to their discharge or since?—A. I believe some of them secured those letters prior to their dismissal, and some received them after their dismissal.

Q. (By Senator KYLE.) Now, I want to ask you another question. You say the Pennsylvania system recognizes your order and treats with you as an order?—A. Yes; there can not be any question about that. They have been very generous to our organization.

Q. So you have been in the habit of meeting the superintendents and managers, have you, on business matters relating to your employees?—A. Our organization has quite frequently met with the general manager of the Pennsylvania Railroad.

Q. Upon complaints of your men?—A. That is, on grievance matters that emanate from the employees.

Q. And they have never refused to treat with you?—A. No; we have never found the disposition of the officials of the Pennsylvania to antagonize our organization.

Q. And when men are discharged from the Pennsylvania Company, and you think unjustly, they will meet you and tell you why the men were discharged?—A. Yes; if it becomes necessary to meet with officers of our organization, I believe the officers of the Pennsylvania Railway would do so, but I might state as a general rule the Pennsylvania Railroad officials settle these matters with their men directly.

Q. I wanted to know what your custom was. In case a dispute arose between members of your order and the railway company, you do not think they would refuse to treat with you and to tell the reasons why they discharged 15 or 20 men?—A. We know they would not refuse to meet with us; at least, their attitude in the past leads me to believe they would not refuse to meet with us.

Q. But your organization, then, has never met any of the members of the Reading road to consult with them as to whether they would recognize organized labor or not?—A. No; they have never given us an opportunity to explain the attitude of our organization to them, and I believe that if the officials of the Philadelphia

and Reading had a better understanding of organized labor they would not oppose it so strongly.

Q. I asked these questions because I think their attitude is quite unusual, and it occurred to me to ask you the questions to know whether you had exhausted every means at your command to ascertain whether they had absolutely and flatly refused to treat with your organization.—A. Well, we know that it is their policy in days gone by, and the same general superintendent is connected with the road, and the dismissal of these men and his refusal to meet with the committee leads us to believe that it is his policy.

Q. Was it not true generally with a great many private industries 10 or 15 years ago that they refused to treat with organized labor, and that since that time organized labor has become quite generally recognized throughout the country?—A. Yes; that has been our experience. Even 5 years ago the Brotherhood of Railway Trainmen did not stand as high with the railway managers as it does at the present time, because they misunderstood the objects of the organization and its intentions, but after they have become familiar with its manner of working they know that the organization is conservative; it counsels its members to be conservative and take into consideration all things that indirectly interest the railroad properties. I might say, as the best evidence of this being true, that when depression struck this country some years ago, in 1893, the railroad men throughout the country and our organization submitted to reduction after reduction in wages for stated times until business revived and the railroad companies were in a position to resume paying their regular rates. There were no strikes and no conflict. During the depression we were willing as an organization, we were willing as employees, to help the railroad management bear the burden.

Q. Is it the fact that where a man belongs to organized labor, is a member of a lodge in good standing, it is a guaranty that they are getting a good man when they employ him; that he is known by his fellows in his lodge as being worthy of employment by the company; he stands well socially; that he is an honest man? It is sort of a guaranty that a man is a good man if he belongs to your organization. Is it not possible if a committee of 3 or 4 of your national organization were to go to the president and general manager and vice-president of the Reading Company you could settle this matter without bringing it to the attention of the commission?—A. Well, if we thought so we would not be here to-day.

Q. Exactly; but you say you have not tried it, that is all.—A. Well, when their own employees can not approach them, can not get an audience with the general superintendent, I would like to know what hopes an outsider would have of approaching a higher officer of that company.

Q. The approach is made by the members of the national order, and it would be a matter probably of greater importance to them to meet the national members of your order than it would be to meet 3 or 4 or 5 of the employees.—A. I am here to say to you, Mr. Chairman, that we will never as officers of an organization approach the Philadelphia and Reading officials, because, as I stated to you and read extracts of our constitution, showing you whenever there is any grievance matter or an employee feels that he is unjustly dealt with, those matters must be taken up by a committee of his fellows employed on the same division. That has been done in this case.

Q. (By Mr. RATCHFORD.) But I understood you to say earlier in your testimony that Mr. Morrissey and one or more of your predecessors approached the company on another grievance, and were refused and denied an interview?—A. Yes; themselves and a committee of the employees. I would like to say that a committee of employees in this case had taken up the complaints of the men carefully; the officials refused to give them any recognition or any consideration, and I do not believe that they would consent to meet those who are entirely out of their service—not employed by them.

Q. (By Senator KYLE.) Did these men say they were a committee representing organized labor or the Brotherhood of Railway Trainmen?—A. Yes, they did; they stated they were members of the organization, appointed by the membership of the Brotherhood of their respective divisions.

Q. (By Mr. KENNEDY.) Has the Reading Railroad Company's opposition to organized labor been so constant through many years that you would not think of such a thing as going to them in the interest of the men? Is that one of the grounds on which you have declined to go to them, one of the reasons?—A. Yes; that is one. I might state if they were officials that had not opposed the organization before we might do the same as we have done with a great many other officials—communicate with them and ascertain their attitude; but we know the general superintendent's attitude to organizations so well that we believe that it was not necessary to communicate with him or any of the other officials.

Q. (By Representative OTJEN.) Did I understand you to say that when there were complaints of any of your members, in order to have those complaints heard they must first secure the indorsement of one-half the membership on their division?—A. Yes; that is correct.

Q. And then it goes to the lodge, does it not?—A. Yes.

Q. And has to be approved by one-half the members of the lodge?—A. Yes.

Q. And then it goes to the general officers of the association; is that correct?—A. No; it goes to the committee representing the employees on that division.

Q. That is a committee of the membership?—A. A committee of the membership employed on that division.

Q. What is the duty of that committee regarding that then?—A. The committee are given absolute power to make a settlement. They meet with the officials to explain the matter of working. If the committee finds that there has been an unjust grievance placed in their hands, they have the power not to go any further in the investigating, or, in other words, to refer it back—make a report as to their finding.

Q. But if they find that the complaint is well founded, what then?—A. Then they proceed to adjust it, meeting with the proper officers of the railroad.

Q. In this case was any grievance presented to a majority of the membership of the division?—A. At Philadelphia, yes.

Q. At Philadelphia?—A. Yes; there was at Philadelphia. At Shamokin there was not, because I advised them not to. A committee was appointed and the matter was taken up with the general superintendent.

Q. Well, at Philadelphia did the grievance receive the majority of the employees of the district—have the approval of the lodge and then go to this committee that you speak of?—A. Yes; it got as far as the committee.

Q. And this committee, did they attempt to present the grievance to the railway officials?—A. Yes.

Q. And were refused?—A. Yes; they were refused.

Q. (By Representative BELL.) That was the official committee?—A. Yes; representing the Brotherhood—the Brotherhood men employed on that division.

Q. It was not composed of the men that were discharged at all, but just your official committee—standing committee?—A. No; they were not discharged.

Q. (By Representative OTJEN.) They were not discharged?—A. But they were discharged the next day.

Q. How many?—A. Three.

Q. Are they still out of the service of the company?—A. Yes; I have no knowledge of their going back. I might state that one of them was not discharged; he resigned, knowing that he would be discharged, or feeling that he would be discharged.

Q. (By Mr. KENNEDY.) After the other two had been discharged?—A. Before the other two had been discharged he resigned.

Q. (By Senator KYLE.) And these three members of the committee were discharged, you think, because they took up the case of these discharged men and attempted to present the matter before the officials of the railroad?—A. Yes; that is my opinion, and the opinion of all the railroad men in and around Philadelphia.

Q. (By Representative OTJEN.) Then, as a matter of fact, your organization did present this grievance, or did attempt to present this grievance, to the railroad officials officially?—A. Not officially; that is, so far as the general officers of the organization are concerned. Locally they complied with the laws of the organization and presented it.

Q. Is not this committee part of the organization—part of your official organization?—A. Yes; but I do not want to confuse the local committee with the officers of our organization.

Q. That is, what you mean to say is, that the grievance was not presented to the railroad by the general officers of the organization?—A. No; it was not.

Q. (By Representative LIVINGSTON.) Was the committee authorized to do it by the general officers?—A. No.

Q. Then it was not official?—A. Yes, it was. It was officially authorized by their lodge.

Q. (By Mr. RATCHFORD.) They were authorized to do it under your laws—under your rules?—A. Yes.

Q. (By Mr. KENNEDY.) Is there any organization known as the Knights of Labor along your line—organization of railroad employees?—A. I do not know of a single railroad man that belongs to the Knights of Labor to-day on any railroad in America.

Q. There is no conflict, then, between the workmen belonging to one organization and the other on this system?—A. No; so far as our relations with organizations on the Philadelphia and Reading Railroad are concerned, they are of the very pleasantest kind.

Q. (By Mr. RATCHFORD.) As you wish to substantiate your claims in your testimony, it might be taken from your testimony, I take it, that you have not presented direct proof of your claim. The most direct testimony might be summed up in this way: That it is the supposition, because of the general hostility of the railroad company toward your organization in the first place, and in the second place because the men who have been discharged have asked for the causes as to why their services were dismissed, and the company has refused to give such causes. Now, upon those two

grounds it is the claim of your organization that such men were discharged because of their connection with a trade union; is that correct?—A. Yes.

Q. (By Representative BELL.) Your statements awhile ago all show that every man discharged belonged to the organization also?—A. Yes; every man that has been dismissed has been a member of our organization.

Q. Now, then, who have their places been filled by, union or nonunion men, as far as you know?—A. They have been filled, so far as I know, by nonunion men; men who do not belong to the organization, and I know of it personally and had them pointed out to me at Shamokin, men who had taken the places of some of these men who have been dismissed—men that have not been in the railway service 1 year; and from their general appearance I would judge they were not experienced railroad men.

Q. There is no probability that any of these railroad men were discharged because business had fallen off or anything of that kind?—A. No.

Q. Has there been a man engaged to take the place of every man who was discharged, so far as you know?—A. Yes. I might say, Mr. Chairman, as to the question that you asked me awhile ago, if there were any other railroads that refused to meet and treat with our organization, it has come to my mind that there was a general manager who refused to meet with our organization on the Pennsylvania lines west of Pittsburg—that is, with the officers of our organization. But it is not the policy of the Pennsylvania Railroad to refuse men a hearing. That same general manager who refused to meet the representatives of the organization spent several weeks in conferences with his men relative to pay and rules to govern men in their employment; and I believe Mr. McCrea, who is the vice-president of the lines west of Pittsburg, has on several occasions, while general manager, met with the representatives of these organizations and transacted business with them.

(Testimony closed.)

Mr. HEEBNER, counsel for the Philadelphia and Reading Railway Company, states that the commission has given this company full opportunity to be heard by witnesses on its behalf on the questions raised by the testimony given before the commission at its sessions by the members of the Brotherhood of Railroad Trainmen, but that the company has no testimony to offer on the subject at this time.

CHAS. HEEBNER.

MARCH 9, 1900.

WASHINGTON, D. C., May 18, 1901.

TESTIMONY OF MR. JAMES F. JACKSON,

(Of the Massachusetts State Board of Railroad Commissioners.)

The Commission met at 10.52 a. m., Vice-Chairman Phillips presiding. At that time Mr. James F. Jackson appeared as a witness, and being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your address, occupation, and other details respecting your business, please?—A. My name is James F. Jackson; my business address is 26 Beacon street, Boston, at the office of the State Board of Railroad Commissioners. I have a private office in Fall River, where I reside. My private business is that of a lawyer, member of the firm of Jackson, Slade & Borden.

Q. You may proceed with a general statement respecting the cost and the development of the work of the Massachusetts Railroad Commission.—A. The commission was founded in 1869. Its duties have been increased from time to time. To-day it has a general supervision over all the railroads and the street railways within the State. I know it is sometimes said that the authority of our commission is purely one of an advisory nature. It is, in a large degree, and yet there are two or three important features of our work wherein we are given mandatory power. Take, for example, questions that relate to public safety. In many instances we have absolute control, as in grade crossings of railroads and highways, railroads and railroads, and railroads and street railways. If we think there is public need for a grade crossing, we grant it. If we do not think there is such public need, we refuse it; and that settles the question.

Take again the matter of safeguards, both from the standpoint of the employees and of the traveling public. Very many matters come before our board for approval where the question is as to the construction of some safety appliance, platform gates, interlocking or other signal systems, protections of one kind and another. There again our power is one of approval, and the road is obliged to accept our judgment as final.

Then, a very important branch of our work is that which relates to the issues of stocks and bonds, or, in other words, which has to do with the financial strength of railroads and railways—at any rate, as far as the public is concerned, and perhaps they are concerned altogether. I think they are. Every issue of stock, the original issue, and all increases in the way of additional issues, are made only upon the approval of the board after an investigation. That is true in connection with bonds, also. So that there are two important features of our work where our power is more than merely recommendatory.

Then there is the work which is purely recommendatory and advisory. This is in connection with matters that affect directly the revenues—questions of rates, passenger rates, freight rates. There we investigate in all instances, and after forming our conclusions we make a report. The companies are not bound by law to follow the recommendations contained in that report or to heed our opinions. It is a question whether they will or not. As a matter of fact, during the history of the board I think I am safe in saying that it has only been in exceptional instances that either the public on the one side or the railroad corporation or street-railway corporation on the other has disregarded the views of the board or its recommendations. Perhaps I ought to limit that to recommendations, because there are matters, as you will appreciate, Mr. Chairman, where a board may desire to look into a matter and to suggest something that is not, in the opinion of the members of the board, necessary to immediately carry out—something it is looking forward to. For example, whether it is better to have certain colors to indicate safety and peril and caution. We have made in the past a recommendation upon that point, but it was made in terms understood to be simply a suggestion, and some of the railroads have adopted it and some have not. It followed a test. It was an interesting point, but the purpose of the commission was distinctly not to say to the railroads in that case, "It is necessary for you to think as we do about it."

Now, on part of the railroads, I hardly know of an instance where a recommendation of the board that they do one thing or another has been disregarded. On the part of the public, in a few instances, there has been some appeal to the legislature and some legislation. There are very few instances, and I think it is only fair to say that the railroads have not been deferential to our views merely because our views are their views. Take, for instance, the last year and a half, which is the extent of my personal acquaintance with these matters. We have passed on questions of rate, questions involving the removal of stations, the building of new stations, change in train service, and a variety of other matters overruling the contention of the railroad, and in every case they have conformed to our recommendations. In our last annual report, after investigating the question of passenger rates, we recommended the introduction of the 500-mile mileage book at 2 cents a mile, and the railroads have adopted it. This was proved to be a reduction in revenue, these books taking the place of sales of single tickets. I think it is a fact that the railroads feel that a board made up as ours is, three members, one acquainted by actual experience with the needs and conditions of the business community, familiar with all questions that affect trade and commercial interests; a second member familiar by experience with railroad construction and railroad operation; and a third member of sufficient legal ability to take care of the legal questions—the railroads feel that this board, made up in that way, has proved to be thus far a valuable aid rather than hindrance in their work. It may be dangerous for me to say what the railroads think of us. I do not want to carry that idea too far, but as far as the following out of recommendations is concerned, they have certainly done it. Matters are referred to us continually by the legislature. An instance of that sort was the investigation as to the safety of the use of vestibules on street cars. We were asked by the legislature a year ago last winter to investigate that. We did so, and made a report.

Q. (By Mr. LITCHMAN.) Will you give just a brief outline as to the nature of that report?—A. The statute itself took in hand a part of the subject. The statute made it mandatory upon all street railways outside of Boston to have vestibules on the cars during certain winter months for the protection of the motormen and conductors. There was a very serious contention on the part of the Boston Elevated Railway Company, which controls all the street railway traffic of Boston, that vestibules were dangerous in some of the narrow streets of Boston where the people were continually crossing, and making transportation something that must be guarded by the utmost care. The railway company claimed that the addition of the vestibule shut off the view and interfered with sounds to such an extent that motormen could not bring their cars to a stop with the promptness that they could if they were upon an open platform. The legislature referred to us one question. That was, whether it was consistent with safety that the company use vestibules. We had several public hearings, and made inquiries all over the United States and Canada, and, as a result, we felt they could be used with safety under proper conditions. As a result, the Boston Railway Company must equip its cars within a certain number

of years with vestibules, but in order that there might be no serious injury done we made it experimental, by interpreting the statute, as we thought we might under the circumstances. They are to test the vestibule in the most difficult places first, so that if we are wrong in our opinion we may recall our recommendation. We feel very positive about the matter, but at the same time believe the question of public safety of the greatest importance.

Q. (By Mr. FARQUHAR.) What is this contemplated vestibule, a closed vestibule or a half vestibule?—A. The closed. It has doors which are to be opened at certain times. The design has not yet been perfected, but the idea is to have them as largely as possible of glass, so that the sight will be obstructed but very little. Then again they are to be so arranged that these glass windows will drop down and the motorman can see out if he wants to. We feel that the vestibule is safe in Boston.

Another instance of a special report was that upon the contribution of street railway companies to the abolition of grade crossings. In our State there has been undertaken a very important work of abolishing grade crossings, and under a statute passed in 1890 the State contributes a certain proportion, the railroads a certain proportion, and the city or town a certain proportion to the expense. The State and city or town is limited to 35 per cent of the cost, and the railroad bears the other 65 per cent. It has often been contended that street railways ought to bear a part of the expense. We made a special investigation into that matter, and reported that in our judgment it was fair that they should. The legislature is at work now on a bill.

Q. (By Mr. LITCHMAN.) That is where the street railway and the railroad crosses, is it not?—A. Yes. It is where there is a grade crossing of the highway and railroad and the street railway, either has a location or is to get one immediately.

Q. (By Mr. RIPLEY.) You may speak, if you please, of the policy of the board in respect to capitalization.—A. It is one of restriction, on the theory that it is right that the people who furnish the income to the stockholders in the way of rates should pay it only upon actual expenditure—the actual cost, fair cost, of these enterprises. Under the laws which were passed recently (some of the most important of them in 1894) we look into the issue of capital stock and of bonds. First, the statute describes the purposes in a general way, for which stock and bonds may be issued. Then the board has to decide whether the particular purposes of the company fairly fall within the general purposes as described within the statute. Secondly, we have to decide the amount which is fairly required for that purpose. If a street railway desires to equip its road we have some skilled expert inform us as far as we are not informed of the cost. They may issue stock for this to the amount which we decide is requisite. If they are to build a road, we have an expert engineer examine into the cost of the construction, and we allow them to issue stock to the extent that is necessary to pay that cost. They may have to buy real estate for one or another essential purpose. There again we determine the actual fair value to be paid for that real estate.

Q. Do you have any authority to examine the books of the company—any powers respecting auditing?—A. Oh, yes; the books of all railroad companies and railway companies are open to our inspection at any time. They make annual reports to the board, and those reports are presented to an expert accountant who is in our employ, who compiles the figures and makes out the tables.

Q. (By Mr. FARQUHAR.) How many different companies operate surface roads in Boston?—A. There used to be a great many companies, but now they are all in one company, the Boston Elevated Railway Company. It leased these several companies. The Boston Elevated has nearly completed a new enterprise in the way of an overhead railroad—elevated railroad. It has leased the entire West End system, and is operating it to day.

Q. Are there any separate suburban companies that make Boston their terminal which are owned independent of this elevated company?—A. There is the Lynn and Boston Street Railway that runs into Boston upon the tracks of this West End system, Boston Elevated, Lessee. Aside from that I think of no other.

Q. (By Mr. LITCHMAN.) Don't the Newton cars run to Boston?—No; their system touches, but does not enter on the Boston Elevated.

Q. There are no cars running from Boston to Newton?—A. Oh, yes; but the railroad company—Boston Elevated—operates such cars as come in over its own system as it does its own cars.

Q. The Lynn and Boston secures the use of the Elevated outside Charlestown, or do they use both?—A. They simply run into the subway, into the city, over the Boston Elevated system through Charlestown.

Q. I would ask whether they use the elevated track or the surface track.—A. They use the surface track.

Q. Might it not be well either here or some point in the testimony to give a brief résumé of the problems solved or attempted to be solved by the combination subway, street traffic, and elevated traffic of the Boston Elevated Railroad?—A. I

would be very glad to furnish anything I could of value, but that belongs to history which antedates my time, and I could not now say to what extent I could furnish the information.

Q. I will ask one or two questions, and then it may develop what I have in mind. How many distinct systems of street-railway traffic have you in Boston?—A. You mean by system methods of operation?

Q. Yes.—A. There is only one to-day; two, if you count the subway—subway and surface—and there will be the elevated very soon.

Q. Within a few weeks?—A. Yes, I presume so.

Q. The elevated system goes from one side of Boston at one extreme and passes through the congested part of the city to the other end of the city, does it not?—A. Yes.

Q. And the subway is in the congested district itself?—A. Yes.

Q. And the surface roads are in both suburban and congested districts?—A. Yes.

Q. And yet they interchange from subway—that is the intention?—A. The whole is intended to work together. There is a great deal of interest in Boston to-day in the efforts to be made in the future to relieve congested traffic. There are different plans now before the legislature. I noticed in the paper this morning that a new suggestion had been made by the prominent officials of the Boston Elevated Railway with reference to a new subway.

Q. Is the general opinion in Boston that the subway is a success?—A. I think it is.

Q. Do you think from the records of the office, Mr. Jackson, that a history of the transformation of the traffic could be given as supplementary?—A. I would be glad to look into it.

Q. (By Mr. RIPLEY.) Are stock dividends permitted at all?—A. Stock and scrip dividends are prohibited by statute.

Q. How far do you examine periodically the books of the railroad and street railroad companies further than to receive reports?—A. We examine their annual reports, which are made upon a prescribed system, and then from time to time upon request they furnish us with the facts and figures that are set out in their books. We do not make personal examination of these books as an auditor would.

Q. (By Mr. PHILLIPS.) Have you a right to do that?—A. Well, the statute reads that they should be open to our inspection at any time.

Q. (By Mr. RIPLEY.) But it has not been your policy, then, regularly to audit those books?—A. It has never been the practice of the board.

Q. Do you make any distinction between bonds and stock in fixing the amount of capitalization?—A. Yes. There is a statutory distinction and there are distinctions in practice. That the bonds must be not in excess of the capital stock is one requirement. Then, although the statute says that stock and bonds may be issued for the purpose of building a road, for example, or of extension, or of equipping it, in practice we never issue bonds until the enterprise has reached the stage of completion. I think that practice has been adopted within the last year and a half. The statute requires that before approving the issue of mortgage bonds the board shall examine the assets and liabilities of the railway or railroad, and shall determine that the value of the property for railway purposes or railroad purposes, and exclusive of any value for franchise, shall be at least equal to the amount of the outstanding capital and indebtedness.

Q. In such a case as that, do you take account of the value of the terminals? The statement has been made several times before this commission that the increase in the value of many railroad stocks is not due to the increase in the value of the road as a railroad, but rather to the value of the terminals. Do you make any such distinction?—A. We do not.

Q. Does your control extend merely over corporations, or over all enterprises which have to do with transportation whether incorporated or not?—A. It is limited practically to the incorporated companies.

Q. Do you find any disposition in Massachusetts to evade the control of the commission by organizing in other ways? I refer, for example, to the Massachusetts electric companies.—A. So far as we know there has not been manifested any disposition to do it. During the past year we have looked into the issues of stock and bonds, consolidations, and leases by companies in which the Massachusetts Electric, so called, own the stock. We pay no attention whatever to the fact that the Massachusetts Electric owns the stock. We deal wholly with the company, its standing. If it has a purpose which is legitimate, and desires stock and bonds which are no more than requisite, we approve, and it makes no difference to us as to who owns the stock. We had a case last year which we always felt was an interesting case. It concerned the Lynn and Boston Railroad, and involved an issue of stock. The previous history of that railroad had been somewhat unusual. The Massachusetts Electric owns the stock.

Q. You may explain the organization of the Massachusetts electric companies in the first instance.—A. The Massachusetts Electric, to reply specifically to that

question, is an unincorporated association which owns stocks in certain street-railway corporations. These stocks stand in the names of certain persons as trustees. Under the agreement upon which this association is founded the trustees, who are 15 in number, practically exercise the ordinary duties of a board of directors of an investment corporation. They declare dividends and vote the stocks in the corporate meetings of the several street-railway companies. The association issues preferred and common shares, and has a so-called capital stock. It would be natural that in the payment of dividends upon these association shares an effort would be made to equalize things and make the prosperous companies in which they own help out the weaker companies. To do this there might be a temptation toward improper management in connection with a particular company or companies in which they have control; but, on the other hand, no issue of stock can be made in any of these companies without the approval of the board and upon proof that the railway property is worth, without reference to franchise value, an amount equal to the outstanding debt and capital stock. The board in determining this pays no attention whatever to the ownership of the stock or the dividends which the association may desire to pay to the holders of its certificates. In other words, the financial interests or affairs of this association receive no consideration whatever from this board.

Q. (By Mr. PHILLIPS.) Does not this company violate the spirit of the law?—A. Well, it is contended so. I do not believe in such organizations.

Q. Their legality has never been tested?—A. I am inclined to think that they are legal. It is done in connection with real-estate interests. One objection, to my mind, is that it gives a false impression to investors who are used to dealing in stocks and bonds and who, as to Massachusetts railway stocks and bonds, have a common impression that they are passed upon by our board. I do not know that many people are deceived. It is claimed by the "Massachusetts Electric Companies" that nobody is deceived. Perhaps that is true, but, in my judgment, it is not desirable to have this condition of things exist.

Q. (By Mr. LITCHMAN.) What is the legal responsibility of the managers of that company?—A. They have a legal title to the stock and control the management of the street-railway corporations in which they own by voting the stock.

Q. I mean, in this Massachusetts Electric Company, what personal or legal responsibility is there to the stockholders or owners of shares of that company?—A. I do not know exactly. I am not familiar enough with their methods or their articles of agreement.

Q. (By Mr. FARQUHAR.) Are these certificates issued by the directorate of the Electrics?—A. Of that association; I understand so. Their property is held by trustees.

Q. Is the directorate of the Electrics the trustee of the stock?—A. It is my very strong impression that the trustees have the entire control. They have the legal title to the stocks, and they manage them and act as a directorate. You see, that organization does not come before us, and I have to give you what is rather an impression than any knowledge officially.

Q. (By Mr. RIPLEY.) What is the relation between the aggregate amount of these trustees' certificates and the capitalization of all the companies which they control—is it greater?—A. I think that there is a watered condition—a difference between the original investment and the present amount of what they call their outstanding capital. There is something more than the actual investment value.

Q. Is there considerable more? Have you any idea of the relative amount?—A. No; I could not give you definite information.

Q. Is there any difference in principle between this organization of all the street railways of Massachusetts and the organization of the steel industries in the United States steel corporation, so far as you know?—A. I do not think my opinion on that would be worth anything.

Q. (By Mr. FARQUHAR.) I would like to ask you if you have any restrictive statutory legislation there on stock issues now?—A. Yes.

Q. Is there any part of your statute that covers the expression "certificates of stock" as representing property so that the word "certificates" could be covered, whatever form stock or its equivalent may take?—A. I think not.

Q. I am hinting now towards the decision in the Standard Oil case and the American Sugar Refining Company, where the trusteeships had the authority to take up the stock and issue certificates of stock, apparently.—A. I am not familiar enough with the proposition that you have in mind to point out differences.

Q. You would seem to suggest the possibility of this Electrics Company being able by law to issue certificates, and these certificates are probably stock, so your statute in the State does not regulate to prevent it.—A. They are not certificates of stock. Strictly speaking, the association has no stock. The Massachusetts Electrics have no shares known to the laws which cover the issuing of stock and limit the purposes for which it may be issued.

Q. (By Mr. CLARKE.) Does the commissioner of corporations of the Commonwealth have to pass upon the ownership of certificates in the voluntary association?—A. My understanding is, he does not.

Q. (By Mr. LITCHMAN.) What enforces the recommendations of the railroad commission of Massachusetts?—A. The recommendations are enforced, I think, through the feeling that the subject-matter is carefully investigated and that the attempt is made by 3 persons, who represent both sides—represent the public on the one side and the private stockholder on the other—to reach a just conclusion, aided by the feeling that unless such an error, such a mistake in connection with their recommendations can be found as to warrant an appeal to the legislature to have it cured, it is practically final.

Q. (By Mr. RIPLEY.) Have you ever had any case go to the courts?—A. Never had anything of that sort.

Q. (By Mr. PHILLIPS.) How does this company pay dividends when you have restricted the other companies not to pay over 6 per cent?—A. They have to pay out of what they get from the other companies.

Q. If I understood you properly they were not to pay over 6 per cent, and the balance would go into betterment?—A. That is the Lynn and Boston, one of those that the Massachusetts Electric owns.

Q. (By Mr. RIPLEY.) How many do they own? What territory do they cover?—A. They are very largely in eastern and southeastern Massachusetts. They cover the whole part—nearly the whole of that territory—the eastern part of Massachusetts, running from the northern part of the State down to the south.

Q. (By Mr. LITCHMAN.) Now, would it be fair to say that your recommendations are respected and obeyed by the corporations because they are sustained by public sentiment of Massachusetts?—A. I think that has a great deal to do with it.

Q. Has it not been the experience of Massachusetts, so far as your knowledge goes, that the public sentiment of Massachusetts has sustained recommendations made by the railroad commission?—A. Every time that we made a recommendation against the railroad, that has been true, and there have been a great many of those, as the record will show. This last which made them introduce 500 mile mileage books was approved. When we have made a recommendation in support of the contention of the railroad, I suppose that here and there there is criticism, but I have not within a year and a half known of very much. To illustrate, the legislature asked that we look into the question of passenger fares, and we considered first suburban fares. The city of Boston is peculiar in respect to its suburban business. It has a very large traffic to and from Boston, and these fares are generally admitted to be very low. Perhaps they ought to be very low on account of the heavy traffic, and yet there is a constant strife here and there for lower fares. There was a request for a 12-trip ticket on all the roads. The board, I think, does not believe in establishing by legislation maximum rates of fares, but in leaving the railroads to handle their rates as a business matter, and then in individual cases correct them if they are unreasonable. We felt that the suburban fares were as low as they should be. Therefore we said upon investigation, and gave the figures for our reasons, that we felt it would work a reduction of the revenue of the railroads which would be unreasonable, in view of the very active competition of the street railways around Boston, and in view of the fact that the suburban business on the railroads near Boston was then on a decline rather than on an increase. Well, the legislature, instead of overruling that conclusion, took an intermediate step. There was then in use a 50-trip ticket. These people wanted a 12-trip ticket, which we refused to recommend, and the legislature passed a law for a 25-trip ticket. The essential thing is that the prosperity of the company shall not be interfered with, and that there be a very careful inquiry on the part of the men who are trying to get at the exact facts without bias, and then if they are wrong (and no man is infallible, and no board is,) the railroad on the one hand, or the people on the other hand have a right to appeal to the legislature. I think the strength of the Massachusetts system is shown in the fact that there has been so little of that appeal.

Q. In almost every case where that appeal has been made, the legislature has sustained the findings of the board, has it not?—A. Yes; it has been generally true. I had in my mind the impression that last winter, owing to the peculiar interest in the Boston and Albany and the New York Central, the Fitchburg and the Boston and Maine leases, they worked through the legislature against our recommendation an insignificant measure, but I do not recall the statute.

Q. It has been claimed, I think before this commission, that there was some discrimination in the handling of freight in East Boston by the Union Freight Railway, as it is called. Do you know anything about that?—A. No such claim has yet come before our board. I would say on the subject of freight rates that we have pending three cases, one the coal rate in Brockton, Mass., a thriving place that has grown rapidly for the last 25 years, and another case involving rates on lumber.

Q. Who owned the Union Freight Railway?—A. I do not know.

J. F. JACKSON:—FUNCTIONS OF RAILROAD COMMISSION.

Q. As far as you know there is no discrimination in the handling of cases from one road to another or from one shipper to another?—A. As far as I know, no. Our board has to do continually with individual cases, and in this way, as you will appreciate, we have worked out general propositions that will apply to other cases. Last year we had over 300 matters, involving hearings almost every day, so that we are constantly coming in contact with the railroad on one side and the people on the other.

Q. (By Mr. RIPLEY.) Do you have the power to fix the price of stock in cases of purchase?—A. Yes; and on that question there has been a great deal of discussion. If the issue of stock is authorized and the purpose is proper and the amount is a proper amount, the law compels us to fix a value at which it shall be offered to the original stockholders. If the capital stock was originally \$100,000, and the road has improved and been prosperous and the stock has gone up to, say, twice its original value, we have to fix the value accordingly at which it shall be offered to the stockholders. That leaves a capital composed of two parts, based upon different conditions. The original amount paid in has the par value of \$100 a share. The new stock is paid in at twice that rate, so the total investment in the railway property is different from the total authorized capital. Now, it is contended that when questions affecting revenues come up, there is difficulty in dealing with these stockholders fairly and equitably. The company pays the same rate of dividend to each on each share when a man has paid perhaps \$100 for one share and \$200 for another, or one man has paid \$100 and another man has paid \$200—not paid into each other's pocket as in the market sale of stocks but into the enterprise. Up to the present time it has not been a matter of any essential trouble to us, but it is argued that it may be; that the time may come that it would have been better to have had all the capital paid in at par value and represent the actual investment in public enterprises. I believe there is force in the suggestion, but at the same time my acquaintance with these problems has only been of about a year and a half.

Q. Has any effect of the leases of the Boston and Albany to the New York Central or the Fitchburg to the Boston and Maine been observed either in rates or in service up to the present time?—A. I think it is a little too early to discover any effects in one way or the other.

Q. What dangers or difficulties, if any, are to be apprehended so far as the port of Boston or the industries of Massachusetts are concerned?—A. I have always assumed that it was generally to the public advantage, and that the port of Boston would benefit from the consolidations. It was understood that was the feeling of those that advocated it. The result of the lease of the Boston and Albany to the New York Central has been seen to this extent, that under the statute they have taken preliminary steps to issue stocks and put in more capital for terminals.

Q. What will that mean as to the development of terminal facilities in Boston?—A. It must mean a great improvement.

Q. Do the terms of the lease prescribed by the legislature require that action on their part?—A. Yes.

Q. What things are included in either of those leases, either in the matter of rates or otherwise?—A. The operation of the road and the maintenance of the road is just as fully under the supervision of the board as before, and the State's right to purchase it (if it ever sees fit) is still retained.

Q. There is no possible evasion of responsibility by the board in any respect by those leases?—A. I see none whatever.

Q. Will there be any effect in rates or otherwise in the absorption of the Massachusetts Central Railroad? Has that absorption taken place yet?—A. I suppose that the control has passed.

Q. Were you called upon to fix the price of the stock?—A. Yes.

Q. Will you explain what your policy has been, or on what principle you proceed, in fixing the price of stock to be purchased by another road?—A. In this particular case we were asked to fix, not the value, but the purchase price which the Boston and Maine ought to pay, and in doing it we considered the value of the property and the history of the property. There had been a practical agreement between the owners of the preferred stock and the Boston and Maine, and we therefore said, "As you have agreed on that, we will not disturb the agreement. It is a trade between you two." Of course there were some who claimed that they ought to be paid more, but we felt that was substantially a matter of bargain, and there was no reason in the public interest to prevent our approving it. The common stock meant practically the balance of the purchase price of the property, and we looked into the structural value of the railroad, what it originally cost, what it would cost to-day, and then we looked into the value of the property for railroad purposes, and we felt that it was a very valuable piece of property.

Q. (By Mr. PHILLIPS.) Did you take into consideration the franchises?—A. We did not have to go so far as that. We felt the fair value of that railroad property to the Boston and Maine for railroad purposes, outside of the franchise, was at least

as much as we asked them to pay by fixing the price of the common stock at 21. The Boston and Maine suggested 15, but we found 21.

Q. (By Mr. RIPLEY.) Has this policy of strict financial control worked well on the whole in Massachusetts?—A. I think it has.

Q. And there is no disposition at present observable on the part of the legislature or the people to repeal it?—A. On the contrary, I think the feeling in its favor has grown stronger and stronger. Men who come before me and discuss the question, lawyers who were formerly opposed to it, admit that the security of railway stocks has been affected for the benefit of the railways and the benefit of the people. The board does not undertake to guarantee the success of the enterprise. We say, "You have got your railway. Whether you will be able to earn anything out of it is for business men to determine. The capital has been properly invested in railway property."

Q. Do you, as a matter of policy, protect the railroads against undue competition by paralleling, or in any way?—A. There is a statute that provides that in case of any new railroad enterprise the board shall pass on the propriety of it. The street railway development is a matter of recent growth, and the proposition is before the legislature to give us the same authority. Within a week, however, a bill which contains that provision was amended by striking out that part of it. There is another bill before the committee on street railways which has the provision in it that we should pass on the propriety of any new street-railway enterprise in the same way that we would pass on the propriety of a new railroad.

Q. Do you see any objection or any practical difficulty, other than in securing the legislation, in the way of extending the powers of the Interstate Commerce Commission in a way similar to that you have prescribed in Massachusetts?—A. I am strongly prejudiced in favor of the theory that has been at work in Massachusetts, and I do not personally see any reason why such a theory of supervision could not be extended to the national board. I understand that is not what they want. They want to make rates. We think that is not desirable. I do not want to pass on the conditions that exist outside of Massachusetts. From our experience we believe in our power of recommendation and advice.

Q. The difference between the proposed policy of the Interstate Commerce Commission and that of Massachusetts is that you exercise very little jurisdiction over rates, but a strict control over the capitalization?—A. No; I would not want to admit that, because I think we exercise a very material influence over rates.

Q. Not by prescribing them in advance?—A. Only through our power of recommendation; not fixing any rates, but supervising rates in individual instances. There have been cases of that kind already decided and there will be others where I have no question whatever but the rates will be changed. We have brought about changes in the street railway and in railroad rates within a year, and there will be more within another year.

Q. Your control is to a considerable degree exercised through your power to pass on general matters of finance as well as upon the making of rates?—A. I think our control over the financial question does strengthen us in other questions.

Q. (By Mr. PHILLIPS.) Have you anything to volunteer, in your own way, that has not been covered by questions?—A. I have not. I would be glad to furnish anything that can give aid to the commission at any time.

(Testimony closed.)

WASHINGTON, D. C., May 8, 1901.

TESTIMONY OF MR. CHARLES D. GRIFFITH,

Representative of the Denver Chamber of Commerce.

The commission met pursuant to recess at 2.40 p. m., Vice-Chairman Phillips presiding. At that time Mr. Charles D. Griffith, of Denver, Colo., representative of the Denver Chamber of Commerce and Board of Trade, was introduced as a witness, and, being duly sworn, testified as follows:

Q. (By Mr. RIPLEY.) Will you state your occupation and your relation to the chamber of commerce?—A. I am in the wholesale boot and shoe business, and a director of the chamber of commerce.

Q. Do you appear officially to represent them?—A. Yes. (Producing letter and handing to chairman.)

"THE UNITED STATES INDUSTRIAL COMMISSION, WASHINGTON, D. C.

"GENTLEMEN: This is to certify that Mr. Charles D. Griffith has been appointed to represent the Denver Chamber of Commerce and Board of Trade before your commission as a witness concerning transportation topics.

"Respectfully,

"THE DENVER CHAMBER OF COMMERCE AND BOARD OF TRADE.

"By ARTHUR WILLIAMS, Secretary."

Q. Have you any general statement to make?—A. There is a general statement prepared by the freight committee of the bureau that I might read.
(Reading:)

"CONDITIONS AT DENVER.

"That Denver is what she is, is by virtue of the diversified mineral resources for which the State in which she is located is noted, and by virtue of her own inherent qualities, her superior climatic conditions, pure air and abundant sunshine, and not by reason of any substantial recognition and assistance on the part of the transportation companies. That her population now numbers, according to the census of 1901, 133,859, is a continual source of surprise to her citizens, in view of the manner in which her commercial development has been handicapped by reason of restrictions imposed by the transportation companies and by reason of the limited population of the Rocky Mountain region.

"Geographically her location from a commercial standpoint is somewhat unfortunate. Denver has never enjoyed a basis of distributive rates on either east or west bound business originating here that would enable her to compete with the Missouri River cities and points east on the one hand, or with Pacific terminal points with California products on the other hand. On the contrary, she has always been a way station, so far as general rate making is concerned, in territory west of the Missouri River. To-day, as for many years past, the Missouri River is substantially the base line of rates to and from all points east of the meridian on which that river is located. From Denver west distributive rates in effect are the results of combinations and concessions made from time to time and of character entirely local, not governed by any well-defined law.

"Denver claims, and we think justly so, that her merchants and manufacturers should reach all points West on the same competitive basis that these points are now supplied from Eastern trade centers. We believe that there is one general principle that should govern in placing Denver in this position, i. e., the removal of the present base line upon which Western rates are built, from the Missouri River to a north and south line passing through Denver and Cheyenne on the north and Colorado Springs, Pueblo, and Trinidad on the south. By such recognition only will mercantile and manufacturing interests located on this meridian be placed upon the same commercial footing as Missouri River cities.

"In a few words, the rate situation as applying to business outward bound from Denver is about as follows: The rates to Wyoming points are of an arbitrary character, dictated and controlled by the Union Pacific Railroad, and so adjusted as to throw the greater volume of business to the Missouri River and farther Eastern centers. The Utah and Montana rates are based upon the Missouri River rates, and are quite uniformly 80 per cent of that rate, a sufficiently high percentage to quite effectually deter Denver merchants and manufacturers from invading that territory. The Utah rate is also based upon the Missouri River rate and amounts on class freight to about 70 per cent of that rate, a sufficiently high percentage also to prevent any considerable business originating at Denver.

"The New Mexico rate is in the main an arbitrary, blanket rate, quite fairly conceded to Denver merchants by the railway lines distributing in that Territory. In the State of Colorado alone are Denver merchants allowed to distribute their products on precisely the same basis as governs Eastern competitive business. We therefore maintain that the only equitable basis would be as a result of the entire readjustment of rates west of Denver, based upon a north and south line through Denver.

"Again, Denver and Colorado common points are greatly handicapped by reason of the limited number of commodity rates into and out of these points. Colorado common points have to their credit about 195 commodities from the Atlantic seaboard. Utah has a list of commodities varying from 300 to 350. Montana and the Pacific coast States have a list of something like 1,136 commodities from the Missouri River. By comparison the number accorded Colorado common points is discriminatingly small. In comparison with Pacific coast terminal points Colorado common points are not to be considered. These rates occupy a class by themselves and are substantially the same from Colorado common points east and west bound as they are from the Missouri River, although the mileage from Colorado common points is approximately one-third less.

"UNIFORM CLASSIFICATION.

"It is our opinion that the adoption of a uniform classification would be alike beneficial to transportation companies and shippers. It would certainly simplify the present system of billing and make more economical this particular class of work on the one hand, and eliminate much occasion for complaint and annoyance on

the other, and at the same time would tend to equalize and prevent discriminations which can not but exist under the present system. We believe that shippers in general would greatly welcome the advent of a universal classification extending from seaboard to seaboard.

"CONSOLIDATION.

"One of the greatest evils with which a commercial and manufacturing community has to deal is the instability of rates. Rate cutting, either open or secret, is recognized as demoralizing and injurious. To a great extent railway consolidation is a corrective. Uniform and stable rates into this territory would work relief and be of benefit, and such relief and benefit would be further enhanced if, by reason of such stability and uniformity of rates, a reasonable reduction would follow, as should be expected. Colorado would greatly deprecate through consolidation any attempt to cut off the Fort Worth gateway, which constitutes at present a valuable check and safeguard over the all-rail lines.

"Present traffic conditions into Colorado on raw material have much to do with the material prosperity of the State. The difference between the raw material and the manufactured article is not sufficiently great to foster enterprises which would exist here except by reason of this fact. Present high rates on raw material act as a tariff and enable a few local industries to maintain prices such as to discourage or make impossible the proper development of our manufacturing interests.

"W. A. HOVER,

"Chairman Traffic Bureau, Denver Chamber of Commerce and Board of Trade."

Q. (By Mr. RIPLEY.) The primary ground of complaint, then, seems to be the high rates from the East into Denver as compared with the rates from the East to San Francisco, which is also a competitive shipping point?—A. Well, not so much that as it is the rate on the raw material that is shipped into Denver compared with the rate on the manufactured product, especially in the iron and steel line.

Q. Will you state to the commission at the outset the principal roads which are engaged in traffic at the city and the character of the traffic east and west?—A. There are 5 lines coming direct to Denver—the Union Pacific, the Burlington, the Missouri Pacific, the Rock Island, and the Santa Fe. The Union Pacific, of course, is a through line. Its main line goes through Cheyenne, a hundred and some miles north, while the Missouri Pacific connects and runs through on the Rio Grande via Pueblo, 115 miles south. The Santa Fe has a direct line to California through the southern edge of Colorado, and has a branch into Denver. So while we have 5 lines entering the city from the Missouri River, three of them, you might say, connect direct with the West, making transcontinental lines. Then we have a water route, as we call it, through the Fort Worth gateway—water transportation to New Orleans or Galveston and then into Denver, which works on an arbitrary rate with a differential of 39 cents per hundred. Our rate to Denver—I will speak of first class, as that probably covers more than anything else—is \$2.72 per hundred, all rail, from New York or from the Atlantic coast, and \$2.33 by way of the Gulf. They haul by way of Newport News, the Kanawha Dispatch, Cumberland Gap, and Norfolk and Western, and then through St. Louis or Chicago to Denver at \$2.33, the same as the Gulf rate.

Q. Is that route by the Norfolk and Western and the Kanawha Dispatch a part of one route?—A. Yes, and by water from New York to Newport News.

Q. And there is no further connection?—A. No further connection.

Q. Do you know the reason of those differentials?—A. The differential is caused by the length of time it takes. It takes quite a good deal longer to ship by way of New Orleans or Galveston.

Q. (By Mr. PHILLIPS.) Will you please state the distance between New Orleans and Galveston and New York?—A. I do not know that I can.

Q. Or the distance by land from each point?—A. The distance from New Orleans is something like—I am not able to give that exactly. I can add that.

Q. (By Mr. RIPLEY.) Will you now speak of the nature of the traffic and of the character of the manufacturing and of the jobbing business at Denver?—A. Our largest manufacturing industry is the cotton mills. We manufacture quite a good deal of paper that newspapers are printed on, and a great deal of mining machinery, and then we might mention, in connection with Denver, the Colorado Fuel and Iron Company, which manufactures at Pueblo a great deal of iron and steel of all kinds.

Q. (By Mr. PHILLIPS.) Is there any petroleum manufactured or refined there?—A. Not in Denver; no. There is a great deal of oil in the State, they say, but they do not refine it there.

Q. Do you know any reason why it is not refined there if there are quite large quantities produced near?—A. No; I do not.

Q. (By Mr. RIPLEY.) What is the territory within which you can at the present time carry on the jobbing business profitably under the rates imposed?—A. Colorado

is practically our ground. The local roads that are running out of there—that is, the Denver and Rio Grande, the Colorado Southern, and the Colorado Midland—add the local rate from Denver or Pueblo or Trinidad or common points to the territory within the State. The Rio Grande does not go out of the State but a very little way. They simply add to the Denver common-point rate that of the local road.

Q. How does the rate from Chicago to Denver compare with the rate from New York to Denver?—A. They charge \$2.05, first class, from Chicago and \$2.72 from New York.

Q. How do the rates from Denver to San Francisco compare with those from Chicago and New York to San Francisco?—A. They are practically the same—some difference in commodities.

Q. Does that condition give rise to complaint on the part of your merchants?—A. Our rate is practically the same from Denver, which is something over 2,000 miles nearer to the coast, as from New York and Chicago.

Q. In other words, you mean that it costs as much to ship from Denver to San Francisco as it would from Chicago and New York?—A. Precisely.

Q. Has this question of the rates imposed at Denver been officially brought to the notice of the Interstate Commerce Commission?—A. Yes; this has been before the Interstate Commerce Commission and a suit was filed called the Kindel case, I think.

Q. Did it have the desired result?—A. We hardly think so. The decision is not clear to me, but practically, as near as I can diagnose it myself, it gives us the same rate from Denver west as from Chicago west, or rather the Atlantic coast west. They could not charge us any more than they could Chicago or New York or St. Louis.

Q. (By Mr. PHILLIPS.) Could they charge you as much as those points?—A. Yes; as much.

Q. (By Mr. RIPLEY.) Did a modification of rates follow as the result of your suit?—A. They have not gone into effect yet, as I understand it. I think they are going into effect this month sometime, unless prevented by the courts.

Q. (By Mr. PHILLIPS.) Was the case appealed after being heard? You speak now of the ruling of the Interstate Commerce Commission alone, and not of the court? It was not finally adjudicated?—A. No; it was not finally adjudicated.

Q. (By Mr. A. L. HARRIS.) Against whom was the complaint—what roads?—A. I think it was Kindel v. The Atchison, Topeka and Santa Fe.¹ It commenced quite a while ago. I am not really familiar with the decision.

Q. (By Mr. RIPLEY.) You have, however, not received any benefit by the action of the Interstate Commerce Commission as yet?—A. Not so far; no.

Q. What is primarily the complaint at Denver now? This case of Kindel, I understand, was brought up several years ago?—A. Yes. We will take, for instance, the territory in Idaho and Montana where we want to job goods. It is territory, we might say, belonging to Denver, as we are the nearest large city to them and the nearest people to supply them. The rate from the Missouri River is \$2.50 a hundred, first class, to Montana common points and Idaho common points, while the rate from Denver is \$2, making a difference of only 50 cents in the first-class rate from the Missouri River and from Denver, although Denver is some 600 miles nearer to these places, and they are all the way from 400 to 1,000 miles from Denver. Now, that would make, if you combine the rate to Denver and from Denver to those points, \$4.72, while if you combine it with the Missouri River rate it is \$3.97, making a difference of nearly \$1 per hundred. Now, the Mississippi River points have a car-lot rate on first-class goods to these Idaho and Montana points of \$2.90.

Q. Do you enjoy carload rates?—A. We do not have carload rates on boots and shoes.

Q. What, then, are the exact figures on freight rates with which you are concerned in endeavoring to sell as a jobber from Denver to a Montana common point, we will say?—A. We are concerned with a \$2.50 rate from the Missouri River to these points on first class, and in car lots a \$3.10 rate per 100 from Chicago, and a \$2.90 rate from the Mississippi River.

Q. How does the rate from Chicago to Denver, plus the rate from Denver up to Montana common points, compare with the rate from Chicago directly out to the same common points?—A. It would be \$4.05 by Denver and \$3.10 direct.

Q. In other words, the jobber in Chicago is able on 100 pounds to underbid the Denver jobber by about 95 cents?—A. Ninety-five cents; that is correct.

Q. Was that the main contention in the case brought before the Interstate Commerce Commission?—A. No; the main contention there was more on the through rates to the Pacific Coast. A similar case was started by the Colorado Fuel and Iron Company on getting their steel and iron to the Coast, but they put in a rate for them of practically what they were asking for. Then the case was taken by Mr. Kindel, who is an enthusiastic freight agitator and thoroughly posted. He is a manufacturer of mattresses in Denver, and was at that time in the chamber of commerce.

Q. (By Mr. FARQUHAR.) This tariff that you are discussing now is on manufactured articles entirely?—A. Yes.

¹ See also Reports of Industrial Commission, vol. IV, pp. 251-254. Compare testimony of Mr. Stubbs, p. 759 of this volume.

Q. (By Mr. C. J. HARRIS.) Do you say they gave the Colorado Fuel and Iron Company that rate?—A. The railroads put a rate in before the decision was brought about. I think they have taken that rate away since. That is only hearsay.

Q. Does that apply to that special company or to all goods of that class?—A. They practically were the only ones that were manufacturing that class of stuff at the time. They are the only iron and steel manufacturers we have.

Q. (By Mr. FARQUHAR.) While you are discussing this are you taking in the jobbers' side of the question alone from Denver or the manufacturers' side?—A. We have comparatively little manufacturing there.

Q. So that the entire argument is as to the jobbers?—A. It is all practically on the jobbers' line, but we want to call attention to our manufactures in iron, machinery, and steel products. Those are the principal things that we have manufactured there.

Q. (By Mr. RIPLEY.) The case prosecuted by Mr. Kindel had reference, however, more particularly to possible manufactures, did it not?—A. Yes; he was taking up manufactures more especially with the western outlet.

Q. We had two distinct classes of problems, one relating to manufactured goods—that raised by Mr. Kindel—and the one you have already outlined, having reference to the position of Denver as a jobbing center?—A. We desire to represent the manufacturers as far as possible also, but the jobber is taking in all interests and we are more familiar with him.

Q. Taking up the first, then, with reference to manufactures, how do the rates on raw materials compare with the rates on manufactured products?—A. Well, they vary. There are some of the manufacturers that have been able to get in a commodity rate that relieved them; others have not. The matter has not been thoroughly fixed with all of them. In the matter of pig iron, a large manufacturer of machinery told me recently that, although pig iron was manufactured there at Pueblo, close to us—a Colorado product—they bought considerable pig iron in Pittsburgh, although the rate was high; that the Colorado Fuel and Iron Company made their price just high enough so that the freight rate covered it.

Q. The freight rate, then, on a raw material like that acts practically—A. (Interrupting.) As a tariff. That is what I claim. I think the rate is given on pig iron from Chicago to Denver as \$9.29 per ton of 2,240 pounds, and on railroad iron manufactured as \$9.60. There is not much difference between the manufactured article there and the pig iron.

Q. Is there any community of ownership, as far as you know, between the Colorado Fuel and Iron Company and the railroads, or do they operate to mutual advantage?—A. No; I do not think there is any. I do not think they are connected specially in any way. Of course, the principal owners of the Colorado Fuel may be large owners in railroads. However, I do not think that that has cut any particular figure.

Q. (By Mr. PHILLIPS.) Can you briefly state about the supply of ore and coal and limestone?—A. Well, the supply of ore and coal is practically unlimited, we think.

Q. Is it convenient?—A. Quite convenient; yes.

Q. And the coal?—A. The coal is quite convenient.

Q. Good quality?—A. Good quality; all the way from lignite coal to anthracite.

Q. Limestone?—A. Plenty of limestone.

Q. Is that convenient also?—A. Also convenient.

Q. Can they not manufacture iron as cheap there as they could in Pittsburgh, bringing ore from Lake Superior?—A. It looks as though they ought to. They get the best quality of iron from Wyoming, just at the edge of Colorado. Hartville, Wyo., is the site of the iron mines. There is quite a good deal in Colorado, but that in Wyoming is the easiest to get.

Q. And yet there is some pig metal shipped from Pittsburgh?—A. Yes; a great deal of it.

Q. Is that because the local works are not sufficient to supply?—A. I do not really know. They have very large works and they are always busy. The Colorado Fuel and Iron Company has got the ground pretty well covered in iron and materials that they need and coal; they have the territory pretty well covered.

Q. (By Mr. RIPLEY.) Are they independent of the United States Steel Corporation?—A. So they say; I do not know. I am not able to answer that.

Q. (By Mr. C. J. HARRIS.) Why would they ship in if they were in one of these syndicates? If they have all the facilities for making iron, why do they ship it in from Pittsburgh?—A. If they can buy it for less money from Pittsburgh. I have understood that the Colorado Fuel and Iron Company have not been able to take care of all their business and that they themselves have been forced to ship in material.

Q. Yes; but if you have all those conditions for making iron there, and you have this protective freight rate which you mention, one would think other local companies would be started.—A. That is true.

Q. And iron would be manufactured?—A. I presume there will be a great many more of them there. Colorado is practically a baby; she is very young.

Q. (By Mr. FARQUHAR.) Have the people of Colorado any desire to go into iron manufacturing independent of the Fuel and Iron Company?—A. That I could not say.

Q. Have there not been many attempts made to interest people in investments in iron?—A. I am not familiar with that. That is practically owned, I think, by Colorado capitalists. It was started originally by the Wolcotts—Mr. Henry Wolcott and Mr. Ed. Wolcott.

Q. Is it not a fact that you have used your capital in Colorado to make other developments in preference to iron and steel?—A. It may have been so.

Q. Has it not been a common remark in Colorado that you have mountains of iron there that you will have until you get through with other more valuable industries?—A. Well, there are many industries there to work on—iron, steel, coal, gold, and silver, and I presume there are all kinds of metals. They claim there are. How much is true, I do not know, but there are few people in Colorado to handle all this compared to what there are in the East. The population, I think, is only something over half a million, and the State is a very large place. It would cover all New England and more besides.

Q. (By Mr. RIPLEY.) Do we understand you to say that a large amount of iron ore is actually at the present time controlled by one company?—A. The Colorado Fuel has leases or the ownership of a great deal of it.

Q. It has been practically a monopoly up to the present time?—A. It could be termed so.

Q. Is it the impression of the people of Colorado that a reduction of the rates on pig iron from the East would result in a reduction of the price of that commodity as produced in Colorado?—A. The manufacturers of iron in Denver have so stated to me, that they considered that the higher rate on pig iron acted as rather a tariff for the Colorado Fuel and Iron Company. That I am unable to state myself.

Q. Has this matter been brought to the attention of the railroads concerned?—A. I do not know that it has.

Q. (By Mr. FARQUHAR.) Do you know the difference in the cost of manufacturing pig at Pittsburg and in Colorado?—A. No. They say it costs them more in Colorado. The labor is higher, and general expenses of that character would be higher in Colorado. As to the cost of producing it or putting it in the mill I am unable to state.

Q. (By Mr. RIPLEY.) Can any of the pig iron go out to the Pacific coast, or does any of the coal go to the Pacific coast under the rates now prevailing?—A. I am unable to answer that.

Q. You are not prepared, then, to say whether the supply of coal in Colorado might compete with the supply from the northern Pacific coast at San Francisco if the rates were reduced to a sufficient degree?—A. No; I am not.

Q. Taking up the question of the rates as they concern the jobbing trade, what would be the effect of establishing a new rate basis at Denver, as desired by your merchants, in the same way that the rate basis exists at Kansas City? Would that enable you to compete on perfectly equal terms?—A. I think it would enable not only ourselves, but those who are in line with us, to compete on equal terms, and would not be an injustice to any of them. We rather think that if we should have an equitable rate there that was based on our line, when there were any cuts on rates it would have to apply to everything west of it, and would operate to prevent those cuts and slashes of rates, and might bring it down to an equitable basis. We rarely hear of cut rates to the Missouri River, because if the rate was cut for one it would apply to the whole West. Now, a rate that applies to Denver does not apply anywhere else practically, and every once in a while there is a slashing of rates and down they go, and people rush in goods, and the rates go up again, and it makes it unstable and unsatisfactory.

Q. (By Mr. FARQUHAR.) What effect would the establishment of a new basis of rates, with Denver as the center, have upon the Missouri rates and the coast rates?—A. If they based it on Denver, it would depend entirely upon where they put their rates. If they left them as they are, and then put the rates West as they are, it would necessarily either reduce Denver to the rate that now applies from the river less the rate to Denver, or they would have to raise.

Q. What argument in the amount of tonnage that this new basis would make would hold good with the railroad men?—A. I would be unable to speak on that.

Q. You are aware that that is one of the greatest reasons that enter into the change of all basis?—A. I presume it is.

Q. If you can not furnish the tonnage, you can not be entitled to a base line, can you?—A. No.

Q. It would be simply a matter of division as to what there is to the west of it and what there is to the Missouri River. If you are participants in a lower rate, would

you not have to show a tonnage there to get that rate?—A. We do not want a lower rate. We want the same basis of rate.

Q. You want a prorate of the through rate?—A. A prorate of the through rate.

Q. Now, what argument can Denver give to the Western traffic lines for making a new base line?—A. All the argument we can offer is the amount of business we have already got and what this change would develop. It is a new country and it must be developed, but you can not develop a country unless it has an outlet for its products, and if you discriminate against that country it never will develop, and we can not furnish the tonnage. We can not furnish the tonnage first because the rate is against us.

Q. Your difficulty in distribution is the fact that you are paying really Missouri rates, and that in your local distribution you must add all local rates, so that you have no profit?—A. We are not minding the rates in Colorado itself because everybody has to pay the same. There are points in Colorado where the first-class rate from Denver is \$2.50. That is pretty high. We are not complaining of that because everybody east of us pays the rate to Denver plus that rate. While it is very excessive we think at the same time it does not work a detriment to Denver. We are not figuring on what the rates will be; we are simply figuring on getting to a basis where we can compete with the rest. From the railroad standpoint it might not be practical. We are not railroad men, and their side might look at it quite differently.

Q. (By Mr. RIPLEY.) Was there not the same objection to establishing a new basing point at Kansas City a good many years ago as against Chicago?—A. I do not know.

Q. If so, would there not be the same argument in favor of establishing a new basing point at Salt Lake City over against Denver?—A. That would be right.

Q. Your people, then, could not consistently ask for the establishment of a new basing point at Denver without at the same time recognizing the right of a city on the west for the same treatment, could they?—A. They could not; but now there are some goods, they tell me—I am not familiar with them—that you can ship from the East to San Francisco and ship back into Utah to the Colorado line practically for less money than we can ship them to Denver and from there to the Colorado line.

Q. Would that be possible from Chicago?—A. No; because the rate is so much less in proportion from Chicago to the coast.

Q. I thought I understood you to say that the rate from Chicago to the coast is the same as the rate from New York to the coast?—A. That is right; but our rate from Denver is so much higher to the coast than it is from Chicago there in proportion, and then our rate out to Denver from the East is so much higher. Chicago has a better rate to Utah and Montana common points in proportion than we have.

Q. Is it against the jobber in Chicago now that you contend or against the jobber in New York?—A. Well, it is against all of them in one sense, because all of them have a better rate to those points than we have.

Q. As a matter of fact, where is the center of the jobbing business with which you have to contend? Is it in the far East, in New York, or is it at Chicago?—A. Well, Chicago and the Missouri River points do the principal business there. They all cover it pretty thoroughly.

Q. What is the argument for giving Chicago the same rate to the Pacific coast that New York enjoys?—A. I presume the manufactured articles that they make similar to those made in New York justify them in having the same rate. It is a shorter distance.

Q. One is practically 1,400 miles nearer San Francisco than the other and yet they both enjoy the same rate at the present time?—A. Yes.

Q. The rate from New York to San Francisco would be conditioned by water competition, I suppose. Would that apply in the case of Chicago also?—A. No; I think not. I hardly know how Chicago could transport there by water.

Q. The difficulty, then, which you have in meeting competition from the East is from both New York and Chicago, or from any center east of the Mississippi River regardless of distance?—A. It is from any point east of Denver really. They all have a better rate or combination of rates. All the rates west of Chicago take the eastern basis of 67 cents first class; all west of St. Louis take a basis of 87 cents to St. Louis, and west of the Missouri River I think it is \$1.47. They all have this same basis and their rates are all the same to these points west of Denver. Kansas City, Omaha, St. Joseph, Chicago, St. Louis, all river points—the rates added from the Atlantic seaboard are the same.

Q. From your statement we understand that there is some ground for complaint in the granting of commodity rates to the Pacific coast. Will you explain a little further?—A. There are special rates made on certain items that have been brought before the Western Classification Committee, by which they were taken out of the class they were in and placed in a class of their own, a commodity, as they term it, having a special rate.

Q. Will you name some of those commodities which have been granted special

rates?—A. These commodities vary. From New York they are one kind and from the Missouri River they are another. They are made to fit the State.

Q. Do they apply equally to all shippers in those States?—A. Yes; I understand they apply equally.

Q. They are not in the nature of individual discriminations?—A. No.

Q. Is the practice of giving rebates or obtaining them in one form or another at all prevalent in the West?—A. It has been. There has been none of it done for quite a while that I know of.

Q. How do you account for its disappearance?—A. I presume by an agreement of the railroads to maintain the rates.

Q. Does the Western classification prove oppressive at all on the various lines of business that are concerned?—A. It may in some cases, but I am not familiar with it.

Q. Have any advances been made in rates in that territory in the last year and a half or 2 years?—A. No; the rates have practically stood the same on first-class business, such as I am familiar with.

Q. You have heard of no complaints because of a general increase of the classification?—A. None whatever.

Q. How about the distinction between earload and less than earload rates? Is that distinction usually made in the Western territory?—A. I know very little about that. I know of no items in my line, or any that I am acquainted with, where we get earload rates.

Q. Are there any commodities that go through from the East on a earload rating?—A. I do not know, except that Chicago has a earload rate into Montana common points. We have none in Denver.

Q. Does not that operate to shut you out of that territory?—A. That has the effect of operating against us.

Q. (By Mr. C. J. HARRIS.) Are you quite sure they do not have earload rates in Denver?—A. Yes; on shoes, I am.

Q. I mean on any commodity?—A. None that I am familiar with. There may be a number of items, but I am not familiar with them. I presume there are.

Q. (By Mr. RIPLEY.) How about that route by the Fort Worth gateway, which is, as I understood you to say, over the line of the Southern Pacific road? What is the reason for the differential there?—A. That is the difference by water. They haul by water to New Orleans, and then the Southern Pacific takes it to Fort Worth, and the Colorado Southern and the Denver and Fort Worth to Denver.

Q. That constitutes, then, at Denver, competition with the Union Pacific and other roads?—A. Yes; with all through lines.

Q. Suppose by railroad consolidation that gateway were closed and that differential were cut off, how would that operate as far as Denver is concerned?—A. I think it would make us all a \$2.72 rate. It might not.

Q. Is there a considerable volume of business that comes in by that line at the present time?—A. Quite a good deal.

Q. Mainly of the lower classes?—A. Of a general class. I think they haul quite a good deal of business by that route.

Q. Suppose the Union Pacific and the Southern Pacific, which had been heretofore competitors, are consolidated; would the effect of that, in your judgment, be to remove this 39 cents advantage, or would it have any effect?—A. That is problematical. It would depend entirely on the management. It might be they would think best to close it, and then, again, they might be able to haul the goods cheaper by water, and would prefer to leave it open and haul by water rather than haul by rail at a higher rate.

Q. What is the judgment of the merchants of Denver as to the consolidation which has been effected between the Union Pacific and the Southern Pacific?—A. Some think it will be no disadvantage, while others think it will. Personally I think it is problematical.

Q. Are you familiar at all with the terms on which the combination of the Southern Pacific and the Union Pacific was made?—A. No.

Q. Other consolidations in that territory have been mentioned in the papers. Have you any knowledge respecting any of them?—A. Nothing but the newspaper talk.

Q. What are some of these consolidations?—A. In the roads of Colorado, the Denver and Rio Grande, the Colorado Southern and the Colorado Midland. A short time ago the Colorado Southern, by newspaper report, acquired a half interest in the Colorado Midland and also in the Rio Grande Western, that runs from the Colorado line west to Salt Lake. They elected the Colorado Southern's president president of the Colorado Midland, and the president of the Rio Grande Western was made vice-president of the Midland. Now, since that, they claim the Missouri Pacific has acquired control of the Denver and Rio Grande and a half interest in the Rio Grande Western, and it is rumored that they are endeavoring to get control of the Colorado

Southern. In that case they would have all the roads practically in the State. We do not know what effect it would have if they did get them.

Q. (By Mr. FARQUHAR.) What transcontinental line would control these Colorado roads?—A. The Missouri Pacific has the Denver and Rio Grande and is trying to get the Colorado Southern. Then it was reported that the Union Pacific was trying to get the Colorado Southern. If the Union Pacific got it, it would amount to two different ownerships, two different transcontinental lines.

Q. (By Mr. RIVLEY.) What if the Missouri Pacific acquired it?—A. It would all be under one ownership and control.

Q. Does the absorption of the Chicago, Burlington and Quincy by the northern transcontinental lines have any meaning for Denver?—A. Not that I am aware of.

Q. Suppose all the roads in that territory are finally gathered into two or three important systems; would that in any way reduce the effectiveness of competition as it exists there?—A. It would certainly reduce competition. As to its effect, that would depend entirely on the management.

Q. You complain, as representing the merchants of Denver, of the unreasonableness of the rates to Denver and from Denver to the Pacific coast. How does it come about that the competition that has existed there between five roads has not remedied that condition?—A. I am unable to state.

Q. Is there any evidence of joint action or agreement in any way to prevent a break in rates?—A. The simple fact that they all have the same rate and have maintained it very firmly with reference to Denver would indicate that they must have an agreement to maintain that rate.

Q. Is it possible at the present time for any of these local products of Colorado to get out to the Pacific coast?—A. I am unable to answer that. The Colorado Fuel and Iron Company being the only manufacturers of iron, I presume they have their own rates.

Q. Will there be any effect on the traffic situation in that territory by the construction of this new road which is now being pushed by Senator Clark of Montana?—A. I am unable to say.

Q. There is no opinion prevailing in Denver on that matter?—A. None that I know of.

Q. You spoke some time ago about what you called an arbitrary blanket rate applying to New Mexico. Is that in the way of a discrimination against Denver?—A. No; that is in favor of Denver.

Q. Will you explain it?—A. They made a conditional rate with the merchants that if we would give them so much tonnage coming into Denver, they would give us a competitive rate going out of Denver, which would enable us to meet the rates in New Mexico and open up quite a little territory to Denver that we would not otherwise be able to get into. That was done through the Denver merchants themselves.

Q. Did the competition of any other road make that particularly easy to obtain?—A. No; there was no other road.

Q. Has the extension of the Atchison, Topeka and Santa Fe road to San Francisco had any effect upon your rates?—A. None whatever.

Q. Is there any competition in the jobbing business from San Francisco back into Denver territory?—A. Comparatively little.

Q. Or any competition of manufacturers at San Francisco with manufacturers who might be interested at Denver?—A. Not that I am familiar with.

Q. Do you know of any manufacturing establishments at Denver which have been distinctly discouraged and have failed of organization because of the rate system in freights?—A. No; I do not. There have been a number of failures, but I do not think they can be attributed to freight rates. There are other causes, probably, that have more to do with it.

Q. The statement has been made before this commission that when the paper pulp mill was founded at Denver the railroads endeavored to discriminate against it and prevent its successful operation. Have you any knowledge respecting that?—A. Well, I am not familiar with that, but I hardly think that probable.

Q. That industry is prosperous at the present time?—A. It has just gone out of the hands of a receiver.

Q. What were the causes that led to the establishment of cotton mills at Denver?—A. I do not know; they were established before I went there.

Q. Have they been successful?—A. I think they have failed once, but whether that was on the account of management or of freight rates I am unable to say. I think they are running now quite successfully.

Q. Is their labor foreign born or native American?—A. Part of it is Massachusetts imported labor and the balance is native.

Q. Do you know whether the labor conditions there were so favorable that they could establish the industry in spite of the high freight rates prevailing on cotton?—A. Our labor conditions there are not advantageous to any manufacture. Wages of labor are higher than in most places.

Q. Have you any knowledge respecting the rates on the raw cotton from the South?—A. I am not familiar with the rates on cotton.

Q. How about the rates on Colorado hard coal, of which you have spoken. Does any of that coal come east for domestic purposes in competition with the hard coal of the anthracite fields in Pennsylvania?—A. I do not know.

Q. (By Mr. PHILLIPS.) Do you have as good quality of anthracite coal as they have in the Allegheny Range?—A. Well, I do not think it is as good as the best of the Pennsylvania coal, but it is better than a good deal of Pennsylvania coal that I have used. I mean a hard coal—anthracite. There is really little difference in my estimation. I have used both.

Q. Are there large quantities of anthracite coal thereof?—A. They say there is quite a good deal. They get out considerable, and they say there is plenty of it to be had in the mountains.

Q. (By Mr. RIPLEY.) That hard coal might be placed in Chicago, I suppose, in competition with the production of the Pennsylvania fields?—A. That makes a long haul.

Q. Is the supply very large?—A. They say it is quite large out in the mountains in Routt County; and where they are able to get at it, there is abundance of it.

Q. In the case of Kindel v. The Atchison, Topeka and Santa Fe Railway Company, I find that the Southern Pacific Railroad voluntarily acceded Denver Missonri River rates on west bound business—but refused to accord it on east-bound business. Does that difference still prevail?—A. I am unable to state.

Q. Are the same rates in force on west-bound business?—A. To the coast?

Q. From Denver to the coast?—A. No; those rates were to go into effect some time this month unless they were stopped by the court.

Q. Will that affect business to any considerable degree in Denver?—A. I do not think that it will. I am unable to state.

Q. This case which was prosecuted before the Interstate Commerce Commission was decided in 1900, and the decision was apparently favorable to the contention of Denver. Has any modification of rates by the railroads followed?—A. Not yet. They were to take effect some time this month, as I have stated.

Q. In that case, then, the recommendations of the Interstate Commerce Commission have been actually effective?—A. Not until the courts pass upon it; until the courts have decided favorably to the Interstate Commerce Commission's report. Now it is a question whether the railroads will put that into effect or carry it higher.

Q. In other words, they are entirely independent of these decisions?—A. So far.

Q. Are the merchants of Denver, then, favorable to the enlargement of the powers of the Interstate Commerce Commission or a rearrangement of appeal to the courts in such a way as to make its decisions effective and binding at once?—A. Yes; we think the Interstate Commerce Commission ought to have more power than it has.

Q. Representing the Denver Chamber of Commerce, would you say that the provisions of the Cullom bill were regarded as fair to both interests?—A. I am hardly familiar enough with the provisions of the Cullom bill to answer that for the chamber.

Q. Take the provision enlarging the powers of the Interstate Commerce Commission, giving it the power to approve the rates promulgated in the first instance by the railroads. Would your chamber favor such a provision?—A. I think so. I would personally.

Q. Would they go further than that and favor the granting of power to promulgate rates in the first instance?—A. I think not.

Q. What would be the objection?—A. I think the ownership of the railroads ought to have the right to name their rates in the first place, because conditions vary so materially that members of a commission who are not in the railroad business would be unable to state what a rate should be. A rate that would be considered very extravagant from here to Denver would not be extravagant in Colorado.

Q. Are the rates the same from the East into Colorado that they are from Colorado to the East on the same commodities?—A. I think they are. There may be some difference in them, but, as a rule, I think they are the same.

Q. The statement has been made before this commission that you can sometimes transport commodities west bound over the transcontinental lines at very much cheaper rates than you can transport those same commodities back to the initial point.—A. It may be so when there is a cut in rates, but I think, as a rule, they are about the same. There may be exceptions, too, in rejected or damaged goods coming back this way, that may be returned in a certain time at a half rate to the East. The rule varies materially; so I do not think we could cover that by "yes" or "no."

Q. Are the transportation facilities in that country, as a whole, satisfactory to shippers in time and service?—A. They are very good, indeed; there is no complaint.

Q. And it is perfectly easy to obtain a settlement and satisfaction of claims?—A. We have very little trouble on that score.

Q. Relations, then, are generally harmonious?—A. Generally harmonious.

Q. (By Mr. FARQUHAR.) In what sections in Colorado and elsewhere do you market your goods?—A. We practically cover all the State.

Q. Is there much difference in the wages paid in Denver and in Chicago in boot and shoe manufacture?—A. We do not manufacture any shoes in Denver at all.

Q. You job them entirely?—A. Altogether.

Q. (By Mr. A. L. HARRIS.) When would you have the finding of the Interstate Commerce Commission go into effect—direct from the finding of the commission, or should it be merely the basis for a suit?—A. I think it should be direct from the commission, giving sufficient time.

Q. Subject to appeal?—A. Subject to appeal, certainly; I think there should be ample time to take the matter up.

Q. (By Mr. CLARKE.) In case of appeal would you have it go into effect immediately or await the judgment on appeal?—A. I should think you would have to wait for judgment on appeal.

Q. (By Mr. RIPLEY.) How about meeting the expense of prosecuting a case in that way? In this leading case prosecuted by the Denver Chamber of Commerce was that expense considerable?—A. Yes; that was paid partially by the chamber and partially by donation of Mr. Patterson, of the Rocky Mountain News, who took quite an active interest in it.

Q. (By Mr. PHILLIPS.) I wish you would give us some information concerning irrigation and water storage. Have you anything prepared along that line?—A. No; I am not prepared to give any particular information. We would like to call the attention of the commission and would be glad to have you look over our conditions out there.

Q. Have you a system of irrigation there now?—A. They do a great deal of irrigating privately.

Q. (By Mr. FARQUHAR.) Have you any public or national irrigation?—A. No; we have not.

Q. (By Mr. PHILLIPS.) Has the private irrigation been profitable and advantageous so far?—A. It has been very advantageous. Where they irrigate they raise splendid crops. They have been testing the sugar-beet industry, and that has proven to be a great beet sugar country. The Rocky Ford district claim that they have produced more saccharin and with a greater degree of purity than any other place in the world.

Q. And that is done by irrigation?—A. Altogether; it gives them a longer season. They say they can run a sugar factory quite a good many days longer than they can in any other district, owing to the dryness and to their ability to irrigate. They have now 3 beet-sugar factories running—1 being constructed this summer—and they are preparing for another. There is a vast territory of splendid soil—I could not say how many million acres; Mr. Harris may know better than I do. How many million acres are there east of the mountains?

Mr. C. H. HARRIS. Millions and millions of acres, but the trouble is there is not water enough. All the land is good, but I do not suppose a hundredth part of it is under irrigation.

Q. (By Mr. PHILLIPS.) Would you not have the water to irrigate a very considerable portion of it?—A. People who are familiar with it say that with reservoirs in the mountains, that could be built easily by blocking the gullies between the mountains, we could irrigate a very considerable portion of it. There is an awful snow-fall in the mountains, and it runs off rapidly.

Q. You have quite an industry in raising cantaloupes?—A. The Rocky Ford.

Q. Are they raised by irrigation?—A. Altogether.

Q. I know they are shipped East.—A. We get very little rain there at any time.

Q. What crops chiefly are raised by irrigation in your section?—A. In the valleys there is a great deal of wheat, potatoes, and hay, and a great deal of fruit. Over in the Grande Valley they raise very good fruit; they do not raise much grain.

Q. Have you agitated the subject of public irrigation by the State or Government?—A. It is only recently they have commenced agitating it. It has been agitated to some extent for quite a while, but not strongly; but now we feel it is time to advocate it pretty strongly, especially since they have developed what beets will do there, and for a while they thought they could not raise anything hardly. But now that we have got water in and irrigated the ground we find we can raise almost anything out there.

Q. Have you anything to volunteer further that we have not covered?—A. Nothing, I believe. I am sorry I have known so little.

Mr. PHILLIPS. We think you have given us a great deal of information. In behalf of the commission I desire to thank you for your appearance before us and for your very interesting and profitable statements.

The WITNESS. If I have been of any benefit I am glad of it, and I thank the commission for their invitation.

(Testimony closed.)

WASHINGTON, D. C., April 3, 1901.

TESTIMONY OF MR. JAMES MORTON LANGLEY,

Representing the Merchants' Association of New York.

The commission met at 10.55 a. m., Mr. Farquhar presiding. At that time Mr James Morton Langley was introduced as a witness, and, being first duly sworn testified as follows:

Q. (By Mr. FARQUHAR.) You may now give your name and address.—A. James Morton Langley, New York Life Building, New York.

Q. Do you hold some official position with the Merchants' Association of New York?—A. You could scarcely call it official; that is, I have no title. I am directly in charge of transportation matters for the association.

Q. How long has the Merchants' Association been established?—A. Four years.

Q. Of what class of business men is it composed?—A. All classes. It has 1,300 members, and is not restricted to any particular class; it includes merchants, manufacturers, bankers, and it ramifies generally into all lines.

Q. Have you an established headquarters in New York City; and if so, where?—A. New York Life Building.

Q. What is your form of membership, simply voluntary, or do you have a regular membership with annual fees, etc.?—A. We have two classes of members; direct members and what we call associate members. The direct members pay an annual fee of \$25; the associate members pay nothing. The associate members are distributed throughout the United States. I think there are thirty-odd thousand on our books to-day.

Q. Can you state briefly the aims of the association?—A. Well, as stated it is to foster the trade and welfare of New York, but that is comprehensive enough and covers the ground.

Q. Was it brought into being on account of discriminating rates as against the city of New York and differentials in favor of other cities?—A. It became necessary through the practice on the part of certain railways to make cheaper passenger fares from certain points to trade centers. Take, for instance, St. Louis. There is a certain territory which is assumed to be tributary to St. Louis as a market. The railroad introduced the system of excursion rates with the object of encouraging merchants to go to market. That was granted to western competing points, and it naturally had an influence in diverting trade from New York. Take a merchant out in a small town, and if the question arises in his mind as to whether he should buy goods in St. Louis, or Chicago, or New York, the existence of these reduced rates would assist him in making up his mind which trade center he would visit; and naturally after having gone to that trade center the dealers there would probably sell him all the goods he would require. In a sense that was a discrimination against New York.

That was perhaps the main reason why the Merchants' Association was established. There are other discriminations, but the one I have just referred to brought the matter to a focus and resulted in the creation of the association.

We have always taken the stand in New York that if there were no discriminations New York would stand, figuratively speaking, upon its own bottom; and we have never since we have been in existence asked a concession from a railroad. All we ask is equality of opportunity.

One of the first active steps taken by the association was to try and have the railroads grant to New York the same privileges that they were granting to other trade centers; that is particularly in connection with this reduced rate matter. Instead of charging 2 full fares, the roads had charged in some instances a fare and a fifth, and in other instances a fare and a third for the round trip.

Q. Were Philadelphia and Boston enjoying excursion rates at that time?—A. I think not.

Q. New York competes quite as directly and severely with Philadelphia and Boston as it does with St. Louis and Chicago, does it not?—A. I should say yes.

Q. Then, in asking for discriminating rates in favor of New York, you ask to have an advantage over Philadelphia and Boston, do you not?—A. We do not ask for discriminating rates. That is hardly a correct way to put it. We have taken the position that we would prefer to have this entire practice abolished. We have told the railroads time and again that whenever they were ready to stop that practice we would stand with them and assist them in doing it; but so long as they would persist in granting them to other places, we asked to be put on a relative basis of equality. I would scarcely call that asking for discriminating rates.

Q. Do you not call excursion rates discriminating rates?—A. Yes; they are discriminating when made in favor of some points and denied to others.

Q. (By Mr. FARQUHAR.) Was there any action on the part of Boston, Baltimore, or Philadelphia merchants to adopt the same plan that you have?—A. Yes.

Q. They have had no success in it?—A. I am not familiar with the success that Boston or Baltimore have had, but Philadelphia at times has had the benefit of these same rates.

Q. You would say, then, that your plan was to abolish the advantageous discriminating rates received by Chicago and St. Louis?—A. Yes.

Q. So that all would be put on the same plane?—A. That is, charged the full tariff rates; we would prefer to see that. That has been our position from the first. In fact our position is well known to the railroads. We have gone on record before them to that effect.

Q. Have you any formal statement to make to the commission; any tabulated statement of discriminations?—A. No; I have not. I had started to prepare such a statement, but after reading it over I considered it was not comprehensive enough, and I thought I had better first find out what sort of information the commission desires.

Q. Have you any fault to find with the freight classification, as now adopted, from the North to the South?—A. Yes.

Q. Would you state that to the commission, and give specific cases, if you can?—A. Perhaps it might be well to establish a starting point by giving my idea of what a freight classification is. Of course, in the effort to systematize traffic, there must be a standard of some sort established in order to group miscellaneous merchandise. A classification perhaps bears about the same relation to rates of freight that the yardstick does to the price of cloth, for instance, or that the bushel measure does to the price of a commodity. It is the gauge.

The railroads have two systems of making rates. One of them is what they style "commodity rates," which covers traffic that moves in bulk, such as grain or flour and various other products. In miscellaneous freight they have arranged 6 classes of freight rates. Under those 6 classes they arrange, say, 3,000 or more separate items. That will give you some idea of just what an undertaking it is to properly classify freight.

Prior to the enactment of the interstate-commerce law, which went into effect in 1887, each individual line made its own classification. I think there were 138. As soon as the interstate-commerce law went into effect it was found that in applying these classifications to the scale of rates in effect in numerous instances the long and short haul clause was violated. In the effort to get the rates in line, the railroads held a convention, and attempted to adopt a uniform classification. That was found to be inexpedient, and they were only partially successful.

The United States is arbitrarily divided into territories. The territory from New York to Chicago and north of the Ohio River is what is known as the Official or Trunk Line territory; east of the Mississippi, but south of the Ohio, is what is known as the Southern territory; west of Chicago is what is known as the Western.

After this convention three classification committees undertook to classify the freight that is moved in their separate territories. There was very little complaint from 1887 until January 1, 1900.

At that time the Official classification committee made wholesale advances in their classification without any notice to shippers. They advanced in class 818 items out of the 3,000 in their merchandise list. Taking the scale of rates from New York to Chicago as a basis, these advances represented an average increase in the rate of freight of 35.5 per cent.

That was followed by the Western classification committee on January 25, 1900, advancing the rates on 240 of the items in their list. The per cent of advance in this instance, using Chicago-Missouri River rates as a basis, was on an average 47.4 per cent.

Following that again, the Southern classification committee on February 1, 1900, advanced their classification. Out of 2,600 items in the Southern classification they advanced two-thirds of them, ranging from 30 to 50 per cent.

As I have said, that was suddenly done, and the railroads did not seem to take into consideration the fact that merchants are in the habit of making contracts ahead based on existing rates, and the effect of that is apparent. If you make contracts to deliver goods, and your freight rates are advanced, it simply means that you lose the difference between the advanced rate and the rates that were in effect when you made the contract.

The Interstate Commerce Commission had their attention called to the matter, and in December they held a session in Washington to investigate and find out what might be done to prevent the railroads from putting the rates in effect. There does not seem to be much certainty as to whether the Interstate Commerce Commission has control over matters of classification. The investigation finally assumed the shape of having the matter drawn to the attention of the Attorney-General of the United States, but after considering the matter, he came to the conclusion that there was no ground for interference by him.

It then seemed to be a question as to whether the railroads and shippers could not

get together and jointly agree on some basis that would be satisfactory to both. In response to a suggestion to that effect, the Official classification committee met with the shippers and subsequently modified the advance, but they did not go back to the original basis.

Q. Do you know whether the Attorney-General found that the advance in the rates was justifiable?—A. I do not believe that he did find they were justifiable.

Q. Did the Interstate Commerce Commission, in their submission of the matter to the Attorney-General, call attention to the fact that they were exorbitant? Do you recollect that?—A. I am not sure as to how the case was presented by the commission. I think, however, that the position taken was that the action of these committees was in defiance of the antitrust law; in other words, that they had come together by joint agreement to make these advances; but the Attorney-General did not seem to take that view of it, or, in any event, he decided that he could not interfere.

Q. Was the position taken that it was a quasi conspiracy as against the spirit of the interstate-commerce law?—A. Yes; that is the idea.

Q. (By Mr. A. L. HARRIS.) Did you file a complaint with the Interstate Commerce Commission setting forth the disabilities that your association was laboring under?—A. Our association did not do that; but I think there were a hundred-odd complaints filed in connection with this matter.

Q. Were they ever investigated?—A. I do not believe a formal investigation was ever made; it was informal.

Q. Was any reason assigned for not investigating the charges of the complainants?—A. Not to my knowledge.

Q. (By Mr. RIPLEY.) Do you understand that the Interstate Commerce Commission has jurisdiction over classification or not? That is to say, could it entertain a complaint of this kind and pass upon it?—A. I am of the opinion, from the way that the present law reads, that it would be utterly useless for the Interstate Commerce Commission to attempt to do anything, because the law seems to me to be vague. It hinges upon a question of reasonableness, and there is no power that I have discovered that can determine what is reasonable and what is not. Of course there are two sides to the question, but in the absence of any arbitrary power to make a decision as to what is reasonable and what is not—

Q. (By Mr. A. L. HARRIS, interrupting.) Do we understand there is a grievance here with no remedy?—A. That is it; yes.

Q. Either on the part of the Interstate Commerce Commission under the interstate-commerce law or under the antitrust law?—A. That is it.

Now, there is one point about this matter, and that is that shifting or advancing items in the classification has really the effect of advancing the rates, so that the classification committees—although it is not generally admitted—really possess what is known as the rate-making power. It is particularly burdensome upon merchants for the reason that when they advance the item from one class to another it is very difficult to ascertain just what the ultimate effect of that is going to be or how much it will advance the rates. If they advance the scale of rates themselves it is a much simpler matter for the merchant to tell just what the effect is going to be upon him. That is the direct method. By using the other system of advancing it in the class, it is an indirect method and it is hard to tell just what the effect is going to be.

Further than that, in making the classification they have certain classes for carloads—that is, for merchandise that moves in carloads—and then they make the higher classification for less than carloads. The effect of that is that shippers who buy in large lots have, through that system, a tremendous advantage over merchants that deal in smaller lots.

Further than that, the system of carload rates tends to establish what has been styled spheres of influence or commercial basins. To illustrate that: If a merchant in New York wishes to make sales in territory that is nearer to Chicago than it is to New York, it is possible through that divergence between carload and less than carload rates, when applied to the scale of rates in effect, for the Chicago merchant to buy in carloads and distribute to that territory which is nearer to him than it is to the merchant in New York, by reason of the lower rate of freight. If you ship from New York to Chicago at a low rate of freight and, in distributing that carload shipment, then ship backward into this territory at a less than carload rate, the ultimate expense is less by that system than if you shipped in less than carload lots from New York to that territory.

Q. (By Mr. RIPLEY.) Could you give an illustration of it that would make it definite?—A. I do not know that I could do that without a tariff.

Q. Simply by naming cities without naming freight rates. Take some interior city in Ohio or Indiana.—A. [Indicating on map.] Take for instance, Connersville, Ind. A merchant in Chicago selling dry goods, groceries, or hardware can get a lower rate of freight on goods purchased in the East in carloads and shipped from Chicago to Connersville in less than carloads, than a merchant in New York could ship in less than carloads from New York to Connersville.

Now, there is another effect in this manipulation of classification matters, and the illustration I have just given would also govern in this case. Take the Southern group of railways. If they are particularly interested in building up Southern territory to the exclusion of merchants in the territory north of the Ohio River they can continue this practice of making such a wide difference between the carloads and less than carloads so that it would be utterly impossible for the outside merchant to make any sale whatever in Southern territory. They can build, so to speak, a wall around themselves.

Q. You do not mean by that that they exclude the wholesaler, not the producer but the jobber?—A. That is it.

Q. This whole question you are discussing concerns the jobbing interest, does it?—A. More particularly.

Q. That is to say, the goods might come originally from New York, but the question is whether the jobbing trade would be located in New York or Atlanta, Chattanooga, or some other place of that kind.—A. That is correct.

Q. (By Mr. PARQUHAR.) There is one question not made clear yet. Is it not natural for the Southern railroads to build up their local jobbing trade as high as they can?—A. I think it is. Their selfish interests would inspire them to do that, you know.

Q. Does not the same complaint that you make in respect to Chicago, St. Louis, Louisville, or Cincinnati, from a New York standpoint, apply also to the Southern men in their great central markets?—A. Yes. It has always been our desire to be as impartial as we can in these matters. We recognize the fact that the railroad operates both ways, and it may be that they are excusable for protecting their own interests. But we do not like to have them go to extremes, as we claim they have done in these classification matters.

Then, again, they exercise a power frequently that is almost equivalent to taxation, and we are excluded from any representation whatever. Their actions are purely arbitrary, and are governed by their consciences solely. You might say, as Lord Clive did in regard to his acts in India, that, considering his opportunities, he had been very modest.

Mr. CLARKE. His exact words were: Considering his opportunities, he was astonished at his own modesty.

The WITNESS. That is it.

Q. (By Mr. KENNEDY.) You say you have no representation before these classification committees?—A. No; they are governed solely by the provision in the interstate-commerce law which requires that if it is proposed to advance rates there must be ten days' notice; if they are going to reduce the rates they are required to give three days' notice.

Q. When the change in classification is made you may appear before their classification committee and argue against the change?—A. Yes; we may present arguments, but that is as far as we can go. There is no power we can invoke.

Q. Are the changes never of avail in your interest?—A. They have been. The Southern classification committee is not so responsive to argument as the others. I have made arguments before them and have covered the ground quite fully, but they have not yet made any response, and that is a year ago. They ruled me out on the basis that my complaints were too general; but when you consider that they had advanced two-thirds of their classification, I do not see how anything else but a general complaint would cover it.

Q. (By Mr. RIPLEY.) Would you specify exactly what some of the advances were, as done in the typewritten statement which you prepared?—A. Yes. I could prepare something and furnish it. It is my idea to find out just what the commission would like to have, and then I can be specific or give practical illustrations.

Now, to be specific in regard to the Southern classification. A comparison of the old with the new classification shows that since January, 1900, 1,977 articles have been advanced in class out of a possible 2,600. They have, I think, 9 different classes of rates. They have more classes in the Southern territory than in the other territories. Of these, 32 articles have been advanced from second to first class; 38 from third to second class; 69 from fourth to third class; 36 from fifth to fourth class; 10 from sixth to fourth class, and 46 from sixth to fifth class. There are many instances in which advances were made from fourth to first and from third to first. In addition to that the classes which were among the lowest are beginning to disappear from the classification list altogether. They are eliminating the lower classes and gradually advancing these articles from class to class. There were 109 of the lower classes and commodity rates in the classification which governed prior to February 1, 1900, and in the new classification, which went into effect on that date, there are only 58 of these left. In addition to these advances there were 75 new instances of discrimination made by widening the difference between the carload rate and less than carload rate.

Q. (By Mr. LITCHMAN.) I would like to know in some way whether these changes in classification apply exclusively to St. Louis or New York or any other particular

place, or whether they were general increases in classification to all places?—A. What we are discussing now is the classification that governs in the territory south of the Ohio and east of the Mississippi. The advances that were made govern generally from all points.

Q. Then they were not a discrimination against any particular point?—A. No, sir; except through that practice of widening the difference between carload rates and less than carload rates.

Q. Is not that a universal custom?—A. You might say that it is.

Q. Is it not true that the carload rate is always lower than the broken carload rate?—A. Yes.

Q. Is that of itself, then, a discrimination?—A. It would not be a discrimination if there was any fixed rule for the difference, but the committees observe no fixed rule. For instance, in classifying freight they take into consideration the cost of handling and the value and the bulk and the inherent liability to damage. That is a general practice.

Q. Is not the classification lower on perishable than on unperishable goods?—A. That is what I say—they consider the inherent liability to damage. If there was a fixed standard as to just what the difference should be, gauged on the cost of handling as between carloads and less than carloads, there could not be much complaint. It is undoubtedly true that it costs more to handle a miscellaneous lot of freight than a carload; but at the same time the railroads have been in existence a good many years and they have a record of their business, and it ought not to be a difficult matter to establish a fair difference based upon the cost of handling the carloads as compared with the less than carloads. They do not seem to have reduced their business to a system as yet for some reason. For instance, they have not yet gotten it down to the basis that the life insurance companies have. A life insurance company can quote figures to cover almost any contingency. A railroad company ought to be able to tell just how much more should be paid for a less than carload lot than a carload lot, and let that be recognized as a standard and let that govern.

Q. Do I understand that whatever classification is adopted it applies equally to all shippers?—A. Yes; there is a provision in the interstate-commerce law (section 10) that makes it obligatory on the part of shippers to observe the classification, and it affects all shippers alike.

Q. Then where does the discrimination come in?—A. The discrimination comes in by making a difference between the carload and less than carload rates that is not justifiable.

Q. Now, can you give some instance of that unjustifiable practice?—A. I think it would be better to let me provide that in an exact way, too. I can hardly explain why it is impossible to do that with the information I have in hand. You must have your exact scale of rates—tariff rates—which I have not got with me. I will willingly provide all those instances, but I must have the data so that I can figure it out at something like a mathematical calculation.

Q. (By Mr. RIPLEY.) Will you name a few specific commodities which were formerly fourth class and moved up to first class, simply naming the classification, leaving the rates out?—A. I have in my office a quite complete list compiled specifically mentioning these advances. I would take pleasure in giving you a copy of that, and that would answer your question. I thought I had it included in this statement here, but I find it is missing.

Q. (By Mr. KENNEDY.) Well, can you say whether the difference between the carload lots and the broken lots is a very wide one, or whether it is wider than it should be, considering the cost of handling?—A. Well, that has been our contention in most of these cases where the difference has been increased. The contention was that they were not governed at all by the difference in the cost of handling it; it was merely an arbitrary advance, and, taking in consideration the results that are produced by that advance, we assume that it was intentionally done to exclude merchants outside of that particular territory—to give the jobbers in the South an advantage over jobbers elsewhere.

Q. (By Mr. FARQUHAR.) Well, the jobber in Atlanta or any great Southern market there has an advantage, of course, in the carload lot in its original shipment, but in his distributions he has got to pay the Southern tariffs, just as the Northern man does?—A. Yes. Now, there is another peculiar condition in respect to Southern territory—that is, that the Southern classification governs on interstate traffic all through that territory, but the various States, through the State railroad commissions, have never authorized the Southern classification as promulgated by the Southern classification committee. In the various States the old basis is still in effect on State business, and you can see what an advantage that is to the merchants of those States. They can distribute on the basis of the old classification, whereas the merchant outside must observe the advanced classification.

Q. Do you pretend to say that in the regulation of State traffic within the State that there are State boards that have power above that of the Interstate Commerce Commission, even of Congress?—A. Not over interstate traffic, but intrastate traffic.

Take, for instance, Mississippi. A merchant can buy his supplies on the basis of what is known as Southern classification and distribute in his State on a much lower basis of classification, whereas an outside merchant shipping to the point in that State is governed solely by the Southern classification, which is about 30 per cent higher than the one governing in the State.

Q. (By Mr. RIPLEY.) You mean where he ships direct to the locality or direct from New York?—A. Direct from his own city to a local point. I attended a convention of State railroad commissions at Lookout Mountain last summer and they unanimously agreed that they would not recognize this new classification.

Q. Their policy, then, is distinctly to build up, of course, the jobbing business within their own borders?—A. Yes.

Q. And those State railroad commissions are bound to look after that interest, whatever happens to the general Southern classification?—A. That is the idea.

Q. (By Mr. LITCHMAN.) Have you any information that shows a comparison between the classification on the different lines of goods in this Southern territory with that of the classification in the Northern territory?—A. Yes. I can illustrate that to you. I had started to make some remarks in regard to uniform classification.

Uniform classification is a good thing to have, but you must take into consideration when you make your classification the scales of rates that are in effect. Suppose that we want to make the Official classification a uniform classification. The Official classification is made to correspond with a scale of rates, which are as follows, based on the rate from New York to Chicago:

	Cents.		Cents.
First class	75	Fourth class	35
Second class	65	Fifth class	30
Third class	50	Sixth class	25

Those are cents per 100 pounds. Now, of course, in arranging their classification the official committee have in a measure been governed by that scale of rates. For instance, the committee know that, if they put an article in the first class it means that the rate from New York to Chicago would be 75 cents. They keep that in view. Well, now, take the same distance running South—New York to Atlanta, for instance; the scale of rates is as follows:

First class	\$1.14	Fourth class	\$0.73
Second class98	Fifth class60
Third class86	Sixth class49

From this it is plain that there are three classes of rates in the Southern territory which are higher than the highest class for similar service in the territory north of the Ohio River. Now, take the Official classification again. If an article is in the first class it is 75 cents, but if it is first class it would be \$1.14 going South, for the same distance; so that there is no justice or equality in applying the classification universally, when there is such a wide difference in the scale of rates themselves.

Q. Is that illustration typical of the whole Southern territory?—A. That is a fair illustration.

Q. Of the difference for an equal distance between the charge in the Official and the Southern territory?—A. Yes; in the Southern territory they have always had an exceedingly high scale of freight rates. That has been complained of not only by commercial interests but by connecting railway lines as well.

Q. (By Mr. LITCHMAN.) Is it not true that the railroad facilities are very far superior in the Northern district than in the Southern?—A. Yes; that was true until very recent years. Recently there has been an era of improvement generally throughout the South in railways.

Q. Do you think that the South even at the present time is comparable with the North in the development of railway facilities?—A. I do not think they are quite up to the standard.

Q. Would not that have an effect on the classification and rate charge?—A. Yes.

Q. If the expense of doing business is higher in the South, necessarily the price charged must be higher?—A. There is another element to take into consideration there, too, and that is the fact that the return traffic from the South is quite light—that is, the traffic moving North.

Q. (By Mr. RIPLEY.) How about cotton?—A. Well, that would not apply in cotton. That traffic would be pretty heavy, but that don't compensate for the difference, for instance, between the quantity of coal moving in the North. The North has the coal interest, the grain, flour, and heavy products that are raised in the West that keep their traffic up to a pretty high standard.

Q. (By Mr. LITCHMAN.) How large a proportion of the cotton crop is shipped by water?—A. I can not answer that question.

Q. Is it true that a large proportion of the crop is shipped to foreign countries?—A. Yes.

Q. Then that portion of the cotton crop would not enter into this calculation you are now making?—A. No; it would not move North; it would move, perhaps, South or East. That would be short hauls.

Q. It would not enter into a comparison of rates between the Northern territory and the Southern territory necessarily?—A. No, sir.

Q. Now, I want to return to the point which I am trying to bring out. This classification and the rates charged under it apply to all consumers in the South, do they not?—A. Yes.

Q. Then where is the discrimination if all in a certain territory are charged alike?—A. There is no discrimination in its application. The discrimination is in the way that the classification is—I do not hardly like to use the word, but it covers the point—manipulated.

Q. You think the discrimination is between sections, then, to the detriment of the South? Is that the point you desire to make?—A. Well, I have made that claim. I don't suppose it will be accepted as correct, but that is the way it looks to me.

Q. You think this alleged discrimination is to the detriment of the development of the South?—A. Yes; any restriction in action of that character I think is detrimental. We have always taken the position there that the less interference and the fewer obstacles there are thrown in the way of development, the better it will be for the country generally.

Q. You think that the price charged should be sufficient to cover the cost, do you not?—A. Undoubtedly.

Q. Have you gone into an examination as to the element of cost?—A. We can not get at it.

Q. Can't you get at it as well in relation to the South as in relation to the North?—A. We can't get at it in the North.

Q. (By Mr. CLARKE.) Is it your contention that the changes in classification have been an indirect way of raising the rates?—A. Yes; there would have been very little complaint, I think, if they had advanced the scale of rates themselves; that would have been direct. There was a time, perhaps, when the merchants were inclined to complain of freight rates, but in later years they have reached a conclusion that the rates of freight of itself is not so material as the universal application of it. They want everybody to be charged the same rate, whatever that rate might be.

Q. Then you think that the changes in classification have induced great confusion and inequality?—A. Yes, sir. We have sometimes thought that while the railroads want to increase their revenues, they did not care to assume the responsibility of advancing the rates; it might create too much of a furor, and they have adopted this other method, which, to my mind, is equivalent to taking a handful of pennies and throwing them in the air and letting them come down. Then there would be so many heads and so many tails, and let that represent the protest. They will have a great many protests. Other changes would not be noticed by people not affected, and out of the toss-up there will be a certain percentage of advances that will remain. That was brought to my mind by reason of the fact that after these advances were made, and numerous protests were filed, certain powerful interests had their protests recognized, and the basis of classification was put back to almost its original standard, while others secured no changes whatever.

Q. (By Mr. CLARKE.) Then you think that a change in the classification was haphazard and not scientific?—A. That is it; and this method of making changes has a further advantage. Not all merchants are familiar with transportation methods, and particularly some are unfamiliar with the effect that the classification has upon a freight rate. They know their rates were advanced, but they do not understand just how it was done, and they might protest and finally forget all about it. Well, it is that percentage that makes an advantage to the railroad people. Now, I suppose in that classification of 2,600 items perhaps, conservatively, one-third of them will continue to remain as they were advanced, due to the fact that the merchants affected have abandoned all hope of ever securing a return to the original basis.

Q. (By Mr. RIPLEY.) Would you specify any recessions from this position of advance taken in respect to particular commodities? Do you recall any?—A. Yes; in the Southern classification I happen to recall from memory—coffee was advanced one class, both green and roasted. The green coffee remains as advanced, and the roasted coffee went back to the original basis.

Q. What is the effect upon the distributive trade of the Southern States as to the jobbing of coffee?—A. Well, I do not think that question, as to the effect of jobbing, enters much.

Q. Would it affect the place where the coffee is roasted? Would it determine the center of roasting?—A. I am not positive, but I think it has that effect. I guess it is well understood that coffee is controlled by a trust—that is, roasted coffee—practically a trust. Now, it seems singular to me that they should not go back to the

original basis of classifying green coffee, and yet saw fit to reestablish the old order of the classification of roasted coffee. How that was brought about I do not know.

Q. But the return to the old basis was advantageous to the coffee interests?—A. Yes; to the roasted-coffee interests.

Q. It enabled them to crush out competition of other parties, or, at least, it might have that effect?—A. It might have that effect.

Q. To crush out competition of persons in other parts of the country who wished to establish a local industry?—A. Yes.

Q. Can you recall any other instance of that kind of a specific commodity which was advanced in the classification and then by virtue of strenuous protest was placed back again to its old basis?—A. That is the only article I can recall from memory.

In checking over the official classification I noticed that a good many of the items that are under the control of these industrial combinations were not advanced at all.

Q. No attempt was made to advance them?—A. No. Take, for instance, paper. I also have a list in my office of that class of articles made by combinations that I would be pleased to provide, if you think it wise.

Q. In other words, you imply that by these changes in classification discrimination between distinct producers can be induced without the giving of personal rebates or preferences?—A. Certainly.

Q. In other words, that by a device by which apparently everybody is treated alike, there is nevertheless the effect of granting a definite discrimination to certain interests?—A. That is right. That is the reason I used that term "manipulate."

Q. Can you specify any influence of this kind at work in fixing any of the dry-goods or woolen classification? Has there been any change in the woolen classification?—A. No; dry goods is in the highest class now, the first class in the Official, in the Southern and also in the Western. There is what is known as cotton piece goods—that is in the lower class. That is supposed to be goods that are made exclusively of cotton. Our organization had, 2 years ago, I think, endeavored to have the classification of cotton piece goods simplified. The classification committee had attempted to subdivide cotton piece goods in accordance with the list that they had established, and it made it very difficult to pack goods. We wished to have it simplified, and presented an argument, and they simplified it by advancing it in class. That is, for instance, they advanced it from a third to an intermediate class which they had established, which was 15 per cent less than second.

Q. Will you, by illustration from that classification, show how complicated the cotton schedule is?—A. Now, this is a Southern classification.

Q. You may read a few of those items under the cotton schedule.—A. They have here calicoes, cambrics, caution flannels, plain or dyed, canvas, checks, domestic, cheviot, and so on. There are 35 different terms of that nature that they have assumed to cover everything that was made wholly of cotton. As a matter of fact, most of these terms are trade names. For instance, you take teazle cloth. It is a patented name, a sort of copyrighted trade name; only one person can make it; and they have endeavored there to condense into these 35 terms at least between 2,000 and 3,000 different styles of goods made of cotton. I might say further than that, that each year there is some new name attached to some product made of cotton, to make it attractive, and it is difficult to tell just how to classify an article that is in reality made wholly of cotton, and that sells for the same price as some of these other products that they have included in this list. When a shipment is made, although it may be cotton piece goods really, the inspectors who are maintained by the classification committee will use their own judgment as to whether the goods in that shipment may be included under these 35 terms or not. If it seems to them that it don't come under those 35 terms, instead of the shipment going forward at the fifth class, it will be advanced to first. That was our idea in having that list entirely eliminated, and having the entire subject covered by the simple term of cotton piece goods. Then the question of trade names or terms would not enter into the proposition at all.

Q. Are those 35 articles classified differently?—A. No; all in one group—fifth class. I am not very well posted on the dry-goods business, but I know that it is a most difficult matter to include under these 35 terms everything manufactured of cotton.

Q. What would be the effect if a bill of lading was made up specifying calicoes or some other article, and in fact including in that package another one of those 35 articles; would that be a misclassification subject to shippers' penalty?—A. Well, yes. For instance, if you had a shipment of cheviots and you had room in the case in which they were packed for a small quantity of what is known as dry-goods—that is, goods made partially of wool, which is first class, the inspector would raise that shipment up to first class even though 75 per cent was cotton piece goods.

Q. That would amount to an advance in freight rates approximately of what per cent, 50 or 25?—A. That is contingent upon the distance transported. That is the reason why it is so difficult to answer offhand a question that involves freight rates.

Q. But it would amount to a very material advance in rates?—A. It might be well for you to answer the question in the way you did for this reason—it will serve to bring out the fact that the percentage of advance which is made by this manipulation of the classification is contingent entirely upon the distance hauled. That is, for instance, in some cases the same goods might be going to a point where the advance would be only 1 per cent, but if they were going farther the advance might be 30 per cent.

Q. The shippers, then, would desire a great simplification of these different schedules?—A. Not only that, but as in the matter of classification, I have always taken the position that while there might be reasons at times that the rate of freight of itself should be advanced, after a classification is made, and made by men who are experts in the business, there is no reason I can see for again disturbing that classification. That should be a standard. When these classifications are made the questions heretofore have been thoroughly weighed, and there was a considerable length of time for the committee to act in, before they classified anything brought to their notice. After being experienced in that line of business for years, if you bring to them a piece of merchandise or a new production and ask them to classify it, and they do classify it after thoroughly considering the question, I do not see any reason why that should be changed again. That should be just as fixed, as I said before, as a yardstick.

Q. The protest of the Merchants' Association, then, is not primarily that freight rates have been advanced, but that they have been perhaps unequally advanced?—A. Unequally advanced and advanced in a way that adds burdens to the small man and the small shipper. You can always look for that effect if this indirect method of raising freight is going to be continued. The small man will get the worst of it. That has been our experience in the past, and we expect to have more of it unless some way is found to stop it.

Q. In your judgment, then, ought the classification for the country at large, or for the different sections of the country, to be drawn up by a representative body, including representation of the shippers and of the railroads and with publicity to the conferences, this classification then to be effective either throughout the United States, or through merely the Official, Southern, and Western territory, as the case may be?—A. Yes.

Q. And your protest is against a system by which discrimination, rebates, and disadvantages of various sorts are introduced indirectly?—A. I would not like to include the word "rebates" in classification.

Q. But it amounts to the same thing?—A. Yes; it is a different means of obtaining the same end.

Q. (By Mr. CLARKE.) You speak of inspectors. Who are they, and by what laws or rules are they governed?—A. That is purely arbitrary, too. They have this classification, and naturally they are not going to trust to the honesty of the shippers to observe it. If it is not observed there is an opportunity of one shipper securing an advantage over another, if his conscience is elastic. For instance, if the commodity in which he is interested is really first-class, and he marks on his box, on his case, something that comes under the fifth-class rate, he naturally makes a difference between the first and fifth class rates. But the railways maintain the system of inspection, and if they have reason to question a shipment they will open it and look it through and classify it in accordance with their classification.

Q. What class of employees does this opening, inspecting, and reclassifying?—A. They are a separate and distinct class by themselves. I do not know from what source they draw them, but they are maintained at the expense of the various railroad associations, and are under a chief inspector. They are stationed at transfer points.

Q. (By Mr. RIPLEY.) Do they not have it in their power, if they were bribed or otherwise induced, to change the freight rates which parties pay?—A. Yes; and it is also possible for them to look the other way on occasion.

Q. Is that practice known to exist to some extent?—A. Well, it is like a good many other things in connection with transportation matters. It is a thing that everybody knows, but it has not yet been proven.

Q. Would it not be likely that the large, powerful, important shipper would be less severely treated by the railroad in the matter of inspection than the small shipper who ships less frequently?—A. Yes; there are certain railroads who use that very thing as a method of cutting the rate. They, for instance, might instruct the shipper in New York, if he is agreeable, that he should misclassify his freight, and thereby get a lower rate of freight.

Q. And they would instruct their inspectors to take no note of it?—A. I do not know that you can say they would instruct the inspector, but the inspector will be friendly with them.

Q. (By Mr. FARQUHAR.) What would the other parties in the same business do in that case?—A. Well, if any other shipper could secure the facts they would probably go to law about it.

Q. But if the others secured the discrimination, would they go to law?—A. No; I think not, if they were benefited by it. [Laughter.]

Q. Now, you seem to make a charge of venality against inspectors. What reason have you to know—have you ever known of a case of venality on the part of inspectors of railroads?—A. I do not know of any. As I said before, it is one of these things that everybody knows.

Q. (By Mr. CLARKE.) Irrespective of the question of honesty in the administration of this practice, let us see if we can't find out a little more about the practice itself. Is it a fact, as you understand it, that all the railroad companies employ inspectors at shipping and transfer points?—A. Not all railroads; no. The railroad associations employ them. For instance, the trunk-line railways which govern transportation matters in the territory extending from New York to Chicago and north of the Ohio have their group of inspectors, the Western Railway Association have theirs, and likewise the Southern.

Q. Is it generally understood among merchants that their packages of goods are subject to be opened by the inspectors of the freight associations?—A. Yes, sir.

Q. And compared with the invoices?—A. Not compared with the invoices; compared with the shipping receipt or the bill of lading.

Q. Is there any contract in the bill of lading or any other paper that passes between the shipper and the railroad company which authorizes the railroad company to open the packages?—A. No, sir; they assume that right.

Q. Do the merchants object to it?—A. No, sir; they do not. I should not think, to express my own opinion, it would be to their interest to object to it.

Q. Is it common practice among the merchants to ship in a lower classification than goods should honestly go into?—A. I should not think it would be right to call that a common practice. That is another thing I can't state of my own knowledge. I think that there is a record statement that covers that point, and I attended a session of the Interstate Commerce Commission that was held in New York when they took up that very point. They had the inspectors before them, and I think the chief inspector testified that that practice was going on. If I remember correctly, he gave the percentage of instances of which his attention had been called to.

Q. You saw the statement of the late George R. Blanchard, made before this commission on that same subject?—A. Yes, sir; I was present when he made the statement. He was qualified to speak; he had access to these records. They keep records of cases of misclassification. The inspectors know just where to put their hands on parties who are given to that sort of thing.

Q. Do you understand that this matter of inspection is in any way regulated or provided for by law?—A. No, sir; I do not believe that it is provided for by law.

Q. Would the merchants feel better protected if it were provided for by law, the same as the inspection of imported goods by the Government is?—A. I think they would. Section 10 of the act to regulate commerce covers that point—that is, in regard to misclassification, and provided a penalty, but nothing is said in it about inspection. That seems to have been left to take care of itself.

Q. (By Mr. FARQUHAR.) Would not a railroad naturally have a right to examine any article for transportation on a road, provided it was in a hazardous schedule—gunpowder, chemicals, or anything else?—A. Well, they only accept those articles by special contract. They have a right to determine that before they accept it.

Q. But you think they have no right to discover fraud at all in transporting a first-class classified article for a fourth class?—A. I think they have a right. If they have not, they ought to have.

Q. At least they exercise it?—A. Yes.

Q. (By Mr. CLARKE.) Do disputes ever arise between these inspectors and shippers as to the reclassification?—A. Yes; that is brought about by the difficulty of correctly grouping various kinds of merchandise or articles in a way that will correspond with the classification as promulgated. Take a variety of things, for instance, in hardware. The shipment may be composed of a variety of different things, the classes of which do not agree. If you want to put that in one class, it is puzzling to know just how to properly group it and yet be in line of the classification. For instance, shelf hardware might be fifth class, pocketknives might be first class. If you have a package of pocketknives and shelf hardware, all of which is a small shipment, in order to agree with the classification, instead of making 1 package you would have to make 2 packages. That is one of the things that is so disturbing to commercial interests. Their packers get accustomed to classification and suddenly it is changed, so it is hard to know how to group shipments again. It requires a man quite expert, and the packer must have a high degree of intelligence to analyze that classification and comply with it in a good many instances.

Q. Do you understand that these inspectors are employed on account of their expert knowledge of classes of goods?—A. Yes; they are supposed to be expert in classes of goods, and also particularly familiar with the classification itself and the grouping of various articles into one shipment.

Q. It is an arbitrary act on their part in transferring from one classification to another, is it not?—A. Well, they have got to justify themselves by the classification. Their actions at times are complained of. When an increased rate of freight is demanded through their act, it will quite frequently happen that the shipper will contend that he was right, and they will have to argue the point.

Q. Would the matter be simplified and made clearer if each bill of lading was practically an invoice of the goods in the package?—A. They do that so far as it is possible now, specify on the shipping papers what the shipment consists of. They do not include the whole invoice.

Q. It is a matter of convenience among merchants, is it not, to put a considerable variety of goods into a single packing case sometimes?—A. Yes, sir; they do that for reasons of economy in their packing department, and also to comply with a minimum weight rule that these classification committees have in their classification. I will illustrate that: They have a rule which is to the effect that no single package of a small lot of freight of one class will be taken at less than 100 pounds at first-class rate, and in no case will the charge for a single consignment be less than 25 cents. Now, the shipper will endeavor, of course, to put as many goods as possible in the one case in order to get the benefit of the weight of the larger shipment, rather than pay a hundred-pound rate on a good many small cases.

Q. Well, since these goods are to be inspected and possibly reclassified arbitrarily in his absence, would it not be some protection to him and some aid to the inspectors if an invoice accompanied the bill of lading?—A. It might be. Yes, you might say it would be. It would be an open question as to whether the advantages would offset the trouble of making an extra invoice.

Q. (By Mr. RIPLEY.) Suppose a jobber in New York is endeavoring to compete with a jobber, we will say, in Montgomery, Atlanta, or some point in the South; do these jobbers in the South deal in a larger number of commodities than would a jobber in New York, as a rule?—A. Well, I should think not.

Q. The jobbers in New York will deal with either dry goods or hardware, or some particular line of commodities?—A. Yes.

Q. In some of these Southern centers are there not jobbers who job in a number of different commodities at the same time?—A. Yes; a sort of a general store.

Q. Would not the jobber with the general store in that locality have a distinct advantage over his New York competitor, in being able to put together a number of commodities in small packages into a large case in shipping out to his customers?—A. The railroads object to that. They have a rule that covers that point also. "Shipments of property combined into package by forwarding agents claiming to act as shippers will only be taken when the names of individuals and final consignees, as well as the character and contents of each package, are declared to the receiving agents, and such property will be waybilled as separate consignments and freight charged accordingly."

Q. No matter even if all boxed together?—A. If I understand your question, he will ship to a certain point to a number of merchants in that point and have one of them distribute packages to the other merchants in that city?

Q. I want to bring out this point, whether the jobber in New York dealing in a single line of commodities is on a par in competition with the jobber in a moderate-sized town in the South who may conduct a business in several lines of commodities, and who, in shipping from that small local center out to little towns round about, may combine his shipments into packages of more than 100 pounds, whereas the New York shipper, dealing in only 1 line of commodities, could not afford to ship direct to the small country store?—A. Yes; the local jobber might have an advantage there.

Q. And no railroad tariff or discrimination could affect that—that is, the nature of the business?—A. No.

Q. (By Mr. KENNEDY.) I would like to ask you whether the increase in rates by this indirect method that you are speaking about is justified somewhat on the ground of the general prosperity of the country—that the prices of commodities are going up throughout the country and railroad rates should also follow?—A. That was the only reason assigned by the railroads for this advance. They claimed that the price of materials had advanced, and that for a long period of years the tendency of railroad rates had been downward, and that they were justified in making that statement. But those were the only reasons assigned for this advance. I took occasion to look into the earnings of railways to a considerable extent and, so far as the Southern railways are concerned, I found that their net earnings were 20 per cent higher—at least 20 per cent higher—than they had ever been in the history of the roads. Yet they claimed that, because of the advance in the prices of materials, etc., they had to have more money. It did not seem quite consistent. It is a well-known fact that in transportation matters an increased volume of traffic produces great results. It seemed to us that the railroads ought to have been satisfied with that increased volume of traffic which produced that 20 per cent increase in their net earnings. There is another point that we do not seem to have touched upon yet.

Whereupon, at 12.55 p. m., the commission took a recess until 2 o'clock p. m.

The commission met at 2.20 p. m., pursuant to recess. At that time the witness again took the stand and resumed his testimony as follows:

(Witness, continuing.) There was one point that I think was not made sufficiently clear this morning, if, indeed, it was touched upon at all. The merchandise traffic, which comes particularly under these classifications, moves in smaller volume, of course, than what are known as "commodities," such as flour, coal, grain, and articles of similar nature that move in carloads, and this class of merchandise pays the highest scale of rates. For instance, the rates on flour from Minneapolis to the seaboard—that is, New York, Washington, and Philadelphia—are comparatively moderate. When this classification was advanced the railroads by that action placed almost entirely upon the merchandise classes the burden of the increase in freight rates, which they claimed were required to meet the demands made upon their revenue by the increased cost of materials, etc. They did not at the same time advance the rates on the coarser commodities to which I have referred. That does not seem to us to be entirely equitable. If the railroad revenues required an increase for any purpose we can not understand why it is that the increase was not assessed upon the entire volume of traffic moved. That seems to us to be in the nature of a discrimination.

Q. (By Mr. KENNEDY.) Is there any feeling among your people that the railroads favor the export traffic of the country as against the home traffic and distribution?—A. They certainly do make lower rates on export business than they do on local business, but I do not know that there is any serious objection to that. That seems to be reasonable.

Q. (By Mr. FARQUHAR.) Do you know of any case where a through foreign rate there has been diverted into the local market in the East?—A. I can not state that specifically. In order to be specific about these matters you will have to have before you a complete file of freight tariffs, which show the scales of rates themselves. There are, perhaps, a hundred thousand or more of those tariffs in existence, and it is like going to a library to look up certain information; it is almost impossible to carry it in your head. If you attempted to be specific offhand it would be merely guesswork, and it is for that reason I made the request that I should be allowed to insert those matters. I do know of such cases, but I can not at the present time state them specifically. I would like to look that up and provide the information.

I was speaking before of export rates. Take, for instance, flour; not for any special purpose, but simply by way of illustration. On flour from Minneapolis to Liverpool the inland rate is less from Minneapolis to New York than it would be on a shipment of flour to be delivered at New York locally and consumed there. The difference, I think, is about 2 cents a hundred pounds.

Q. (By Mr. CLARKE.) Did you notice the news of this morning that the flour mills in the Pennsylvania district have consolidated, with a view to competing with the Western mills for the export trade?—A. I did not see the news. I have known, in a general way, that such action was contemplated. With the exception of two the Western mills at Minneapolis, Duluth, and West Superior are now consolidated. It is in the direction perhaps of creating a trust, but my own opinion is that a trust, as applied to the manufacture of flour, is an impracticable thing.

Q. I understood you to indicate that, in your opinion, there is no particular objection to a through export rate from the interior of this country and the far West, half way across the Continent, and then across the Atlantic Ocean.—A. I had better qualify that by saying that I do not believe it is proper to export the raw material in that way—for instance, wheat—because the ultimate effect of that is to deprive the home manufacturer of the opportunity to get the profit in the manufacture of that staple. The effect of making what you might term excessively low rates on wheat seems to be working in favor of the foreign miller as against the home miller, with whom the home miller has to compete in the foreign market.

Q. You are aware, I suppose, that there are through import rates to the interior of our country?—A. Yes.

Q. And that these are lower than the rates for shipment from certain manufacturing centers in our country, like Pittsburg, to certain distributing centers, like St. Paul? Do the merchants of New York object to that?—A. I would not say that we would object to it. It is a most difficult thing to answer that question in an intelligent manner, taking into consideration the conditions as they exist. The principle that seems to underlie or seems to govern the promulgation of freight rates is in favor of the longest haul. There is not any relative equality as between the rates for a short distance hauled and a long distance. For instance, if a shipment originating in Liverpool is destined to Chicago the conditions would seem to be beyond the control of any influence, dictating that the rate from Liverpool to Chicago shall be almost as cheap as the rate from Liverpool to New York.

Q. Which, in your opinion, has the greater power in fixing these through rates—the railroad or the steamship companies?—A. If there is any advantage in the matter,

it probably lies with the railroads. The inland rate, I think, has a greater influence over the through rate.

Q. Apparently a through rate of that kind is a discrimination against the domestic producer and the domestic distributor or merchant. Now, can you tell us what offsets of an advantageous character there are to that?—A. No; I can not.

Q. (By Mr. RIPLEY). How does that affect the competition between jobbers in Chicago and in New York? Is it possible that jobbing merchants in Chicago can on a low through import rate reship their commodities and compete with you in territory which otherwise would be tributary to New York?—A. Yes; they do it.

Q. Will you explain further about that, as to the nature of that competition?—A. For instance, Marshall Field & Co., of Chicago, will sell in territory that is within 50 miles of New York the same kinds of goods, bought, perhaps, in the same market abroad, that the New York jobber will buy. That does not seem to be reasonable on its face, but it is a fact nevertheless; and in trying to discover the reason for it we can only reach the conclusion that it must be through some advantage in the matter of the through rate.

Q. In other words, do you mean that the whole through rate to Chicago, plus the local rate from Chicago back to the point of destination, is less than the rate which the New York merchant will pay from the foreign point to New York and from New York to destination?—A. That is it.

Q. Does this affect the nature of the commission business as distinguished from the jobbing business? Will you explain the difference between those two if there be any?—A. Well, as I understand the commission man, he is an intermediate or third party that does not invest his capital directly in the business, nor does he carry an extensive stock of goods. He has what they term accounts with certain mills, and, in a sense, is their selling agent. On the other hand, the jobber buys his goods outright, takes his chances of whatever element of risk there may be in conducting ordinary business; he is under the expense of maintaining a store and having his capital locked up a certain length of time, and the circumstances surrounding him are entirely different. There is one difference there that is very significant. In the commission business it is possible to ship from the mill to the buyer in, say, Central or Western territory direct—only one haul and one expense of freight rates. With the jobber, he has two hauls and the expense of paying freight twice—that is, in the accumulation of his stock and in the distribution of it.

Q. In other words, the jobber pays the shipment from the mill into New York, the goods being unloaded, and then he pays another shipment from that point out to the consumer?—A. Yes.

Q. Or to the general store which sells to the consumer?—A. Yes.

Q. Would it be to the interest of the railroad to foster the jobbing trade, then, in order that it might retain 2 hauls instead of 1?—A. It might look so on its surface, but when you consider that railroads seem to be favoring large shipments and large shippers, I think the reverse would be the case. You might think that the railroad would rather have a man pay freight twice, but the trend of things indicates just the opposite—that their interests lie in the direction of doing business in large lots.

Q. In other words, do you mean to imply that the industrial combinations which manufacture in different parts of the country are shipping direct to the consumer and eliminating the jobber?—A. Yes.

Q. And that railroads are assisting in this transformation by the distinction which they make between carload and less than carload lots, or in other ways?—A. Most decidedly, yes.

Q. The increase, then, in the Southern classification in the proportion of distinction between carload and less than carload lots is directly in line with this tendency which has been indicated?—A. Yes, that is the case.

Q. How does this affect New York as a distributing center or as a center of jobbing trade?—A. Well, now, I scarcely like to deal with family secrets. We will put it this way: a few years ago there were 28 dry goods jobbing houses in New York, to-day there are 4.

Q. Does that necessarily mean that the 4 may not have the control of just as large a volume of business as the 28 formerly had?—A. I think not.

Q. In other words, there has been a proportionate shrinkage in the amount of jobbing business done from New York?—A. Yes.

Q. Has there been any compensation to New York in return for that?—A. Not to my knowledge.

Q. Is that typical of other lines of industry, so far as your information extends?—A. Yes.

Q. What is the ultimate effect likely to be?—A. The elimination of the jobber as a factor in commercial affairs.

A. This will tend to lessen the importance commercially of many of the large centers in that respect?—A. In that respect, yes.

Q. (By Mr. KENNEDY.) Does that mean the removal of one item of cost between the producer and the consumer?—A. Possibly. It means a closer connection between the producer and the consumer, and naturally that will have a certain economic effect.

Q. (By Mr. LITCHMAN.) How far is that condition of affairs the result of the growth of the department store?—A. That has an influence as well, and the introduction of trolley lines, and the maintenance by department stores of their free-delivery systems.

Q. And the mail-order system also?—A. Yes.

Q. Well, would that not be a very large factor in the elimination of the jobber?—A. That competition could probably be met if it were not for this matter to which we have been referring here of the difference in freight rates.

Q. Is it the custom of the department store to deal directly with the manufacturer?—A. Yes; as I once heard it expressed, the department store does a retail business in a wholesale way. That is a paradoxical expression.

Q. That is exactly it, however. You think, then, that this discrimination in classification and other ways that you have described is the principal factor, do you?—A. I do; yes. That is the basis; that is the starting point. The existence of the department store simply emphasizes and exaggerates it. It puts the jobber, as the expression goes, between the devil and the deep sea.

Q. How long ago was it that there were 28 jobbing houses in New York?—A. I was trying to fix the date in my mind. I will have to answer that afterwards.

Q. By these jobbing houses, do you mean jobbing houses connected entirely with the domestic trade or with the foreign trade, or both?—A. Both.

Q. So far as you have observed, how far has this elimination of the jobbing interest been affected by the change in the tariff system of the United States?—A. I am not familiar with that phase of the question.

Q. Do you know whether these jobbing houses were at some time agents of foreign manufacturers?—A. They might be in some instances, but those are exceptions. They are a different class. They have their own agents solely. The foreign houses in many instances have their own representatives here.

Q. If the market formerly occupied by them has been absorbed recently by domestic manufacturers, that also would be a factor in the elimination of the jobber to that extent, would it not?—A. Yes.

Q. (By Mr. FAIRHUR.) What is the difference between the profits of the jobber and the commission man?—A. I am afraid that I can not answer that question. I have never been in the mercantile business myself, and I am not posted in reference to it at all.

Q. Well, then, in the elimination of the jobber the expense attendant on the whole jobbing trade is eliminated as between the manufacturer and the distributor?—A. Yes.

Q. Would you generally say that that conduces to cheaper goods to the consumer?—A. I should think so.

Q. Is it a fact that most of those large department stores, like Siegel, Cooper & Co. and Wanamaker and others, take the entire product of mills and dispose of it without the interposition of either the jobber or the commission man?—A. I think that might be true. For instance, I have noticed that John Wanamaker is handling the output of the Chickering piano factory and one or two others. There is another point—about the effect of the community of interest.

I scarcely know how to present that in a simple way. We had better start off with the idea that it is assumed that competition among railways is a benefit to commercial interests. That may have been true to some extent, but after New York has suffered so much from the competition of other trade centers, many of which had railway lines that were interested in building up these centers, we have come to the conclusion that competition is not so beneficial after all, and we look to this so-called community of interest to eliminate a great many of the complaints that we have heretofore had. And we take a broad view of it—that the interest of certain railways to their local territory will not be so great as it was heretofore; that by grouping these railways together there will probably be no such thing as a local interest to a railroad, and that, because there is no local interest to a railroad, they will not favor one point at the expense of another, and they will put them all on a basis of equality.

Q. (By Mr. RIPLEY.) Has New York suffered in the past specifically by the operation of such causes?—A. I might say that New York has been discriminated against for 20 years in the scale of rates in force east and west. Boston is in the same fix as we are in that respect. Beginning at Boston and down to Newport News, there is in existence what is known as a differential scale of rates; that is, take a common point, Chicago, the difference in the rate from Boston, New York, Philadelphia, Baltimore, and Newport News is about 2 cents per hundred pounds. I will make that specific when I get my scale of rates. That, of course, is a discrimination in

favor of the Southern ports on business originating in Chicago, or originating at the seaboard and moving to Chicago.

Q. Does that apply to west-bound business?—A. Yes; it applies east and west.

Q. Do you understand that there is a differential, then, by which New York is discriminated against in shipments to Chicago?—A. Yes.

Q. West bound as well as east bound?—A. Export and import.

Q. On through export and import rates?—A. Yes.

Q. And on business originating at New York?—A. On business originating at those points. Take the same illustration I have used, flour. Baltimore gets the flour from Minneapolis for about 5 cents per barrel less than New York gets the flour from the same point.

Q. But in the opposite direction does it cost New York more per 100 pounds in shipment of merchandise than it costs Philadelphia and other cities?—A. Yes.

Q. Is this a subject of agreement between the railroads?—A. Yes.

Q. Practically a pool?—A. Well, that went into existence before pools were ever thought of. That was a question that was submitted to arbitration at the instigation, I think, of the New York Central and Pennsylvania railroads, and a commission was appointed which consisted of Allen G. Thurman, ex-Senator Washburn, and Judge Cooley; and they investigated the question and made that recommendation, and it has been in force ever since. I think that was 20 years ago.

Q. Have the organized merchants of New York attempted at any time to induce the New York Central to break that agreement and to give them as low rates to Chicago as Baltimore and Philadelphia secure?—A. The merchants were opposed to it at first, but I think when they reflected that that condition of things was practically forced upon the New York Central to protect its earnings, they ceased to make strenuous complaint about it. It was practically a blackmailing scheme on the part of lines competing with the New York Central.

Q. By that do you mean that the railroad rates are made by the circuitous roads rather than by the most direct and best equipped ones?—A. Yes.

Q. (By Mr. LITCHMAN.) What is the rate to Boston as compared with New York?—A. Boston, I believe, takes a rate of 2 cents per 100 pounds higher than to New York.

Q. From New York?—A. Yes.

Q. Then Boston is worse off than New York in that scheme of discrimination?—A. In domestic business it is, but in export business it takes the same rate. There is a difference made there to equalize—to put Boston on the same basis as far as export.

Q. (By Mr. RIPLEY.) What is the reason of the special advantages which Baltimore and Newport News have enjoyed under this system?—A. Well, the only reason that can be assigned, perhaps, is that it represents the price of peace as among the lines to the seaboard.

Q. Have the merchants of New York any remedy to suggest for this discrimination under which they labor in competing with the Western territory?—A. The only one that we could suggest would be for the New York Central to break away from the agreement and insist that rates from these seaboard points or to and from these seaboard points should be the same.

Q. (By Mr. CLARKE.) New York merchants have the benefit of the competition of the trunk lines so far as there is competition, do they not?—A. If there was any competition we would probably get the benefit of it; but I question very much if there is any.

Q. Do not large quantities of freight to and from New York pass over the several trunk lines?—A. Yes.

Q. Do you mean to intimate or say that competition is entirely eliminated by this differential rate that has been agreed upon?—A. It has practically that effect. I am speaking now, of course, of what is publicly done. As I remarked this morning, there are some things that everybody knows, but that have not yet been proven, and I would not want to go into the question of what is not done openly.

Q. (By Mr. RIPLEY.) Have you reference to the Eastern Trunk Line Association in speaking of this agreement, or is this broader than the agreement of the Eastern Trunk Line Association?—A. No; all the roads concerned in that are members of the Trunk Line Association.

Q. Does the Eastern Trunk Line Association cover the Norfolk and Western and Chesapeake and Ohio?—A. Yes.

Q. (By Mr. FARQUHAR.) Were not these the differentials made by the arbitration board?—A. Yes.

Q. They were agreed upon by all the railroads?—A. Yes.

Q. Agreed upon by the Interstate Commerce Commission?—A. I do not know whether the Interstate Commerce Commission has indorsed that or not.

Q. That it was a fair differential at that time under the conditions?—A. At that time, yes; and I believe that the commission stated at the time they rendered the

decision that they did not expect it to be operative perpetually, that conditions might arise—

Q. (Interrupting.) Since the establishment in these Southern ports of regular lines between the United States and Europe, has not that lessened the New York trade itself?—A. Oh, most undoubtedly.

Q. Just on direct shipments?—A. Most undoubtedly.

Q. Well, have not also your terminal charges in New York had a great deal to do with the differential?—A. It is claimed that that is true. Personally I have never thought that they had much to do with it.

Q. Would not the same rule hold good of your transfer charges in New York as they would in Buffalo, in respect to diverting it by the Canadian lines?—A. Yes.

Q. In other words, do you think it is a rule of business, without any sentiment or any feeling about the thing, that commerce takes the cheapest route, as long as it is feasible and safe?—A. Commerce follows, as they say, the line of least resistance, and always will do so, I presume.

Q. (By Mr. KENNEDY.) Is there a probability that by means of this community of ownership of railroads, or consolidation, these differentials in favor of Baltimore and Newport News will be done away with?—A. There is a possibility that that will be brought about, I think.

Q. Through those means?—A. Yes.

Q. (By Mr. RIPLEY.) If this community of interest plan does not extend to all the trunk lines, but separates them into two great groups, might it not be possible that warfare of a very exaggerated sort might arise between the two giant interests?—A. I think that the method of settling those questions by so-called warfare is a thing of the past. I would rather take the other view of it. If there were two giants they would embrace each other. They would do practically what was done in the steel business. There were two strong lines there—I do not mean lines of railway now—that crossed one another, and the way out of the difficulty was to consolidate them.

Q. (By Mr. KENNEDY.) How do the merchants of New York view the railroad consolidation which is going on as affecting their interests or affecting the increase in rates that has come about in the way you describe?—A. We have never objected to direct increases in rates. We are more particularly interested in the question of having each merchant or each shipper secure the same rate, so that there shall be no advantage—there shall be no commercialism in the rate of freight. That is, difference in the rate of freight practically has the effect that a man who is securing an advantage in the rate of freight and using it in his business is simply using as capital money that rightfully belongs to the railway. He has that much added capital in his business if he has an advantage in the rate of freight, and he is getting that right out of the railroad treasury, and also at the expense of his competing merchants.

Q. Many transportation experts and some railroad presidents have said that the great cause of complaint was not that the rates were high, but that there was discrimination between individuals, etc., but now that there is stability of rates and no discrimination. We have a good deal of testimony to that effect.—A. I do not think they have exactly reached that state of perfection yet where there is no discrimination and no secret rebates; but I expect this community of interest to abolish—perhaps entirely abolish—all those practices; for, as I say, there will be no longer any reason to put out these inducements. They are bound to get the business—that is, by close community of interest they are bound to get the business. There is no reason why they should seek it or try to induce it by any secret practices; it would be against their own interests.

Q. (By Mr. RIPLEY.) Would you speak of the combination between St. Louis and Chicago and against New York as applied to the great central territory of the United States?—A. Do you mean the relative possibilities?

Q. The relative importance as distributing centers. Is New York holding its ground as a distributing center throughout the middle west as against Chicago and St. Louis?—A. I will have to say no to that question.

Q. Your protest as I understand it, representing the Merchants' Association of New York, is that the freight rates and classification recently put in force tend to hamper the extension of New York's influence in the Southern States?—A. Yes; but it likewise hampers in the same way Chicago and St. Louis; that is, this particular matter of classification.

Q. Is there then no competition as between New York and Chicago for this Southern territory?—A. Oh, yes.

Q. What form does that competition take, or what is the nature of it?—A. It is the same kind of competition that exists anywhere else. The question of transportation does not enter there.

Q. Can you ship from New York as cheap or cheaper into Atlanta as a merchant in the same line of business in Chicago?—A. If there is any advantage in the scale of rates itself, New York has it against St. Louis and Chicago.

Q. In other words, you can lay down goods in any one of the main centers of the Southern States cheaper on the basis of freight rate than the Chicago or St. Louis merchant can?—A. Yes; due to another agreement between railway lines that dates back perhaps 30 years. It was an unwritten agreement among all railroads that merchandise should enter the South from the East—that is, from her seaboard.

Q. Do you mean that it was agreed that that was the natural inlet?—A. I do not know what brought about that agreement. I only know that agreement in a general way; I can make that specific too; I have a record. The idea was to exclude the Western lines from any participation in business that moved into the South from the West. That was the general effect of the agreement. Why that was done I do not know.

Q. (By Mr. CLARKE.) Can you tell whether or not the Wabash or Illinois Central are parties to that agreement or understanding, whatever it may be?—A. They are all concerned in it. It was sort of a general agreement.

Q. (By Mr. RIPLEY.) Does that condition prevail at the present time?—A. Yes.

Q. How far would it be due to the effect of cheap water rates which New York enjoys through to Southern ports?—A. Well, if there are any cheap water rates from New York to Southern points, I am not familiar with them.

Q. Do you mean that you have no knowledge of their existence?—A. I mean that I do not think that they do exist. There is no competition between the coastwise water lines and the railroads. In fact, this very classification that we were discussing this morning, although it is designed to fit railroad conditions, applies via the steamship lines as well.

Q. (By Mr. KENNEDY.) Does the community of interest between the railroads and steamship lines bring that about?—A. It is entirely community of interest; I can say yes to that, that competition between the coastwise lines and the railroad lines is more apparent than real.

Q. The community of interest then is likely to deprive the people of the advantage of the cheaper shipment by water?—A. Yes, it will certainly do that; has done it, in fact. For instance, you would naturally suppose that the influence of the lakes was of some significance, but every merchandise line on the lakes is owned by the railroads. The same way with the Erie Canal, which runs from Buffalo to the Hudson River; there are merchandise freight lines owned by the railroads operating on the canal.

Q. You recognize, then, that it is at the present time possible to lay down goods from New York in the Southern States cheaper than it is from Chicago or St. Louis, by virtue of this agreement?—A. Yes; I said if there is any advantage east of the Mississippi we have it.

Q. Is there any recent movement of the Western lines, such as the Illinois Central and the lines from Chicago to the Ohio, intended to equalize those conditions?—A. That is a question that they can not govern for themselves. The lines east of the Mississippi in the South refuse to cooperate or prorate with the lines west of the Mississippi.

Q. How about the Illinois Central's having a continuous line from Chicago to the South coast?—A. If they attempted to take independent action, it would simply precipitate a rate war.

Q. Will you speak of the peculiar conditions which enter into commerce between New York and San Francisco—that is, transcontinental rates?—A. You refer to what is known as transcontinental freight rates?

Q. Yes; is it possible for a New York merchant to do business in California territory in competition with San Francisco?—A. Yes.

Q. Will you explain further?—A. I was going to refer to the fact that on business destined for California and the Pacific coast there is another classification in effect which is peculiar to that traffic. It is made in a different way from the Official or the Western or Southern. It is made by making groups and naming rates to cover groups rather than items—that is, rather than separate items. There has been a contention by commercial bodies of the Central West, particularly Chicago and St. Louis, that the scale of rates and also the classification in effect from Chicago and St. Louis was detrimental to their interests. Chicago and St. Louis claim that the transcontinental lines are using this same difference between the carload and less, to exclude them from the Pacific coast territory. On the other hand, the Pacific coast jobbers maintain that Chicago and St. Louis have no right to do business out in their territory, and there is a case now before the Interstate Commerce Commission in which that whole question is involved. It is of a rather complicated nature. For instance, a rate from New York to San Francisco, and from Chicago to San Francisco, is the same. Chicago claims that because she is nearer San Francisco—and St. Louis makes a similar claim—the rate to San Francisco should be relatively less than it is from New York to San Francisco.

As a matter of fact the rate from New York to San Francisco on transcontinental business is what should be properly styled a compelled rate—that is, a rate that is

not based on the cost of service rendered, or distance hauled, or anything of a similar nature. It is a compelled rate, because it is fixed by the rate by ocean from New York around Cape Horn and up to San Francisco. The correct position, from a rate point of view, of Chicago to San Francisco is in reality the rate from Chicago to New York plus the rate from New York to San Francisco. What the interests of Chicago and St. Louis seek is to have that compelled rate used as a basis and then oblige the railroads to grade the rates from the Eastern seaboard to the Pacific coast. That would bring about this result: That, instead of the rate being \$1, for instance, from both New York and San Francisco, it would under a graded system be 75 cents from Chicago to San Francisco.

Q. The rate of \$1 being fixed as a minimum on the basis of water competition?—
A. As a maximum.

Q. Does the city of Denver make a similar contention that it is entitled to still less than the Chicago-San Francisco rate?—A. Yes; there is one of the difficulties. If the principle involved in the compelled rate is not recognized and protected, and this graded system of rates is introduced, you can at once see that with the rate from New York to San Francisco of \$1 to begin with, to grade that westward you would soon reach a point, perhaps after you left Denver, where there would not be any rate to decide. You would be carrying goods for nothing.

Q. Under present conditions a jobbing merchant in Chicago can compete on even terms with one in New York in the whole California territory?—A. That is apparently true, but not wholly true for this reason. The Chicago merchant has against him the rate that it originally cost him to get his stock from the East to Chicago, which must be added to that rate which he must pay from Chicago to San Francisco. There is that much against him.

Q. You have testified that the through export rate would be almost as low to Chicago as to New York.—A. Well, on imported goods that statement which I have just made would not apply. I was speaking of a shipment originating in the East and rehandled by a Chicago man dealing in San Francisco.

Q. (By Mr. CLARKE.) Do the New York merchants generally favor the building of the Nicaragua Canal?—A. I do not think I am qualified to answer that question. I would like to explain that our association has undertaken so much that there are some matters we have been compelled to overlook. That canal question, although of very great importance, we have not had time to take up as yet; but we propose to do so.

Q. (By Mr. KENNEDY.) Do I understand you to say that you believe the inequalities and evils in the classification, from your point of view, would be cured by the combinations and consolidation of the railroads?—A. No; not the classification matter. They seem in that respect to have adopted a new system of advancing rates. We do not know that they are going to continue to do it, but they have the opportunity to do if they desire. There is not anything to restrain them.

Q. What is it that will be cured by consolidation?—A. Other practices. For instance, rebates or discriminations of other nature, particularly in the matter of scaling rates.

Q. You said this morning, I believe, that these discriminations which were effected by the advances in classifications were practically rebates, did you not?—A. I do not want to be understood in just that way. The idea I wish to convey was that by manipulating the classification there was an opportunity to accomplish the same thing as is accomplished by rebates.

Q. You spoke this morning about some classes of articles that were not discriminated against in these recent changes in classifications and mentioned paper as one.—
A. Yes.

Q. Do you attribute that to the influence of the paper trust, or to a fear of the influence of the newspapers in case paper was advanced?—A. No; that was merely an assumption on my part that that was done. I arrived at that by checking from the list when the advances were made, and I was very much surprised to find that a good many of these articles that are controlled by these combinations were not disturbed; and naturally the question arose in my mind as to why that should be, and the answer suggested itself.

Q. (By Mr. RIPLEY.) I would like to ask whether there is any complaint about the regulations as to the style of package, as to the make-up of freight in these different classifications?—A. Yes.

Q. Has the Interstate Commerce Commission any power whatever to prescribe such regulations as those of which you speak? Has it any supervision over classification or the detailed regulations for shipment of freight, or in this matter are you entirely at the mercy of the railroad?—A. Entirely so. Referring to that style of package again. The Southern classification has a clause to this effect: "Property presented to carriers packed in so-called boxes or cases made from strawboard, leatherboard, wood-pulp fiber, wire-split wood, and other analogous material included in wooden frames, will be charged 10 per cent higher than the classification provided for such property in boxes or cases."

To illustrate that: A fiber box has a frame, or more correctly speaking, a crate, made of strips of wood to form the corners, and instead of wooden boards for the sides and bottom and ends and top, they use this fiber board which produces a case weighing very little, and which is quite strong and waterproof. Naturally it is light in weight, and being light in weight makes a shipment made in that style of case weigh less than one shipped in a wooden box. The railroad loses the freight on that extra weight, and in order to restrict the use of these fiber cases which are used by milliners and merchants who ship the finer styles of dry goods, they make this discrimination, and charge 10 per cent higher rate on all freight shipped in these boxes.

Q. Is there a similar complaint respecting discrimination as between barrels and boxes, or other arbitrary distinctions made by railroads against which the shippers have no remedy?—A. Yes; in hardware there are instances in which they charge a higher rate for goods packed in boxes than in barrels. The railroads explain that by claiming that the shippers will put goods in boxes—particularly hardware, and if it is a high class hardware they will call it low class hardware, and thereby get a lower rate of freight.

Q. The point I wish to bring out is simply this: Would the merchants welcome some extension of the powers of the Interstate Commerce Commission which would enable them to pass on the reasonableness of such regulations as these, or such regulations as those of which the ones you mention are typical?—A. Yes; it seems to us that, in the absence of the privilege of representation by shippers on these classification committees, there should be at least a power lodged somewhere that could take up questions of this nature, and determine what is reasonable and what is just. It is entirely optional with the railroads now, however strong or meritorious your case may be, whether they will pay any attention to it or not. Take this same southern classification committee. They have had arguments presented to them that we think ought to convince anybody, and they do not make any response.

So far as our views in relation to that question are concerned, I would like to read an extract from a statement I made at the commerce convention in St. Louis. We have taken this position, briefly stated: (1) "That the Interstate Commerce Commission should consist of at least 8 members, among whom shall be lawyers, railroad experts, and representatives of the shipping public; (2) that the commissioners should be appointed to hold office during good behavior, as in the case of the United States Supreme Court; (3) that common carriers should be given the right to enter into agreements, approved by the commission, in respect to interstate commerce only for the purpose of carrying into effect the provisions of the act." That was in connection with the effort that was made to pass what is known as Senate bill 1439, known as the Cullom bill.

Q. (By Mr. KENNEDY.) There is a probability that there will be such a community of ownership of railroads that there will be nobody to enter into an agreement—it will be all under one head?—A. Yes; that is a possibility.

Q. There would be no use for such a provision as the third one read, then. I want to ask you if your people have any complaints to make against the commodity rates of the railroads?—A. None of our members have as yet asked us to make any complaint. The commodity rates, I may say, are very low. I have never known of a case where it has been necessary to complain of them. At times they discontinue some of them, and you may then hear some complaints seeking their reestablishment. But, generally speaking, I am not familiar with any complaints made of commodity rates. I might add to that the statement that these commodities are, most of them, controlled by combinations—industrial or trade combinations.

Q. (By Mr. RIPLEY.) The whole question of classification of all the higher classes applies primarily to the small shipper?—A. Yes; the small shipper is the one who is suffering and the one who is being pinched by these advances in classification.

Q. (By Mr. A. L. HARRIS.) I have a few questions I would like to ask that have been partially covered. You stated this morning that the net receipts from the Southern territory had increased about 20 per cent, as I understood it?—A. Yes.

Q. Can you give the per cent of increase of net earnings in the Trunk Line territory?—A. I have that information [addressing Mr. A. L. Harris]. I will not be positive, but I think it is somewhere in the neighborhood of 30 per cent.

Q. Can you give it for the Western territory?—A. I have not as yet seen any figures on that.

Q. By this reclassification in the different territories, can you even approximate the increase in freight rates?—A. I covered that this morning, I think.

Q. In all the territory?—A. I think I gave the per cent in each.

Q. You gave the per cent of articles that were reclassified.—A. I will give that again for your information. The official classification committee on January 1, 1900, advanced in class 818 articles on the merchandise list, in which there are a few over 3,000. These advances, taking the scale of rates from New York to Chicago as a basis, I may say it is a physical impossibility to ascertain what the advance might

be from all points to all points upon all classes for all distances; so for that reason I have endeavored to get at it by selecting the New York-Chicago rate as a basis. The advance was 35.5 per cent.

Q. You have given that for each one of the 3 divisions that you named this morning?—A. Yes.

Q. Now that was done not by increased freight rates, but by change in classification?—A. By change in the classification entirely.

Q. Would there not have been more complaint made if they had allowed the classification to remain, and had changed the scale of rates?—A. I think not.

Q. There would have been no objection?—A. Not the same objection, because if you advance the scale you assess the advance on the entire value of the traffic moving; by the other method you can advance the rates on just a portion of the traffic. This method exempts the commodities from any advance, because the commodity rates are not covered by the classification at all; they are separate and distinct from the classification.

Q. Now you spoke of the Cullom bill, approving its general provisions. If the railroads agree upon a classification in these different territories, would there not be some protection in having somebody like the Interstate Commerce Commission authorized to approve that classification and not permitting it to be changed for a certain period of time?—A. Yes.

Q. Would that steady conditions to some extent?—A. It would.

Q. Can you see any objection to that on the part of the railroads after they have made their own classification?—A. I can not; no. In protesting before the official classification committee in January, 1900, I called their attention to the fact that their classification had been in existence then 13 years, from 1887 to 1900. It had been established by a committee of experts who naturally would be supposed to sift every item that was brought before them for classification, and I put it to them this way: "If you insist upon these advances, you must either admit that your experts did not know their business, or you must defend the charge of being arbitrary in your advance." Now, for 13 years practically the same men had handled classification matters for them, had adjusted all these matters. Then, all of a sudden, they reached the conclusion that everything they had done had been wrong, and they revised it in a wholesale way. We can not understand why it is that a classification after it is once established is not as permanent as any other standard of measurement. It is a standard of measurement after all.

Q. You spoke of the consolidation, of community of interest of railroads. Does that relieve the general public from the need of protection through some body like the Interstate Commerce Commission?—A. Not necessarily so.

Q. Would a body like the Interstate Commerce Commission, constituted as you have defined in your paper, be more or less needed as the railroads became consolidated?—A. I am inclined to believe it would be less needed in this way, that there would not be so many complaints, perhaps, but the complaints that were made would be just as important.

Q. Wherein would the general public be protected?—A. By this community of interest. They would be only protected by the elimination of competition, which I regard as a dangerous thing in transportation matters.

Q. The elimination of competition is dangerous?—A. No. I say competition itself in transportation matters is, to my mind, a dangerous thing. This community of interest would eliminate that competition by grouping the roads together, and practically making one family of them all.

Q. Are you of the opinion with the common carriers of the country that nobody should have any control over them?—A. No. I think they should have.

Q. As competition is being eliminated, does the importance of some controlling power become greater or less?—A. Well, I think the necessity for control would still be there. As I have stated, the Interstate Commerce Commission might not have so many complaints presented to them, but those they did have would be just as vital; and it is important that a supervising power should be lodged in somebody, not leaving it entirely to the railroads to exercise their own will.

Q. Is the existing power of the Interstate Commerce Commission satisfactory to the general shipper?—A. No. They do not seem to be able to enforce their orders.

Q. Why is it that they are not able to enforce their orders?—A. Well, there is a legal point involved there that I am not familiar with.

Q. Does the law give the power? Is it the fault of the Interstate Commerce Commission?—A. It is the fault of the law itself. The law is vague and indefinite.

Q. Has the Interstate Commerce Commission as much power now as it had when it was first organized?—A. I think not. I think the Supreme Court has curtailed its power to some extent.

Q. Is there any encouragement at the present time for the shipper who feels that he has been discriminated against or injured to file a complaint before the Interstate Commerce Commission?—A. No; not the slightest. They simply regard the Interstate Commerce Commission about the same way as you look upon a sifter—that

they sift these matters and arrive at certain conclusions, and that is all they can do. Their order practically amounts to a recommendation; that is as far as I can say.

Q. You would enlarge the members of the Interstate Commerce Commission so as to take in the various industries so that they would be able—A. (Interrupting.) We had thought that over and it seemed to us that if it was made too large they never would be able to accomplish much. There would be too many conflicting interests. For that reason we cut it down to 8 members—some lawyers, some railroad men, and some shippers.

Q. Would you compel the carrier complained of to come in and make his defense before the Interstate Commerce Commission?—A. I should think so. For instance, when they take an action similar to that taken by these classification committees I think they should be compelled to present some reasons and defend their course.

Q. What is the practice now with the carrier complained of? Does he make any defense before the Interstate Commerce Commission, as a rule?—A. Oh, yes; he is represented by counsel, and they plead, in a way, about the same as they do in the courts.

Q. Now, when a finding is made by the Interstate Commerce Commission, how soon is that executed?—A. That I can not answer. I do not remember as to whether the law is specific in that respect or not.

Q. Is it or is it not a fact that years frequently intervene before there is a final hearing and decree?—A. Yes; they have on their docket numerous cases that they have never reached as yet, and some of them have been pending for years.

Q. What effect does that have on the complainant? Is it any encouragement to him to pursue a line laid down by the interstate-commerce law?—A. Not the slightest.

Q. (By Mr. CLARKE.) Is the delay of which you complain regarded as the fault of the law or the fault of the commission?—A. I do not know that any fault in the law could keep them from rendering a decision.

Q. (By Mr. A. L. HARRIS.) Is the delay caused by the Interstate Commerce Commission or is it caused by the circuit court?—A. There may be various causes why they do not operate more quickly. Take, for instance, that transcontinental case which is before them, and has been before them for, I think, a year or two. That is a very much-involved subject. If the commission decides that the grounds taken by St. Louis and Chicago interests are good and sufficient, and decides in their favor, it would practically amount to a readjustment of rates almost the world over. Naturally, with a question like that before them they are excusable for being slow.

Q. Would you have a provision in the law to advance cases taken to the United States circuit court on the docket so they could be tried within a reasonable time?—A. Yes.

Q. Would you be willing to give to the Interstate Commerce Commission jurisdiction to permit their finding or judgment to go into effect at once, subject to appeal to the circuit court?—A. If it would be of interest, I have a statement here that covers a good many of these points, and if there is no objection I will read it.

Q. I would like to hear it, so far as I am concerned.—A. This was before the Interstate Commerce Law Convention, held at the Planters' Hotel, St. Louis, called for the purpose of taking action to secure the enactment of Senate bill 1439, known as the Cullom bill, which was on the calendar of the United States Senate at its last session.

(Reading:) "In representing The Merchants' Association of New York I desire to state that there are some matters connected with the measure now under consideration that we felt should be further discussed; or, to put it in another way, we think that the bill pending before Congress should be amended so as to embrace some features we have in mind.

"So far as the bill in its details is concerned, our association has already put itself on record before the Interstate Commerce Committee of the United States Senate. This position was set forth by me, under instructions from our officers, when I had the honor to appear before that committee last spring. It was then stated that we were convinced of the necessity of amending the 'Act to regulate commerce' in such manner as would remove defects therein which the test of 13 years' experience in the practical application of the present form of the law had developed. It still seems to us that the proposed measure, with the changes I am about to indicate, will effectively strengthen the weaknesses that have been made apparent. But, on the other hand, we are convinced that in the criticism that has been aroused against, and in the arguments that have been filed in opposition to, the adoption of the proposed measure as it now stands, there are some features which are of sufficient merit to indefinitely postpone its enactment, or possibly to accomplish its ultimate defeat.

"It will not be denied that the proposed amendment imposes upon the commission vast responsibilities and duties involving matters of grave importance, and in amending the law this should not, in our opinion, be lost sight of. In the judgment of those

I represent, the Interstate Commerce Commission should be removed from all suspicion of political influence, so far as that is possible, in its make-up and in its life, so that in the eyes of the public it may stand upon a plane similar to that occupied by the Supreme Court of the United States. If it is to make decisions on the intricate and far-reaching questions which are to come before it under the enlarged powers which it is proposed to give this commission in this bill, conservative people would feel far safer if they knew that the commission was removed from politics and all political influences.

"I do not mean to imply by this hint that the present body is susceptible to political influences, but in the very nature of things such influences are almost certain to have weight in the determination of questions, unless its members feel that they do not owe their existence or continuance in office to any political backing, or are to be plunged into the midst of political agitations for the purpose of holding themselves in power.

"In fact, I think we ought to go a step farther in amending this bill and provide that the number of commissioners shall be increased so as to include among them, first, men trained in railway freight management, and, second, men who are thoroughly familiar with commercial affairs, who could act as advisers in the practical and technical questions which are sure to come before them.

"The adjustment of rates in interstate commerce is a delicate task, involving intricate questions. While, undoubtedly, an administrative body of proper jurisdiction may determine principles which are supposed to underlie matters of this sort, yet, in deciding the proper application of those principles and the equitable-ness or reasonableness of rates under the complex conditions existing in this country, there ought to be among the members of that body those who have made a study of the subject in all its involved ramifications.

"I think you will find, as this question is agitated in the public press and elsewhere, that the principal opposition from conservative people, and the principal opposition as heretofore expressed by the representatives of the railroad corporations, against giving to the Interstate Commerce Commission the enlarged powers proposed in this bill arises from the fear that the questions of great import to be decided will be passed upon by men not trained to regard the subject from other than elementary, purely legal, or political standpoints.

"Briefly stated, we believe—

"1. That the Interstate Commerce Commission should consist of at least 8 members, among whom shall be lawyers, railroad experts, and representatives of the shipping public.

"2. That the commissioners should be appointed to hold office during good behavior, as in the case of the United States Supreme Court.

"3. That common carriers should be given the right to enter into agreements, approved by the commission, in respect to interstate commerce, only for the purpose of carrying into effect the provisions of the act.

"Our reasons for the first two propositions have been set forth above. With respect to the third, we may say that aside from the fact that it is our belief that no amendatory legislation can be passed unless this feature is included, we are convinced that the changes in business methods and conditions which have been wrought by the consolidation of industrial, manufacturing, and business interests make this privilege essential to the successful administration of the act. The foundation for this belief is the thought that powerful corporations which have in the past become accustomed to ignore the law when they felt that its strict observance by them was detrimental to their interests, will continue to find secret and illegal ways and means to compete for the large volume of traffic controlled by commercial combinations, notwithstanding the stringency of any laws that may be passed. Legalized right of contract among carriers will, we feel, minimize the incentive to practice illegal acts and bring to the aid of the commission, in the discharge of its important functions, that degree of cooperation on the part of railway managers that heretofore has been so necessary, but at the same time is so conspicuously absent. It also removes the objection that the proposed legislation is solely in the interest of shippers.

"By adopting these suggestions and making the changes in the bill outlined above, it seems to us that the principal points of the opposition heretofore strenuously made by the representatives of the railroad corporations to this measure, and the opposition in the minds of conservative people, now raised and which will be raised in the future by agitation on this subject in the press, will be eliminated. That, too, at no sacrifice whatever of the object which you are desirous of and striving to attain, namely, an equitable adjustment of maintained and reasonable rates throughout the United States.

"In conclusion, I am authorized to say that if it shall prove that the interstate-commerce law can not be amended in a manner that will assure its successful administration, we shall energetically labor for its repeal and a return to the condition existing prior to 1887, from which the entire subject can be opened up anew under the changed conditions now existing in the country.

"The law in its present form, as construed and applied, is a conspicuous failure. Ineffectual attempts to administer it result not only in the useless waste of at least \$250,000 public funds per annum, but it is continually used as a screen to conceal the very practices it was designed to prevent. It serves to operate as an inducement to secret bargains and agreements, and encourages a growing indifference to the majesty of the law, which the interests of the business public demand shall be checked. This can best be accomplished by wiping it out of existence."

Q. (By Mr. A. L. HARRIS.) One thing more: As the railroads become more and more consolidated, will not that to some extent simplify the objection to fixing rates by these large corporations to be approved by the Interstate Commerce Commission?—A. Yes.

Q. And in that way, at least, will aid in simplifying the work of the Interstate Commerce Commission, properly organized?—A. Undoubtedly.

Q. And will not the people be greatly protected, or feel, at least, that they are greatly protected, if the Interstate Commerce Commission is reorganized on the plan that you have outlined?—A. Yes.

Q. (By Mr. KENNEDY.) What do you mean by approving the rates? Do you mean that the Interstate Commerce Commission might not have such an intimate knowledge of the rate question as to be able to intelligently pass upon all the rates?—A. Yes; that is absolutely essential. The commission must have some knowledge of the subject, otherwise they can not say what is reasonable. A man must have some knowledge of a subject or he can not see a fact when it is right before him. This subject of classification is one of the most complex subjects that there is on the face of the earth to-day. It does not respond to logic or mathematics or any other treatment. It is a separate and distinct study.

Q. Do not some railroad people contend that it is impossible to set up a body of Government commissioners who can pass upon the rates, or practically make the rates?—A. Yes; and they are right in that.

Q. They are correct in that?—A. Yes.

Q. (By Mr. A. L. HARRIS.) But suppose the Interstate Commerce Commission has a life tenure or long tenure?—A. Take, for instance, the present commission. They have now had 13 years' experience. They ought to be educated up to the point where they are quite expert in these matters.

Q. (By Mr. KENNEDY.) Practical railroad?—A. No; not railroad, but the rate questions. I must say I sympathize with these people—these traffic managers. Anybody who has had any experience with the business knows just what a difficult undertaking it is to handle a railroad properly from the rate point of view. We do not take the position that all traffic managers are corrupt. Some of them mean to do just as correctly as may be possible, but it is quite often the case that their hands are tied. They can not do what they want to do and what they think is right, because of the existence of conditions over which they have no control whatever. Now, it is that training that the men should have who possess the rate-making power. There should be railroad men on the commission—not entirely railroad men, but enough there to assist the others in arriving at conclusions.

Q. I heard one railroad man say that there were hundreds of thousands of different rates, and it would defy any body of men to get together and be able to pass on that intelligently.—A. Yes; that is all true.

Q. Do you not think the better way would be to let the railroads make the rates and then let the Interstate Commerce Commission have the power to simply change them when they were found on complaint to be unjust?—A. That is practically the rate-making power. If you have the power to change the rate, it is practically the rate-making power. I would not want to have the power to make the rates taken entirely away from the railroad.

Q. (By Mr. A. L. HARRIS.) The Cullom bill does not provide that.—A. No.

Q. (By Mr. KENNEDY.) I suppose you know what a certain railroad president said in New York—that he would rather have a place on the Interstate Commerce Commission, if he was venal and inclined to make money, than to have a free license to loot the United States Treasury?—A. Well, he might with just as good grace have made the same remark of the Supreme Court. We have to trust somebody. I do not see why a man can not be just as honest on the Interstate Commerce Commission as he can sitting on the Supreme bench.

Q. (By Mr. CLARKE.) However great may be the intelligence or expert knowledge of the members of the commission, still you would not have them decide a question without hearing evidence, would you?—A. No.

Q. Then practically the commission becomes a judicial body, does it not?—A. Yes.

Q. You consider that the decisions of the Supreme Court of the United States on a question appealed to it from findings below should be respected, even though the members of that great tribunal may not be expert in their knowledge of the questions involved in the case; therefore, if the Interstate Commerce Commission have

the power to fix rates, is it not more important that it be composed of gentlemen of good judicial minds than of men who may have had some service as freight clerks?—A. Well, I think a judicious mixture of both is the proper thing. I would not question a decision or ruling of the Supreme Court on ordinary matters, but I do know that in this particular question it is hard to get at the facts and give them in such a way that they will be understood by a person who has not had actual contact and actual experience. For instance, I have frequently talked with gentlemen who were as brilliant and brainy as they could be on other subjects, and they would not understand what I was talking about at all.

Q. I have not yet heard you answer Governor Harris's question as to whether or not you would give the Interstate Commerce Commission power to fix rates, and have it provided by law that those rates should go into effect even though appealed from by the railways.—A. I do not know any other way than that of accomplishing the thing in view, which is that there must somewhere be lodged power to do the thing that you want to have done. Now, leave it the other way. If a commission appointed to take charge of matters of this kind and of this importance can only go up to a certain point, and when the time for action comes they can not go beyond that point, I do not see the use for their existence at all. If they can only recommend, they can not produce results.

Q. What is the universal effect of an appeal in law?—A. That I can not answer; I am not lawyer enough.

Q. Does it not vacate a judgment or suspend its operation until final judgment is given by the appellate tribunal? In practice, if a different rule were to be adopted, would not inextricable confusion result?—A. It might in other matters; but, as I have stated, I am not one of those who would like to see the power to make rates taken away from the railroads themselves; but there must be a governing body somewhere.

Q. If you give the Interstate Commerce Commission power to disapprove a rate agreed upon by the railroads, do you not thereby give them power to fix the rate?—A. That depends upon the strength of that disapproval—the conditions under which that power to approve or disapprove is given.

Q. You say you wish to increase their power?—A. Yes.

Q. If the railroads agree upon rates which are satisfactory to everybody, there is no need for the commission to have anything to do with it, is there?—A. That is true.

Q. Then your desire is to give them power to disapprove a rate and prevent it from going into operation, is it not?—A. Yes.

Q. In practice, therefore, would not that give them power to fix the rate?—A. It would be equivalent to the power to fix rates.

Q. Suppose they fixed a rate and the railroad people appealed, and then in 6 months the appellate tribunal reversed the decision of the Interstate Commerce Commission disestablishing that rate; then the railroad companies would have to make the rates themselves, would they not?—A. Yes.

Q. Would not the conferring of that power on the Interstate Commerce Commission result in very great confusion in rates and in the business of merchants with railroads?—A. You mean if the case was decided against the railroads and appealed by the railroads?

Q. Certainly.—A. The appeal, as I understand it, operates to set aside the decision. Would not that leave it on the basis upon which it began? Would not the rate complained of then be in effect just the same as if there had been no action brought before the commission?

Our reason for desiring to put more power in the hands of the commission is this: It is a well-known fact that if the railroad takes action they might carry that out as soon as possible. If a shipper feels himself aggrieved and presents the matter before the commission and secures a judgment, the next thing they can look for is an appeal by the railroad, and the railroad can afford to spend \$20,000 or \$30,000 for the cost of legal action, but there are not many shippers who can do that, and it is through abuse of those privileges that this question has been brought to the position it is now in. We had a case against the express companies. It cost us \$30,000 before we got through with it; it went right up to the Supreme Court.

Q. The point I wish you to be very clear upon is whether putting a decision of the Interstate Commerce Commission into immediate effect, notwithstanding it may be appealed from, would not induce great confusion?—A. Not necessarily so; no.

Q. Supposing the whole thing were reversed in a very short time—now, you have been pleading for steadiness of rates?—A. Yes.

Q. Would this induce steadiness?—A. I can't see why it would not. It is not fair to assume that a body as dignified as that is would trifle with a question and jump in and begin slashing right and left, simply because it had the power to do it. I do not think that is a reasonable expectation. They would be just as cautious as could be expected. I think that is one of the difficulties. It seems too often to be assumed

if you give a commission the power they seek they are immediately going to run away with it. I don't look for anything of that sort.

Q. Wholly irrespective of whether the commission will be better than the law, do you think it would be a wise law to authorize the immediate execution of a judgment which can be appealed from?—A. That is another legal question that I am not qualified to deal with.

(Testimony closed.)

SUPPLEMENTARY STATEMENT OF PROF. FRANK PARSONS,

President of the National Public Ownership League.

As the vice-president of the Western Union and the general manager of the New York Telephone Company have referred to parts of my testimony in criticism, questioned my sources of information in relation to two of the facts cited by me, and misunderstood my position in some respects, I trust it may be deemed proper for me to make some explanation and suggestive comment in the interests of thorough understanding.

Remarks were made by the general manager (somewhat modified in his revised testimony) tending to throw discredit on my sources of information in respect to two cases without inquiring what those sources were. In fact, they were of the highest character in both instances. I got the data relating to the Cooperative Telephone Company of Grand Rapids, Wis., from Mr. John A. Gaynor, the first president of the company, a man of excellent repute and thoroughly familiar with the facts. At the time of my testimony I held in my hand a letter from Mr. Gaynor, written a few days before, and from that letter I took the facts about lines, cost of construction and operation, net charges, etc., that I gave the commission. The facts about the Government telephones I obtained directly from the books of the Department by a personal visit to the Patent Office building in 1896. The general manager said he thought it perfectly safe to say that the expenses of a man to attend to the maintenance of the plant were not included in the \$10.25 total cost per phone. The fact is, however, that one of the items in the Government account was \$300 a year for the services of an expert electrician under contract to attend to the maintenance of the plant, which duty took only a part of his time. The general manager's statement as to the use I made of the Government data is also incorrect, as may be seen by examining my testimony. I used the data to show that the Bell Company was wrong in that case in its refusal to reduce rates, wherefore it may be mistaken in other cases as to the practicability of low rates. At the time of my testimony I did not know that the Department exchange had been given up, but on inquiry I find that it has; that the installation was not satisfactory (a thing that has happened many times in private systems also), that a wider service was needed, and that the Bell folks withdrew their refusal to make reasonable rates to the Department and now supply such wider service, long-distance facilities, and all, at rates that come down close to the cost under the Department system with its comparatively narrow service—all the way down, perhaps, considering the additional facilities now enjoyed.

The statement I made about the wages of telephone girls related to the general situation in this country, and is not met by a comparison of foreign wages with those in New York City, one of the highest wage centers in the United States. I am informed on high authority (that of a leading telephone official) that in the smaller places the companies pay many of their telephone girls only \$10 and \$12 a month, \$16 being considered good pay. Compare what the general manager says about wages of telephone operators in France and Switzerland.

My position on the flat-rate question was misunderstood. I believe in the measured service plan for large places, but think the double flat rate (residence and business) simpler and better for small exchanges. If the message charge is carried too far it limits communication where no end is gained by the limitation, as well as where limitation is useful.

The general manager's data of telephone development are of great interest, but the comparisons made do not have the bearing impliedly given them in reference to the influence of public and private ownership on telephone development, because of the mixture of other causes, and because of the selection of American cities entirely from the list of those most highly developed. That New York City has 26 telephones per 1,000 people while Paris has 13 per 1,000 proves nothing as to public ownership, because there is even a greater difference in favor of New York in respect to transit and other interests which are private in both cities. Moreover, the heart of New York (Manhattan and Bronx) is selected for comparison with Paris instead of taking the whole city, Greater New York. It would be fairer to compare London's 7 telephones per 1,000 people, under private ownership, with the 13 per 1,000 in the public

system of Paris, for general conditions are more similar in London and Paris than in New York and Paris. It should be noted also that the 7 per 1,000 of the private system in London, and the low development in Warsaw and Moscow and other half civilized places are among the principal factors in pulling down the average of the European cities dealt with by Mr. Bethell. Instead of comparing the 26 telephones per 1,000 of population in the heart of New York with the 25 per 1,000 in the whole of Berlin, why not compare Greater New York's 20 per 1,000, or Brooklyn's 11 per 1,000, or Philadelphia's 16 telephones per 1,000, or St. Louis's 17, or Washington's 14 per 1,000 with Berlin's 25 per 1,000? With smaller places, Larchmont's 180 phones per 1,000 people is contrasted with Trondhjem's 38 per 1,000, but it is not explained that Larchmont is a gilt-edged residence town filled with wealthy New Yorkers, while Trondhjem is a city of more than 30,000 with the various classes of people in ordinary proportions. It would be fairer to contrast the 6 telephones per 1,000 in the Bell system in Chester, Pa. (34,000 population), or the 10 per 1,000 in Camden, or the 19 per 1,000 in Trenton, N. J., or the 14 per 1,000 in Wilmington, Del.

If a city of low general condition shows a higher telephone development than another city that is in general more civilized and progressive, then some valid inference may be drawn as to the effect of differences in rates and management. But if the more civilized and progressive city has the higher telephone development, that is what might be expected even in spite of overcharges. The truest comparison is between public and private ownership in the same place, and Mr. Bethell's statements about Stockholm¹ and the movement from private to public telephone systems in Amsterdam, Denmark, Sweden, Austria, Switzerland, France, and England are of the deepest moment.

In view of the importance of the subject of telephone development, and the fact that the true test of it is not the phonage of a few of the most progressive cities but the average development throughout the country, I have drawn up a comparison which includes a number of other places besides those mentioned by Mr. Bethell. It would be desirable if still more numerous comparisons might be made, and the data for 1880 included as well as those for 1900.

	Population, 1900.	Rates.	Telephones per 1,000 inhabit- ants, Jan., 1901.
New York City (proper)	2,050,000	\$60 to \$240	26
Berlin*	1,884,000	16 to 45	25+
Paris*	2,540,000	80 (60 new).	13
London	5,631,000	60 and 100	7
Manchester, England	544,902		19.6
Amsterdam,* Holland	513,000	\$36 and \$46	8.7
Boston	560,000		42.3
Vienna,* Austria	1,635,000	\$40	8
Budapest,* Hungary	729,000		8—
Brussels,* Belgium	560,000	\$50 and \$70	8+
Antwerp,* Belgium	278,000	50 and 70	10
Zurich,* Switzerland	152,000	10 to 160	40
Louisville, Ky	204,000		25
Trondhjem,* Norway	30,000	\$8 to \$16‡	38
Copenhagen, Denmark	312,859	27 and 48	49
San Francisco	342,782		62
Stockholm,* Sweden	320,000	\$13 to \$27	69

* The places marked with a star have public systems, Stockholm having also a private company in competition with the Government exchange.

The data down to and including Larchmont are simply a tabulation of the principal facts given in the general manager's testimony, except the rates in Trondhjem and the population of Berlin, which he did not state, merely saying that it was about the same as New York. The exact figures, however, for 1900, as given in the Statesman's Year Book, show a difference of 166,600. The last 5 ratios of the table are probably too high, since the telephone stations are taken from the June book, 1901, while the population data are from the census a year before. The difference in most cases is only 6 months, as in Mr. Bethell's data.

¹ When the Government entered the field in Stockholm, Mr. Cederger, manager of the private company, had 5,000 subscribers, and was running along with single overhead wires. The Government started by bringing rates down from \$22 and \$28 to \$16.50 and \$22, putting in metallic wires against single wires, underground against overhead wherever possible, direct connection with long-distance trunks, and free connection with all places within a radius of 43 miles. The company met the competition nobly, gave free service within 43 miles, put in metallic circuits, so that in 1894 there was not a single wire circuit left in Stockholm; and, with the aid of their big start of 5,000 subscribers, the genius of Mr. Cederger, one of the leading telephonists of Europe, the wealth of the owner who could get along whether he got any profit or not, and the aid of the municipality, which took sides with the company against the State, the private exchange has been able to keep ahead of the Government exchange in its membership; but it is clear that the impulse for development came from the Government and not from the company, as Mr. Bethell indicates. (See pp. 335-336, Telephone Systems of the Continent, by A. R. Bennett, a leading English expert and former general manager of the Mutual Telephone Company, of Manchester, England.)

	Population. 1900.	Rates.	Telephones per 1,000 inhabit- ants, Jan., 1901.
Larchmont			180
Chester, Pa.	34,000		8 +
Philadelphia	1,293,697		16
Washington	278,718		14
Wilmington	76,500		14 +
Trenton	73,300		19 +
Camden	76,000		10
Newark	216,000	\$60 to \$150	17
Providence	175,597	78 to 120	38
Rochester*	162,600	36 to 48	25
Indianapolis*	170,000	24 to 42	47
St. Louis*	575,200	36 to 60	17
Toledo	131,627	54 to 72	24
Detroit	285,700	24 to 72	24
Buffalo	352,380	36 up.	17.7
Springfield, Mass.	62,500	72 to 93	41
Baltimore (2 companies)	500,000	60 to 125 ↑ 36 to 48	16
Cincinnati	325,900	60 to 150	36
Harrisburg	50,000	48 to 80	22
Greater New York	3,437,000		20
Brooklyn	1,166,582		11
Richmond Borough	67,021		18
New Brunswick	20,000		22
Jersey City	206,000		10

* Means independent company with a Bell Company also in the field. All the telephone stations of both companies are included in estimating the number of telephones per 1,000 of population, but the rates given are those of the independent companies, as the lower rate schedule ought to govern development where it has once secured a strong exchange.

It is clear, even from this little table, that other causes than the system of ownership are vigorously at work. The variations between 6 telephones per 1,000 of population in Chester and 7 in London to 62 in San Francisco and 180 in Larchmont, all under private ownership, are much greater than the difference between the public group and the private group.

On page 801 of his revised testimony Mr. Bethell says: "January 1, 1901, London, with a population of 5,633,000, had 41,111 telephones; that is, 7 per thousand. * * * Among European cities of its class London's development is exceeded only by that of Berlin." This is clearly incorrect, for, on the general manager's own data, London has less development than Vienna and only about half that of Paris. In fact the private system in London has a lower development than any public system in any city of its class (over 1,000,000) for which Mr. Bethell presents the figures—a lower development than any system, public or private, in any civilized city of 500,000 or more for which I have the data.

I have taken Mr. Bethell's estimate of "54,647 stations" for New York (Manhattan and Bronx), or "26 per thousand;" have used that estimate also in figuring the telephone development of Greater New York, and have shown that Mr. Bethell's case is not good, even on his own data. It must be noted, however, that these figures and Mr. Bethell's estimate of \$85 as the average rate are not the fair data for New York in comparing it with European cities, for the reason that these data are based on figures which include the telephones in the private branch exchanges in New York. Most of these private telephones are for communication between different parts of the same establishment, and are used little or none in connection with the city telephone system. These branch phones are very numerous in New York, but are not much in use in European cities. The number of stations in New York exceeds the number of lines connecting such stations by about 42 per cent, while in European cities the number of stations substantially represents the number of lines in connection with the city exchanges. The number of lines in New York January 1, 1901, was about 31,750, or 15 to 16 per thousand of population. President Thomas, of the Independent Telephone Association of the United States, to whom I am indebted for these facts, tells me that 15 telephones per thousand is about the fair figure for New York in comparison with Berlin's 25 per thousand. Some of the branch phones, however, are used in connection with the city exchanges, and New York, moreover, is entitled to some credit even for private phones; wherefore I think the fairest comparison probably lies between Mr. Bethell's figures and those of President Thomas—18 or 20 per thousand for New York, perhaps, and 16 for Greater New York. Similar considerations apply to Mr. Bethell's comparisons of European cities with Boston, San Francisco, etc.

The \$85 average rate is the average for all the stations, including the private branch phones, for many of which the company receives only \$8 and \$12 a year, as Mr. Bethell has himself informed us, while the European rates with which it is contrasted are rates for direct-line service. President Thomas says that the average rate in New York, on the basis of direct service, is \$183. "From the records of the New York Telephone Company (Mr. Bethell's company), we find that the average number of calls per subscriber's line per day is 10.6. Assuming that the average user has 10 calls for each working day, he will use 3,000 calls per year, the rate for which, according to the schedule of the New Telephone Company, direct-line basis, is \$183 per year."

Mr. Clark began with a statement which shows an entire misapprehension of my testimony. He says the evidence given the commission in favor of the public ownership of the telegraph was chiefly based on the conditions of the telegraph in Great Britain, Switzerland, and Belgium, and proceeds to point out the disparity of conditions as to population, wires, wages, distances, etc. In fact, however, the said evidence was chiefly based on the broad principle that the fundamental test of any system is its effect on character, justice, government, civilization—the human effects being far more important than any material considerations—and upon the broad facts: (1) That a normal public plant aims at service and benefit for all, while a private monopoly aims at dividends or profit for a few; (2) that public ownership tends to superior harmony of interest and fuller cooperation, removing the vital antagonism of interest that private monopoly creates between the owners and the public and transferring the interest of wealthy and influential men to the side of good government and honest administration; (3) that private monopoly means congestion of power and benefit, while public ownership favors diffusion of power and wealth and service; (4) that private monopoly means taxation without representation, with power to make and unmake the fortunes of individuals, cities, States, and nations—sovereign power in private hands; (5) that in the same country, and under similar conditions, otherwise than as to ownership, the change from private to public ownership has resulted in superior service, lower rates, better treatment of employees, less corruption of government, improved citizenship, nobler manhood, and higher civilization; (6) that the movement of civilization is toward the public ownership of monopolies, etc., facts entirely independent of the "disparity of conditions" in wages, wires, offices, rates, distances, etc., to which Mr. Clark directs attention.¹ These material elements are of much importance and furnish, I believe, strong evidence for public ownership, but not the chief evidence. The philosophy of public ownership and cooperative industry rests primarily on considerations entirely above the material plane and wholly out of range of these statistics of dollars and wires and offices and telephones—as far out of range as good government, public spirit, partnership, and brotherly love are out of range of the stock exchange.

As to the data of miles and wires, etc., 1 mile of wire to 76 people in the United States against 1 mile to 130 people in Great Britain proves nothing except the relative sparsity of population in the United States, even if we take no note of the evidence that the wire mileage tabulated by the Western Union includes all the old rattletrap and worthless lines that were bought up solely to get rid of rival companies and that were built solely to be bought up.²

The vice-president's statement relating to offices—76,000 post-offices and 39,000 places reached by the telegraph companies and their telephonic connections in the United States, against 40,000 (estimated) post-offices and 10,816 telegraph offices in Great Britain—shows the telegraph reaching 50 per cent of the post-offices here and 25 per cent in Great Britain, as Mr. Clark says. I suggest, however, that the statement is invalid: (1) Because the witness's own Exhibit B shows that only 29,000 places are reached by telegraph and telephone, 39,000 being there given as the total number of telegraph and telephone distributing offices in the country; (2) because

¹ Mr. Clark did not touch these fundamentals except where, in answer to questions after he had finished what he wished to say, he denied that the Western Union's distribution of franks is intended to influence legislators, etc., and where he answered "No" to the question whether or not he approved of the principle (adopted in Europe, Australia, and New Zealand) of administering the telegraph to secure the greatest public service, rather than for profit, expressing personal dissent from a principle, which, if admitted, establishes the case for public ownership and cooperation, since philanthropy is not practicable as a general business foundation, and public ownership or cooperation are the only other things that can make it an aim to forego profit and so extend the service to its widest limits. Private monopoly must say "No" to the greatest service principle, for profit is an essential condition of its continued existence, and profit is inconsistent with greatest service, for without the profit rates could be lower and service greater.

² See Senate Doc. No. 65, Fifty-sixth Congress, first session, p. 30; Blair (Senate Committee on Education and Labor) Report on Labor and Capital, 1883, Vol. II, p. 1277; Bingham Hearings on Wamaker Bill of 1890 (House Committee on the Post-Office), p. 76, and House Report 114, Forty-first Congress, second session, p. 85, giving the statement of G. S. Thompson, a prominent telegraph builder of New York, in which he says, "It must be remembered that the estimate (in its report) of the quantity of lines owned by the Western Union has been predicated upon a computation made by simply adding together all lines that have come into its possession. Many of these wires have now ceased to exist, and others that are still standing are not in operation."

the number given for the British telegraph offices is the figure for more than 2 years ago, while the other factors in the comparison are brought down to date; (3) because the British post offices are overestimated. The 1898 report gives the number of post-offices as 21,197 and the telegraph offices 10,483; (4) because telephone connections are included in the American figures and not in the English; (5) because about three-fourths of the Western Union offices are railway offices if the same ratio holds as a few years ago,¹ while less than one-fourth of the British offices are railway offices; (6) because there is no mention of the fact that in Great Britain every post-office and every post-box is a place of deposit for telegrams. Lastly, the figures, even if correct, would only show that Great Britain had a much greater relative development of post-offices than we have. The implication that the telegraph development in Great Britain is relatively less than in this country is wholly unwarranted, even on the figures as they stand, since 10,816 offices is a more extensive service for the United Kingdom, with 120,973 square miles, than 39,000 for the United States, with thirty times the area.

Later in his testimony, the vice-president says: "If you are going to extend the telegraph . . . as was done in Great Britain, to carry it to every hamlet," thus admitting that the development of the telegraph in Great Britain is greater than it was in England under private ownership. Afterwards he says he thinks "it was the policy of extending the telegraph to unprofitable places that caused the deficiency."

I suggest that the vice-president's comparisons of American rates from New York with European rates from London are invalid. (1) Because the American rates are internal, while the European are international, the messages passing through 2, 3, and 4 countries, each of which adds its tariff; (2) because the American rates are land rates, while each of the European routes includes the cable from England to the Continent, and, as Mr. Clark admits, in answer to a question later in his testimony, the cable service is "infinitely" more costly than the land service.

I suggest further that all his rate comparisons are vitiated by his assumption of 11 words as the average of address and signature, making 21 words to the ordinary message as a basis of comparison. In the first place, the addition of 11 words as the average for address and signature is not justified by experience, or by Western Union testimony in the past. President Green, of the Western Union, some years ago placed the average number of words in address and signature at 7 per message.² In the second place, even if the average ordinary message here were 21 words, the comparison would not fairly present the situation, for, whatever may be the case here, it is perfectly certain that the average message in England is not 21 words, but about 15 words.

The vital matters are the minimum rates at which messages can be sent, and the actual average charge, for these are the things that in connection with the extension of facilities really govern the use of the telegraph, and give the English people about double the per capita use of the wires that we attain. A few words more or less to the message is of comparatively little consequence, but the ordinary minimum rate at which any message may be sent determines the strata of the population that can afford to use the telegraph and the frequency of its use by the whole middle class. The internal rate in Great Britain is 12 cents; that is, a message from any point in Great Britain to any other point in Great Britain may be sent for 12 cents. From a point in Massachusetts to another point in Massachusetts the ordinary rate is 25 cents. In New York State the internal rate is 25 cents; in Connecticut, 25 cents; in New Jersey, 25 cents, etc. The average charge for all messages in Great Britain is about 15 cents, against 31 cents in the United States. By Mr. Clark's admission 3 cents a message added in Great Britain would pay for all extensions and cover the interest charges on a debt overloaded by the purchase of the lines at about 4 times their value.³ By Western Union data less than 3 cents of the 21 is due to distance,⁴ and the evidence does not favor the idea that our telegraph runs up its expenses by paying high wages.⁵ If, then, the 31-cent charge is not due to

¹ Bingham committee, hearing of Mr. Thurber, testimony of Mr. Winan, a director of the Western Union, p. 22. (See, to same effect, testimony of President Green, Blair committee, Vol. I, p. 881.)

⁴ Senate Doc. 35, Fifty-third Congress, first session, p. 16, n. 1, and p. 83, n. 3.

⁵ According to the Tenth Census, volume 4, the average telegraph salary in the United States for 1872 was \$360, against \$288 in Europe, and in 1880 the average telegraph salary was \$327 in the United States and \$320 in Europe, showing a large increase in Europe and a fall in the United States. In view of the facts that further reductions were made in the United States, causing the great telegraph strike of 1883, that the company won the strike and have continued their policy of wage reduction (Senate Doc. 65, Fifty-sixth Congress, first session, pp. 38, 39, and authorities there cited), that English wages are above the general European level, and that the British reports show a rise of telegraph wages from 55 per cent of the total expenditures in 1881 to 65 per cent in 1895 (the last report I have in which I find this item dealt with), and from 44 per cent of telegraph receipts in 1880 to 67 per cent in 1899, while since 1881 the hours have been reduced in England from 56 per week to 48 day and 42 night. In view of all these facts it seems clear that the average telegraph wage is higher now in Great Britain than in the United States, this roundabout method being the only one available since the average telegraph wage in this country is not attainable.

distance or wages, and the efficiency of labor is greater in the Western Union system than in the English—more messages per employee here!—then, what is the reason for the 25-cent minimum and the 31-cent average?

The vice-president says that the Baltimore and Ohio telegraph (which maintained a 10-cent rate on 19 long routes and other low rates averaging 16½ cents a message on the whole system) became bankrupt in consequence of its low tariff. But Mr. D. H. Bates who was manager of the Baltimore and Ohio telegraph system, testified at the Bingham hearings,² that the Baltimore and Ohio made a profit in spite of its low rates, and that the Western Union succeeded in buying up the Baltimore and Ohio lines, not because they proved unprofitable, but because disaster overtook the road in other departments, and it sold its telegraph business as the most available source of realizing the funds necessary to right itself.

Speaking of the charge that inventions have been suppressed by the Western Union, the vice-president says: "If the person or persons who make that charge will kindly name the apparatus I should be very glad to know it." The gentleman will find a list of inventions on pages 144-146 of Wanamaker's Argument on the Postal Telegraph, 1890, in respect to which the Postmaster-General said (p. 11): "I have had enumerated, perhaps, a score of devices already patented for the purpose of cheapening and quickening the telegraph service, which find no use and no profit under the present condition. I am not an expert in electrical matters, but I know that all of these inventions can not be wholly bad. I am sure that many of them are good, but they can not be got into operation with the field monopolized. The public can not have the benefit of this rare class of American brains, nor can the inventors find a deserved remuneration for their work. The Western Union Company, having the control of the telegraph business, has no use for devices which cheapen and quicken the telegraph service and warrant a claim for reduction of rates. The public, not knowing what it misses, can not become aroused to the defects in methods now in vogue. If once a break is made in this rampart of telegraph monopoly, not only will the men and women who build and use the telegraph wires find a better market for their fidelity and skill, but inventors, knowing that their cases are to be tried before an impartial court, will also find a spur to better efforts."

The statement about the potential pressure for the withdrawal of the postal telegraph bill of 1890 made to me by Mr. Wanamaker, in the presence of several others, is said by the vice-president to be without justification. Mr. Wanamaker's high honor and excellent judgment make me feel otherwise, but I suggest that the correctness of Mr. Wanamaker's information is not incompatible with Mr. Clark's belief in the matter. The witness does not seem familiar with this side of the company's affairs. He even says that the giving of telegraph franks is entirely a personal courtesy, and that the company does not expect any favors, nor get any. But the president of the Western Union, in his report some years ago, said that the judicious use of complimentary franks among Government officials had been the means of saving the company many times the money value of the free service performed.³ It is admitted that the franks are still given to the same class of beneficiaries, and I submit that the purpose and results are probably similar to what they were when the above confession appeared.

The vice-president gives a table of the deficits in England footing up \$37,600,000, but the estimates of deficiency are made by including the cost of new construction, extensions, and improvements every year in the expenses to be subtracted from income, whereas they belong in the capital account and are so included by the vice-president in another part of his testimony, making them do duty on the deficit and on the capitalization also. Suppose a manufacturer operates at a cost of \$50,000 and sells his product for \$60,000 and builds a new mill costing \$15,000, has he made a profit of \$10,000, having cleared that amount above expenses of operation and maintenance, or has he made a deficit on the year's business by building the new mill? It seems clear that he has made a profit. The cost of the mill belongs in the capital account, and he has the mill to show for the expenditure. The difference caused by the wrong use of construction cost is very great, turning a small deficit into a big one, and in some years changing a profit into a deficit. For example, in 1880, the vice-president's statement gives a deficit of £29,909, whereas there was a profit of £7,187 above all cost of operation and maintenance and interest on the debt.

¹ Senate Doc. 65, Fifty-sixth Congress, first session, pp. 18, 19, n. 3, giving the facts from the Tenth Census.

² House Committee on Post-Office, hearings in reference to the Wanamaker bill, 1890. The following are examples of the Baltimore and Ohio tariff: New York to Portland, Me., and intermediate points, 10 cents; New York to Philadelphia, Baltimore, and Washington, 10 cents; New York to Chicago, 15 cents; New York to St. Louis, 20 cents; to New Orleans, 50 cents; to Galveston, Tex., 75 cents. The average charge on all messages was 16½ cents (Bingham Hearings, pp. 21, 62, 76, and Senate Doc. 65, Fifty-sixth Congress, first session, p. 21).

³ See full citation, verbatim, and references, in my testimony.

Here are some other instances of the same sort, taking my figures from Mr. Morley's returns to the House of Commons:

	Deficit by vice-presi- dent's state- ment.	Profits by re- turns to Commons, putting new construction in the capital account.
1881.....	£264	£125, 048
1882.....	112, 524	31, 442
1883.....	142, 234	36, 611
1884.....	346, 114	4, 418

The postal statements put the deficit sufficiently high without magnifying it. The Government believes the country gets more than a full return for the deficit in the development of business, etc., through low telegraph rates, while experts say that if a fair division of expenses were made between the mail and the telegraph there would be no deficit at all—a 2 per cent change in the line of division would do it. If the telegraph had remained in private hands the service would have cost the people many millions more than the total governmental cost, deficit and all.

The English deficit is no argument against public ownership of the telegraph, any more than the postal deficit here is an argument against public ownership of the post, or the political condition of Philadelphia or New York is an argument against government by the people. There are plenty of countries that do not make any such deficit with the telegraph, and we can follow their example until it is deemed wise to throw the electric wires open to public use, just as the roads are now, the whole cost of which is a deficit, but a most beneficial one, which brings me to my last point in this connection, viz, that a deficit is not necessarily a bad thing—it depends on what you have to show for it.

The vice-president states the Western Union stock and bond capitalization at \$645 per mile of line and \$130 (\$129.80) per mile of wire, and compares it with the British capitalization, which he estimates at \$1,530 per mile of line and \$216 per mile of wire, by adding to the outstanding capital debt the whole cost of extensions and improvements from the start (although these were included in current expenses in an earlier part of his testimony dealing with the English deficit) and making no allowance for depreciation. "Men may come, and men may go, but I go on forever," is the song of capital when a monopolistic corporation writes the music. Private monopoly does not believe in burying its dead capital, but keeps it on the register as a basis for taxation, not of itself, but of the people. Monopoly's census of capital includes as present population all the inhabitants who have ever lived in the building since it was put up. Besides this gratuitous inflation of the British capital, by applying corporation methods to its estimate, it is well known that England paid the companies at least four times the value of the lines, and probably five or six times their value. I suggest that it would be better to take for comparison the capitalization in some country that has not made such a dropsical purchase—France, or Belgium, or Germany, making due allowance of course for difference of wages, etc. Better still, to compare the \$645 a mile with the cost of construction in this country,¹ or with the Western Union's claim in recent tax litigation in Ohio, that its whole property in that State did not cost over \$103 per mile of line.²

¹ Western Union reports show cost of construction varying from \$75 to \$100 per mile of line and \$21 to \$70 per mile of wire, on an average for large blocks. For the year ending June 30, 1894, President Eckert reported the construction of 1,300 miles of new poles and 22,000 miles of new wire, one-half of it copper, at a total cost of \$557,021, or \$21 a mile of wire. In the report of October, 1895, President Eckert says that \$574,639 was spent during the year in putting up 15,784 miles of new wire, two-thirds of it copper, and part of it on new poles (817 miles)—about \$76 per mile of single line and \$36 per mile of wire. Colm Fox, a Western Union builder, testified that he had built lines for the company from 1868 to 1876, constructing 500 to 800 miles of poles in Michigan (some of it 2 or 3 wire, but generally 1-wire line) at a cost of \$75 a mile and \$30 a mile of additional wire. (Senate Report 577, Forty-eighth Congress, first session, p. 6.) In 1884, Dr. Green, president of the Western Union, testified that the average cost of the Western Union lines was about \$45 (*Ibid.*, part 2, p. 227.) During the year ending June 30, 1895, 2,584 miles of poles and 20,370 miles of wire that constituted the American Rapid Telegraph Company has been bought by the Western Union for \$550,000 in its stock at par, or \$27 a mile of wire (Western Union Reports 1894, 1895, and United States Statistical Abstract for 1894, p. 363.) The actual market value of the stock payment was \$22 a mile, and the Rapid lines were among the very newest and best the Western Union has ever bought.

See further Senate Document 65, Fifty-sixth Congress, first session, pages 27-30, where many data on construction cost are collected from various sources—public, private, domestic, and foreign—al- tending to confirm the drift of the figures given above.

² Western Union Telegraph Company v. Auditor of Ohio, 61 Fed. Rep., 447; State v. Jones, 51 Ohio St., 492; 165 U. S., 194, Feb. 1, 1897; and see 64 Fed. Rep., 9, reversing the decision of 61 Fed. Rep., and holding the Ohio law constitutional, the State supreme court in 51 Ohio, and the United States Supreme Court in 165 U. S., having sustained the validity of the statute.

Even this contrast probably does not show the real inflation in Western Union capital, for the vice-president took the whole mileage of poles and wire reported by the company, which, as we have seen there is reason to believe is the sum of all the lines bought and built from the start, many of them now in the junk heap. Allowance for this would make the divisor smaller and the quotient larger.

The vice-president says that the "capital of the Western Union Company has resulted from the amalgamation of a large number of telegraph companies from the beginning," and every business man knows that when companies amalgamate the resulting capital is usually a good deal more than the sum of the former separate capitals. What the people want to know in this connection is the relation between capitalization and the real value of the plant. The practice of heavily capitalizing franchises given by State and city, thereby compelling the people to pay dividends on legislation and interest on abstract privilege, is a very questionable practice. Labor and capital actually invested are the only things that ought to draw income. It is so with the ordinary merchant and manufacturer, and it ought to be so with a telegraph company. The merchant can not make the people pay interest on a blue book, or on dead capital; neither should a carrier. Equal rights to all. Fair exchange, service for service. No charge for wind, and no tax on the dead.

I solemnly swear that the matters in the above statement made by me of my own knowledge are true, and that all other matters contained therein I believe to be true.

FRANK PARSONS.

Subscribed to and sworn before me this 6th day of August, 1901.

MAUD M. CRANE,
Notary Public.

STATEMENT OF ROMYN HITCHCOCK,

Consulting Chemist and Technologist, New York City.

Arguments in favor of Government ownership of the telegraph have been ably presented before this commission and from time to time before other committees of Congress appointed to investigate the subject. The general and specific facts concerning the telegraph business in this country and abroad have been set forth in detail by different authorities before such investigating committees. There is no reason why any person of an inquiring disposition should be deceived by ambiguous or erroneous declarations concerning matters of fact in the telegraph business.

Objections to Government ownership and management of the telegraph, based upon considerations of political patronage and abuses, have been repeatedly put forward, but they are more theoretical than real. If the people want Government ownership they will also demand efficient and economical management. This can not be had if political influence controls the selection or discharge of employees. The operation of the telegraph is a technical service and employees should work their own advancement. Civil-service rules should be applied rigidly; promotions should depend upon efficiency and skill and the results of special examinations, with no discharges except for cause. Life positions and a pension system should be the reward of faithful service.

But it is unprofitable to spend time over matters already well thrashed out. What the people desire they should have. It is the duty of the Government, imposed by the Constitution, to utilize the best available means for the transmission of correspondence. It is unconstitutional for the telegraph, which should be a part of the postal system, to be operated as a private monopoly. Among the more important nations, the United States stands alone for its shameful neglect in the matter of telegraph communication. This condition is anomalous. The most active and progressive people on earth are unable to enjoy the telegraph as a public utility. Yet the popular demand for it, expressed in many ways, is indisputable. Doubtless on no other single question are the people so united. More than 75 bills have been before Congress advocating a postal telegraph. Sixteen investigating committees have reported in its favor. Of 75 countries the telegraph is owned and operated by the respective governments in all except Bolivia, Cuba, Cyprus, Hawaii, Honduras, and the United States.

The following organizations and many others have expressly favored a postal telegraph system:

The Farmers' Alliance, the National Grange, the Knights of Labor, the Railway Union, the American Federation of Labor, the International Typographical Union, the People's Party, the Prohibitionists, many boards of trade and commercial bodies. More than 2,000,000 votes have been cast for it.

Mr. Wanamaker declared in 1890 that the only visible opponent was the Western Union Telegraph Company.

Testimony has been given before this commission relative to discriminating freight rates on railroads and the demoralizing effects resulting therefrom. These things are only too familiar to students of economic conditions, but few people know that similar conditions have prevailed in the telegraph in regard to the distribution of news. Mr. S. H. Bell, representing the Typographical Union, used these words before the Senate Committee on Post-Offices and Post-Roads:

"Mr. Chairman, the news of this country is controlled by two great press associations, and in any place in which either has a footing no new journal can be established and secure a telegraphic news service except on such terms as may be prescribed by the paper or papers which already occupy the field. In England, on the contrary, all papers are on an equal footing; that is to say, all may receive the dispatches on payment of the charges of the news-gathering agencies and those of the Government for the transmission of the same. We believe that under governmental operation a similar condition would soon prevail here, which would be of untold benefit to all connected with the newspaper industry."

A great part of the testimony given at various times deals with comparisons. The experience of Great Britain and the continental countries, the reductions of rates invariably accompanying changes from private to public ownership, evidence that cheap rates enormously increase the use of the telegraph—all these facts have been admirably brought out. But the testimony has dealt almost exclusively with the telegraph as it has been and is. The time has come when we should seriously inquire whether the methods of the past, although they still prevail, are the best; whether there have not been improvements in telegraphy as in other arts, or if in this alone there has been stagnation for a generation.

Improvements have been made in the telegraph, but the great monopoly which controls it has opposed changes. The logical result has been realized—that we have in the United States the poorest, most inefficient, slowest, most antiquated and expensive telegraph service in the world. It is conducted on the basis of small business at high prices, regardless of the obvious teachings of experience that the opposite policy is the wiser and also, when largely developed, the most profitable.

To offset this humiliation, due to ignoble and shortsighted financiering, I propose to advocate before this commission the introduction of an American invention which represents the highest achievement in telegraphy as a foundation upon which to establish a Government postal telegraph service which shall be superior to any the world has known. This invention far outranks its nearest rival, the great Wheatstone apparatus. It is an invention not to be superseded, because it attains the limit of the working speed of a telegraph wire.

The question has always been, How shall the Government obtain control of the telegraph? How can it best do so with just regard to the vested interests which must be more or less affected? Important as these considerations are, they are subordinate to the larger interests of the people. If, as I believe, the time has come for a postal telegraph in this country, the people have a right to demand the best in the world. If it can be shown that the best is also the cheapest in first cost and maintenance, and that its adoption will improve, cheapen, and quicken the service far beyond what would be possible by any other method, there can be no question that this is what they should have.

It is my purpose to advocate such a system. Under private management for profit it is thereby practicable to reduce the present telegraph rates to one-tenth what they are at present, with vastly improved service. Under Government management the rates could be still further reduced.

The system of which I shall speak is the high-speed automatic of Mr. Patrick B. Delany. The main features and possibilities of the Delany system were discussed before the Senate Committee on Post-Offices and Post-Roads in 1896. (Doc. No. 291.) Although at that time the Elliott Cresson medal was awarded to the inventor, the system is much improved and is even better adapted to the needs of a postal telegraph than it was then. The tapes are now punched by the ordinary operating of a Morse key, and the signals are recorded in Morse characters. The electro-static conditions of a telegraph line have hitherto imposed limitations upon rapid signaling by the ordinary methods. By a recent improvement Mr. Delany has succeeded in utilizing the static charge in the production of signals on the receiving tape.

There are two leading questions which must receive brief consideration here. First, what are the points of practical superiority in the Delany system? Second, if it is so extremely valuable, why has it not been adopted by the telegraph companies?

Replying to the first question, technical features are involved, which, however, it is perhaps advisable to pass over for the present. The practical aspects of the subject are just now of most importance. The one great feature of the system is the extreme speed of operating with reliability and accuracy. The second is the relative cheapness of line construction, maintenance, and operation.

The points of superiority of the Delany system over its nearest competitor, the Wheatstone, are these: More certain legibility of signals. Simpler mechanism, not liable to derangement, well adapted to army work in the field. Improved methods for handling a large volume of business. It will work without repeaters from New York to San Francisco. The receiving instrument is controlled by the operator at the sending instrument. The transmitter increases the efficiency of ocean cables.

The invention is a result of gradual development of a fundamental principle. The inventor is not only an expert practical telegrapher, but he is a member and ex-vice-president of the American Institute of Electrical Engineers, member of the Franklin Institute, and the inventor of numerous telegraph devices. His synchronous-multiplex system, whereby 1 wire is made to carry 6 messages simultaneously, one way or in opposite directions, has been in use by the British post-office for 15 years, and his system for cable transmission holds the record for high speed over Atlantic cables.

When it is considered that a great item of cost in ordinary telegraphy is the construction and maintenance of a large number of wires, it will be understood that if the practical speed of working is greatly increased, the number of wires or the amount of copper could be correspondingly reduced, with great resulting economy. Let me give one illustration of this from high authority. Mr. Norvin Green, formerly president of the Western Union, stated that the introduction of the "artificial" or "phantom" circuits of the quadruplex represented in value to that corporation \$10,000,000. The quadruplex is used only on a comparatively few circuits, and it does not quite double their practical duplex efficiency. These are large figures, but a simplex Morse operator, sending at the rate of 15 words a minute, may monopolize a line which cost \$20,000.

When we come to the Delany system, however, the economy is enormously greater. For while the quadruplex sends an average of 60 words a minute with eight operators, four sending and four receiving, and the Wheatstone automatic 125 words, or, if duplexed, about 200 words, the Delany sends over a single wire 1,000 words a minute for a distance of 1,000 miles. In other words, one Delany wire is equal to 60 wires worked simplex or to about 20 wires quadruplexed, and it operates 8 times as fast as the Wheatstone.

The money-earning capacity of a line which is able to carry messages at a speed of 1,000 words a minute demonstrates the desirability of speed for economical working. If we take 10 hours of constant operation for business and social messages and allow 20 per cent of the time for manipulating the apparatus, the practical working result will be 800 words a minute.

Assuming messages to comprise 50 words each, 16 messages could be sent each minute. For convenience, we will say 15 messages a minute. In 10 hours this would amount to 9,000 messages, which at 15 cents each would yield a gross income of \$1,350.

An estimate of the profits of a line between New York and Chicago, fully equipped, at an assumed cost of \$1,000,000, will indicate the immediate possibilities. This line is supposed to have two wires, with a speed capacity of 1,000 words a minute each, one for sending and one for receiving.

We will suppose these wires are operated at a speed of 500 words a minute each way, and that 15,000 messages of 50 words each are transmitted every day of 12 hours. The present telegraph business between the two cities at 40 cents for 10 words is 12,000 messages a day. Therefore, the estimate of 15,000 50-word messages at 15 cents each is conservative.

15,000 messages, at 15 cents, \$2,250 a day, for 300 days	\$675, 000
Line maintenance, at \$4 a mile, 2,000 miles	\$8, 000
Handling messages, at 2.6 cents each	117, 000
Interest, 4 per cent	40, 000
	<hr/>
	165, 000
Income	540, 000

There is reserve capacity on the line. Only one-fourth of its working capacity is utilized. Press dispatches will occupy some of this. But no account is here taken of business from intermediate cities.

The figures do not include expenses of administration.

The question has been asked, How much cheaper can the Government conduct the telegraph service than the present corporations? I have not attempted to estimate that in a specific manner, but the select committee on the telegraph in 1870 estimated that the annual saving would be at least a million and a half a year. The receipts of the telegraph companies are now four times what they were in 1870, so that the saving under Government would be very much greater, without any improvement whatever in technical operation. It is probable that, taking account of dividends upon watered stocks alone, after deducting the probable value of the line equipments

of the corporations, the saving by Government management would be not less than \$4,000,000, and other economies would considerably increase that sum, without change in the methods.

Prof. Frank Parsons said, in 1896, concerning this subject: "If improved methods, well known to the electrical world, were adopted in the postal telegraph, the saving would be far greater—so great, indeed, that there seems every reason to believe a uniform rate of 5 cents a message would yield a substantial profit."

As to the second question, pertaining to the attitude of the existing monopoly toward this system, or toward any new system, I wish to quote a few pertinent words from Mr. Delany himself, which are to be found in Senate Document No. 291, Fifty-fourth Congress, first session: "So anxious have the telegraph owners been to perpetuate the condition of the early days—the golden span from 1858 to 1870—when a \$500,000 plant grew to one of \$20,000,000, every innovation calculated to upset or interfere with this comfortable situation has been unwelcome. Every step in advance has been viewed as an encroachment on an exclusive domain, and such great improvement has been obliged to knock loud and long for recognition. It is significant that none of the improved methods of telegraphy now in use originated within the controlling telegraph organization, all having come to it by purchase of competing lines or from individuals outside. The well-known Page patent was the work of an examiner in the Patent Office. Stearns was connected with the municipal telegraph of Boston when he brought out his duplex system, and it required 2 or 3 years' effective work by a competing line to gain a foothold for it. Edison's quad-ruplex system was an outside creation. The telephone was a founding left on the doorstep of the leading telegraph company, but was not adopted and was recognized only after it had grown into great promise."

With proper regard to the future and a disposition to maintain an up-to-date installation, a part of the large earnings would have been invested in improvements, and rates should have been reduced. But what has been the policy throughout? The fatal, ruinous policy not to meet competition, but to buy it up. A dependence upon the purchasing power of wealth to prevent changes or the use of new methods, to antagonize improvements, and to suppress inventions. It has been a battle of money against the pervading spirit and the irresistible tendencies of the age, and it will meet its Waterloo whenever improvements in either methods or means come into the field. It needs not even the Delany system to ruin the telegraph monopoly; it needs no new devices; nothing but the same old system that the companies are using still, supplemented with one-fifth of the money represented by their outstanding securities, and a liberal and wise business policy. But it is not competition that we are striving for; it is the best and cheapest system for the people.

One of the worst features of the present monopoly is the utter disregard of the welfare of faithful employees. Their condition is as bad as it can be, for the wages are insufficient for comfortable living. If the truth were all told, there would be popular indignation. Yet the employees are powerless to better their condition. Probably the average operator should receive about double the wages paid by the Western Union Company.

Leaving out of consideration the possible economies which might be effected by Government administration with the older methods, let us suppose the telegraph to be brought into universal use through the greatest possible cheapening of rates. Whether this result is attained through Government ownership and the operation of the telegraph in conjunction with the post-office or by its adoption by a private corporation working for profits, does not materially affect the point at issue. In either case there will be at least 90 per cent reduction in charges.

While personally favoring Government ownership and disposed to actively further it so long as there is any prospect of success, I am also convinced that it is possible to make the telegraph a public utility in private hands. The proposed reduction in rates of 90 per cent are based upon the Delany system under private management. By no other system would such a large reduction be profitable to the owners. It is proposed to establish a rate of 15 cents for 50 words and 30 cents for 100 words between New York and Chicago. It is proposed to do away with the 10-word messages and substitute letter-telegrams—letters carried by wire instead of by train.

Comparatively few men are able to immediately grasp the idea and follow it confidently to the inevitable conclusion. It requires time and thought and familiarity before the transmission of letters of 50 or 100 words from New York to Chicago or San Francisco presents itself to the mind as commercially possible or even to be desired. Any radical departure from old methods requires time to permeate the average brain cells and ganglia and bring forth definite or logical conclusions. The man of wealth does not at first recognize its possibilities for gain; the people will not conceive the reality of it until they have experienced it, learned its advantages, the saving in time, the completeness of knowledge as contrasted with the suspense, uncertainties, even anxieties of the ambiguous short telegrams, short because every additional word costs. Such letter-telegrams will be something new under the

sun. No man can estimate what they will lead to in number; in bringing people nearer together in time and social intercourse, and in the distribution of news for the press.

Likewise our forefathers could not foresee the wonderful growth of correspondence which we now enjoy because of cheap and rapid mails. The postboy, pony post with relays, packet boat, train, telegraph, pneumatic tube, telephone, represent successive stages with a premium subsidy for speed, reaching an anticlimax in the 10 cent stamp to hasten the delivery of a letter by a few minutes which may have been many hours on the way. But even now the telegraph is too slow, because it can be speeded up.

The conviction that the telegraph should belong to the people, that cheap communication is one of the greatest blessings to a nation, should be strong enough with all to eliminate selfish considerations. But as I look forward I see the signs of a new private monopoly in the air, the basis of which is the Delany system. At present I believe it is possible to direct the system into Government control; but if this is to be done, there must be no delay in Congress. If the system gets into the control of those who are more interested in the profits of an investment in stocks than in the needs of the people, the Government will not be able to secure it without a much larger expenditure and probably a delay of several years.

This is not a matter which admits of any lobbying. Fair, open, and direct dealing, I am assured, will characterize all negotiations on behalf of the owners of this system. If it is true, as has been intimated to me, that a fund of \$1,000,000 was at one time provided to defeat legislation in favor of Government ownership of the telegraph, the same conditions may have to be met again, and they can best be met by giving the utmost possible publicity to every detail of the negotiations.

I wish now to make one further suggestion in the direction of radical departures from old methods. If we have something which promises to effect material changes in social or business methods, it is well to prepare for them in advance. Now, these cheap letter-telegrams are sure to enormously increase the bulk of the telegraph business. While messages will be much longer, they will also be in vastly greater number. And if the system is introduced by a private corporation, its operations will profoundly affect the post-office business. This is a matter which deserves very critical examination.

The primary function of a telegraph company is the transmission of communications over its wires. The practical development of the business, however, has involved the immediate delivery of messages by special messengers. Obviously, if the company could be relieved of the special-delivery obligation, it would be greatly to its advantage, and the public service could be made much cheaper.

With the larger development of the telegraph business—larger, it should be understood, than anything the world has seen—which will result from the new system, the special delivery of such a great volume of correspondence in large cities would require an organization rivaling in extent the post-office carrier service and practically duplicating it. Letter carriers make regular rounds, but if messages required to be sent out singly, as they arrive, it would add very much to the complications and expenses of the telegraph administration.

The argument that the telegraph companies do now deliver all messages does not affect the point of this discussion. Service can always be rendered if people are willing to pay for it. All telegrams handled by the companies now are urgent, although not so regarded by the companies, and delivery by messenger is obligatory.

By far the greater number of letter-telegrams will be of a nature that will not require immediate delivery. It is therefore proposed to have them delivered by the post-office. If ordinary letter-telegrams are handed in at New York and posted in the Chicago post-office 20 minutes later, for delivery in that city, they will reach their destinations soon enough. Patrons who wish to do so, can have lock boxes at the telegraph office, in which their dispatches will be placed as they arrive.

This post-office delivery does not conform to the conventional idea of telegraphic correspondence. We are accustomed to have telegrams sent to our offices and homes, and the idea of receiving them by mail seems at first glance a backward step. But in truth it is not, for what time is lost in delivery is largely made up in getting the messages quickly through to the cities of their destination. The new system will lead to the delivery of messages through the post-office almost if not quite as promptly as they are now delivered by the Western Union Company. I do not wish to exaggerate in this regard. The local post deliveries are often slow and far apart, but as the demand for this service increases there will be material improvements all around.

Nevertheless, a certain proportion of letter-telegrams will require immediate delivery, and for this purpose responsible, uniformed men, not boys, should be the carriers. For this service a special charge should be made.

My contention is that the less urgent business should not be taxed to pay for this special service rendered to a comparatively few correspondents. Good business policy requires special pay for special service and minimum charges for ordinary service.

The routine of business will be, in a general way, as follows:

In every city there will be a central transmitting and receiving office, and there may be a number of branches similarly equipped, but we will consider only the central office. Connected therewith by ordinary wires will be small local offices where letter-telegrams can be handed in, but from which deliveries will not, until after later developments, be made. At each of these local offices a telegraph operator will have a Morse key which operates a tape-punching apparatus at the central office. If the Government owned the system, all this would be arranged in connection with the postal stations.

At the central office the punched tapes are immediately run through the line transmitters, at a speed of 500 to 1,000 words a minute, or faster for short distances. With such rapid transmission, there must be an immense amount of business before there can be a moment's delay in sending off a message. For example, a single instrument, on one wire, will do all the business that can be provided by 50 men constantly working Morse keys. It will require a very large development from the present business before 50 Morse operators will be kept continuously at work sending messages to any one city. If such a result should be realized, between such important cities as New York and Chicago, the immediate running of another wire would be advisable. That may happen after a while. When a wire is worked to anything like its carrying capacity by this system, it will be earning so much money that, under Government control, there will be either a large profit or a reduction of the 15-cent rate to 10 or even 5 cents for 50 words.

Now we will follow the message to its destination. At the distant city it is recorded in Morse characters on a tape. In the ordinary course it will be written out on a typewriter, inclosed in an envelope, stamped and addressed, and deposited in the post-office.

The system involves important details in the convenient and systematic manipulation of the tapes, and the method of distribution of messages to distant parts of the city, which need not be dealt with here.

An important feature of the system is that it affords absolute secrecy for all correspondence, whenever this is desired. For Government business, as well as for some private correspondence, this is worthy of consideration. The only way to insure secrecy is to prevent any employee of the telegraph company from knowing the words of the communication. The tapes may be punched by confidential clerks in private offices. Whenever such confidential business has to be transacted, suitable apparatus for this purpose can be leased from the telegraph company. There are several ways of punching the tapes, and employees can quickly learn to do the work. Such tapes will be rolled in compact coils, in the usual way, and carried to the transmitting office, where, in the presence of the messenger, they are run through the machine, automatically coiled up as before, and handed back. Not a word of the message can be read.

At the receiving station the tapes are also automatically coiled as they come from the machine. When a message of this secret character is received, the tape must be sent to the address without uncoiling. Any person can soon learn to translate the Morse characters on the tape.

Now, in regard to the policy to be pursued by the Government in securing a postal telegraph, it seems to me, in the light of facts herein presented, that the purchase of the properties or securities of the existing telegraph corporations would be highly inexpedient. If the entire plant of the Western Union Company could be reproduced for \$25,000,000, or less, as is confidently declared by persons who know about such things, the people of the country should not be called upon to pay a hundred millions for it merely to protect investments. It is easy to predict ruin to the business of that great monopoly when confronted with a competitor too strong to be bought up. And if the purpose of such competition should be the ruin of the existing companies, it could succeed in its aim. But industrial disturbances and revolutions, predicted by enthusiastic advocates of new systems, seldom bring sudden disaster to established business. Usually there is time for a natural readjustment to meet the changed conditions. The canal boat still competes with railway traffic. Doubtless the present telegraph companies will continue in fairly profitable business, parallel with the Delany system, although to do so they must adopt a more liberal and enlightened policy than in the past. They will lose all the general telegraph business, but this, which should have been their main source of revenue, they have made no effort to develop. Indeed, they have systematically restricted it to the public necessities by excessive charges. They will also lose the press business. But there is enough of other business remaining which would seem to be undesirable for the Government to undertake.

Doubtless the simplest course for the Government to pursue in the introduction of this system would be to enter into an agreement with the owners whereby the latter shall construct the first line—between Washington and New York, for example—with complete equipment, and operate it for 6 months or a year, for their own

profit, at 10 and 15 cent rates for 50 and 100 word messages. If, at the end of the time, it has been shown that the working is satisfactory, as provided in the specifications, the Government is then obligated to take over the line, paying an advance of 10 per cent on the construction cost. It would be well to have a Government engineer in some way associated with the construction.

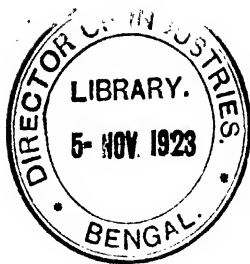

It may be asked, What evidence can be adduced that the Delany system can practically accomplish the results claimed for it? If the evidence were not beyond question there would be a weak point in my whole argument. But there is no such weakness. Nothing has been asserted that does not rest upon indisputable facts of experience, which are capable of demonstration at any moment. At a meeting of the Franklin Institute, at Philadelphia, November 20, 1895, the Delany system in its first practicable form was shown and later received the Elliott Creason medal. The following quotation is from the journal of that date: "At this point Mr. Delany made several experimental transmissions through an artificial line. * * * Perfectly legible records were obtained at a speed of 1,200, 1,800, and finally to 2,400 words per minute, as timed by Mr. Thomas Shaw, M. E., and others.—The Secretary."

The apparatus has been operated at a speed of 8,000 words per minute, but this has no commercial significance.

Finally, gentlemen, if there is any solid basis for industrial innovations, if there is any sound, safe, and sure foundation upon which we can rely in these days, either for the encouragement of an industrial enterprise or the investment of our precious money in it, that must be in the profound and accurate knowledge of men thoroughly grounded in the knowledge and methods of physical science.

It is upon such high authority that I have ventured to thus boldly and confidently advocate the Delany system before you, and I think the Government of this progressive people should be quick to recognize its merits and utilize them for the public good.

INTRODUCTION.

For the purpose of this report special charters, granted by every State and Territory in the United States, were examined. The session laws of the various legislatures, as published, contain the charters granted by them; and while not all the charters that have been granted were examined, the number which was examined is so large that generalizations may safely be based upon them. As a rule, the charters granted during the first 10 years or so in any one State were compared with one another. The charters granted during the later decades were likewise examined, with a view of noticing in what ways, if any, these differed from the earlier ones. Parallel with these, an analysis of general laws was undertaken, including only the earlier enactments on the subject of railways. The discussion of contemporary railway legislation was based upon the latest edition of the revised statutes of the different States, supplemented by the general laws of the States which had been enacted since the publication of the statutes. In this manner, it is believed, no essential provision of the railway laws of any State, whether included in the revised statutes or not, have been overlooked. The material upon which the treatment of constitutional provisions is based is found in the appendix to this report. The treatment of foreign railway charters and legislation rests almost exclusively upon material submitted by the various departments of public works in the different foreign countries. The respective officers were requested to submit typical charters and important general laws; and there is every reason to believe that the material thus submitted is thoroughly representative of the railway legislation of the countries concerned.

Without attempting to formulate definite conclusions or to express whatever opinions may be justified on the basis of the facts presented in this report, a number of the leading characteristics brought out may be enumerated here. In the first place, the essential similarity of charters the world over has been confirmed. The lineal descent of present railway charters from the earlier canal and turnpike acts in England can likewise not be questioned. While in different countries certain forms of expression found their way into the charter, in many respects more than similarity can be discovered. Identity of contents, even, can in many instances be established. A characteristic of railway legislation in the United States is the great extent to which special legislation was persisted in after general laws had been enacted by the respective State legislatures. In all sections of the country the statute books afford numerous instances of the granting of special railway charters, completely ignoring the existence of general laws for the incorporation of railway companies. In addition, illustrations can be found of the organization of railway companies on the basis of special charters granted many years before, when at the time of such organization general laws and constitutional provisions prohibiting special franchises were found upon the statute books. As a whole, the railway legislation of the United States is incomplete, especially with respect to such subjects as the issuance of stock, making joint arrangements, providing for emergencies, and similar topics. A tabular analysis of railway laws shows at a glance the absence of essential provisions in the laws of many States. Together with this incompleteness there goes a certain lack of uniformity, which must be extremely exasperating to railway companies that attempt to act in obedience to the law. Our great railway systems lie in territory under the jurisdiction of a number of different States, and when two or more of these States legislate in diverse ways on the same subject, it is difficult to see how a railway manager can act in accordance with the laws of all the States to which his road is subject, and at the same time adhere to that unity in management which good business principles demand. The railways are essentially alike all over the United States, and no good reasons can be advanced for the extraordinary differences which exist among the laws of some of the States.

The lack of elasticity in railway legislation is best illustrated by the many constitutional provisions which have been incorporated by various States. It is a well-known fact that amendments can not be readily secured, and, that legislation

which is rigidly limited in its scope by constitutional amendments can not embody that freedom of action which the nature of the railway business demands. Our railways are an important part of our industrial mechanism, and, in common with all other domains of social and economic life, they undergo changes and adjust themselves to modifications and variations in this social and economic life. Rigidity in railway legislation prevents that prompt readjustment which progress demands. The tendency, noticeable in the laws and constitutional provisions of a number of States, to permit suspension of the long and short haul provisions, for example, is an excellent illustration of a most commendable tendency in our railway legislation, because it gives to administrative authorities discretionary powers, which will enable them better to adjust the railway service to concrete conditions as the same may arise.

In general, it is true that our laws do not recognize differences in the degrees of importance represented by different railways. A subordinate branch of a small independent road in a remote section of the undeveloped part of a State is subject to the same laws that govern the most important systems, except, perhaps, in regard to taxation, for which purpose various schemes of classification have been adopted. Again, it may be said that our laws do not provide for adequate administrative machinery, and that many of them appear to have been enacted on the assumption that statutes execute themselves. An examination of the commission laws shows clearly the great lack of uniformity in the qualifications of commissioners, their terms of office, and in the powers exercised by them. The question naturally arises whether any system of administrative control could not be greatly strengthened by legal provisions, outlining certain qualifications for every agent who may be a part of the administrative machine. At present there is nothing in our State laws to prevent persons totally unfamiliar with railways from occupying positions which call for high ability and thorough knowledge of railway affairs. Furthermore, there is very little in our laws which enables the commissions or other officers to compel prompt compliance with the laws on part of individual railways which do not see fit to obey them. A single obstinate manager may prevent other managers from voluntarily doing what justice to shippers and railways alike demands, and what every citizen should have a right to demand; and, in case the demand goes unheeded, to have the same enforced through an efficient and prompt administrative agent. A study of the laws of Prussia, Switzerland, and Japan impresses one with the lack of representation of social and economic interests in the management of our railways. The full significance of this becomes apparent when the composition of advisory bodies in these and other countries is taken into view, and the wholesomeness of the influence and power which they exercise over the railway systems of their respective countries is realized. They are, in a sense, clearing houses of information through which the railways and the people learn to know each other.

PART I.—EARLY RAILWAY CHARTERS.

General characteristics.—A railway charter may be defined as a special act of a legislative body authorizing a person or persons duly organized to construct and operate a railway or railways in a certain territory under certain conditions. Such a legislative act is a private law. With the exception of a few of the Western States—Arizona (Territory), California, Colorado, Idaho, and Montana—which began with general laws, special charters have been granted by every State and Territory in the United States. The charters have numerous resemblances and differences which will be noted more in detail later on, but at the outset it is well to notice certain features which charters in all parts of the United States have in common. In spite of numerous striking differences which exist, we may speak of a typical railway charter.

The leading features which are common to railway charters of the different States may be associated with the following points, every charter having one or more provisions relating to some or all of these points: Name of company; number of commissioners; number of board of directors; the amount of capital stock; size and number of shares; the amount of the payment per share at the time of subscription, and the maximum assessment per share, together with the number of days' notice required; systems of voting; the time limit as to beginning and completing construction; junctions, branches, and extensions; route; expropriation and methods of valuation, together with the manner in which disputes are settled; the amount of land which may be held; the number of miles to be constructed before traffic may be opened; the power to borrow money and the rate of interest; the distribution of dividends, liability of stockholders, annual reports, passenger and freight rates. In every State charters may be found which contain provisions on only a few of these points, while in most States charters were granted containing provisions on all of them, and perhaps others not here indicated.

Following an old English custom, a few charters in a number of States contain a preamble. Where a preamble is found, it usually sets forth the reasons why the proposed railway should be constructed, the public service which it can be made to perform, and the manner in which the project is to be carried out. Preambles of this kind can be found in charters of States so far apart as Wisconsin, Pennsylvania, and Georgia. Similarly, charters in some North Atlantic States declare the public use of the projected railways. Both the preamble and the declaration of public utility serve the same purpose, namely, to bring before the legislative body before the franchise is granted the social and economic conditions which make the project desirable, if not necessary.

While there is no general order in which the different provisions of a typical railway charter are incorporated, in the individual charters of the different States, it is very common for a charter to enumerate first of all a number of persons, designated commissioners, under whose direction the proposed railway is to be organized. These commissioners are authorized to open subscription books in specified localities on a certain date, and to continue to receive subscriptions during a certain period of time. The charter further specifies that after a certain minimum sum has been subscribed, and a certain payment on each subscription, varying greatly in its amount, has been made, the subscribers shall hold a meeting and elect a board of directors. The size of the board to be elected, like the number of commissioners, varies very greatly in the different charters, although 9 and 13 are perhaps the most common numbers. In a few States, like Connecticut, Maryland, and Kentucky, charters were granted making it obligatory on the part of the elective officers to bind themselves to the performance of their respective duties by an oath.

The board of directors having been elected, the company has obtained legal status and is prepared to carry out the provisions of the charter in its possession.

The powers granted to the company, acting through the board of directors, include powers common to corporate bodies, such as purchasing, holding, selling, and leasing property; to have perpetual succession: to sue and be sued; to use a common seal, and in general to exercise those powers, rights, and privileges which other corporate bodies exercise, in order to carry out the provisions of the charter.

One power which is invariably given to the board of directors, with or without restrictions, relates to rates; and, considering the great importance which has always been attached to the question of rates, it may be well to bring together typical features of charters of different States on this important question.

Charter provisions as to rates.—A charter granted by Connecticut in 1832 provides that the company may charge "such rates per mile as may be agreed upon and established from time to time by the directors of said corporation." This, in substance, is the provision on rates which is more frequently found in railway charters in the United States than any other. The Connecticut charter just referred to names 3 "commissioners," who shall be sworn to a faithful discharge of the trust imposed upon them by virtue of the act, and who shall not be interested in any way whatsoever in the company.

A Colorado charter of 1865 provides as follows: "They (the board of directors) shall have power to establish such rates for the transportation of persons and property in all matters and things respecting the use of said road and the transportation of property as may be necessary: *Provided*, That the legislative assembly of this Territory, or any legislative body, having legislative authority over the county in which said road is located, may, after the expiration of 25 years from the passage of this act, and at the expiration of each period of 20 years thereafter, prescribe rates to be charged and collected by said corporation for transporting passengers and freight over said road and the branches thereof."

One of the earliest Florida charters grants the company "the right to demand and receive such prices and sums for transportation as may be from time to time authorized and fixed by the by-laws of said company or companies: *Provided*, That such prices and sums shall not be increased without at least 60 days' previous notice thereof being given." This charter further provided that the "tolls" should not yield more to the company than 20 per cent per annum on its stock, and any excess over 20 per cent should be paid into the internal improvement fund.

Maximum rates are prescribed in a charter granted by Georgia in 1837, as follows: "*Provided*, That the charge of transportation or conveyance shall not exceed 25 cents per 100 pounds on heavy articles, and 10 cents per cubic foot on articles of measurement for every hundred miles, and 5 cents a mile for every passenger." Similar provisions were incorporated in Georgia charters during succeeding years.

An Indiana charter of 1832 empowers the company to "change, lower, or raise rates at pleasure: *Provided*, That the rates established from time to time shall be posted in some conspicuous place or places."

A provision similar to that found in the Florida charter above quoted is found in a Connecticut charter of 1829. "It shall be lawful for them (board of directors) to charge for every hundred pounds transported 60 miles or upwards, 2½ mills per hundred pounds weight for each mile; for ever hundred pounds weight transported over 60 miles and under 60 miles, 3 mills for each mile; for every hundred pounds below 60 miles, 3½ mills per mile." Passengers were to pay 4 cents per mile.

A charter granted by Maryland in 1827 prescribed different rates for different directions. From north to south the freight charges were not to exceed 1 cent per ton-mile for toll and 3 cents per ton-mile for transportation; south to north the charges were not to exceed 3 cents per ton-mile for tolls and 3 cents per ton-mile for transportation. The maximum rate for the transportation of passengers was fixed at 3 cents per mile. The same State granted a charter in 1831 which fixed the maximum rate for freight at 3 cents per ton-mile for both toll and transportation, and for passengers not exceeding 3 cents per mile, provided the passenger does not carry baggage exceeding 50 pounds in weight and occupying space not exceeding 2 cubic feet.

The early Massachusetts charters, like the charters of other New England States, are the most complete of any that can be found in the legislation of other States. One of the earliest charters, granted in 1820, refers to a general law enacted by Massachusetts in 1808, thus subjecting the corporation created by the charter to the provisions of a general law. That is perhaps the earliest instance of its kind. While this charter fixes a maximum freight rate it does not mention passenger rates at all; but another charter granted by the same State during the same year provides that the company may impose charges "not exceeding 3 cents, and for every passenger passing and repassing not exceeding 2 cents per mile,

which shall be conveyed upon said railroad, exclusive of the expense of transportation, payable at such time and in such manner as may be described in the by-laws." It will be noticed that this charter, like the Maryland charter already referred to, makes at least a theoretical division of the aggregate charge into "toll" and "transportation."

The early charters granted by Michigan are essentially like those granted by Ohio, Illinois, and Wisconsin. Many of them are quite complete and contain leading features of typical charters. Those which are more carefully drawn contain provisions relating to maximum rates for both freight and passengers. The amount which the company may charge varies, however, very materially, not only in charters granted during succeeding years, but also in those enacted during the same year. For all of the Western States the statement holds true that among earlier charters we find more numerous examples of maximum rates, even though the same charters give the board of directors wide discretionary powers over rates. Following the period during which charters of this kind were granted, it was more common to omit the maximum-rate feature and to incorporate the power over rates in the board of directors, giving this body the right to charge such rates as it may from time to time think expedient. It may be noticed that an early Ohio charter (1838) makes a distinction in charges upon ordinary and "pleasure carriages."

There is no essential difference among the early charters of Pennsylvania and Maryland, except perhaps that in Pennsylvania a distinction was sometimes made between "through" and "way" passengers. Nor is the difference between the charters in these States and those granted by North and South Carolina a striking one, except that the systems of voting rather common in the Carolinas do not appear in the Atlantic States farther north. In 1837 North Carolina granted a charter which provided for maximum rates as follows: "On persons, not exceeding 6 cents per mile for each, unless the distances to which any person be transported be less than 10 miles, in which case the president and board of directors may be entitled to make an extra charge of 50 cents for taking up and putting down each person so transported; for transportation of goods, * * * not exceeding an average of 10 cents per ton mile; and for the transportation of mails, such sums as they may agree upon." In a similar manner later charters in both North and South Carolina prescribe maximum rates. These rates frequently bear a direct relation to distance and space occupied.

These quotations suffice to indicate the manner in which early charters in different parts of the United States attempted to control rates. The variety existing among provisions of this kind is no greater than among provisions on other subjects, and in nearly all instances the maximum rates prescribed appear to have been much above what railway companies would in ordinary circumstances be inclined to charge.

As a matter of interest, rather than of importance, it may be noted that in a few States several charters prescribe rates by reference to another charter previously granted by the same legislature. Thus a Michigan charter of 1848 refers to rates charged by the Michigan Central Railway; a Georgia charter of 1838 specifies that the company may charge as much as the Georgia Railroad and Banking Company; in 1831 Mississippi adopted a charter granted by Louisiana; and a Tennessee charter of 1851 grants the same provisions which have previously been granted to the Nashville and Chattanooga road.

Publicity of rates.—Publicity of rates is not generally provided for, although provisions on this subject are found in some of the charters granted by Indiana, Louisiana, Maine, New Hampshire, Vermont, New Jersey, South Carolina, Georgia, Missouri, and in occasional charters granted in the Northwestern States, all of which are fairly well illustrated by the clause of an Indiana charter quoted above. A Louisiana charter of 1831, after providing that such rates may be charged as shall have been previously fixed by the resolution of the board of directors, stipulates that "rates shall be published in some newspaper, * * * and it shall be unlawful to increase such rates, after the same shall have been established, during the period for which they have been established." The same charter further provides that every new board of directors shall publish a schedule of rates within 10 days after its election. Another charter granted 2 years later specifies the number of newspapers in which the schedule of rates shall be published, and that such rates "shall not be changed during the year in which they are established." Publicity of a different kind, and quite unique in railway legislation, is provided for by joint resolution of the South Carolina legislature of 1836: "That no charter for the incorporation of railroad companies, or in extension thereof, shall be granted by the legislature unless 3 months' public notice of the application for same be previously given by advertising in one of the papers of

the city of Charleston, and also in the paper of one of the counties in which said road may be situated, or, if there be no newspaper in such county, then by publication of such notice at the court-house or some conspicuous place in the county." The South Carolina resolution evidently aimed to accomplish the same thing as the declaration of utility in some of the other States, namely, to give interested parties an opportunity to be heard and to demonstrate to the public the necessity of incorporating the projected company.

Another, but a much more restricted, kind of publicity is that provided for in some charters granted in all parts of the country, by giving stockholders the right to inspect the books of the company at any time. This, however, is not publicity as we now understand it, for it simply gives the persons directly interested in the financial success of the enterprise access to the books, while the real and essential publicity suggested to-day is of a very different kind. It is therefore more a matter of curiosity than of vital importance that notice is taken of a New Hampshire charter of 1836, which provides that the books of the company shall be open for inspection by a committee of the legislature. Analogous provisions are occasionally met with in charters of Rhode Island and the Northwestern States, but to what extent legislative committees ever exercised this privilege does not appear.

Discriminations.—Relatively few early charters contain any reference to the matter of discrimination, which figures so largely in later railway legislation. Among the States which granted charters containing clauses on discrimination are North Carolina, Rhode Island, Vermont, and Wisconsin. A North Carolina charter of 1837 says: "They shall give no undue preference to the property of one person over that of another, but as far as practicable shall carry each in the order of time in which it shall be delivered or offered for transportation with the tolls paid or tendered." An early Wisconsin charter contains a much more elaborate provision on discriminations.

Administrative agents.—So far as internal evidence is concerned, early charters were granted upon the assumption that the companies organized under them would voluntarily fulfill the obligations imposed by the franchise. The assumption which underlies early as well as later railway charters is that they execute themselves. It is consequently doubly interesting to observe that the small State of Rhode Island apparently took the initiative in establishing commissions, for in 1836 the legislature of that State passed "An act to establish railroad commissioners." After providing for the appointment of three commissioners by the general assembly, the act specifies that "it shall be the duty of said board of commissioners, upon complaint or otherwise, whenever a majority of them shall deem it expedient, personally to examine into any or all of the transactions or proceedings of any railroad corporation that now is, or hereafter may be, authorized and established in this State, in order to secure to all the citizens and inhabitants of the same the full and equal privileges of the transportation of passengers and property at all times that may be granted, either directly or indirectly, by any such corporation to the citizens of any other State or States, and ratably in proportion to the distance any such persons or property may be transported on any railroad as aforesaid; and to inquire into any contract, understanding, or agreement by which any railroad company shall attempt to transfer or give to any steamboat company any favor or preference over any other such company or boat, either as to freight or passage, contrary to the true intent and meaning of this act and the several acts hereafter passed in relation to railroads."

The commissioners in the Connecticut charter quoted before may here be recalled, together with the boards of internal improvement of Tennessee and Florida, which had some, although much more restricted, administrative powers over certain railways. Analogous functions were performed under a Vermont charter of 1843, by which "the supreme court at any stated session thereof, * * * upon application of ten freeholders in any town or towns through which said road may pass, may alter or establish the rates of toll upon said road for any term not exceeding ten years at any one time." It is evident that the Rhode Island commission is the only one of these bodies that could exercise, under the law, fairly comprehensive administrative functions. The Vermont court is here alluded to simply because it is another illustration of the introduction into the management of railway affairs of persons other than those directly interested in the corporation.

Powers reserved to the legislature.—Considered numerically, a majority of the charters granted in the different States do not reserve to the legislature either specified or general powers. It is very common, however, for charters to contain provisions reserving to the legislature the right to regulate, with more or less latitude, the charges of transportation. In the New England States this power could generally be exercised under charter rights as long as the net income of the

railway in question exceeded a certain per cent, usually 10. Thus a Massachusetts charter of 1829 reserves to the legislature the right to revise the schedule of rates every 4 years if the net income exceeds 10 per cent. A contemporary New Hampshire charter gives the board of directors full power over rates, and permits the legislature to reduce them after 10 per cent net on the investment has been realized. A clause typical of provisions of this kind is found in an early Maryland charter: "That nothing in this act shall be construed so as to prevent the legislature of this State from legislating upon the subject of the tolls reserved in this act at any time after the expiration of 20 years after the passage of the act: *Provided*, That at no time shall the toll be so regulated or reduced as to yield less than 6 per cent per annum." Other Maryland as well as Pennsylvania charters embody analogous provisions. Ten per cent net income is by far the most common limit placed upon the discretionary powers of legislatures over railway rates in all the States in which such chartered provisions are found. In a few instances the rate of net profits permitted under the law is very much larger. For instance, in Indiana charters were granted permitting the legislature to regulate rates whenever the profits exceeded 15 per cent, and any excess above 15 per cent was to be paid into the common-school fund.

Another right reserved to the State in a considerable number of charters is the power to purchase the railway after a certain number of years. This power was frequently reserved in the charters of the New England States, the significance of which was perhaps illustrated in the agitation accompanying the recent leasing of the Boston and Albany Railway. Early Massachusetts charters reserved to the State the power to purchase after a period of 20 years. In Vermont this period of discretionary power of the State varied from 20 to 50 years. New Hampshire followed Massachusetts, fixing it at 20. An Illinois charter of 1850 gives the State the right to purchase, after 25 years, by refunding to the company the cost of the entire plant, with interest at the rate of 6 per cent per annum. In New Jersey similar right was reserved after 30 years. An early Michigan charter contains a provision which is typical of isolated charters in all of the Northwestern States: "The State shall have the right, at any time after the expiration of 15 years from the completion of said road, to purchase and hold the same for the use of the State at a price not exceeding the original cost of said road, exclusive of repairs thereof, and 14 per cent thereon, of which cost an accurate account shall be kept and submitted annually, on the first Monday in January, to the legislature, duly attested by the oath of the officers of said company, and at such other times as the legislature shall require the same." In Missouri a charter granted in 1837 reserved to the general assembly the right to purchase the railway after 4 years by giving notice in writing. This charter also provided for the appointment of valuers, whose function it was to fix the price of the transfer.

Limitations on the life of charters.—The preceding paragraph illustrates one class of limitations placed upon some charters in all parts of the United States. While a majority of the charters are silent upon this point, now and then charters were granted which were limited in their existence to a certain period of years, varying all the way from 10 and 20 to 90 or more years. One of the powers granted in the charters which do not contain provisions directly limiting their life was that which gave to the board of directors "perpetual succession," which means, of course, a franchise unlimited in the period of its existence. In the Northwestern States a few charters were granted limiting the life of the corporation to 50 and 60 years. Florida granted a few which were to lapse after a period of 20 years; Louisiana, after 40 and 50, and, in one instance, 25. In one charter, a provision is found that after a certain number of years the same shall expire, and the assets of the corporation shall be distributed among the stockholders. The session laws of the different States contain numerous acts extending the charter period in those cases where the original act contained time limits; and it is obvious that in all those instances in which the charter reserved to the legislature the right to purchase, no time limit whatever was necessary.

Limitations on the power of taxation.—After the country at large had begun to realize the necessity and importance of railway transportation, various means were resorted to to encourage the construction of railways. American manufacturers were unable to provide the necessary material. This had to be imported from abroad, hence it was but natural that legislators should have resorted to the expediency of exempting from import duties materials to be used in the construction of railways. But the railways, after they had been constructed, represented valuable property, and to that extent increased the taxable resources of the territory in which they lay. To provide against the imposition of taxes, which might become burdensome or even discourage the construction of railways, legislatures of States in all parts of the Union incorporated, in some charters, a provision

limiting the power of the respective States to tax railway property; and, in a considerable number of instances, exempting such property altogether from taxation, usually for a limited period of years. "That the capital stock of said corporation shall be and remain free from taxation until the profits collected by said railroad corporation shall be sufficient to afford a dividend of 5 per cent per annum on the capital stock." This is from a Connecticut charter of 1833, and represents analogous provisions found in New England charters of that period. In Massachusetts some charters exempted railway property from taxation for one or more years, after which the legislature had the right to levy a tax not exceeding a certain sum, frequently 25 cents per annum, on each share of the stock. In the Northwestern States isolated charters limit the power of taxation to a certain per cent on the capital stock; others to a certain per cent on the net income. Then, again, other charters make railway property liable to taxation like all other property; and late laws in a few of the Western States specifically state that no railway property shall be exempted from taxation.

State participation.—To a limited extent the individual States participated in the construction of railways, either by becoming stockholders and lending the credit of the State or by giving direct financial aid. The well-known illustrations of the railways owned by the States of Georgia and South Carolina and the city of Cincinnati, stand quite alone in the contemporary railway history of the United States. The history of internal improvements had been such as to discourage the active participation of our commonwealths in the construction of railways. Works of internal improvement, greatly exceeding both the capacity to construct and to utilize them, had been projected by many States. The inevitable failure of these gigantic projects brought these States into disrepute as active economic agents; hence we find in constitutions and charters granted after this period of disaster in State works of internal improvement direct prohibitions of State participation. As a matter of historical interest, however, it may be well to notice a few typical instances of direct or indirect participation of the State in building up our railway system. It should be noted that the term "state" is here used in the specific rather than the generic sense, for even after constitutional prohibitions and statutory restrictions had become common, the smaller political units—county, town, village, and city—freely participated in railway enterprises. Large numbers of illustrations can be found in nearly every State. An act of the legislature of Maryland, in 1827, authorized subscription on the part of the State to the stock of the Baltimore and Ohio Railway. A contemporary Michigan charter empowers the State to take stock in the company chartered; likewise in case of New Jersey; also in Arkansas and other States in the Mississippi Valley. An early Indiana charter limits the State in its subscriptions to 500 shares, and in Louisiana the governor is authorized to subscribe a certain amount in behalf of the State after a certain number of shares have actually been paid for by individuals. In turn, the governor may appoint one director to represent the interests of the State. It is important to notice that in this representation of the State in the management of railways to protect the financial interests of the Commonwealth may be found the beginning of attempts at administrative control of our railways. In like manner the board of internal improvements, and later the commissioner of railroads appointed by the governor, were intrusted with the interests of the State in the control of railways to which Tennessee had given aid. Isolated charters in Wisconsin, Michigan, and other Northwestern States, as well as in various other States, authorized the company to borrow money and to pledge the credit of the State in its payment. In a few States, like Wisconsin and Texas, attempts were made to utilize the school fund in the construction of railways, on the plea that such an investment of these funds would be carrying out the provision of the law directing that school moneys shall be invested in the most profitable manner. In the estimation of the promoters of such plans, nothing could be more profitable than the railways which they had projected.

Miscellaneous provisions.—Under this head mention will be made of provisions found in isolated charters in States in all parts of the country, being essentially alike in substance, although varying in the form of expression or exact scope of their contents. During the early part of the nineteenth century it was common to organize corporations for a variety of purposes. Experience soon demonstrated that corporations which divided their interests and their energy among two or more enterprises became involved sooner or later in difficulties, if not in absolute failure. As a result of this experience it was not long before State legislatures enacted general laws or inserted provisions in special charters to the effect that corporations shall be organized only for one specified purpose. A few charters, for instance, were granted, which authorized the construction of a railway, as well as participation in other kinds of business. An excellent illustration of this is

found in the title of the Georgia Railroad and Banking Company, which has lasted into our own times. There appears to have existed a very close affiliation between railroading and banking, the same corporation frequently engaging in both kinds of business. A reaction against this is clearly shown in statutes and charter provisions prohibiting railway companies from engaging in the banking business. Such prohibitions are found in the charters of Alabama, Illinois, Kansas, Michigan, Nebraska, Pennsylvania, South Carolina, Florida, Georgia, Wisconsin, and other States.

The route of the railways chartered by the various acts is described with varying degrees of completeness and accuracy. In perhaps the great majority of charters the termini and a few leading intermediate points are named; in others, only the termini; and in still others, nothing more definite than the expression that the railway in question shall be constructed between some eligible point on a certain river to another eligible point on a certain lake or in a certain township. Instances are recorded in which projectors solicited aid in the construction of a railway along one route and then chose another, and repeated their solicitations for aid along the second, and perhaps secured support from both.

The amount of land which the railway company might legally hold was quite generally restricted to that which was necessary for construction and operation—a strip of 100 feet in width, and, in addition, whatever may be necessary in order to secure material and for the construction of depots, warehouses, and other necessary buildings. In many of the States the right of way was donated to the company; and, of course, in numerous instances, State and Federal grants were given in aid of railways. But to provide for the purchase of the necessary land, charters usually contain provisions relating to eminent domain or expropriation. Most charters name some officer or tribunal before whom cases relating to condemned property may be heard and the manner in which decisions and awards may be made.

The capital stock of the company was usually named in the charter, although, with very few exceptions, the amount of the capital stock apparently bears no relation to the magnitude of the railway in question. In only a few instances does the charter fix a definite ratio between the number of miles of road and the amount of the capital stock. While now and then a charter does not provide for the payment of anything whatsoever at the time subscriptions are made, or calls for only a dollar or two, in a large number of charters a payment of \$5 is called for at the time subscribers enter their names on the books of the company. Usually the manner in which the balance shall be paid is indicated, and the number of days' notice which must be given is stated. The voting power of stockholders is quite generally limited to one vote per share, although in the North and South Atlantic States the graded system of voting, by which the number of votes of the individual stockholder decreases as his holdings increase, is common.

It is a familiar fact that our early railways were built for short distances and without reference to one another, and that our present magnificent systems are but consolidations of large numbers of smaller roads. We are not surprised, therefore, to find the subject of consolidations rarely touched upon in early charters. To be sure the term is used; and now and then a clause, either directly authorizing or prohibiting consolidations, was put into a charter. The right to cross other railways, as well as to form junctions, is frequently granted; and in reality such a right can easily be construed as the right to consolidate. Similarly, the power to operate and lease other railways was frequently given, although in the Southern States the term "farming" is sometimes used.

Later charters quite generally expressly prohibit the leasing or joint operation of parallel or competing lines; and in numerous early charters companies are protected against the construction of parallel lines either within a certain number of years or a certain distance from their own roads.

A great majority of charters provide for an annual report in one form or another. This report is most frequently made by the board of directors to the stockholders; in fewer instances to the legislature; and, in still others, to both the stockholders and the legislature. The number of items specified in this report varies all the way from less than 10 to more than 100.

Forerunners of laws relating to safety appliances and the protection of persons and property can also be detected in early charters. Provisions may be found relating to the order in which cars shall be put into a train, the manner in which crossings shall be protected, bells upon locomotives, fences along tracks. (It is a matter of curiosity that in some of our earliest charters, provision is made for the construction of gates across the railway tracks, which the train operators are to open and close whenever they cross the public highways.)

The transportation of troops and munitions of war is occasionally provided for; and in various Southern States railway officers are expressly exempted from the performance of military duty. In a few charters the power of the company to own slaves is treated. A sinking fund is also mentioned in a very few of them.

An archaic feature of our charters is found in the provisions relating to the use of the same railway track by different shippers, and the rules governing the construction of rolling stock. For example, in Massachusetts a corporation was authorized to specify in its by-laws the form and construction of the wheels, and the weight of the loads which should pass over its road. This clause had directly in view the use of vehicles other than those owned by the corporation. In several charters granted in the Northwestern States the form of the vehicles, as well as the price to be charged for the transportation of goods and owners' vehicles, is specified in the charters. In New Jersey, it is provided "that no farmer belonging to this State shall be required to pay any toll for the transportation of the produce of his farm to market over the said road or roads, in his own carriage, weighing not more than one ton, when the weight of such produce shall not exceed 1,000 pounds, but the same farmer may be charged toll as for empty carriage." It will be noticed that the term "toll" is here used to designate remuneration for the act of transportation, while the term "expense," or "cost of transportation," as was noted in an earlier paragraph, relates more particularly to remuneration for the use of the track and represents a contribution to the fixed charges of the road.

PART II.—LATER CHARTERS AND EARLY GENERAL LAWS.

General characteristics.—The terms "early" and "late," used with reference to railway charters, are relative in their significance; for the same year which is early in the history of one State may be late in that of another. For instance, charters granted in the New England and Middle States between 1835 and 1840 may be characterized as later, while those granted in States like Wisconsin and Minnesota during those years would decidedly belong to the earlier charters of that section. The legislative history of railways in the various States of the Union is essentially similar, and as we observe the movements of this legislation from east to west we may notice that in turn each State goes through, in the main, all the experiences and stages of advancement of other States which preceded it in railway development. An examination of the contents of these charters, as one observes their march westward, clearly indicates the fact that the restrictions of the earlier types granted in the East are gradually made milder, if they are not altogether lost. Occasionally there is a reversion to type—a Western charter embodying all the salient restrictions and regulating features of the severest Eastern charters. The additional observation may be made that the maximum-rate provisions, which are rather common in the charters of the earlier East and Middle West, are frequently embodied in later charters. Then, as time advances and the more modern phases of railroading make their appearances, clauses referring to consolidations, discriminations, and even long and short haul are occasionally inserted. Aside from the enumeration of names comprising the board of commissioners, which usually appears in the first or second section of the charter, no regular order is maintained.

It is clear that States copied largely from one another, and in the process of copying different charter sections appear to have become badly mixed; and in numerous instances a considerable number, even a majority, of clauses incorporated in the more complete charter which served as the model are left out altogether.

While large numbers of special charters were granted up to 1870, general laws relating to railways appeared early in the thirties, and in a few isolated cases even before that time. A custom which aided in bringing about the transition from special to general laws was the abbreviation of railway charters by reference to previously granted charters in the same or, in isolated cases, in other States. Under this custom the charter only contained a few purely individual and local specifications, with the additional blanket provision that the company thereby incorporated shall enjoy all the rights and privileges previously granted to another specified corporation. Thus, in New York numerous charters are abridged by reference to the Attica and Buffalo charter granted in 1836. The same method was largely employed in the construction of charters in Maine, Virginia, Missouri, Indiana, Minnesota, Tennessee, and other States. When, as was often the case, a considerable number of charters were abridged in the same State by reference to some one charter, an element of uniformity was introduced with almost as much efficiency as if general laws had been enacted.

One of the peculiarities of railway legislation in all sections of the country is the granting of special laws after general laws had been enacted in the respective States. Indeed, it is not uncommon to find upon the statute books a comprehensive general law enacted on a certain day and perhaps a special charter granted, if not on the same, then on immediately succeeding days. Large numbers of special charters were granted completely ignoring in their provisions existing general laws.

The Northern Pacific franchise.—A late illustration of the organization of a railway company under special charter is afforded by the history of the Northern Pacific Railroad, the leading facts of which are set forth by the general counsel of that company in the preface to his compilation of the Northern Pacific charters.

"Soon after the institution of the foreclosure proceedings it was determined that it would be necessary to reorganize the Northern Pacific Railroad Company under a new charter, to be obtained either from Congress or from some one of the States. Congressional legislation was considered doubtful, and the reorganization committee early took steps to secure a charter for reorganization under a State law.

"In all of the States in which any portion of the property is situated the granting of charters by special act is prohibited, and corporate organization can only be effected under general laws. Such a constitutional amendment had been adopted in Wisconsin in November, 1871, but the supreme court of Wisconsin had several times decided that the amendment was prospective in its operation, and left the legislature at liberty to amend special charters granted prior to the adoption of the constitutional amendment.

"It was considered preferable to secure a special charter, which should be open from time to time to special amendment, and it was determined that the charter of the Superior and St. Croix Railroad Company (a Wisconsin corporation) would be the best adapted for the purpose. This charter was acquired by the purchase of all the stock of the company and was amended by special act (chapter 244, Laws of 1895) of the legislature of Wisconsin, as hereinafter set forth.

"As the reorganized company was to acquire the vast properties of the Northern Pacific Railroad Company and to issue thereon a great amount of stock and bonds in order to carry out the plan of reorganization, it was thought prudent to leave unsettled no possible question, however technical, based upon nonuser or upon any other ground, concerning the validity of the charter. To test the question the attorney-general of Wisconsin applied to the supreme court of that State for leave to file in the court, according to the practice thereof, a bill in the nature of a quo warranto to forfeit the franchise on the ground of nonuser. The case was fully argued, and on the 19th day of June, 1896, the supreme court unanimously decided that the corporation was not dissolved by nonuser, and that if any ground for forfeiting the charter had existed it was waived by chapter 244 of the Laws of 1895 amending the charter above referred to. So that before the purchase of the properties of the Northern Pacific Railroad Company and the increase of its capital stock and the provision for the issue of securities, the validity of the charter of the present Northern Pacific Railway Company (formerly Superior and St. Croix Railroad Company), by the unanimous decision of the highest court of the State, had become *res adjudicata*."

The charter of the Superior and St. Croix Railroad Company, upon the basis of which the Northern Pacific now does business, was granted in 1870 and provided for the construction of a rather short and not very important railway in the north-western part of the State of Wisconsin. The road, however, was not built, and the charter provisions were not made use of. A few unimportant amendments were adopted in 1871, and in 1895 the legislature of Wisconsin adopted another and very comprehensive amendment which, together with the original charter, constitutes the present franchise of this great transcontinental line. The amendment of 1895 describes the route of the present Northern Pacific; it gives the company power, among other things, "to receive and store any property in any of its depots or other buildings, including elevators * * * ; to demand, collect, and receive such sum or sums of money for the transportation of persons and property and for the storage of property as shall be reasonable." The extension of the road and its connection with other lines was not directly provided for in the charter itself, but the general laws of the State, as amended in 1897, grant ample powers for this purpose:

"Any railroad corporation organized and existing under the laws of the Territory or State of Wisconsin, or existing by consolidation of different railway companies under the laws of the Territory or State of Wisconsin, and of any other Territory or Territories, State or States, may consolidate its stock, franchises, and property with any other railroad corporation, whether within or without the State, when their respective railroads can be lawfully connected and operated together, to constitute one continual main line, with or without branches, upon such terms as may be agreed upon, and become one corporation by any name selected, which within this State shall possess all the powers, franchises, and immunities, including the right of further consolidation with other corporations under this section, and be subject to all the liabilities and restrictions of this chapter, and such in addition, including land grants and exemptions of land from taxation, as such corporations peculiarly possessed or were subject to at the time of consolidation or amalgamation by the laws then in force applicable to them or either of them."

The Wisconsin statutes, like those of most other States, as will be noted more in detail later, prohibit the consolidation, lease, purchase, or control by one railway corporation of another parallel or competing line, to be determined by jury. To complete its franchise the Northern Pacific filed this charter in all the other States through which it runs, and appointed certain persons as its legal representatives in those Commonwealths. In Idaho a special promise is exacted to the effect that the corporation accepts in full the provisions of the State constitution. It should be noticed that the reorganization of the Northern Pacific under a special charter took place at a time when every State through which its lines pass had on its statute books general laws governing the organization of railway companies.

The physical location of the railway is by no means an indication of the source of its legal power, for, as in the case of the Northern Pacific, a great system may be operated on the basis of a charter granted to an insignificant road in a distant State. The Southern Pacific, for instance, is organized under the laws of Kentucky. What constitutes the essence of the legal privilege of a modern railway corporation is an extremely complex problem, the difficulty of which is strongly impressed upon us when we realize that scores, if not hundreds, of separate charters granted by different States are comprised in the existing franchises of our great companies. The Pennsylvania company, for instance, represents more than 150 original lines, each having its special charter or certificate of incorporation. Many of these charters represent conflicting, if not mutually exclusive privileges, and what the charter rights of such a corporation are is a question difficult of solution. Not only is there a possibility of conflict between the diverse provisions of different charters, but also between the charters and the general laws, although in many States the supremacy of general over special laws has been at least acquiesced in, if not publicly recognized. The chairman of the Massachusetts railway commission writes that in that State it has been recognized that general laws have superseded the earlier special enactments. This appears especially significant when we remember that, with a few minor exceptions, all the railways of Massachusetts were incorporated under special charters—a compilation of which makes a good-sized volume—before comprehensive general laws had been passed. This possibility of a conflict between special and general laws is illustrated in the railway history of Michigan. The legislature of that State in 1898 created a commission, composed of the railway commissioner and two State officers, to negotiate with certain railway companies of the State operating under special charters, for the purpose of ascertaining upon what terms the companies would be willing to surrender their charters. While the question of the amount of taxes these companies were to pay was the immediate cause of this action on the part of the legislature, a similar situation with respect to the other question is by no means an impossibility. No further reference is here made to this difference between the railways and the State, because it involves the question of taxation, which the Industrial Commission has fully treated in another part of its report. (The well-known instance of the Illinois Central and the reserved rights of the State with respect to taxation in the charter of that company is also suggested in this connection.)

Early general laws.—In the first part of this report on early charters reference is made to an early law of Massachusetts of 1808. In 1833 the legislature of that State enacted a law "defining the rights and duties of railway corporations in certain cases." This law was included in a larger act on canals, turnpikes, and railroads. The law of 1833 also embodied the idea of a preamble by specifying that petitions for the construction of a railway shall be accompanied by the report of a competent engineer. Connecticut, in 1849, adopted a fairly comprehensive amendment to the earlier act relating to railway companies. In the first section this law provides that all railway companies shall be subject to general laws, except when otherwise specially provided for. A provision similar to that found in Massachusetts was embodied in the law providing for the report of a competent engineer in connection with the petition for a charter. The usual provisions with respect to organization, shares of stock, location, annual reports, and other financial affairs of railway companies were provided for. In Maine a general law adopted in 1841 contained the following section: "No petition for the establishment of any railroad corporation shall be acted upon unless the same is accompanied and supported by the report of a skillful engineer, founded on actual examination of the road and by other evidence, showing the character of the soil, the manner in which it is proposed to construct said railroad, the general profile of the country through which it is proposed to be made, the feasibility of the route, and an estimate of the probable expense of constructing the same. The

petition shall set forth the places of beginning and ends of the proposed railroad, the distance between the same, the general course of said railroad, together with the names of 5 towns through which the same, on actual survey, may be found to pass." This provision is typical of analogous clauses in the laws of other North Atlantic States. By 1848 Maine granted charters containing only a few sections, together with the additional statement that "all the privileges and immunities usually granted to such corporations" shall be delegated to the company thereby formed. New Hampshire adopted a general law in 1843 dealing with expropriation, crossings, fences, contracts among railway companies, and so on. The year following "An act to render railroad corporations public in certain cases, and constituting a board of railroad commissioners" was adopted. The commission established by this law was empowered to lay out routes on petition only, to inspect roads and railway accounts. Vermont enacted similar laws in 1846-47 and 1849, the latter being quite a comprehensive general law.

New York, which is representative of the Middle States, had passed 90 general laws before 1834, beginning with an act to prevent injury to railroad property and to insure the safety of passengers. These laws embraced subjects like the relation of railroads to canals, highways, Indian lands, to taxation, maps and profiles, contracts, loaning the credit of the State, carrying mails, junctions, baggage checks, altering lines, transportation of freight, suits against companies, destruction of noxious weeds, and such like. A law of 1843 compelled railway companies to report annually to the secretary of state. Like the New England States, New York declared the "public use" of a railway, and demanded proof that the proposed railway was of "sufficient utility to justify the taking of private property" in accordance with the provisions of the general law authorizing the organization of railway companies. By 1848 New York had worked out a fairly comprehensive general law, but it was not until 1850 that what may be called the fundamental law of the State was adopted. (The New York law of 1850 was transcribed, with the exception of a few sections relating to the Erie Canal, by the legislature of Wisconsin in 1853, which, however, failed to pass the bill.) The law of 1850 forbids the organization of corporations by special acts, except for municipal purposes and in cases where, in the judgment of the legislature, the objects of the corporation can not be obtained under general laws. In addition, it contains, among others, provisions relating only to the organization of railway companies, subscription and forfeiture of stock, transfer and increase of stock, expropriation, change of route, filing maps and profiles, paying labor employed in construction, formation of trains, baggage, intoxication of employees, annual report of over 100 items, and other phases of legislative control.

Notwithstanding numerous general laws, the New York and Erie Railway secured 17 amendments before 1850. The Portsmouth and Concord Railway secured 1 amendment during each of the first 10 years of its existence. The Western Branch, Massachusetts, secured 22 amendments before 1853, and the Eastern Branch secured 18. Thirteen were granted to the Housatonic between 1838 and 1850; the Camden and Amboy, 15; the Delaware and Raritan, 14. The Pennsylvania adopted 22 up to 1854, and the Baltimore and Ohio 21 between 1838 and 1852. Since these amendments dealt with such topics as the increase of stock, the issuance of bonds, holding lands, building telegraphs, extending lines and forming connections, the construction of bridges, and so on, it is obvious that a single comprehensive law, properly observed would have answered all the purposes, and in a uniform way, of all the special charters with which the various legislatures had to concern themselves. Numerous contemporary newspaper paragraphs can be found deploring the fact that legislatures are obliged to use so much of their time for the construction of special laws which could be so much more efficiently dealt with under general statutes.

Among the States of the Middle West, Illinois began early. In 1849 the legislature of that State passed "an act to provide for a general system of railroad incorporations." This law prescribes the formation of railway corporations and the powers, duties, and liabilities of officers. The board of directors is given full power over rates, but these are limited to 3 cents per mile for passengers, unless otherwise provided for by special act of the legislature. The legislature is empowered to reduce rates without the consent of the company, but no such reduction shall cause the net profits to fall below 15 per cent per annum. The probable use of the proposed railway must first be ascertained, and the interested parties must be given an opportunity to be heard. Annual reports are demanded, and the act is to apply to all existing corporations, so far as the same is not in conflict with special charters granted. The legislature of Massachusetts, in 1855, adopted a comprehensive general law including provisions on legislative control of rates, junctions, taxing capital stock 1 per cent per annum, providing for reasonably good service, consolidation, and so on. However, in this, as in so many

other States, during succeeding years charters were granted by the legislature which are as long and involved as if no general laws had been in existence. Iowa (consult Dixon, *State Railroad Control in Iowa*) passed an incorporation law, providing for the incorporation of railroads, at the first session of its general assembly, and in most of the earlier legislation of that State interference with railway management is foreshadowed. A law of 1856 contains the significant provision that "railroad companies accepting the provisions of this act shall at all times be subject to such rules and regulations as may from time to time be enacted." In 1860, maximum rates were prescribed, and 2 years later railways were required to maintain offices within the State and to submit annual reports. Another law provided for the periodical publication of rates and certain provisions relating to safety.

The active regulation of rates was attempted in 1866, but most of the restrictive laws enacted up to this time were rarely enforced. Kansas, after most prolific crops of private charters, passed an elaborate general law in 1857, but within 3 days after this law had been passed a special charter was granted without reference to the act in question, although covering in its provisions matters which the general law treated very elaborately. The contents of this rather elaborate law are essentially like those of the Illinois law.

Taking North Carolina and Alabama as representatives of another section of the country, it may be said that their general laws, while fairly comprehensive, are not as complete as the best laws of States farther north. The North Carolina law of 1871 embraces 70 sections, in one of which a maximum rate of 5 cents for passengers is prescribed; another calls for an annual report of 105 items, and another prohibits consolidation with parallel or competing lines. The Alabama law of 1850 reserves to the legislature the right to alter or repeal any certificate of incorporation; it places a limit upon the indebtedness which the company may assume; and contains furthermore the very novel provision that no railroad shall be constructed through an orchard without the owner's consent. In 1858 all railway companies were made subordinate to general laws.

California was one of the few States which began to legislate on railway matters in general rather than special acts, beginning with 1850. In 1853 a law was passed which enabled any 25 persons to form a railway company. The life of the franchise was limited to 50 years. While section 2 of the law specified that the capital stock of the company shall exactly equal the actual cost of the road, section 16 empowered the company to increase its capital stock "to any amount which may be deemed sufficient and proper for the purpose of the corporation." This law was amended in 1853, 1856, and 1857, but in 1861 the whole of it was repealed and another law, supplementary to the original general act of 1850, was adopted. An important provision of this last law is found in section 1, which specifies that at least \$1,000 per mile shall be subscribed, and 10 per cent actually paid in before the articles of incorporation can be filed. The form of the articles of the association is prescribed, and the period of its existence limited to 50 years. A sinking fund for the redemption of bonds is provided for and the unusual liberty of laying out its road, "not exceeding 9 rods wide," is given to the company. There are elaborate sections on eminent domain, arbitration, tolls, and so on. By a vote of three-fourths of the constituents of the companies, consolidated railway corporations may be organized. Maximum rates of 10 cents per passenger-mile and 15 cents per ton-mile are prescribed, although the company can not be compelled to undertake the transportation of a small quantity of freight for less than 25 cents. The maximum rates of the California law are in part exceeded by those prescribed in a Washington charter granted in 1862, which are 10 cents per passenger-mile and 40 cents per ton-mile. It is also a significant fact that the first general law enacted by the legislature of Washington, in 1873, relates to "extortion and unjust discrimination in the rates charged for the transportation of passengers and freight on railroads in this Territory." Montana, Colorado, Arizona (Territory), and Idaho are other States which, like California, began with general laws.

PART III.—CONSTITUTIONAL PROVISIONS.

General considerations.—Constitutional provisions probably represent the more fundamental and permanent features of railway legislation. It may be assumed that the provisions incorporated in the constitutions of the various States of the Union were thought to represent those matters respecting railways which the people of the different States, represented in their respective legislatures, considered most important and least likely to require changes in the future. The history of American constitutions does not reveal an undue readiness on the part of the people to change or modify their organic laws; and in view of this slowness in bringing about constitutional changes an element of fixity and rigidity is infused into the legislative control of railways.

The constitutions of the older States, as a class, contain fewer and less comprehensive provisions relating to railways; and two of them, Massachusetts and New Hampshire, embody no direct provisions of this kind, while Rhode Island is saved from being classified with these two States by a brief and rather unimportant constitutional provision. In addition, there is an absence of clauses relating to railways in the organic codes of the Territories of Arizona and New Mexico. With these exceptions, every State in the Union contains more or less elaborate provisions on this subject, varying from the less comprehensive and incomplete sections of many of the constitutions of the older States to those much wider in their scope and stringent in their nature, as in the recently adopted constitution of Montana.

By far the greater part of the contents of all the constitutional provisions may be grouped under three general heads: First, those relating to incorporation; second, those relating to public aid; and, third, to direct regulation and control, the latter having in view the correction of abuses and the establishment of equitable rates. While a few of these provisions are negative in their character, a good many of them are positive, empowering legislatures to establish rates and to do other things calculated to subordinate the agencies of transportation to the public good.

Acceptance of the constitution.—Fifteen State constitutions contain provisions to the effect that no railway, canal, or other transportation company in existence at the time of the ratification of the constitution shall have the benefit of any future legislation by general or special laws, other than in execution of a trust created by law or by a contract, except on the condition of complete acceptance of all the provisions of the section or article of the constitution in question. In a few instances the further provision is embodied that whenever existing charters are revised or amended, the same shall become subject to the constitution. (The constitutions incorporating such provisions are found in Alabama, Arkansas, Colorado, Delaware, Idaho, Kentucky, Louisiana, Mississippi, Montana, North Dakota, Pennsylvania, South Dakota, Texas, Utah, Wyoming.)

Corporations organized under general laws.—In the first section of this report it was noted that great crops of special charters were produced in all sections of the country, and it was perhaps a reaction against those excesses in special and local legislation which led to the adoption of constitutional provisions prohibiting the organization of railway and similar companies under special charters. One method of avoiding these constitutional and statutory provisions was observed in the case of the Northern Pacific Railway; but Section XXI of the original charter of the Superior and St. Croix Railroad Company declared "that in the judgment of the legislature of this State the objects of the corporation hereby created can not be attained under the general laws." The later constitutions of the Western States are very stringent in this respect, and the organization of a large class of corporations, of which railways are an important member, under special acts, is rigidly prohibited. (The following States have incorporated

such prohibitions in their constitutions: Arkansas, California, Colorado, Delaware, Florida, Illinois, Idaho, Indiana, Iowa, Louisiana, Maryland, Michigan, Minnesota, Missouri, New York, North Carolina, South Carolina, Utah, West Virginia, Wisconsin, Wyoming.)

Previously granted charters.—Closely allied to the last type of constitutional provisions is another, found in only 6 States, which invalidates all charters and special or exclusive privileges granted before the adoption of the constitution, unless organization had been actually effected. Organization thereafter could not be effected without a full acceptance of the new constitution. (This is found in the constitutions of Arkansas, California, Colorado, Kentucky, Idaho, Wyoming.)

Special charters.—In addition to the positive provision that railway companies shall be organized under general laws, 19 constitutions contain the negative clause that no special charters shall be granted, except for charitable, educational, and certain other purposes, when the same shall remain under State control. A few constitutions specify that special charters may be granted to corporations and organizations not having in view financial gain. (The following are the States whose constitutions contain such provisions: Arkansas, Colorado, Idaho, Kentucky, Kansas, Minnesota, Mississippi, Missouri, Nevada, New Jersey, North Dakota, Ohio, Oregon, South Dakota, Tennessee, Texas, Utah, Washington, Wyoming.)

Railways public carriers.—The analogy of railways to common roads and other public highways is expressed in constitutional provisions declaring all railway and canal companies to be common carriers. While provisions bearing on this topic are differently worded in the different constitutions, sometimes a separate section being devoted to it, and in other instances only a phrase or sentence embodied in another section, the meaning is usually the same; namely, the declaration that the railway is a public highway and that railway companies are common carriers. (The following constitutions contain such provisions: Alabama, Arkansas, Colorado, Idaho, Louisiana, Mississippi, Missouri, Montana, Nebraska, North Dakota, Ohio, Oregon, Pennsylvania, South Dakota, Texas, Utah, Washington, West Virginia, Wyoming.)

Eminent domain and public use.—Ever since the Supreme Court of the United States handed down the decision of *Munn v. Illinois*, declaring that whenever a person devotes his property to a use in which the public has an interest, he must grant, to the extent of that interest, the right of the State to control that property, no one could consistently question the public nature of railways. This fact has found common expression in the term "quasi public," which is now generally applied to railway corporations. A large number of State constitutions declare that the respective legislatures may take the franchise and property of railway companies and subject the same to public use, when the general welfare requires it, in the same manner in which the property of individuals is taken. In other words, these States reserve in their constitutions the power to exercise the right of eminent domain over all the corporate property of a railway company. (The following States have this provision: Arkansas, California, Colorado, Idaho, Illinois, Kentucky, Mississippi, Missouri, Montana, Nebraska, North Dakota, Pennsylvania, South Dakota, Washington, West Virginia, and Wyoming.)

Power to annul charters.—Sixteen States reserve constitutional power to alter, amend, revoke, or annul charters granted under special or general laws, whenever in the opinion of the legislature it may be injurious to the citizens of the State in question to continue the same. Usually the additional clause is incorporated that in case of such repeal or revocation no injustice shall be done to the members of the corporation. (Found in the constitutions of Arkansas, California, Colorado, Idaho, Iowa, Kansas, Mississippi, Montana, New York, North Carolina, Oregon, South Dakota, Utah, Washington, Wisconsin, and Wyoming.)

Public aid.—Even after the downfall of the national system of internal improvements, together with the failure of individual States to make such works a success, subordinate political units—counties, towns, cities, villages, etc.—extended aid to railway companies in a variety of ways, the most common among which were granting the right of way, making cash donations, purchasing bonds, or becoming stockholders, loaning the public credit, etc. Provisions relating to subscriptions to stock are found in 14, and to loaning of the public credit in 15 constitutions. (The former including the following States: Arkansas, Connecticut, Delaware, Florida, Idaho, Louisiana, Kentucky, Mississippi, Missouri, Oregon, Pennsylvania, Virginia, Washington, Wyoming; the latter, Connecticut, Florida, Maine, Mississippi, Nevada, New York, North Carolina—excepting a few specified cases—Oregon, Pennsylvania, Texas, Utah, Virginia, Washington, Wisconsin, Wyoming. Idaho breaks the monotony of this rule, in that it prohibits certain political units

from becoming stockholders in all joint stock companies, except "railroad corporations, companies, or associations.")

Intersections, junctions, and consolidations.—Varying somewhat in the number of subjects specified in the constitution, 11 States make provision for the connection, crossing, and intersection of railways and interchange of traffic. In one form or another, it is prescribed that every railway shall have the right to intersect, cross, or connect with any other railway, and that it shall receive and transport the freight and coaches, loaded or empty, of every other railway, without delay or discrimination. Closely allied to the subject of connections and the interchange of traffic is the question of consolidations, and constitutional provisions dealing with both subjects are found in several States. The most common form in which the traffic arrangements of the different roads is expressed is that which permits one railway to lease, control, purchase, or consolidate with any other railway, provided that the other is not a parallel or competing line. To what extent provisions relating to mere interchange of traffic would permit the consolidation of competing lines is not clear. Isolated provisions prohibiting the holding of stock of other railway companies may be found. (Among the States prohibiting the consolidation of competing lines are: Arkansas, Colorado, Illinois, Kentucky, Missouri, Montana, North Dakota, South Dakota, Texas, Utah, Washington, West Virginia. The following provide for junctions, connections, etc.: Alabama, Kentucky, Idaho, Louisiana, Mississippi, Missouri, Montana, Pennsylvania, South Dakota, Texas, Wyoming.)

Vote of shareholders.—Only 9 States provide for some system of suffrage on the part of shareholders, and for these the constitution of Illinois appears to have served as a model. "The general assembly shall provide, by law, * * * the right of every stockholder to vote, in person or by proxy, for the number of shares of stock owned by him, for as many persons as there are directors or managers to be elected, or to cumulate such shares, and give one candidate as many votes as the number of directors multiplied by the number of his shares of stock shall equal, or to distribute them on the same principle among as many candidates as he shall think fit." (Found in the following constitutions: Delaware, Illinois, Idaho, Kentucky, Mississippi, Missouri, Montana, Nebraska, West Virginia.)

Free transportation.—The granting of free passes to members of the legislature, State, municipal, and other officers, or the selling of tickets at a discount, is constitutionally prohibited in Alabama, Arkansas, California, Florida, Kentucky, Mississippi, Missouri, New York, Pennsylvania, Washington. The constitution of Wyoming also treats of the sale of unused tickets or parts of tickets.

Regulation.—The establishment of tariff schedules and the regulation of rates are treated in the constitutions of Georgia, Mississippi, Missouri, Utah, Washington, and West Virginia. The legislature expressly reserves full power of control, in addition to reservations expressed in other sections of the constitutions of Alabama, Florida, Idaho, Illinois, Louisiana, Nebraska, South Dakota, Wyoming. Discriminations against persons and places or industrial sections are occasionally directly prohibited in the constitution. The form in which the prohibitions are expressed varies, but they all have in view the equal treatment of all the interests affected by the railway service. (The following constitutions contain more or less complete provisions on the subject of discrimination: Arkansas, Colorado, Florida, Georgia, Idaho, Illinois, Kentucky, Missouri, Montana, Nebraska, Pennsylvania, Texas, Utah, Washington, Wyoming.)

Pooling.—The formation of trusts or combinations and the making of contracts restricting competition or having in view the control of prices is prohibited in ten constitutions (California, Kentucky, Idaho, Mississippi, Montana, North Dakota, South Dakota, Utah, Washington, and Wyoming).

Miscellaneous.—Only a few States provide in their constitutions for the organization of administrative bodies, such as railway commissions, and the powers and duties of the same. The California constitution not only prescribes the organization of the commission, but enumerates the more important powers of this commission, specifies the manner in which the commission shall be elected by the districts into which the State is constitutionally divided, and fixes fines for violations of the law on the part of railway agents or employees. Analogous provisions are found in the constitutions of Kentucky and Louisiana. The constitutions of Arkansas, Missouri, and Pennsylvania make it unlawful for railway officials to be interested in the purchase of materials and supplies for the construction of a railway. The constitutions of Arkansas, Kentucky, and Indiana prohibit the charging of a greater sum for a shorter distance over the same line in the same direction under similar conditions. Four constitutions—Colorado, Kentucky, Mississippi, and Montana—make it unlawful for a corporation to require its

servants or employees, as a condition of their employment, to sign a contract limiting the liability of the company in case of suits for damage, or precluding the possibility of bringing such suits altogether, by contract. About ten constitutions expressly limit the activities of a chartered corporation to the business which is expressly provided for in the charter. In a few cases the constitutions specify that no railway company can become a foreign corporation by consolidation; and, in a small number, a provision common in many of the earlier laws is enacted, compelling railway companies to establish stations or depots whenever they pass within a certain distance of towns and villages, frequently the county seat. The constitution of Washington stands alone, in that it expressly prohibits discriminations against express companies. Idaho and Wyoming demand the appointment of legal representatives of railway companies in those States. (This provision is common in general laws but not in constitutions.) The Missouri constitution provides for the payment into the State treasury of specified sums of money proportionate to the amount of capital stock, before a charter can be issued.

This analysis presents the leading features of the constitutional provisions of the several States. None of importance have here been omitted and only a few of the less important ones have not received mention. An examination of the appendix containing these constitutional provisions will show the great similarity which exists among many of the constitutions with respect to certain clauses, and the manner in which constitutional provisions were copied in one State from the constitution of another.

PART IV.—PRESENT GENERAL RAILWAY LEGISLATION.

Terms applicable to later charters.—In a technical sense the term "charter" can scarcely be applied to the instruments issued to railway corporations under contemporary general laws. The word charter, through long usage, has come to signify a special grant of authority and power. In the constitutions of 21 States, as was noticed in the preceding section, the incorporation of railway companies under special or local acts is prohibited; in other States this prohibition is found in general laws; and in some States in both the constitution and in the general laws. The statutes of South Carolina mention the organization of railway companies "under charters," and in the Kansas statutes the term charter is also used. But these are exceptions. Terms like "articles of association," "certificate of incorporation," "articles of incorporation," "articles of agreement," and "letters patent" have come into use, and carry with them the significance of earlier special charters. Articles, certificates, etc., are charters only in a loose and general sense, because the contents of the franchise itself are expressed in the general law relating to railways and the constitutional limitations under which these have been exacted. The grant of a charter involves a distinct legislative act, authorizing the company receiving the same to exercise, in a measure, the rights of sovereignty, and to do the things for which the organization was accomplished. A certificate of incorporation, on the other hand, is issued in pursuance of law by administrative and not by direct legislative authority. Formerly a separate act of the legislature was necessary. Under general laws an administrative act for each such grant of power is all that is requisite for the organization of a railway company. To be sure, there is a very direct connection between the earlier charters and the later general laws, for many of the latter embody not only the essential features of the former, but frequently they are expressed in similar and even identical language. The change of name from article or certificate did not carry with it any radical change in the nature of the franchise. In this respect there exists continuity of development. The greatest change brought about by the transition from special charters to incorporation under general laws consisted in uniformity. Almost infinite variety in charter provisions was common during the earlier period of special legislation. Under general laws, even when compliance therewith was not enforced or enforceable, a certain degree of uniformity was brought about from the very first.

Conditions under which railway companies may be organized.—There are, however, features of railway legislation in the United States which reveal many elements of uniformity as to the conditions under which railway companies may be organized; and yet, after admitting this much, we are compelled to recognize the fact that railway laws are very far from being uniform, and that numerous variations and differences are noticeable.

The number of persons who may associate themselves for the purpose of incorporating railway companies varies from two or more in Washington to any number in Iowa. Between these extremes there exist 10 different numerical groups which may effect an organization: Three or more in Florida, Oregon, Montana, and Wyoming; 5 or more in Illinois, Indiana, Kansas, Nebraska, Wisconsin, Montana, etc.; 6 in Louisiana; 7 in Michigan, Kentucky, Alabama, New Jersey (for roads less than 10 miles in length); 10 in Maine, Georgia, Arkansas, Texas, etc.; 13 in New Jersey (for roads more than 10 miles in length); 15 in New York, Indiana, etc.; 20 in Vermont; 25 in Massachusetts, New Hampshire, etc. These numbers, or more, may in some States be composed of any persons whatsoever; in others, a certain proportion must be citizens; and, in a few, all of them must be citizens. Certain restrictions are occasionally made with respect to residence, both on the part of the stockholders and on the part of the board of directors and officers. The object of restrictive provisions relating to residence was evidently

to prevent the projected road from being controlled by "foreign influence." During the early history of railways in the United States the possibility of foreign control, on the assumption that such control would result in the neglect of local interests, was used as a weapon to encourage local subscriptions to the stock of railway companies.

Contents of the articles.—The nature of the contents of the articles of association, or certificates of incorporation, can best be indicated by presenting the salient features of such articles in a few of the leading States, which may be considered typical of analogous provisions from the laws of other States—understanding by the term "typical" not identity, but essential similarity, leaving room for modifications of one kind or another in particular cases.

The law of *Illinois* requires a statement of the name of the corporation to be organized, the States from and to which the railway is to be constructed, the location of the principal offices, the time of beginning and completing construction of the railway, the amount of capital stock and the number and size of the shares, the names and residences of the persons who contemplate effecting an organization, and the names of the first board of directors.

According to the statutes of *Maine*, the articles must contain the name of the corporation and the gauge of the projected railway, the names of the places from and to which the same is to be constructed, the amount of the capital stock, which shall be not less than \$3,000 per mile for narrow-gauge and \$6,000 for standard-gauge railways, the number of shares of stock, and the names and residences of 5 directors. Since, on this point, the laws of *Maine* (General Laws, 1899, p. 117, Sec. I) are in many respects much better than those of most of the States, a full quotation is here inserted:

"Said directors shall present to the board of railroad commissioners a petition for the privilege of said articles of association, accompanied with a map of the proposed road, on a proper scale. The board of railroad commissioners shall, on presentation of such petition, appoint a day for a hearing thereon, and the petitioners shall give such notice thereof as the said board deems reasonable and proper, in order that all persons interested may have an opportunity to appear and be heard therein. If the board of directors, after notice and hearing parties, finds that all the provisions (of law) have been complied with and that public convenience requires the construction of said railroad, said board shall indorse upon said articles a certificate of such facts and the approval of the board, in writing. The secretary of state shall, upon payment of \$20 to the State, cause the same, with the indorsement thereon, to be recorded, and shall issue a certificate in the following form."

Then follows the prescribed form of certificate, with the contents indicated above.

The laws of *Arkansas*, for 1899, created a State board of railroad incorporation, composed of the governor, who acts as chairman, the attorney-general, auditor, secretary of state, treasurer, and commissioner of State lands. This board hears all applications for certificates of incorporation, and on its recommendation such certificates may be filed with the secretary of state, and thus legally empower an organization to construct a railway under the terms of the general laws of the State. Ten or more persons may organize, elect a board of directors, and subscribe to the articles of association when \$2,000 per mile has been subscribed and 5 per cent of the subscriptions paid to the board of directors, a majority of which must be citizens of the State.

The laws of *California* require the articles of incorporation to state the name of the projected corporation; the purpose for which it is to be organized; the places from and to which the railway is to be constructed, as well as all intermediate branches; the estimated length of the road; the amount of the capital stock, \$1,000 per mile of which must be subscribed before the articles can be filed, and 10 per cent actually paid in. The number of directors varies from 5 to 11, but 5 of them must be residents of the State. The sale of railway franchises and municipalities must be advertised, and the franchise given to the highest bidder.

Massachusetts.—The articles must contain the name, route, gauge, capital stock, and other common items. In case of standard-gauge railways \$10,000 per mile must have been subscribed and for narrow gauge \$3,000. The amount of the capital stock depends upon the detailed estimate of costs. No increase in capital stock can be made without the authority of the railway commission, before whom a hearing must previously have been given, upon which such increase or refusal to permit such increase is determined. The articles and certificate must be filed with the secretary of state. All petitions (compare the laws of *Maine*) for such charters must be accompanied by a map upon a proper scale, showing in detail the entire route of the road. A "certificate of public exigency" is also required

before a charter can be granted. The railway commission, upon due notice, must give a hearing to all persons interested in the projected railway, and not until such persons have been given an opportunity to be heard and all the other provisions of the law complied with can a charter be granted. It will be noticed that the Massachusetts law still provides for the granting of special charters, although these special grants are surrounded by wholesome and what appear to be entirely adequate provisions and safeguards.

Michigan.—Although a law of 1891 of this State declared every railway company operating within the limits of the State "to be in all respects subject to the general laws of the State respecting railroads, as now existing or as hereafter amended," a conflict between such charter provisions and general law provisions is still possible, as has already been indicated in another connection. Consequently, in 1899, there was created in this State a commission—composed of the commissioner of railroads, the State treasurer, and the secretary of state—whose duty it is to negotiate with railway companies operating under special charter, to determine upon what terms such railway companies will surrender their charter rights. For this purpose the commission is given authority to inquire into the business of railways, to secure the necessary information by subpoenaing witnesses, etc.

Georgia.—In addition to the usual provisions of the articles of incorporation the laws of Georgia provide for a petition which must be presented at least 4 weeks before a charter can be secured. Companies may amend their charters by adopting the general railway laws of the State.

Significance of certificates and articles.—These articles and certificates empower railway companies to make examinations and surveys for the proposed railway, in order to select the most advantageous route; to purchase, receive, and hold an amount of real estate necessary for the construction, maintenance, and operation of the road; to own other kinds of property essential to railway business; to have perpetual succession, or succession for a certain period of time; to have the power to sue and to be sued; to establish connections with other railways; to charge or to receive such remuneration for their services as from time to time may seem reasonable; and, in general, to enjoy those rights, privileges, and immunities which the law guarantees to all similar corporations, and which are essential in carrying out the legitimate aims and purposes of the corporation. The completeness with which the powers and duties of railway corporations are prescribed in different laws vary somewhat, yet there exists, perhaps, greater similarity and more completeness in this respect than in any other subject of railway legislation. In some States corporate powers of railway companies are enumerated in separate laws; and, in others, all the leading features of legal provisions relating to railways are expressed in the commission laws. It is unnecessary to enumerate in the lengthy phraseology of the law books the detailed rights and privileges of railway companies, for they are the same as those enjoyed by corporations in general, and are not essential to a consideration of the degree of regulation and control which is possible under the existing railway laws of the different States of the Union.

The provisions of the few articles which have been presented above are sufficient to show that there exist differences among the States with respect to the time limits within which railways may be constructed; the amount of capital stock, and the subscriptions thereon per mile of railway; the degree of publicity given to the applications for charters, and other things. A fee for filing certificates is charged in a number of States. For instance, in North Carolina \$250 must be paid before a bill can be introduced to incorporate or amend. In Maine, a fee of \$20 is exacted; and similar fees are charged in Wisconsin, Washington, and other States. The laws are weak in the financial requirements which they exact of railway companies. It would seem that some definite proportion should exist between the amount of the capital stock and the length and characteristics of the projected road; but such is not generally the case. Idaho and Indiana require a subscription of \$1,000 per mile; Kentucky, \$250 per mile, of which 20 per cent must be paid in cash; Arkansas, \$2,000 per mile; Maryland, 10 per cent payment on shares; Virginia, a payment of \$2 per share when subscriptions are made; New Jersey, \$10,000 per mile, and a deposit of \$2,000 per mile when the articles of association are filed, which latter sum, however, is returned to the board of directors when the road is completed. This is sufficient to show existing variations.

Corporate life and reserved rights of the State.—While many of the early charters and general laws were unrestricted in their nature, it was not long before a reaction against this lack of restraint set in, and regulating features, more or less adequate in their nature, were introduced in charters and certificates. Many such charters contained in one of their concluding sections the proviso that the

charter in question should be considered a public act and, as such, to be construed favorably for the purposes for which the company was organized. Both in England and the United States, however, it has been held that the mere insertion of such a clause does not make a special or private law a public act, and that unless a charter is public by the nature of its contents it will be construed as a special act when passed with reference to a particular company organized to construct a certain road. The public importance of railways and the vital connection between them and the social and economic interests of the States, frequently led legislators into a good deal of indulgence, especially during the early period of railway development. The limitations of charter rights had not yet been established; and it was not uncommon for incorporators to maintain that the rights and privileges granted by their charter were absolute and unrestricted. Not until the advent of Granger legislation, culminating in the leading case of *Munn v. Illinois*, had the right of the State to interfere in the management of railways incorporated under special charters been established; and at the present time nearly two-thirds of the States have statutory provisions reserving to the respective States the right to alter, amend, or repeal the franchise of any corporation, whether organized under special or general law. Reference to Part III, on constitutional provisions, will show similar limitations placed upon franchises by State constitutions.

The nature of the reserved rights of the States and the limitations placed upon the corporate life of railway companies are illustrated by provisions in several States here inserted:

Maine.—The laws of Maine provide that "no corporation can assign its charter or any rights under it; lease or grant the lease or control of its right or any part of it, or divest itself thereof, without consent of the legislature." In addition, all corporations, whether organized under special or general laws, shall be subject to general laws. In Maine and Massachusetts the State may amend or repeal the charter, or the Commonwealth may purchase railways on 1 year's notice, after 20 years' corporate existence.

Michigan.—Legislation in Michigan on this point has already been indicated.

Illinois.—In Illinois charters are granted for 50 years, with the privilege of renewal for the same length of time; and a law of 1895 reserves to the legislature power to enact laws on all the leading topics relating to corporate existence.

Iowa.—In Iowa companies may likewise be chartered for 50 years, with the privilege of renewal for as many more, and they shall eventually be subject to legislative control. The legislature may alter, abridge, set aside the charter, or impose new conditions which it deems necessary for the public good.

Kansas.—Special charters which do not designate the period of corporate life continue 99 years. The legislature has power to extend the charter period as it may deem proper.

Wisconsin.—The legislature of Wisconsin expressly reserves the power to pass laws relating to reasonable maximum rates, the correction of abuses, unjust discrimination, and for the protection of the just rights of the public. Corporations, however, under the laws of this State "shall continue perpetually."

North Carolina.—Sixty years, unless otherwise provided for in the act creating the same, is the corporate life under the laws of North Carolina.

Louisiana.—This State limits the corporate existence to 99 years.

Texas.—In Texas a charter is forfeited if 10 miles of the proposed road are not put into running order within 2 years, and 20 miles during every year thereafter until the road is completed. Charters may be granted for a period of 50 years, with the privilege of renewal for an equal number of years.

Maryland and Rhode Island illustrate an entirely different type of statutory provision:

Rhode Island.—The laws of Rhode Island prescribe a course of procedure which appears to be entirely in harmony with the needs of our growing railway and industrial systems. In that State the general law alters special charters whenever the latter are found to be inconsistent with the former.

Maryland.—Exactly the opposite is true in Maryland, where the adoption of the "general code" is not to affect the rights and privileges granted by special charters.

Provisions found in the laws of all the other States dealing with this subject at all, do not contain anything not found in what has here been presented.¹

¹ States having statutory or constitutional provisions, or both, directly reserving to those States the power to alter, repeal, or amend charters, are the following: Arkansas, California, Colorado, Indiana, Iowa, Kansas, Massachusetts, Michigan, Mississippi, Montana, New Hampshire, New York, North Carolina, North Dakota, Oregon, Pennsylvania, Rhode Island, South Carolina, South Dakota, Texas, Vermont, Virginia, Washington, West Virginia, Wisconsin.

Determination of route.—Under early railway methods the route was very indefinitely indicated, the best of all descriptions being frequently contained in that clause in the charter naming the termini of the road; and it will be remembered that not all of the termini were mentioned in some charters, but that merely certain zones thought to contain "eligible points" were loosely indicated. In other charters not only the termini but one or more important intermediate points were designated; in but very few, often insignificant, charters was the entire route described with sufficient definiteness to enable one to tell beforehand exactly where the railway would be constructed. The course of a railway is a matter in which the public has an interest. The manner in which the right of eminent domain has been exercised has depended very greatly upon the extent of the public interest in the railway in question. Before the charter was granted to the Liverpool and Manchester Railway—known to all the world as the first important modern railway—every piece of land to be crossed by the proposed railway had to be described and the exact location of the entire line definitely determined before the charter was granted. Such a mode of procedure had been practically unknown in the United States until more recent times. Even at the present time great competing systems quietly send out their surveyors to gain an advantage in entering new sections or in constructing lines which will shorten the route between important competitive points. It is not uncommon to have one railway build, section by section, year after year, until finally the design, which must from the first have directed the movements of the constructors, dawns upon the public mind and the real significance of what appeared to be perhaps the construction of a subordinate branch becomes apparent. This may or may not be desirable; that is immaterial. The fact, however, remains that important public interests are affected by just such movements, and every interest which is thus liable to be affected should have an opportunity to be heard before such important industrial operations are undertaken. No State in the Union has legislated in this respect with greater care and completeness than Massachusetts. The laws of that State provide that the termini, together with the names of the cities and towns through which the projected road or branch is to run, are to be given with as much certainty as the nature of the case will admit. The articles of association of the company fostering the project must be published in each county once a week for a period of three weeks; and the map of the proposed route, together with the report, must be submitted to the mayor, aldermen, and selectmen of the different municipalities affected. Public hearings, after due notice to all persons interested, are also provided for.

In Maine the railroad commissioners must approve the location of the railway before construction is begun. Extensions of existing lines may be built on application to and approval of the commission. Frequently the more remote States are less restrictive in such matters; but the laws of Arkansas make it obligatory for the company to file the map with the county clerk of every county through which the proposed railway is to be run, for the inspection of all persons interested. The location having once been established, no modifications in the line, exceeding a certain distance, are permitted, and a map of the road, together with such modifications, must be filed with the secretary of state. One of the most important provisions bearing upon this question is found in a recent law (1899) of Tennessee, which prohibits one railway company from holding exclusive possession of a narrow pass, thus preventing another railway company from laying its tracks through the same. If the pass is so narrow that only one track can be laid, joint use of the same is made mandatory upon the road which has built through it. No point named in the articles of incorporation can be avoided under the laws of California. A map of the road must be filed with the secretary of state after location. Changes in the line must also be filed. In Connecticut a map of an approved route must be filed with the town clerks on a prescribed scale; and, after construction, the lineament of the road can be changed only by permission of the board of commissioners. Florida charters must state the place from which and to which the road is to be constructed; its length, and the name of each county through which it runs. However, the direction of the road may be changed by a vote of two-thirds of the directors. Similar provisions are found in the laws of Georgia.

In a number of States maps are not required to be filed until after construction has begun or is completed, or within a year after the road has been finished. In Indiana, on the other hand, a map must be filed with the county clerk in every county named in the articles of association before construction can begin. If necessary, the route may be changed, but no place named in the articles is to be avoided. Kansas also requires the filing of a map with county clerks before construction; and the road bed may be changed, but not the general route. The map, approved by the president and secretary of the railway company, the attor-

ney-general, railway commissioner, and secretary of state, must be filed in the office of the registrar of deeds under the laws of Michigan. In New Hampshire the railway commission reports to the supreme court on the public utility of the proposed road, and a map of the same, if constructed, must be filed within 1 year after the railway is opened; and the railway commissioner may authorize a change in the location and assess damages caused thereby. The New York railway commission has power to approve or disapprove railway projects; persons interested are given a hearing; and a map must be filed before construction begins. In North Carolina the charter must be filed within a reasonable time after construction. Petitions must be presented to the "statutory court" if the proposed route appears objectionable to the commissioners. To alter the route by a two-thirds vote of the board of directors, to deflect a route from a certain city by a two-thirds vote of the council, are the privileges enjoyed by railway companies chartered under the laws of North Dakota. In that State they are also required to file a map at any time within 6 months after definite location has been decided upon. The names of the termini and the counties through which the proposed railway runs must be filed, under the laws of Ohio. For good reasons a change in the route may be made, but the secretary of state must be notified thereof, and all subscribers and all persons who subscribed for the former route must be released from their obligations. In Wyoming the law simply declares that railway companies may exercise the right of eminent domain in locating or relocating lines. This was a common provision in early charters, under which railway companies were empowered to locate and to relocate the respective roads at their pleasure. Approximately, one-half of the States have statutory provisions governing the location of railways; and only a few cause accurate surveys and maps to be made, so that the exact location of a road may be known before construction begins.

Equipment.—The subject of safety in railway transportation has been one of the most prolific sources of railway legislation in recent years. There are few topics about which so many different laws have been passed, and perhaps none in regard to which more separate acts have been approved by the various legislatures. A majority of these laws relate to mechanical appliances and the physical condition of the road, while numerous others have in view the improvement of cars and stations, in so far as these affect the comfort and health of passengers. Numerous police regulations also appear upon the statute books of recent years, relating chiefly to subjects like stealing rides on trains, shooting at trains or throwing missiles, destruction of railway property, interference with railway signals, destroying tracks, or other things affecting the safety of traffic. A movement is noticeable to encourage the abolition of grade crossings and to guard these more carefully in the many places where they still exist. Bringing trains to a stop at railway crossings, or permitting them to pass without stopping in case interlocking switches are used; the construction of switches and the use of keys for the same; the blocking of frogs, in order to prevent feet of workmen from being caught in them; and similar subjects, relating to safety in the construction of tracks, have called forth numerous recent laws. An old and ever-continuing subject for legislation is that of fences, cattle guards, bells, whistles, etc. The introduction of automatic couplers has been greatly promoted by the legislatures of a number of leading States, as well as the use of continuous train brakes. In a few laws the number of brakeman for every train, or for a certain number of cars, is also prescribed. Several laws regulate the question of precedence among trains, and in almost all States laws have been passed regulating the speed of trains in cities—although these are most commonly limited by municipal ordinance—in crossing each other's tracks, and in crossing bridges. In the southern States the law commonly provides for separate coaches for white and colored persons; in others, the heating of cars and coaches is made compulsory. Fresh water must be supplied at stations and in coaches, and the necessary conveniences for personal comfort provided on trains and in railway stations. In a few cases the laws provide for the examination of employees and the licensing of engineers, and prohibit the employment of persons addicted to drink. The adequacy with which individual States deal with one or more of these topics will be illustrated by the summaries of the laws upon these points in several leading States.

Alabama.—Speed of trains in cities regulated; fresh water supplied; separate coaches for white and colored persons; conductors may assign seats to colored persons; employees may be examined and licensed; the necessary lights shall be kept on switches.

Arkansas.—Separate coaches to be provided; officers assign seats to passengers; fresh water; railways responsible for baggage 48 hours after arrival; the rear of passenger cars kept clear.

Connecticut.—Crossings regulated and frogs locked in the manner prescribed by the commission; safety couplers, approved by railway commission, required; speed of trains regulated by the commission; number of brakemen varies with speed and equipment of trains; fresh water to be supplied, and engineers sworn to obey the law.

New York.—Automatic couplers; automatic air brakes for every train, sufficient to control train; railroad commission supervises the construction of switches and signals; tunnels properly lighted and ventilated; when set-offs are used in cars, the commission may approve or disapprove; railway crossings according to law.

Ohio.—Automatic couplers, and interlocking switches at grade crossings, subject to the approval of the commission; commission to prescribe speed of trains over bridges; crossings constructed according to law; engineers addicted to drink not to be employed.¹

In recent years the commission laws of different States have provided for the reporting of accidents to passengers and employees. These reports are frequently made to the commission in the forms prescribed by that body. In some cases it is made the duty of the commission to investigate railway accidents.²

Quality of service.—Legal provisions falling under this head are closely related to the topics discussed in the section immediately preceding. Under the head of equipment, however, physical conditions were chiefly considered in their bearing upon safety in travel. Although numerous laws on this subject have been enacted, on the whole the physical side of railway transportation has presented fewer difficulties from the point of view of regulation and control than many others; because the immediate self-interest of railway companies made the prevention of accidents necessary, and for this reason uninterrupted progress has been made in the application of those appliances which make modern railway travel so very safe to passengers and constantly less and less dangerous to employees. Recent laws compelling the introduction of automatic couplers and air brakes illustrate this sufficiently. In the present paragraphs relatively little attention will be paid to physical conditions. These will be assumed; but the question that directly concerns us here is that of State influence on the operation of trains when they have once been put into service.

Train service.—The general laws of nearly all the States contain a more or less definite provision to the effect that trains shall be run "at regular times" (to use the phrase of New York), that bulletin boards shall be put up, and that trains running on other than schedule time shall be duly announced on these boards. About one-fourth of the States, however, contain more definite provisions, wider in their scope and looking toward a more direct control of the train service. In Alabama trains may be made to stop at all stations advertised and at county seats. Under certain conditions double-deck cars must be provided, and the speed of trains in cities is regulated. On petition of 50 citizens every train must stop in the city of the petitioners, according to the laws of Arkansas; bulletin boards must be provided and trains run at regular intervals; while provisions similar to those of Alabama govern the use of double-deck cars. In California the railway company may regulate the number and frequency of trains, subject to the legislature. Colorado laws compel trains to stop in cities, and give railway companies the power to designate loading points. At these points cars shall be furnished in proportion to need; and, in case of failure on the part of the railway company to provide them, for one reason or another, an appeal may be taken to the railway commission. The laws of Connecticut are more detailed on this topic than those of nearly all the other States. On petition of 20 citizens the railway commission may order trains to stop whenever they pass within 1½ miles from a village; stations may be established on petition, and the same are not to be discontinued without the assent of the commission. Railway companies are obliged to make proper connections. The Florida railway commission has power to establish train schedules. In Minnesota, in case a sufficient number of cars can not be provided for all applicants, the same shall be distributed proportionately among them. North Dakota railways are by law compelled to run one train each way on each week day. Power to control time tables, and consequently that of the frequency of trains, is given to the South Carolina commission.

¹ In addition to those above mentioned the following States have fairly complete statutory provisions on these subjects: Illinois, Kentucky, Maine, Michigan, Nebraska, New Hampshire, Rhode Island, South Carolina, Vermont. Other States, of which the laws are less complete or practically wanting, are: Arizona, Idaho, Kansas, Louisiana, Maryland, Montana, Nevada, New Jersey, New Mexico, North Carolina, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin, New York.

² Among the commissions that have power to investigate accidents are those of Massachusetts, Connecticut, Maine, New Hampshire, Rhode Island, New York, Ohio, North Carolina, and Virginia.

Up to 1899 the laws of Texas provided for regular trains once per day in each direction; but in 1899 (Laws, chap. 48) a law was passed making it obligatory to supply cars, without preference, to applicants. A shipper applying for 10 cars or more is to be furnished with them in 8 days; if the call is for 50 cars or more the same are to be supplied within 10 days. As a protection to the railway company the same may require shippers to deposit one-fourth of the freight rate on the contemplated shipment as a condition of delivery of cars; and this deposit is forfeited in case the cars are not loaded within 48 hours. In addition, the shipper may be fined for actual damages sustained by the railway company for his failure to load the cars ordered by him.

With this we have practically exhausted the legal provisions of the States bearing directly upon the frequency of trains and the delivery of cars. Under the heading of discriminations the same will be indirectly reverted to; because, as is well known, failure to supply cars has been one of the most common forms of discrimination. The subject of publicity of rates will indirectly contribute something to this topic, because the same statutory provisions dealing with one, in many instances, also deal with the other. The question of rates, being so important, will be taken up with much more detail later on, and for that reason train service and the publication of schedules may be dismissed for the present.

Through trains, routes, and bills of lading.—Many of the earlier charters and practically all the later charters and general laws provide that railway companies shall permit connections, junctions, and intersections with other respective lines. Apart from this no direct attempt was made to control through shipments and through service in general. This is primarily a question of interstate commerce and largely out of the control of State authorities. The Interstate Commerce Commission has handed down a large number of decisions bearing upon questions of through rates, routes, and bills of lading, and also on the choice of routes when goods may be directed over different ones varying in length and cost of transportation. The principle has perhaps been well established that railway companies are bound to obey the directions of the shipper, and that without explicit directions the shortest and least expensive route possible must be chosen for the consignment of goods. The legislatures of about one-third of all the States have touched upon this subject in their enactments, and some of them have passed fairly comprehensive laws upon it. The laws of Connecticut give the railroad commission the general power to regulate the exchange of passengers and baggage. In Florida other railways may be authorized to enter terminals and union stations of competitive lines, and two or more railways in the same town may be required to erect union stations. In addition, the Florida commission has the general power to order adequate and proper railway facilities. In case railways send goods over a longer route, when a shorter one could have been used, no more shall be charged for transportation over the longer line. The laws specify that transportation shall be directed over the shortest and most convenient route. The Georgia railway commission has power to establish joint rates, and it is the duty of this commission to investigate through rates, and, if necessary, to make representations before the Interstate Commerce Commission. Likewise, in Iowa, the commission may establish joint through rates and copies of such joint-rate schedules made by the railway company shall be filed with this body. The Maine law of 1899 governing leases and contracts expressly provides that none of the provisions governing contracts among railways shall be construed to prevent agreements between such corporations "allowing the trains of one to run over the road of another, both corporations assenting thereto." Under the Minnesota law joint rates may be established on demand, and under the law of 1899 the railway commission is given direct power in establishing joint rates upon such important objects of traffic as grain, flax, lumber, coal, and live stock. A rather stringent law was enacted in Missouri in 1899. It gives the railway commission power to order close connections of competing lines, when such connections will not cause serious injury to one or more of the roads in question; and in case of refusal on the part of the railway companies to make these connections, under conditions determined by the commission, a fine of from \$500 to \$1,000 may be imposed. Copies of all contracts for joint rates must be filed with the Nebraska board of transportation. The corporation commission of North Carolina has power to establish through rates and to approve contracts for the division of earnings in such cases. The law of North Dakota guarantees ample facilities for transferring freight and passengers from one line to another, and prescribes that no railway company shall do anything which may interfere with shipments of freight from being continuous. In 1899 South Carolina enacted a law making connections compulsory, and providing that the expense involved in making such arrangements shall be borne ratably in accordance with the orders of the commission.

Older laws provide for through bills of lading. The laws of Texas compel the railway companies to receive freight from connecting lines. Penalties are imposed for collecting more than the charges specified in the bill of lading, and goods are to be delivered on the payment of the amount named in the bill. In Wisconsin, on complaint, the railway commissioner shall investigate connections made between railway companies, and if he thinks the case of sufficient importance he shall bring the same before a board composed of the commissioner, the attorney-general, and the governor, who shall try the case and make a proper order in accordance with their findings. Perhaps a half-dozen additional States have laws specifying that railway companies shall permit an interchange of business; that track connections shall be made on demand, and analogous provisions. More than one-half of the States, it will be noticed, have thus far failed to provide by law for matters relating to through traffic. To what extent the Federal law on interstate commerce and the powers given to the Interstate Commerce Commission makes this unnecessary or undesirable lies outside the province of this report.

Consolidation and pooling.—The assumption on which State and Federal railway legislation largely rests is that of free and unrestricted competition among the railways of the country. Provisions on consolidation were rather common among early charters and are almost universal in case of later charters and general laws. Pooling, whether regarded as an end in itself or as a stage in the growth of consolidations, has received much less attention at the hands of State legislatures than discriminations, for more than one-half of the States have no statutory provisions governing pooling contracts or in any way recognizing them. Among economic students it is a familiar fact that railways are not, like many other industries, subject to the laws of competition; that competition acts only within narrow limits among lines of railways. But the accuracy or inaccuracy of the assumptions of our laws is not the problem before us. We are concerned here primarily with the statement of facts in regard to legislation governing railway consolidations and pooling.

Consolidations.—Legislation under this head falls into two groups. On the one hand, those laws which either directly or in a modified form permit consolidations among all classes of railways; and, on the other hand, laws which prohibit consolidation among parallel or competing lines but permit it in cases of continuous lines of railway. In a number of States like Michigan, Maryland, Georgia, and Missouri laws governing the consolidation of continuous lines are very elaborate. It is common to specify a certain number of days' notice which must be given to shareholders when action upon consolidation schemes is to be taken. The number of votes requisite to approve the consolidation contract is usually prescribed, and varies from a unanimous to a majority vote—a two-thirds or three-fourths vote of the stockholders being most common. It is worth while briefly to indicate the contents of a few typical laws of this kind.

Georgia permits the consolidation of continuous lines and the leasing of other railways, but all contracts must be recorded, and suit for the unlawful acquisition of railway lines may be brought in any county through which the same runs. Under the statutes of Maryland one railway company may acquire the property and rights of other railway companies, but articles governing such acquisition and control must be filed with the secretary of state. In Michigan these contracts have no force before a duplicate copy has been filed in the office of the secretary of state and the articles of consolidation have been submitted to and approved by a board consisting of the attorney-general, commissioner of railroads, and the secretary of state. In Wisconsin parallel or competing lines are enjoined from consolidating, but the fact whether or not such lines are competitive may be determined by jury. To quote the laws governing this topic in full, even in one or two States, would unduly increase the volume of this report without adding anything of vital importance to its contents; and it may therefore suffice to give a brief extract from one of the most condensed statutory provisions of this kind: "Any railroad, canal, or other corporation, or the lessee, or purchaser, or manager of any railroad or canal corporation, shall consolidate the stock, property, or franchises of such corporation with, or lease or purchase the works or franchises of, or in any way control any other railroad or canal corporation, owning or having under its control a parallel or competing line; and the question whether railroads or canals are parallel or competing lines shall, when demanded by the party complainant, be decided by a jury as in other civil issues." This is illustrative of the provisions in two-thirds of the States. Only a few, like Delaware, Oregon, and Rhode Island, are silent on this point.

Coming now to that group of a dozen States which permit consolidation within limits, attention may be called to the laws of New Jersey under which domestic—that is, State railways—may consolidate, but consolidation with foreign railways

is prohibited except with the consent of the legislature; and a law of 1900 expressly provides that railway companies may acquire the rights of other companies. While New York laws prohibit the consolidation of parallel lines, such consolidation may, nevertheless, be permitted by authority of the railway commission. New York provisions for the consolidation of continuous lines, like those of Ohio and Michigan, are extremely elaborate. In Massachusetts the consolidations are subject to the approval of the railway commission; and in Florida contracts for the consolidation of competing lines are ultra vires unless approved by the commission.

Without duplicating further legal provisions bearing upon both types of consolidation, the lack of uniformity upon this, as upon so many other questions, is apparent. When we view the facts of railway history, the steady and uninterrupted consolidations which have absorbed line after line, on the one hand, and the contemporary existence and growth and duplication of laws attempting to govern these, on the other hand, the conclusion is irresistible that somehow these laws did not accomplish the purposes for which they were enacted. The wisdom of the purposes of these laws may be, and is, seriously questioned by students of railway transportation; but that is not the problem before us. We are concerned simply with the facts of the law, and these facts clearly and unequivocally reveal a wide disparity between the provisions of law and the facts of railway development.

Pooling.—Both the interstate-commerce act and the antitrust law prohibit pooling. The Trans-Missouri Freight Association, the Joint Traffic Association, and other cases have finally decided the illegality of all combinations, just or unjust, good or bad, for the maintenance and control of rates, the restraint of competition or the arbitrary interference in any other way with the free play of competitive forces. For many years pooling was a favorite and one of the most efficient agencies in checking destructive competition and in maintaining reasonable rates and equitable relations among railways. Less than one-half of the States have prohibitive legislation, directly or indirectly, on the subject of pooling, and only about a dozen prohibit this practice.

"That it shall be unlawful for any common carrier subject to the provisions of this act to enter into any contract, agreement, or combination with any other common carrier or carriers for the pooling of freight of different and competing railroads, or divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in the case of an agreement for the pooling of freight rates as aforesaid, each day of its continuance shall be deemed a separate offense."

In words identical with or similar to these, the pooling of freight or the division of business is prohibited in Arkansas, California, Iowa, Kansas, Minnesota, Nebraska, North Dakota, South Dakota, and Wisconsin.

A group of States, a little smaller than the one just given, contains laws bearing less directly and rigidly upon pooling contracts. The New York law, for instance, authorizes the railroad commission to gather information on contracts and agreements entered into between railway companies. The laws of North and South Carolina make it the duty of their respective commissions to examine and approve or disapprove the contracts among railways. In Vermont the commission is charged with the prevention of unlawful combinations to increase rates. Similar administrative supervision of contracts is provided for in the laws of Florida, Georgia, New Hampshire, Texas, and Ohio. More than one-half of the States have, consequently, no laws regulating pooling.

Tickets: Scalping, redemption of unused tickets, passes.—The public has long been familiar with arguments for and against ticket brokerage, commonly called scalping. Irrespective of the merits of the arguments on either side, the fact can hardly be disputed that scalping may seriously reduce the revenue of railways, become an agency of discriminations and other abuses, and in the hands of weak roads provide the latter the means through which they may dictate, in a measure, at least, to the stronger and larger systems. In all but a dozen States ticket brokerage is extra-legal; that is, the law has ignored the subject, unless we unduly extend the meaning of such general provisions as that found in the laws of California, that railways shall provide tickets. In Connecticut the railway commission may regulate the sale of tickets and prescribe hours during which ticket offices may do business. South Dakota stands alone in that it expressly authorizes scalping. "Any person having an established place of business * * * shall have the right to buy, sell, and exchange passage tickets. * * * Any person purchasing a ticket from the authorized office * * * shall have the right to sell his ticket or tickets to any person doing business under this act." (Revised Statutes, 1899, §§ 8950, 8951.) Villages and cities may, however, regulate this

business by law. Not nearly so wide in its scope is the Alabama provision licensing ticket brokers on paying a fee of \$50 in towns of 10,000 or over. In smaller towns a fee of \$30 is exacted. In Colorado all tickets are transferable. Tickets are limited as to time, but not as to person.

On the question of free transportation and passes, New Jersey occupies a position as unique as that of South Dakota, in that the laws of this State enumerate certain State officers who shall be permitted to ride free. Most of the States that have legislated on scalping have in the same act inserted provisions relating to the redemption of unused tickets or unused portions of tickets. The lists are not entirely identical, scalping being prohibited without providing for the redemption of tickets, and vice versa, in a few States. The nature of legislation of this kind may be illustrated by the following (Laws of Maine, 1899, chap. 69):

"SECTION 1. No person other than a duly authorized agent of the railroad company issuing the same shall sell, offer for sale, or rent any railroad mileage book or any coupons therefrom, or any other railroad tickets limited to the use of a person or persons thereon specified at the time of its issuance by the railroad company, under a penalty of not less than \$10 nor more than \$100 for each offense, to be recovered on complaint.

"SECTION 2. No person, other than the one specified in any railroad mileage book or other railroad ticket limited to the use of the person or persons specified thereon at the time of its issuance by the railroad company, shall offer for passage or in payment for transportation on any railroad any such mileage book or coupons therefrom, or any other railroad ticket limited as aforesaid, under a penalty of not less than \$1 nor more than \$10 for each offense, to be recovered on complaint.

"SECTION 3. Any railroad company which shall issue a mileage book limited to the person or persons named therein, shall, upon presentation thereof by the person to whom such book was issued or his legal representatives, at some one or more of its principal stations in each county through which its road runs, to be designated by such company, at any time after one year from the time when such book was issued, redeem all the coupons then attached to such book at the same rate per mile as such mileage book was sold at."

A similar law passed by the legislature of New York has recently been declared unconstitutional. Other States prescribing the sale of railway tickets through authorized officers are: Florida, Illinois, Minnesota, Montana, New Jersey, Iowa, Texas, and Pennsylvania. In Montana the railway company must provide its agents with certificates which, when presented to the secretary of state, entitle the holder to a certificate authorizing him to sell tickets for the railway in question on the payment of \$1. Selling tickets without such a license is unlawful.

The redemption of unused or unused portions of tickets has been provided for by law in Pennsylvania since 1863. Other States having statutory requirements to this effect are Alabama, Florida, Illinois, Iowa, Michigan, and Minnesota.

Laws governing the free transportation, or transportation at reduced rates, of certain persons or classes of persons have been enacted in less than one-fourth of the States, most of these making it a misdemeanor, punishable by a fine, forfeiture of office, or otherwise, for persons holding public offices to accept passes or tickets at rates other than those charged to the public at large. Excursion and commutation tickets and reduced rates for exhibitions, fairs, political and other gatherings may still be granted, as well as special favors extended to charitable, religious, reformatory, and other institutions. States having legislated on this topic are Alabama, Arkansas, California, Colorado, Florida, Massachusetts, Mississippi, Missouri, North Dakota, Pennsylvania, Virginia, Wisconsin. In most of these the law takes the form of positive prohibition of the acceptance of passes on the part of public officials. In 1899 Minnesota passed a law making it obligatory for railway companies to grant free transportation to shippers of car-load lots of live stock. Free baggage is expressly provided for by the laws of a number of States, 150 pounds being the usual exemption on first-class tickets. In recent years laws declaring bicycles baggage have been enacted in a number of States.

Long and short hauls.—With the exception of discriminations and reasonable rates, there is no subject which the decisions of the Interstate Commerce Commission touch more frequently than that of long and short hauls. During the period covered by its first annual report 58 petitions, representing 95 different railways, were presented to this body for relief under the fourth section of the interstate-commerce law, commonly known as the long and short haul clause. The question of long and short hauls is chiefly an interstate matter, yet nearly one-half of the State legislatures contain the long and short haul provision in one form or another, that used in the interstate-commerce law being the most common.

Among the States prohibiting a greater charge for a shorter distance included within the longer for transportation in the same direction over the same line, under substantially similar conditions, ten introduced the much-needed element of elasticity in that the respective railway commissions, or other authority, may permit the suspension of the long and short haul provision in certain cases and under certain conditions.

"That it shall be unlawful for any common carrier, subject to the provisions of this act, to charge or receive any greater compensation in the aggregate for the transportation of passengers or of like kind of property, under substantially similar circumstances and conditions, for a shorter than for a longer distance over the same line, in the same direction, the shorter being included within the longer distance; but this shall not be construed as authorizing any common carrier within the terms of this act to charge and receive as great compensation for a shorter as for a longer distance: *Provided, however*, That upon application to the board appointed under the provisions of this act, such common carrier may, in special cases, after investigation by the board, be authorized to charge less for longer than for shorter distances for the transportation of passengers or property; and the board may, from time to time, prescribe the extent to which such designated common carrier may be relieved from the operation of this section of this act.

"No railroad corporation shall charge or receive for the transportation of freight to any station on its road a greater sum than is at the time charged or received for the transportation of the like class and quantity of freight from the same original point of departure to a station at a greater distance on its road in the same direction. Two or more railroad corporations whose roads connect shall not charge or receive for the transportation of freight to any station on the road of either of them a greater sum than is at the time charged or received for the transportation of the like class and quantity of freight from the same original point of departure to a station at a greater distance on the road of either of them in the same direction. In the construction of this section the sum charged or received for the transportation of freight shall include all terminal charges, and the road of a corporation shall include all the road in use by it, whether owned or operated under a contract or lease."

This brings before us a typical provision governing long and short hauls. Among others, the law of Florida contains the following clause bearing upon the same point:

The railroad commission "shall have full power by rules and regulations to fix the rates of freight and passenger transportation to be allowed for longer and shorter distances on the same or different railroads, and to fix what shall be the limits of longer and shorter distances."

Alabama expresses the same conditions in almost identical language. Kentucky, Louisiana, Minnesota, Nebraska, North Carolina, Tennessee, and Texas likewise authorized their commissions to suspend the long and short haul provision. In Mississippi the law specifies that "the commission shall regulate and fix the rates to be charged on short hauls in excess of what may be charged on long hauls."

Other States having long and short haul provisions are Arkansas, California, Connecticut, Iowa, Nevada, North Dakota, South Carolina, Vermont, Virginia, and Washington.

Discriminations.—Discriminations have from the first presented the most serious aspects of railway regulation, and we are therefore not surprised to find statutory provisions prohibiting discriminations in 16 State constitutions and in the laws of three-fourths of all the States. A common form of expressing this prohibition is the following:

"If any railroad corporation shall willfully charge, collect, or receive from any person or persons, for the transportation of any freight upon its railroad, a higher or greater rate, toll, or compensation than it shall at the same time charge, collect, or receive from any other person or persons for the transportation of a like quantity of freight of the same class, being transported from the same point, in the same direction, over equal distance of the same road, or if it shall charge, collect, or receive from any person or persons, for the use and transportation of any railroad car or cars upon its railroad, a higher or greater sum than it shall at the same time charge, collect, or receive from any other person or persons for the use or transportation of a car or cars of the same class, for a like purpose from the same point in the same direction, and an equal distance, all such discriminating rates, charges, or collections, whether made directly or by means of any rebate, or other shift or evasion, shall be considered and taken as *prima facie* evidence of discrimination, which is hereby prohibited and declared unlawful, and shall be punished. * * *

The great importance of the legal attempts to wipe out evil practices, known under the names of discrimination, rebates, extortion, abuses, etc., warrants a brief indication of the essence of the statutory provisions found in a number of other States.

Alabama.—What constitutes extortion decided by jury. Penalty, double the damage inflicted upon a shipper plus attorney fees. Commission hears complaint. (Consult constitution, Article XIV, section 21.)

California.—Railway commission given power to correct abuses. Railways obliged to transport for each other without delay, to grant right of intersection, etc. (Consult constitution, Article XI, section 17.)

Florida.—A law of 1890 prohibits railway companies from charging more than reasonable rates and from practicing unjust discriminations.

Illinois.—Extortion and discriminations punished by heavy fines, amply provided for in the law.

Michigan.—Discriminations of all kinds forbidden and rates at noncompeting points not to be greater than those at competitive points.

Nebraska.—Board of transportation shall investigate and prevent discriminations.

Ohio.—Railways shall not discriminate between each other, between way and through freights, between trunk and other railways. Roads shall furnish equal facilities and forward freight by lines specified by the shipper. The latter may enforce by injunction.

South Dakota.—Unjust discriminations and preferences declared unlawful in two separate sections of the law. Discriminations as to goods, cars, railways, persons, etc., expressly prohibited.

Texas.—Discriminations prohibited under former laws; but a law of 1899 punishes discriminations on part of railways against steamship lines in the interchange of traffic. The unusual punishment of not less than 2 and not more than 5 years in the penitentiary is inflicted by the law, but this shall not prevent railways from granting reduced rates to charitable and State institutions, to excursionists, fairs, railway officers, etc.

Additional States legislating on discriminations are Arkansas, Colorado, Connecticut, Georgia, Iowa, Kansas, Kentucky, Louisiana, Massachusetts, Mississippi, Missouri, Montana, Nevada, New Mexico, New York, North Carolina, North Dakota, Pennsylvania, South Carolina, Utah, Vermont, and Wisconsin. In a few of these States the legal provisions simply assert the power of the commission to correct abuses, and in the hands of an energetic commission or other State officer this is probably sufficient to combat successfully the evils of discriminations.

Rates: Publicity and revision.—This subject is closely connected with the powers and duties of railway commissions. Since, however, not all the States have commissions, and laws relating to the fixing, revising, and publishing of rates exist in some of these States, it is necessary to give separate treatment to this question. The intrinsic importance of the subject of rates warrants its being set off by itself for special treatment. Railway rates have long constituted the pivotal point upon which have turned the most complex as well as important railway problems, and it is no exaggeration to say that all the other phases of the railway problem sink into relative insignificance in the presence of this predominant question.

Only 4 States (Connecticut, Delaware, Oregon, and Rhode Island) have no laws regulating rates or providing for their revision and publicity. One of these States, Connecticut, passed laws of this kind at various times from 1853 to 1897. Since the latter date no laws have been on its statute books governing railway rates. In 8 States the laws on this subject are less complete than in the great majority of the other States, providing in some instances for the posting of rates, fixing maximum rates in others, reserving to the legislature the power to alter them or to fix them on complaint, either directly or through an administrative officer.¹ The maximum rates which are established in some instances are so high that they can scarcely be said to afford any regulation of rates; for instance, Nevada prescribes 10 cents as the maximum for passenger rates per mile, and 20 cents per ton-mile for freight, although no railway company need accept less than an aggregate charge of 35 cents for any service of transportation. Another illustration is found in Arkansas, where a law establishes 8 cents per mile on lines of 15 miles in length or less; lines 15 to 75 miles in length, 5 cents; over 75 miles, 3 cents. A company may charge 25 cents "for the carriage of any passenger who may get on or off a train at other than the regular station."

¹These States are Florida, Idaho, Indiana, Kentucky (the commission has no power to fix rates in this State), Montana, New Hampshire, New Mexico, Vermont, and Wyoming.

Coming now to those States which provide more specifically for the establishment and publicity of rates, it will be most convenient to associate such provisions with the considerable number of leading States having enacted them. In Alabama the railroad commissioners may revise or increase rates, always having due regard to the value of the service and other conditions of traffic. Having been approved by the commission, such rates may be published, special as well as general. In Arkansas a legal form very common in earlier charters and laws is still in existence, limiting the power of the legislature to regulate rates and fares so as never to bring the net income on the capital stock of a railway below 15 per cent per annum. The rates on lines 50 miles and less in length are fixed by law, but may be reduced by the commission, not, however, so as to bring the net income below 10 per cent. The classes of freight and corresponding rates shall be posted 5 days before taking effect. Up to 1890 an Arkansas law was in effect exempting railways subject to competition from that provision of the law providing for some days' notice; such roads were permitted to put posted rates into effect immediately. Under its constitution the State of California is empowered to regulate rates. The commission fixes reasonable rates and the railway companies (under the constitution) are liable to a fine of \$20,000 for overcharges. The schedules adopted by the commission must be published by the companies, although the commission itself may publish them. The maximum rates prescribed in California are on the graded mileage system. In Georgia railway companies may control rates on their respective lines, subject to the commission and laws of the State. Rate schedules shall be published by the commission in certain newspapers and railway companies must post the same. Weighing of freight is done by sworn weighers. Publicity is compulsory under the laws of Illinois, and the general assembly directs the commission by law to make schedules. On the application of the mayor and council or trustees of a township the commission shall examine rates under the laws of Iowa, and all rates established by the commission shall be considered just and reasonable until proven otherwise. Railway companies shall promptly post and file with the commission schedules of rates. Ten days' notice is required for an advance in rates, although no previous notice must be given for reductions. The Kansas commission law having been declared unconstitutional the legal status of the question of rates is perhaps uncertain in that State. Formerly maximum rates were prescribed and no rates could be increased without 60 days' notice. In Louisiana maximum rates are prescribed by the laws of 1890 and 1894. The commission adopts changes and regulates rates and governs the relations between main and branch lines. In Maine the legislature may fix rates which shall be subject to the revision of that body and posted. Whenever practicable rules and regulations shall be printed on the ticket. In Michigan railway companies have power to regulate the time, manner, and compensation for their services, within the limits of maximum rates established by statute. The 1,000-mile ticket law of 1891, requiring companies to sell such tickets at the rate of 2 cents per mile, and to redeem unused portions of the same, was declared unconstitutional in 1899. A recent statute regulates the relation of railways to bridge and tunnel companies and fixes the maximum rates for those companies. The commission may report upon the desirability of classifications of freight, as well as compare and fix proportional rates on milk. The Minnesota companies file schedules with the commission. Published schedules can not be changed except on 10 days' notice. A law of 1899 prevents railway companies from raising rates on grain, flax, lumber, coal, and live stock, except on 60 days' notice, unless permitted to do so by an order of the commission in writing. Railway companies are required to give 10 days' notice when the revision of rates is under consideration in Mississippi. The commission may revise both individual and joint rates and approve classifications and rate schedules before the same are posted. The Missouri commission may make classifications and freight rates, and from time to time revise schedules of maximum rates. In Nebraska the legislature prescribes maximum rates, from which companies may take an appeal to the supreme court. On order of the court the board of transportation may reduce and revise maximum-rate schedules. No advance can be made without 10 days' notice, although reductions are permitted without notice. Railways file schedules with the commission. (Consult Nebraska maximum freight-rate cases.) A New Jersey law permits railway companies to charge what they may think reasonable, below a certain maximum established by law. Railways shall not charge more from way stations than between centers. The legislature of New York may fix maximum rates, reduce the same, and require companies to furnish necessary information to the commission. Penalties are imposed for charging excessive rates. The 1,000-mileage-book law of 1895 was declared unconstitutional in 1900. The rates established by the corporation commission of North Carolina shall be considered *prima*

facile reasonable, from which carriers may appeal to the courts. Rate schedules must be posted. In North Dakota railway companies are required to publish schedules of classification, and rates must be examined and revised by the commission. No advance can be made except on 10 days' notice; reductions, without notice. Railway companies may appeal to the district courts from any order of the commission. Maximum rates on coal are especially prescribed. Under the laws of Ohio every company shall post its rates, and accept no less than the published rates except on 10 days' notice. Maximum rates are prescribed for both main and branch lines, charges being "evened up" by nickels. The Pennsylvania bureau of railways shall see to it that no more is charged than what is permitted by special charters or general laws under which the railway companies do business. Maximum rates have been commonly prescribed in charters and statutes of the State. A recent law of South Carolina compels railway companies to post schedules of rates. The latter shall be reasonable and just, and may be made by the commission. On complaint, the commission may also revise and fix rates on milk. The railway corporations of Tennessee are required to file schedules with the commission and to secure a certificate of privilege, with which the same shall be published. If railway companies fail to file such schedules the commission may fix rates. In establishing rates the commission is required by law to take into consideration water competition. The Texas commission may make classifications, establish rates, and provide railway companies with schedules. These can not go into effect except on 20 days' notice. Carriers may bring direct action to test the reasonableness of such rates. In Vermont railway companies may fix rates, subject to revision by the courts on petition of 3 or more freeholders. Railways more than 50 miles in length, wholly or partly in the State, shall sell 1,000-mile books at not over 2 cents per mile, on penalty of from \$500 to \$1,000. The laws of Virginia prescribe maximum rates which, under present conditions, are clearly very much above what any railway company would think of charging, and prevents any statutory reduction as long as the net returns do not exceed 15 per cent. Copies of rate schedules must be filed with the commission, and no changes are permitted except on 10 days' notice for an advance and 3 days' notice for a reduction. It will be noticed that reductions can not be made without giving previous notice. This is important. All other States not mentioned thus far have analogous laws on the subject of rates. Some of them do not provide as liberally as many of those which have been quoted, and all of them, in one way or another, cover the subject.

Access to books.—In about one-half of the States legal provisions governing access to books of railway companies are not very stringent and frequently do not go beyond the general statement that such books shall be open to officers, directors, and stockholders, or a certain number of them. Railway commissions or other State officers have no direct control over the records of companies.¹

To illustrate the nature of legal provisions in the other group of States brief statements of laws governing access to books in them may here be introduced. In Alabama the commission shall examine books and records of a railway company on application of 1 director or representatives of one-fiftieth of the capital stock or of one-fiftieth of the total indebtedness. The results of this examination may or may not be published, discretionary power lying with the commission. A committee of the general assembly may investigate the books of Connecticut companies. In Massachusetts the commission shall examine books and papers on request of 1 director or the holders of one-fiftieth of the stock and bonds of the company. The commission of South Carolina may at any time examine the books, or on written application of 1 director or of the holders of one-fiftieth of the stock, bonds, etc., the commission shall make such examinations. In Texas the commission, a committee of the legislature, and 3 stockholders, and "any officer or agent of the State may examine books of railway companies." In States other than those mentioned commissions have access to books and records by law. These are Arkansas, California, Colorado, Florida, Georgia, Illinois, Iowa, Kansas, Maine, Massachusetts, Michigan, Missouri, New Jersey, North Dakota, North Carolina, Rhode Island, South Carolina, South Dakota, Texas, and Vermont.

Annual and other reports.—Reference to the sections on charters, as well as early general laws, will recall the fact that annual reports were frequently called for under private as well as public laws, and that such reports vary in their comprehensiveness not only among different States, but also among charters granted by the legislature of the same State. In some charters and laws such reports

¹ States falling into this group are Arizona Territory, Colorado, Delaware, Idaho, Indiana, Kentucky, Maryland, Minnesota, Mississippi, Montana, Nebraska, Nevada, New Jersey, New Mexico, Ohio, Oregon, Pennsylvania, Tennessee, Utah, Virginia, Washington, West Virginia, Wisconsin, and Wyoming.

include only a half dozen or dozen items relating to mileage, capital stock, and bonds. In others, a hundred or more items were carefully prescribed and penalties imposed for noncompliance with the provisions of the charter or of the laws. The reports which are called for under existing statutes differ quite as widely as those made pursuant to early legislation. Typical provisions existing at the present time in the laws of those States which provide in a legal way for these needs can be illustrated by reference to the laws of the States here given. In Maine the commission prescribes the form for the annual report of railway companies which shall "be designed to produce uniformity" in the annual returns of all the railroads in New England. Similarly, in Massachusetts, an act of 1899 aims to bring the returns of railway companies into harmony with those of the Interstate Commerce Commission. Reports must be uniform, as prescribed by the commission, and quarterly financial statements shall be made. In New York railway companies make annual reports in forms prescribed by the commission and the commission in turn makes its annual report. In Pennsylvania officers of railway companies are required to report annually to stockholders and at such other times as the legislature may require. The law of 1897 orders the secretary of internal affairs to supply blanks for reports of railway companies, copies of which shall be sent to the government and members of the legislature. The bureau of railroads also keeps these reports on file. In Illinois railway directors are required to report annually to the auditor in the manner prescribed by law; also to the commission in a form embracing 41 items. The commission is required to file and tabulate the reports of railways. The law of Iowa is similar to that of Illinois except that the annual report, as prescribed by the commission, contains only 11 items, and, instead of reporting to the auditor, "a detailed exhibit" of receipts, etc., shall be presented to the government.¹

Twenty States have statutory provisions less definite and comprehensive in their scope, calling for reports to stockholders by boards of directors, or reports of railway officers to some State officer or officers, or to the legislature, or to two or more of all these.²

Issues of stocks and bonds.—Many controversies have been waged over the question of the capital stock of our railways. A conservative student of the question has placed the capitalized value of the railways of the country at \$60,000 per mile, and this he does not consider excessive nor appreciably above the real value of the plants as they exist at the present time. So far as State laws are concerned it would be difficult to determine the truth of this matter on the basis of information railway companies have been obliged to furnish under the statutes. In Massachusetts an increase in capital stock or signs of indebtedness may be made only on authority of the commission before which such questions are determined on hearing. Ohio railways shall report to the commission the cost of the road, the amount of capital stock, indebtedness, etc. The aggregate indebtedness shall not exceed the capital stock. In Pennsylvania railway stock is limited to \$150,000 per mile, bonds to the same amount, and the total of the stock, bonds, and other papers to \$300,000 per mile. In Arkansas consolidated companies shall not cause the aggregate of their stocks and bonds to exceed the sum represented by constituent companies. By a majority vote of the stockholders the company may borrow, at 7 per cent, an amount not greater than the total capital stock. In Colorado all stock shall represent labor, services, money, and property; the same shall be increased only under general law and by a majority vote of the stockholders. Kentucky companies can increase capital stock only on recommendation of the commission. The amount of indebtedness shall never exceed the total cash paid in. In Indiana boards of directors may not increase capital stock; capital stock may not be increased to exceed \$15,000 per mile, and a certificate stating the amount of such increase shall be filed with the secretary of state. The New York commission may regulate stock issues and pass upon an increase or a reduction in the same. Other States having similar provisions are Indiana, Illinois, Louisiana, Maine, Maryland, Mississippi, Missouri, New Hampshire, New Jersey, South Dakota, Texas, Wisconsin, and Wyoming.

This leaves a group of more than one-half of the States which do not attempt directly to regulate the issuance of stock by law. In some of them it is provided that a certificate of increase shall be filed with the secretary of state or some

¹Other States calling for annual reports, more or less comprehensive, either to the commission or to some executive or administrative State officer, in forms prescribed by the commission, are Colorado, Connecticut, Florida, Illinois, Iowa, Kansas, Kentucky, Maine, Michigan, Minnesota, Mississippi, Massachusetts, Missouri, Nebraska, New Hampshire, Ohio, New York, Rhode Island, South Dakota, South Carolina, Texas, Vermont, Virginia, and Pennsylvania.

²These States are Alabama, Arkansas, Arizona, California, Georgia, Idaho, Indiana, Louisiana, Montana, Nevada, New Jersey, New Hampshire, North Carolina, North Dakota, Oregon, Tennessee, Utah, Washington, West Virginia, and Wisconsin.

other State officer, and that a two-thirds' vote of the stockholders is necessary before directors may authorize an increase in capital stock or the issuance of bonds.¹

State railway commissions.—The railway commission laws sometimes embody all the railway legislation in existence in the State. This was true in Oregon; and when in 1898 the commission law of that State was repealed Oregon was left practically without any legislation on the subject of railways. In addition to Oregon, Delaware, Rhode Island, and Arizona are the only States which have failed to legislate on railways to any considerable extent. In States where the commission laws embrace only regulative features, questions of organization and management are treated in the general corporation laws or in subtitles under these. The general statement, however, holds true that the regulative features of railway legislation of the different States of the Union are embodied in our commission laws in all States in which commissions exist. The railway commissions represent the only active administrative agent which our laws have provided, and the adequacy or inadequacy of State administration depends upon the authority vested in this agent.

In their composition our commissions represent the same degrees of variety that exist in legislative provisions on most other railway topics. In the number of members they vary from 1 to 5; in the number of years during which they held office, from 2 to 6. In the manner of their appointment we find popular suffrage, appointive power of a governor, and the advisory power of a branch of the legislature. Their salaries vary from \$1,000 to perhaps more than 5 times that amount, being entirely independent of the duties performed by them, and bearing no relation whatever to the responsibilities vested in them. The funds from which the salaries are paid are sometimes provided by general taxation, sometimes by an assessment on railways in proportion to mileage, and again by levying a certain per cent on the net income of the railways in the State. The absolute lack of system will be apparent to anyone who makes even a cursory examination of these provisions.

In qualifications we find less although some variety. It is generally provided that the commissioner or commissioners shall be qualified voters of their respective States; that they shall be citizens of the State, and, in some instances, of the United States; that they shall have attained a certain age, usually that of qualified voters, and finally that they shall have no financial interests in any of the railroads over which they are expected to exercise control.

The jurisdiction of railway commissions varies from controlling railway companies alone, on the one hand, to exercising administrative control over a large combination of corporate interests representing practically the entire industrial life of the Commonwealth, on the other. The latter is strikingly illustrated by the industries over which the corporation commission of North Carolina is legally bound to exercise supervision. These embrace street railways, steam railways, steamboat and canal companies, express companies, sleeping-car companies, telephone and telegraph companies, banks, building, loan, and trust associations. The Pennsylvania bureau is required by law to exercise administrative control over railways, banks, mining, and manufacturing establishments. The Illinois, Nebraska, and Minnesota commissions exercise control over railways and warehouses. The New York commission, in addition to railways, has charge of sleeping and drawing-room car companies. Others are charged with railway and street railway companies. Others also with bridges and ferries. Not a few of the commissions are by law obliged to devote more or less of their time and energy to institutions which lie entirely outside of the means of transportation and communication. From the point of view of efficient administration the tendency, if such exists, to empower a single administrative organ to exercise control over a great variety of industrial establishments can not receive the approval of thoughtful men. All of our great industrial establishments represent interests which are peculiarly their own, and other features which are characteristic only of similar establishments. This calls for special agencies, whose duty it should be to concentrate all their efforts in that particular field. The inclusion of so many industries inevitably leads to a division of interests, and the equally inevitable diminution in concentration and efficiency. Special types of industry require special administrative agents, and that tendency in our laws which burdens a single administrative organ with a great variety of complex duties can not be looked upon as desirable. It is beside the mark to attempt to maintain that a large

¹ These States are Alabama, Arizona, California, Delaware, Florida, Georgia, Iowa, Kansas, Kentucky, Michigan, Minnesota, Montana, Nebraska, Nevada, New Mexico, North Carolina, North Dakota, Oregon, Rhode Island, South Carolina, Texas, Utah, Vermont, Virginia, Washington, and West Virginia.

administrative body can, in its membership, be differentiated in such a way as to represent in a consolidated form the specialized interests of all the different leading industries of a State.

Railway commissions are frequently divided into two general classes—advisory and regulative—the former being illustrated by the commissions of States like Massachusetts, Wisconsin, Vermont, Alabama, and the latter by Illinois, Iowa, Nebraska, and Texas. So far as a formal statutory enumeration of specified powers goes this classification is doubtless correct. But we should not lose sight of the fact that an advisory commission, with its powers exercised by thoroughly competent men familiar with the railway business and capable of handling the duties of their office with facility, may in the long run accomplish infinitely more than a regulative commission of the strongest type, represented by men whose tenure of office is uncertain, whose familiarity with railways is the most imperfect and superficial, and whose purpose in the attempt to exercise their duties must at best be vague and beclouded. The efficiency of all control and regulation through commissions must ultimately rest upon the man. It is the power that lies behind the throne which vitalizes the machine. A railway commissioner in a State embracing some of the most important railway systems of the country not long ago made the statement that in the office now occupied by him little was done except the gathering of statistics and the giving of useless advice. He pointed out in detail how the efficiency of that particular office had varied very greatly with the incumbency of different types of men. Without anticipating what may be said in later sections of this report it will add something to the interest that may attach to an examination of the powers and duties of different commissions to state at the outset that the vital weaknesses of all the legislation of all the different American States may be grouped under two heads: First, the lack of adequate administrative machinery; second, the lack of organic connection between this administrative machinery and the railways on one hand and the public on the other; also, this same lack of mutual understanding and vital connection between the railways and the public. To bring about the latter there is not a single efficient provision in all the railway laws of the United States; and the fact that railways have voluntarily, and in some instances with marked success, brought about such mutual understanding by no means affords a sufficient excuse for the absence of provisions establishing such organic connections by law. It has often been said that in America the weakest line is capable of dictating with success to the strongest, and that the strongest, finding itself at the mercy of the weakest, is under the circumstances obliged to pursue a course which is as ruinous to its own interests as it is antagonistic to the interests of the public. No one whose privilege it is to know the railway men of the country will for a moment maintain that these are not, as a body, sincerely desirous of serving the public in the best possible way. Their aspirations and ambitions, altogether legitimately and necessarily keeping in view the immediate interests of the corporations which they represent, go beyond the horizon of narrow selfish interests and take into view the larger field of mutual prosperity and common gain. But granted that 99 per cent of the railway managers and officials are voluntarily inclined to do that which we believe the public interests demand, what is there to prevent the one recalcitrant road from holding out and demoralizing the entire service and preventing the ninety-nine from living up to their good intentions? The sincere desires of the best railway officials may be frustrated by the arbitrary demands and reckless dictation of a single unscrupulous manager. In this point lies the fatal weakness of American railway legislation. One feels again and again the absolute helplessness in which the shipper finds himself on the one hand, and the good railway manager on the other. No administrative machinery has been provided whereby this one outlaw can compulsorily be brought into harmonious action with the ninety-nine promptly, thoroughly, and finally. Demoralization in railway affairs has again and again been the result of the imposition upon the ninety-nine considerate officials of the inferior and defective code of the one unscrupulous manager. In view of the great importance of commission legislation, it has been deemed desirable to give in greater detail the provisions governing them. Some provisions which are common to many laws, such as those relating to certain qualifications of commissioners and employment of secretaries, clerks, deputies, and experts by these commissions, will not be repeated in all the States. Likewise those clauses governing railway taxation and railway labor and the duties of commissions with respect to these topics will be omitted, because the same are included in special reports of the Industrial Commission. Nor will repeated references be made to reports made by commissions to governors, auditors, and other officers and legislatures. It will be understood that the making of reports is one of the regular duties of commissions.

Summary of commission laws.—*Alabama.*—Three commissioners, holding office for 4 years, appointed by the governor with the advice and consent of the Senate. Removable by the supreme court on impeachment, like other State officers. The commission may settle disagreements between connecting roads with appeal to chancery court; exercise general supervisory power and make recommendations to railway companies and governor, to whom an annual report must be submitted. Railways shall furnish necessary information to commissions. Commission to carry on correspondence with similar bodies in other States.

Arkansas.—Three commissioners, elected by qualified voters, shall hold no Federal offices; railways shall submit rate schedules; commission may make rates and approve schedules; no change in rates except on 10 days' notice; they shall investigate and hear complaints; railway officers shall furnish information; facts as found by commission to be prima facie evidence; may employ experts; examine books of companies; shall determine cost of reconstruction, and, on petition, order connections and fix joint rates; report annually to governor.

Arizona.—No commission.

California.—Three commissioners, elected by districts for 4 years; legislature may remove by two-thirds' vote (consult constitution, Article XII, section 22): "The board shall have power to issue writs of summons and of subpoena in like manner as courts of record." Commission hears complaints, and defendant companies shall appear within 15 days; decisions and grounds upon which same are based to be given in writing; shall hold public session in San Francisco every month, and, if necessary, at other places.

Colorado.—One commissioner appointed by governor, with consent of senate, for 2 years. He shall inspect railways and make recommendations to them; has no power to change manner of operating roads; county commissioner or 25 citizens of a county may enter complaint before commissioner, who shall investigate rates and so on; but such complainants shall bear the expense of investigation; commissioner decides on appeal the ratio of cars which shall go to individual shippers; he may call and examine witnesses.

Connecticut.—Three commissioners appointed by governor, with consent of senate, for 4 years; one to be a lawyer, another a civil engineer, and the third a business man; commission inspects railways twice each year; publishes and posts important railway legislation; may order gates, flagmen, signals, and so on; subpoena witnesses; investigate accidents; recommend to railway companies in writing things conducive to public safety and interest. Appeal from decision of commission may be taken to superior court.

Delaware.—No commission.

Florida.—Three commissioners appointed by governor and senate for 4 years. The first commission was composed by law of 1 lawyer, 1 railway man, and 1 farmer; succeeding commissioners elected without reference to vocation. Commission has power to establish classifications, rates, and regulations which shall be just and reasonable; hearings must be given to persons and corporations; decisions of commission published at its discretion; commission may examine books, agents, etc.; non-compliance with laws subject railways to fines; commission may institute proceedings through attorney-general; railway officers making false reports fined heavily. The commission has judicial power—"that said railway commissioners are hereby vested with judicial powers to do or enforce or perform any function, duty, or power conferred upon them by this act, to the exercise of which judicial power is necessary." (Laws, 1899, number 39, section 22.) Commission has also power to create rating or basing points: "Provided That the said commissioners shall have the power to create rating or basing points at places where competing lines meet, or where water or other competition exists, and to break the continuity of rates to and from such points, so as to maintain competition between rival lines and points, and may, in fixing the rate upon any commodity, take into consideration the competition between different localities or shipping points producing or shipping such commodities." (Laws, 1899, No. 39, sec. 6.) Duty of commission to bring proper matters before Interstate Commerce Commission.

Georgia.—Three commissioners appointed by governor and senate for 6 years—one a lawyer and one a railway man. Commission may make reasonable and just rates and regulations, "for each of the corporations doing business in the State." They shall examine rates into and out of the State; may examine agents and officers under oath; compel evidence to be given; penalties are imposed for disobedience to the rules of the commission; commission appeal to Interstate Commerce Commission. (Consult Georgia commission cases: 5 I. C. C., 324; 99 Fed. Rep., 52; 168 U. S., 144.)

Iaho.—No commission.

Illinois.—Three commissioners appointed for 2 years by governor and senate; commission shall "visit each county" twice each year and examine railways and warehouses; may bring action in any county court for violations of law; attorney-general may compel compliance with orders of commission; commission in its report shall pay especial attention to the possibility of classifying railways in regard to rates and fares; may employ civil engineers.

Indiana.—No commission.

Iowa.—Three commissioners elected for 3 years; commission has general supervision over railways, and shall investigate matters relating thereto; recommend changes, examine bridges semiannually, subpoena witnesses, administer oath, and enforce orders through district courts, but the same court may also issue injunctions if the orders of the commission seem unjust. (Marked similarity between this and the Federal act regulating commerce.)

Kansas.—Kansas commission law recently declared unconstitutional, but as showing the trend of legislation, salient features of that law are here inserted. The law created a court of visitation composed of 3 members—1 chief justice and 2 associates—elected for 4 years. This commission had power to compel adherence to impartial and reasonable train service; require the construction of depots, switches, and other facilities; regulate intersections and joint operation of roads; prescribe the movement of trains and necessary measures of safety for passengers and employees; require uniform appliances; hear and decide cases relating to freight rates, switching and demurrage charges, and to apportion such charges among connecting railways; regulate rates for carload and less than carload lots, including live stock; classify freight and restrict railways in the exercise of their powers to charter privileges, and compel obedience to railway law.

Kentucky.—Three commissioners elected by districts for 4 years. No power to fix rates, but a law of 1899 requires commission to hear complaints of extortion and excessive rates "when complaints shall be made to the railway commissioners accusing any railroad or corporation of charging, collecting, or receiving extortionate freight or passenger rates over its line or lines of railroads in the Commonwealth, or when said commission shall receive information or have reason to believe that such rate or rates are being charged, collected, or received, it shall be the duty of said commission to hear and determine the matter as speedily as possible." (Laws 1899, chapter 2.) In addition, commission gives notice, fixing time and place of hearing, whereupon rates may be agreed upon and put in operation on 10 days' notice. The commission shall also examine through rates and bring proper matters before the Interstate Commerce Commission. It may order improvements and, if its advice is not heeded, call the attention of the attorney-general and the legislature to those matters.

Louisiana.—Three commissioners, elected for 6 years by districts, shall inspect railways; hear and determine complaints against classification of rates; compel attendance of witnesses. Sheriffs refusing to execute and enforce process or order of commission subject to penalty as in similar civil cases. "It shall be lawful for the commission to fine and commit to the parish prison of the parish where the commission may be in session at that time any witness or other person adjudged to be in contempt of the authority of said commission, the same as in cases of contempt before the district courts of this State." Railways may appeal from decisions of commission to courts, pending which commission orders are suspended.

Maine.—Three commissioners for 3 years, appointed by the governor and council. Commission shall examine railways and rolling stock, and give certificate showing their condition to railway companies; may reduce speed on unsafe roads; settle disputes among connecting lines; order erection of stations; investigate accidents; make rulings as to crossings, which are final, unless appealed from within 14 days; compliance with orders may be compelled by court.

Maryland.—No commission.

Massachusetts.—Three commissioners, appointed for 3 years by governor and council; commission to exercise supervision of railways; to see that laws are complied with; to inform corporations of necessary improvements, changes, etc.; to examine condition of roads on complaint of city or town authorities; to investigate causes of accidents; to be furnished with information as to condition, management, etc., of roads; to examine books, accounts, etc.; on request, to publish financial condition; summon witnesses; employ experts; approve by-laws of railway relief societies.

Michigan.—One commissioner, appointed by governor and senate for 2 years. Commissioner shall examine condition and management of railways; examine tracks; hear petitions for better railway facilities; subpoena witnesses; arbitrate on joint use of stations and terminal facilities; prescribe uniform systems of accounting; prescribe forms of signals and order automatic bells at crossings.

Minnesota.—Three commissioners elected for 4 years. Commission to investigate rates, fares, and classifications; visit each county annually; hold sessions in any part of State; inquire into management of common carriers, and, at discretion of commission, these may be sued for noncompliance with orders; attorney-general ex officio attorney for commission; commission notifies carriers of petitions and complaints, and fixes rates either on complaint or on its own motion; subpoena witnesses; prescribe uniform systems of accounts; may require uniform gauges if thought necessary after examination.

Mississippi.—Three commissioners, elected for 4 years by districts. Commissioners may apply to courts of chancery to compel obedience to State laws, lawful orders, decisions, and determinations. "Every railroad ought to use the same classification of freight, and, as far as practicable, the railroad commission shall require them to do so, and to conform the classification to that in use in interstate commerce, when practicable." (Revised Statutes, 1892, section 4, 818.)

Missouri.—Three commissioners, elected for 6 years. Commissioners shall prosecute complaints involving unreasonable rates before Interstate Commerce Commission, subpoena witnesses, call for papers and books, and secure other evidence. Courts may revise orders of commission. Commission may classify freight and reduce rates; institute proceedings against railway companies; promote the consolidation of parallel lines, and prosecute companies for preventing competition between express companies. The commission also has power to establish connections between competing lines.

Montana.—No commission.

Nebraska.—Board of transportation composed of attorney-general, secretary of state, auditor, treasurer, and commissioner of public lands. The law prescribes classification of freight in full. The commission shall inquire into the management and business of railways for the protection of public interests; subpoena witnesses and invoke power of courts; courts may compel obedience by injunction, but railways have power to appeal to supreme court. Proceedings of commission accepted as prima facie evidence; commission shall report investigations in writing.

Nevada.—No commission.

New Hampshire.—Three commissioners, appointed by governor and council for 3 years. Commission has power to fix maximum rates; investigate accidents and complaints; administer oaths, summon witnesses, and compel them to testify; institute proceedings against railways for violation of law; examine railways annually; investigate accidents, and report to supreme court on necessity of new roads, bridges, or on the desirability of consolidations.

New Jersey.—No commission.

New Mexico.—No commission.

New York.—Three commissioners, appointed for 5 years by governor and senate. Commission exercises general supervisory powers over railways. Attorney-general may prosecute railways for failure to comply with orders of commission; investigate accidents; make recommendations after hearing, for which the attendance of witnesses is compulsory; make rulings on grade crossings, from which rulings appeal may be taken within 60 days; no mortgages, except purchase mortgages, shall be issued without consent of the commission.

North Carolina.—Corporation commission, composed of 3 members elected for 6 years. Commission has general supervisory powers; may establish rates; prevent discriminations, rebates; call the attention of the Interstate Commerce Commission to proper cases; investigate books and papers; examine officers, and exercise powers and jurisdiction of a court of general jurisdiction on subjects embraced in the act; establish stations, and pass upon applications for discontinuing the same; investigate accidents; act as arbitrators between disagreeing companies. In fixing maximum rates the commission shall always consider the value of services performed and other factors entering into the composition of rates. The commission may make special rates, with a view of developing certain industries. (Compare Tennessee laws.)

North Dakota.—Three commissioners, elected for 2 years. Commission shall have general supervision; inquire into violations of law, neglect of duty, etc. Attorney-general ex officio counsel to enforce decrees of commission. Hearings shall be given on petitions, for which witnesses may be subpoenaed and oaths administered. Where railway companies cross on same grade commission may compel construction of Y's.

Ohio.—One commissioner, appointed for 2 years by governor and senate. Commissioner shall examine complaints; subpoena witnesses; call for books; enforce acts against railways having inexperienced employees, the act regulating height

of bridges, automatic couplers, limiting the hours of service of employees, fire extinguishers on train, and interlocking switches (interlocking switches are compulsory); investigate accidents.

Oregon.—No commission. Commission established in 1887, and in 1898 commission law, and with it practically all other railway legislation, was repealed.

Pennsylvania.—Secretary of internal affairs, elected for 4 years, appoints a deputy, who supervises railways. The secretary of internal affairs shall supply the blanks for reports of railway companies, copies of which shall be sent to the governor and members of legislature; such reports filed in bureau of railroads. Special reports may be required. Bureau of railroads shall see that corporations act within legal limits, hear complaints, and, if well founded, instruct attorney-general to institute proceedings against offending companies.

Rhode Island.—One commissioner, appointed by governor for 3 years. Commissioner shall "personally examine into the proceedings of any railroad corporation," secure compliance with laws, investigate accidents, subpoena witnesses, approve or disapprove the abandonment of stations, order flagmen at crossings, and make orders in regard to grade crossings, from which an appeal may be taken. Commissioner shall report annually to the general assembly, "so far as the public interest may require, with such suggestions and recommendations as he may deem necessary or expedient."

South Carolina.—Three commissioners, elected by general assembly for 6 years. Commission shall have supervision of all railways; investigate complaints, accidents, etc.; may require information concerning rates with connecting roads; may ask additional questions with respect to schedules, and make requests and give advice; investigate accidents. Jointly with railway companies commission may make special rates for the purpose of developing industries of the State. No new railway may be opened without examination and certification of commission. Railway company may appeal from decisions of commission to circuit court.

South Dakota.—Three commissioners, elected at large for 6 years. Commission shall investigate complaints and furnish report of investigation to complainants; subpoena witnesses; examine books; fix schedules of maximum rates and classifications; establish joint rates on petition of disagreeing railway companies; exercise general supervision, and institute action to compel compliance with law.

Tennessee.—Three commissioners, elected for 6 years by grand divisions of the State. Commission shall supervise and fix rates, charges, and regulations of freight and passenger tariffs; correct abuses; prevent unjust discriminations and extortions. Commission may subpoena witnesses, examine books, and compel testimony to be given, but no railway employee, officer, etc., shall be subject to legal process on basis of his own testimony; investigate through rates and, in case of violations of law, report to the Interstate Commerce Commission; attorney-general conduct proceedings. Circuit, chancery, and justices' courts shall have jurisdiction of cases arising out of the act.

"Railway companies may make contracts with coal, mining, and manufacturing companies or persons for special rates of freight not to be controlled by this article" (Rev. Stat., 1896, sec. 3000). This section relates to long and short hauls, and should be read in connection with section 10, chapter 24, laws of 1897, which provides that nothing in the act shall be construed to prevent railways from giving special rates to encourage infant manufacturing industries, and for the encouragement of any other new industry, or for the transportation of any perishable goods.

"That it shall be the duty of the railroad commissioners, by correspondence or otherwise, to confer with the railroad commissioners of other States and the Interstate Commerce Commission, and such persons from States which have no railroad commissions as the governors of such States may appoint, for the purpose of agreeing, if practicable, upon a draft of statutes to be submitted to the legislature of each State, which shall secure uniform control of railway transportation in the several States, and from one State into or through another State, as will best serve the interests of trade and commerce of the whole country."

Texas.—Three commissioners, appointed by governor and senate, holding office for same period with governor. Commission shall adopt all necessary rates, charges, and regulations to govern and regulate railroad freight and passenger rates; to correct abuses and prevent unjust discriminations and extortion; may change rates and fix same for empty and loaded cars. Emergency freight rates established by law as amended in 1899: * * * "Said commission shall have power, when deemed by it necessary, to prevent interstate rate wars and injury

to the business interests of the people or railroads of this State, or in case of any other emergency to be judged by the commission; and it shall be its duty to temporarily alter, amend, or suspend any existing freight rates, tariffs, schedules, orders, and circulars on any railroad, or part of railroad, in this State, and to fix freight rates where none exist."

"Whereas interstate cut freights from other States to Texas are frequently made and put in force on 3 days' notice to the Interstate Commerce Commission, to remain in force often for only 10 days at a time, suspending the regular rates for that time; and whereas these temporary cut rates are intended and actually do benefit only a favored few, who are notified in advance; and whereas such cut rates tend to demoralize traffic and create rate wars, to the great detriment of Texas railway companies and the public generally; and whereas under the law as it now exists emergency rates to meet such cuts and prevent such rate wars can not be put in force until 3 days' notice to the roads interested, an imperative public necessity and emergency exists for the suspension of the constitutional rule, requiring bills to be read on 3 several days, and this bill shall therefore take effect and be in force from and after its passage."

Utah.—No commission.

Vermont.—Three commissioners, appointed by the governor and senate for 2 years. Commission exercises general supervision; examines books and witnesses; may employ experts; make recommendations and apply to supreme court to compel compliance with its orders; inquire into lack of connections; recommend repairs, improvements, etc.; and, in general, see that the laws are complied with. So far as consistent with State laws commissions shall conform to the rules, etc., of the Interstate Commerce Commission.

Virginia.—One commissioner for 2 years, elected by general assembly. Commission shall inquire into and examine conditions of railways, and, in general, bring about obedience to law; on complaint of mayor, aldermen, councils, certain judges, commission shall investigate and report to the board of public works, composed of governor, auditor, and treasurer. Persons suffering from violation of law may seek relief in court of equity through commission. Commission shall report on actual working of the railway system in its relation to the business and prosperity of the State; make suggestions as to general railway policy; investigate accidents; and require railway companies to furnish information regarding the management and operation of roads.

Washington.—No commission.

West Virginia.—No commission.

Wisconsin.—One commissioner, elected for 2 years. Commissioner shall inquire into neglect of duty or violations of law; inspect railways, and ascertain their pecuniary conditions; notify railway companies of complaints, and give notice of hearing; subpoena witnesses; request attorney-general to prosecute in behalf of commission. Decisions of commissioner final unless appealed from within 20 days.

Wyoming.—No commission.

PART V.—FOREIGN RAILWAY CHARTERS AND IMPORTANT LAWS.

Introductory.—In these times of commercial expansion and the establishment of more far-reaching and complex international relations a survey of foreign experience is especially appropriate. The railway as an institution is everywhere the same. As an industry it presents characteristics which are in many respects different from those common to other industries. These peculiarities of the railway business have been so often pointed out that it is not necessary to repeat them here. Railway legislation, like legislation in other domains of the industrial world, must bear definite relations to the business treated in such laws, and the fact being indisputable that the intrinsic nature of railway enterprise is everywhere the same, the corollary must go unchallenged that railway legislation must, in its essential features, bear the same degree of similarity and identity. It is only in secondary and local characteristics that we find differences of importance in a study of railways of different countries; hence it follows that only in such secondary matters should laws aiming at the control of railways differ in the substantial elements of their contents. The experiences of foreign countries have frequently been brushed aside on the assumption that whatever success or failure may have characterized foreign effort, nothing of vital importance to American States could possibly be discerned therein because of differences in conditions which, it is alleged, exist between the United States and the respective foreign countries. No one will be inclined to deny that certain important differences do exist, but the position can be successfully maintained that, so far as railways are concerned, these differences do not, as a rule, touch upon the essential features of the railway problem, and that along the large lines of industrial growth and development every important modern nation is cosmopolitan; that is, modern, social, and economic conditions have the world over become more and more alike, and as this similarity increases the need for similar legislation in all the different countries becomes increasingly urgent.

Railway charters—using this term in the sense of special legislation as well as grants of railway charters under general laws—are essentially alike the world over so far as the great nations are concerned. In all the different countries railway charters bear upon them the marks of lineal descent from early English charters, which in turn were copied directly from the charters granted to canal and road companies. This similarity between railway and macadam or plank road charters can be readily detected in our laws. Many common road charters are identical in language with contemporary railway charters, the only differences lying in a few things peculiar to road companies, such as the smaller size of shares, provisions on toll gates, the use of the road by drovers, etc. Were one to take out of a railway charter and a common road charter clauses relating directly to these topics, it would probably be impossible to determine whether a certain charter had originally been granted to a common road or a railway company. Certain archaic features which were embodied in the Liverpool-Manchester charter, reference to which will be made later, may be discerned in charters of different States in the United States, as well as in those of foreign countries. One of the most common of these is the right of different shippers to use the same track. One of the most serious objections brought against some of the early railway projects was the impossibility of using ordinary coaches and vehicles in the transportation of persons and property over railways. Inventors during the earlier decades of the nineteenth century devised contrivances by which carriages could be used on both common and rail roads. These provisions were inserted in some cases for the purpose of reserving to the State certain rights which it might otherwise find difficult to assert. It was thought that the State, or a person or persons authorized to do so by the State, could become active competitors over

the same tracks, and thus enforce rules of justice. The fallacy of this theory was soon discovered, but the archaic clauses continued to find their way into charters.

In surveying the legislation of foreign countries one is impressed with the promptness with which Japan apparently adopted many of the more advanced ideas, as expressed in legislation of other countries, and for this reason the laws of Japan will be considered first. England naturally takes its place at the head, or very near to it, because of the vital relations existing between the laws of our own and the mother country. For obvious reasons some attention is also paid to English colonial history. Prussia deserves to be dwelt upon at some length, because in that country the most successful system of State railways that the world has thus far known has been in operation for nearly a quarter century. For the sake of completeness, as well as for the sake of the interest which attaches to leading features of railway legislation of other countries, France, Austria, Switzerland, Norway, and other foreign States will be considered. Students of railway affairs feel the need of a thorough study of foreign systems. They have the feeling that the experiences of foreign countries have not yet been adequately brought before us, and that, in order that we may profit by whatever lessons such experience may convey, a much fuller presentation of the subject of foreign railways should be made. It is needless to assert that this paper makes no such attempt. All that the writer hopes to accomplish in these paragraphs is to point out the most important features of foreign charters and laws in their bearing upon practical questions of regulation and control.

Classification of foreign railways.—In connection with the discussion of foreign railway legislation it will be necessary to refer to the different kinds of railways recognized in the laws of other countries; and, as a matter of convenience, it may be well to bring together here the classifications of the leading countries. In the United States we are accustomed to speak of trunk and branch lines only. In England no real classification exists. However, a law of 1868 imposes less onerous duties on "light railways," this term implying railways the speed of which does not exceed 25 miles per hour and whose burden is not greater than 8 tons per axle. Prussia has from the first recognized primary and secondary railways; but not until 1892 were narrow gauge and other local railways included in the term "railway" at all. French law formally recognizes only 2 classes, but a very rigid administrative division of the first class into 2 subclasses, really creates a third class of roads. These 3 classes are, the primary network of railways of general interest, the secondary network of railways of general interest, and railways of local interest. The particular class to which a railway shall belong depends upon the place which is assigned to it by the authorities of the State in the "declaration of public utility." Belgium recognizes 3 classes—railways of general interest, parochial, and urban railways. In Holland 3 classes also exist—primary, secondary, and regional. The Austrian and Hungarian classifications are essentially like that of Prussia, including main and local roads. The Italian law of 1879 distinguishes between 4 classes, based upon the proportion of the total cost of the railways borne respectively by the Federal Government and by subordinate political unities. Secondary railways are divided into 5 classes, depending upon the width of tracks, speed, curves, grades, etc.

The convenience of classifications of this kind is apparent; and, furthermore, such classifications are in themselves a recognition of varying degrees of importance attached to different kinds of railways. Under the laws of the different States in the Union, except for purposes of taxation, all railroads are practically put into the same category and treated, so far as the law is concerned, as if they all stood upon a plane of intrinsic equality. A short and insignificant road in an isolated corner of the State is governed by the same laws through which an attempt is made to control and regulate the most extensive system embracing thousands of miles of double, triple, and quadruple tracks. Along this line, foreign legislation may teach us a valuable lesson in that it points out to us the imperative necessity of recognizing in the law decisive differences in the social and economic importance of different railway systems.

Japan.—Apart from the important changes which have been made in the laws bearing upon administrative organs, the fundamental railway law of Japan is "the act for a private railway," passed in May, 1887. Under this law 5 or more persons desiring to build a railway for the transportation of passengers and goods are required to hand in an "estimation" of their project to the central government through the provincial authorities. The estimation is similar to the American articles of incorporation, and is divided into the following 5 sections:

Section I: Name of company; place of main offices.

Section II: Names of termini and of places through which railway is to pass; also a general map of the route.

Section III: The total amount of capital stock and the number and size of the shares.

Section IV: Estimated expense of building road, together with an estimate of the probable volume of business.

Section V: Names and addresses of incorporators; also the number of shares for which each is responsible; but the number of shares held by the incorporators must exceed 20 per cent of the whole amount of the capital stock.

After examining the estimation, if the central government approves of the project, a preliminary charter may be granted and the provincial administration may be ordered to permit the incorporators to make an exact statement regarding the lines, work, means, probable cost, and rules of the company. The Government shall reject the proposal if it considers that the new railway interferes with other railways already in existence, and that the necessity of the construction of the proposed railway can not be fully demonstrated.

If, after a careful investigation, the Government recognizes the project as a desirable one, a permanent charter shall be granted. Until the permanent charter is granted the incorporators can not receive subscriptions as a company; neither can they begin constructing the road.

When authority to do so has been granted, the company must start within 6 months after registration in the work of construction, and must finish the road within the term indicated within the charter. If sufficient reason exists, an extension of the charter time may be granted on application to the provincial government at least 2 months before the expiration of the time limit, but under no circumstances shall this extension in time exceed one half of the charter period.

The sections on eminent domain, right of way, and the amount of land which the company may hold are almost identical with similar sections in American charters, with the very important difference that all land is purchased through governmental authorities. In case the railway runs through public lands, such lands must be bought from the Government for an agreed price; but if it is private land which the company proposes to cross or use, the Government is empowered to purchase the same, according to the provisions of such laws governing such transactions, and then to sell the acquired land to the company. Provisions on crossing public roads, bridges, and canals, as well as on the construction of bridges, crossings, fences, gates, embankments, and the like, are much like similar parts of American charters.

As soon as the company desires to open a part or the whole of the road for traffic, a communication must be addressed to the head of the national or central railway department, now the department of communication. The department of communication, having received such notice of the intention of the company to open its new line to traffic, shall order an inspection of the road, with respect of gauge, bridges, rolling stock, buildings, etc., in accordance with the provisions of the estimation. If the inspection is satisfactory, then a business charter or "grant to begin business" is given to the company. This charter finally authorizes the corporation to do business. It will be noticed that under the Japanese system the entire grant of franchise to the company is divided into 3 parts, beginning with the preliminary charter, continuing through the permanent charter for construction and equipment, and culminating in the business charter. The first or the preliminary charter, which merely gives to the company the right to make detailed estimates and surveys, is open to competition. In the nature of the case, no competition can be permitted after the permanent or construction charter has been granted.

The department of communication is required under the law to send inspectors, not only during the period of construction, but also after the road has been completed; and if at any time such inspection reveals defects, or prejudices public safety and comfort, repairs and even rebuilding may be ordered.

The Government reserves the right to construct telegraph lines on the right of way of a company; and the company may use, on payment of the proper price, such telegraph posts. (In Japan the telegraph is owned by the Government). The company must give up the use of a part of its land and station houses, without charge, for the postal and telegraph service. In case rebuilding is necessary in order to accommodate the Government the latter shall pay the actual costs of construction. Regulations relating to pay for the mail service are also contained in the law, as well as provisions governing free transportation of postal and other officials. Prisoners and police officers may travel at half price, and in time of war the use of railways may be determined by special decree. At any time, if army or naval officers desire improvements or changes in construction, such may

be ordered on paying the actual cost. In addition, the department of communication may order all private railway companies to do those things which are required of State railways for the purpose of insuring public safety and promoting the public good. All regulations of State railways apply to private railways, unless specially ordered otherwise. If a company desires to make changes in the operation of its road, it must first secure permission from the Government. Rates are established and changed under the direction of the department of communication, and maximum rates are established in the law. All changes in train schedules must be reported to the central Government. A semiannual report is required of each company, which must be sent to the central department within 40 days after the expiration of the term for which the report is made.

A railway company may mortgage a part of or the entire plant, but the amount of such indebtedness shall never exceed five-tenths of the total amount paid by subscribers; no dividends can be declared before the debt for that term has been paid. Other provisions govern systems of accounting, intersections, and junctions.

The Government reserves the right to purchase railways after 25 years of chartered existence, and the purchase price may be fixed on the basis of the average price of shares during the 5 years immediately preceding the time of the purchase. Upon any violation of the act on the part of railway companies, or upon any violation of the proper use of railways, the Government may order the election of a new set of officers or authorize the State railway bureau to operate the road; but in case the State continues the operation of a railway the profits accrue to the company.

The department of communication, which has been mentioned a number of times, is divided into 2 bureaus, the railway bureau and the bureau of operation and accounting. The latter has charge of all State railways, comprising about one-fourth of the entire network. The railway bureau supervises and controls private railways and is virtually the authority which grants charters, provided such charters do not unduly interfere with existing railways, and when real need for the construction of a new line can be shown to exist. The bureau may establish and alter rates and time-tables in accordance with the provisions of the law discussed above.

The notable features of the Japanese law, connected with the grant of the franchise and the purchase of land, have already been discussed. A third provision deserves especial attention. This relates to the advisory council, in the establishment of which the Japanese seem to have followed in the wake of the most progressive European countries. The Japanese advisory council is composed of not more than 20 persons, representing the cabinet departments, both houses of the Legislature and, for special purposes, members with limited tenure, who serve as experts in the council. The powers of the council are only advisory, and relate to questions of location, construction, financiering, and operation. While the department of communication and other branches of the Government may direct inquiries to the council, the latter may also act on its own initiative and bring its conclusions and findings before the proper officials. A comparison of the Japanese with the Prussian councils shows important differences in their composition. Under the Prussian law bureaucracy is guarded against by the exclusion from the council of all immediate State officials. In Japan, on the other hand, the law specifically provides for the inclusion, in the council, of cabinet officers and members of the Legislature. In this respect the Japanese council system is probably inferior to the Prussian. Bureaucratic influence is said not to have made itself felt up to the present, but that there exists a real danger of an undue influence in an advisory body of this kind, when its members are so closely connected with the Government, is too obvious to require argument. However, Japan deserves credit for having incorporated in her laws so many of the most desirable features of epoch-making laws of foreign countries.

England.—The history of English railway charters is not essentially different from that of the charters granted in the United States, except that the process of mutilation by which, during succeeding years, numerous important provisions were eliminated from them, never developed so far in England as it did in our own country. It is an error, however, to suppose that the great crops of railway charters which marked the legislative activity of our numerous States did not find their counterpart in England. In the year 1825, Parliament granted no less than 59 charters, and during several of the years from 1840 to 1850 more than 200 charters were granted in each year. These were nearly all for short railways, just as in our own country numerous local lines, projected, constructed, and for a while also operated, under separate charters, were the material out of which the present systems have been constructed. The Stockton and Darlington was chartered in 1820, and on May 5, 1838, Parliament granted the epoch-making

Liverpool and Manchester charter. The latter is a long and cumbersome document of 200 sections, many of which are archaic, and bear the impress of turnpike and canal charters. It is unnecessary to specify in detail the provisions of this important charter, for these do not differ materially from those found in the best charters granted by our States. In another place¹ the writer has traced this similarity between the Liverpool and Manchester charter and charters granted in the United States through the provisions bearing upon a number of the essential points of a charter; and, as result of this parallel study, the fact has been firmly established that many American charters embody, literally, sections of English charters, and that probably all the American charters found in English legislation their form and content.

Early attempts were made in England to legislate through general laws. The first general bill for railways was introduced in 1825, and provided that "dividends be limited to a certain rate," and that Parliament reserve to itself the power to fix periodically the tolls on passengers and goods. During the same year a distinguished member of the House of Lords advocated a forfeiture clause in railway charters; and another member of that House submitted a plan under which the elaboration of the English railway system was to be intrusted to a technical board approved by the Peers. A resolution in the House of Lords, excluding members of that House from railway projects in which they themselves were interested, indicates another phase of English public opinion at that time. Following the example of the earlier turnpike charters, a prominent member of the House of Commons demanded a periodical revision of maximum-rate schedules every 21 years. Although none of these resolutions and bills brought about immediate changes, they are important in that they show a recognition, on the part of Parliamentary leaders, of some of the peculiarities of this new means of transportation, out of which were later to grow some of the most complex problems with which administrative authority has ever had to deal. In 1842, the board of trade was empowered to appoint inspectors of railways, with sufficient authority to postpone the opening of railways, to pass upon by-laws of railway corporations and to bring legal proceedings against companies for violating existing statutes. The board of trade also had power to compel railway companies to report accidents and to furnish information with respect to railway traffic and rates. The first commission was established in 1846. It was empowered to do essentially those things which the board of trade had previously been authorized to do. Other experiments were made with a different type of commission, and also with a retransference of power to the board; but administrative control was not placed upon a permanent footing until the regulation of railways act of 1873. This act established a new tribunal, known as the "railway commissioners," composed of 3 members, 1 experienced in law and 1 in railway matters. The principal duty of these commissioners was to enforce the observance of the "reasonable facility section," of the act of 1854, the exact text of which is here inserted:

"Every railway company, canal company, and railway or canal company shall, according to their respective powers, afford all reasonable facilities for the receiving and forwarding and delivering of traffic upon and from the several railways and canals belonging to or worked by such companies, respectively, and for the return carriages, trucks, boats, and other vehicles, and no such company shall make or give any undue or unreasonable preference or advantage to or in favor of any particular person or company, or any particular description of traffic, in any respect whatsoever, nor shall any such company subject any particular persons or company or any particular description of traffic to an undue or unreasonable prejudice or advantage in any respect whatsoever; and every railway company and canal company and railway and canal company having or working railways or canals which form part of a continuous line of railway or canal or railway and canal communication, or which have the terminus, station, or wharf of the one near the terminus, station, or wharf of the other, shall afford all due and reasonable facilities for receiving and forwarding all the traffic arriving by one of such railways or canals by the other, without any unreasonable delay, and without any such preference or advantage or prejudice or disadvantage as aforesaid, and so that no obstruction may be offered to the public desirous of using such railways or canals or railways and canals as a continuous line of communication, and so that all reasonable accommodation may, by means of railways and canals of the several companies, be at all times afforded to the public in that behalf."

The commissioners also had power to enjoin the forwarding of the traffic of other roads on request of railway companies, and were, furthermore, empowered to act as a board of arbitration.

¹ Meyer, Early Railroad History of Wisconsin, Wis. Hist. Col., XIV.

The law of 1873 stood until 1888, when it was superseded by "An act for the better regulation of railway and canal traffic, and for other purposes." The law of 1888 is to be construed as one with that of 1873 and the acts amending the same, and all these acts "may be construed together as the railway and canal traffic acts, 1873 and 1888." Under the new law the railway commission is composed of 2 permanent, appointed members, and, in addition, an ex officio member, being 1 of 3 officers representing England, Scotland, and Ireland, respectively. The ex officio member attends only the sessions held in the country represented by him, and is designated in England by the lord chancellor, in Scotland by the lord president and the court of sessions, and in Ireland by the lord chancellor of Ireland. His Majesty appoints the 2 permanent members on the recommendation of the president of the board of trade. One of these shall be of experience in railway business. The law specifies the commissioners' salary, time and place of meeting, and other details. A list of bodies and corporations through whom complaint may be brought is enumerated, including harbor boards, common councils, and other representative bodies, justices, associations of traders, chamber boards, commercial and agricultural societies, etc.

The board of trade may require security for costs to be given before granting permission to bring action before the commission.

The commission is given full power to execute existing railway regulations, to exercise jurisdiction over questions and disputes relating to rates, to order traffic facilities and award damages, and, in general, exercise full supervisory powers over the railways of the country. Sections 25 to 35, inclusive, of the act relate to classifications, through rates, group rates, and similar matters. Section 17 is one of great importance because it deals with a subject in which the weakness of much American legislation has long been supposed to exist:

"(1) No appeal shall lie from the commissioners upon a question of fact, or upon any question regarding the locus standi of a complainant.

"(2) Except as otherwise provided by this act, an appeal shall lie from the commissioners to a superior court of appeal."

In order to show that the conditions out of which English legislation grew are not radically different from those which shape American legislation, brief reference will here be made to Parliamentary reports of 1872, 1882, and 1893. The conclusions and recommendations of the committee of 1872 were summarized as follows:

"1. Past amalgamations have not brought with them the evils which were anticipated.

"2. Competition between railways exists only to a limited extent, and can not be maintained by legislation.

"3. Combination between railway companies is increasing, and is likely to increase, whether by amalgamation or otherwise.

"4. It is impossible to lay down any general rules determining the limits or the character of future amalgamations.

"5. The most urgent question now pressing for solution is whether, under the present state of things, the interest of the public is adequately provided for and protected, and is not, whether any and what improvements can be made in railway legislation, consistently with the fair rights of the companies, which would protect the public against certain evils incident to the present system.

"6. The self-interest of the companies alone will not effect the object, since their interest is only to a limited extent the interest of the public; and it becomes, therefore, necessary to consider what can be done in the way of statutory obligation.

"7. There can be no doubt that the introduction of certain amalgamation bills, which have been the immediate occasion of the appointment of the committee, affords opportunities for imposing conditions on the companies which may be desirable in the public interest.

"8. But it has been impossible to separate the consideration of such conditions from the consideration of measures, which it may be expedient to adopt, with respect to all railways; and such measures, if adopted by Parliament, might remove some of the objections to the present and future amalgamation.

"9. Whilst, therefore, the committee advise further legislation of a general character, they are of opinion, that, in the absence of such legislation, the measures they recommend should be imposed as conditions, so far as applicable, on the companies which are now seeking, or which may hereafter seek, to amalgamate with other companies."

Conditions which prevailed in 1882 are carefully described in the report of the select committee to Parliament of that year. Complaints brought against railway companies in respect of freight traffic—complaints in regard to passenger traffic were practically not made—were arranged by the Committee under 6 differ-

ent heads. The first, relates to charges in excess of rates authorized by law; the second, shows the existence of discriminations between different kinds of goods when transported over the same line under the same conditions; the third, is directed against discriminations unfavorable to commodities consumed at home and preference shown to export goods; the fourth, relates to discriminations between rival shippers; the fifth, asserts that rates were, in certain instances, much higher than they had been many years before, and that excessive, though not illegal, rates prevent traffic, to the prejudice of the public and of the railways; in the sixth, the question of obtaining redress on the part of private individuals is dwelt upon, especially in cases of overcharges and discriminations; and finally that, because of imperfect classification and defective schedules, it is practically impossible for private shippers to ascertain the particular class to which any article belongs, and the rates which are applicable to it. In another part of the Parliamentary report reference is made to the great difficulty which private persons frequently encounter in approaching a railway company and securing information which ought to be at their disposal. The report further discusses the disputed questions which arise out of station and terminal facilities and services incidental to conveyance. The committee called attention to the imperfect classification of goods and the lack of uniformity in these classifications and in the rates based upon them. Almost every railway company, says this committee, charges rates under several different charters, applicable to different portions of the same system, and that in some cases reference must be made to more than 50 charters, in order to determine the various rates the company is authorized to charge. The committee is unable to discover any general principle on which maximum rates have been fixed or in accordance with which articles have been classified; and in many cases the exceptions are so numerous and the determination of the rate otherwise so uncertain that an ordinary trader will prefer applying to a railway official to quote the rate. Railway charges represent all sorts of anomalies, and many witnesses urged the general advantages in fixing rates on some intelligible principle. Another complaint, which in these times of rapid railway consolidation certainly does not find such wide application in the United States, is that regarding the needless expense involved in the duplication of managements, as illustrated by the railways of Ireland, which were then represented by 270 directors, 37 secretaries, 20 managers, and a corresponding staff of subordinate officers for the administration of railways having a capital of £36,000,000; whereas the Great Western Railway of England, having a capital of nearly twice that amount, is managed by a single board of 18 directors, a secretary, and a general manager."

Many witnesses testified before the committee to the reluctance of traders to make complaints, because of the pecuniary or other disadvantage to which the railway might subject such a witness. Furthermore, the testimony showed that, because of the great interests involved in the litigation and the losses almost inevitably accompanying even a successful suit, together with the great inconveniences encountered, shippers were prevented from bringing action. It is a noteworthy fact, however, that the committee did not hear many complaints against personal discriminations. The report on railway rates and charges for 1898 contains the following significant sentence: "Very few cases have been brought before the commission, and the number of times on which its members have been engaged in court has not averaged more than 23 in each year." In England, as well in the United States, there probably exist good reasons for this, some of which have been indicated in the discussion of the report of 1892. That legal actions should be so few is not surprising when competent authority asserts that "law reports show no case of a recovery for damages resulting from a transportation rate unreasonable in and of itself."

It is facts like these which the writer had in mind in formulating the earlier statement in this report that a feeling of absolute helplessness was bound to overcome an aggrieved shipper after investigating the efficiency of the machinery through which our railway laws are administered.

Canada.—The three charters submitted by the minister of railways as typical of those granted under Canadian law vary in length from 2 to 6 octavo pages. Each of the charters contains a preamble in which reference is made to a petition previously presented to Her Majesty's Government. The names of the incorporators are given, and the project is "declared to be a work for the general advantage of Canada." Section 306 of the general railway law pronounces certain Canadian railways works for the general advantage of the country, and provides that every branch line or railway now or hereafter connecting with or crossing these lines of railway shall be regarded as a work for the general advantage of Canada. This feature of the Canadian law is similar to the declaration of public utility required under French law, and also similar to declarations made

under earlier laws in the North Atlantic States. The Canadian charters indicate that there is room for those variations in law which grow out of differences in individual and local conditions. A railway projected through a thinly settled frontier district is very different from one to be operated in a densely populated fertile country. This the Canadian charters recognize and the general law permits. The special railway acts of Canada are little more than a means of providing for the peculiarities of the particular road authorized under the act, and specifying to what extent provisions of the general law shall or shall not apply in that particular case. These charters state the amount of capital stock to be issued, and place a definite limitation upon any future issue of bonds, debentures, or other railway securities in proportion to the length of the railway constructed. This supplies a noteworthy provision in which, it will be recalled, one of the greatest weaknesses of the American railway charters was found. Both the general law and the special charters specify to what extent public aid may be received; and one of these special charters makes provisions for agreements with other railways, subject to the approval of two-thirds of the shareholders and the governor in council.

Coming now to a consideration of the general railway law of Canada, attention should be called at the outset to the list of definitions with which the act opens. Much confusion and indefiniteness has resulted from this lack of definition in American laws. The Canadian law defines such terms as "company," "county," "court," "department," "deputy," "goods," "highway," "inspecting engineer," "judge," "justice," "lines," "map or plans," "near," "owner," "railway," "railway company," "sheriff," "special act," "toll," "tariff," "the undertaking," and "working expenditure." Neither the American interstate-commerce act nor the general laws of our States contain definitions of the term "railway." (The so-called definition of the interstate-commerce act does not define.)

Supreme administrative control over railways is vested in a railway committee of the privy council, composed of the minister of railways and canals, who is chairman of the committee, the minister of justice, and two or more other members of the Queen's privy council for Canada, who, from time to time, are appointed by the governor in council. For purposes of comparison with the powers of American railway commissions, the powers of the railway committee of Canada are here stated in full:

The railway committee may—

(a) Regulate and limit the rate of speed at which railway trains and locomotives may be run in any city, town, or village, or in any class of cities, towns, or villages described in any regulation; limiting, if the said railway committee thinks fit, the rate of speed within certain-described portions of any city, town, or village, and allowing another rate of speed in other portions thereof—which rate of speed shall not in any case exceed 6 miles an hour unless the track is properly fenced.

(b) Make regulations with respect to the use of the steam whistle within any city, town, or village, or any portion thereof.

(c) Make regulations with respect to the method of passing from one car to another either inside or overhead, and for the safety of railway employees while passing from one car to another, and for the coupling of cars.

(d) Impose penalties, not exceeding \$20 for each offense, on every person who offends against any regulation made under this section—which penalties shall be recoverable upon summary conviction.

2. The imposition of any such penalties shall not lessen or affect any other liability which any person may have incurred.

11. The railway committee shall have power to inquire into, hear, and determine any application, complaint, or dispute respecting—

(a) Any right of way over or through lands owned or occupied by any company.

(b) Changes in location for lessening a curve, reducing a gradient, or benefiting the railway, or for other purposes of public advantage.

(c) The construction of branch lines exceeding one-quarter of a mile in length, but not exceeding 6 miles.

(d) The crossing of the tracks of one company by the tracks of another.

(e) The alignment, arrangement, disposition, or location of tracks.

(f) The use by one company of the tracks, stations, or station grounds of another company.

(g) The construction of works in navigable rivers.

(h) The construction of railways upon, along, and across highways.

(i) The proportion in which the cost of fencing the approaches to crossings on railways constructed or under construction on the 19th of April, 1884, shall be borne by the company and the municipality or person interested.

- (j) The compensation to be made to any person or company in respect of any work or measure directed to be made or taken, or the cost thereof, or the proportion of such cost to be borne by any person or company.
- (k) Tolls and rates for the transportation of passengers and freight.
- (l) The adjustment of such tolls and rates between companies.
- (m) Running powers or haulage.
- (n) Traffic arrangements.
- (o) Transshipment or interchange of freight.
- (p) Unjust preferences, discriminations, or extortions.
- (q) Any highway, street, ditch, or sewer, water, gas, or other pipes or mains over or through lands owned or occupied by the company.
- (r) Any matter, act, or thing which by this or the special act is sanctioned, required to be done, or prohibited.

In addition, the committee has power to investigate accidents, and to inspect railways and accessory works, examine books, papers, administer oaths, and so on. An important difference in the powers of the Canadian and American commissions lies in the standing given to the decisions of the Canadian committee. Subject to modifications by its own order, "every decision and order of the railway committee shall be final; provided, always, that either party may petition the governor in council, and the governor in council may, in his discretion, rescind, change, or vary such order as he deems just and proper."

The provisions of the law relating to incorporation contain nothing noteworthy except that some definite relation is maintained between capital stock and the length of the railway, and that a financial qualification is required of directors, no shareholder being eligible to this position unless owning 20 shares of stock absolutely in his own right. Petitions for a private charter must be heard by the minister of railways, and if, after such hearing, the desirability of building the projected road has been established, this official issues a certificate declaring such projected road to be necessary in the public interest. Plans and surveys are required containing a general description of the land, names of owners and occupiers, and everything else necessary for the right understanding of such map or plan and profile. The minister examines these plans and must permit persons interested to secure access to the same. Finally, when the road is completed, another map must be deposited with the minister within 6 months after the opening of traffic. The law contains specific provisions governing crossings and junctions. Periodical inspections are required, and, upon the report of an inspecting engineer, a railway may be condemned, repairs and modifications ordered. The by-laws and rules of the company must be submitted in writing and approved by the governor in council; until such approval has been given the same have no force or effect.

Rates are established in the first instance by the company itself; but the governor in council, through the minister, may from time to time prescribe uniform classifications of freight, which the company is bound to accept; and all rates must finally be approved by the governor in council. Schedule and rates, after revision by the governor in council, must be published and posted and kept in places convenient of access for shippers. Provisions on discriminations and special rates are much like analogous sections in American laws and equally strong in their prohibitions. The influence of water competition is recognized, and companies are permitted to discriminate under the stress of such competition; but secret rates of any kind are forbidden.

Although one railway company is enjoined from purchasing or otherwise acquiring shares of stock, bonds, and securities issued by another railway company in Canada, close traffic arrangements may be entered into under the law, as the following quotation will indicate:

"The directors of any company may, at any time, make and enter into any agreement or arrangement with any other company, either in Canada or elsewhere, for the regulation and interchange of traffic passing to and from the company's railways, and for the working of the traffic over the said railways respectively, or for either of those objects separately; and for the division and apportionment of tolls, rates, and charges in respect of such traffic; and generally in relation to the management and working of the railways, or any of them, or any part thereof, and of any railway or railways in connection therewith, for any term not exceeding 21 years; and to provide, either by proxy or otherwise, for the appointment of a joint committee or committees for the better carrying into effect any such agreement or arrangement, with such powers and functions as are considered necessary or expedient; subject to the consent of two-thirds of the stockholders voting in person or by proxy, and also to the approval of the governor in council."

The above are the most noteworthy features of the Canadian law. The usual provisions relating to safety appliances, bells, whistles, regularity of trains, handling of baggage, guarding crossings, investigating accidents, etc., are incorporated in the act; but all these are rather of a secondary nature and do not differ essentially from analogous sections of the best laws in our own States.

India.—The early Indian railway charters took the form of contracts between the East India Company and the railway companies. To illustrate this early type of charters, the leading features of the contract between the East India Company and the Great Indian Peninsula Railway will be given.

The Great Indian Peninsula Railway Company was incorporated under an act of Parliament for the purpose of constructing and maintaining such railways as the company jointly with the East India Company might determine. In the determination of the route the East India Company agreed to cooperate with the railway company; also in the construction of the road, and, in addition, to provide the necessary lands. The East India Company reserved the right of establishing grades, fixing the weight of rails, and the manner of laying them. The usual provisions governing the capital stock and its division into shares were inserted. The number and speed of trains to be operated by the railway company was subject to the approval of the East India Company. The rates charged for passengers and freight were likewise subject to approval by the East India Company, and whenever the net receipts exceeded 10 per cent, reductions in rates were to be made. The East India Company reserved the right to purchase the railway company on 6 months' notice at the end of 25 and also 50 years, and at the end of 90 years the charter was to expire and the entire railway buildings and fixtures were to revert to the East India Company on payment of the full value of the plant. In the board of directors the company was represented by one member. Periodical accounts, showing the financial condition of the road, were to be submitted to the East India Company. If at any time the East India Company should find the service inadequate or unsafe, and should be compelled to order repairs or improvements, the same could be ordered done at the expense of the railway company by withholding the sums of money thus expended from the interest which the East India Company had guaranteed to the railway company.

The later railway charters of India are in most essentials similar to those of England and Canada, with the exception that the secretary of state is capable, under the law, of exercising unusually large powers. In fact, he seems to have almost absolute control over the railways. The State reserves important rights, which will be considered under the general law, and insists upon systematic train service and adequate facilities of traffic in general. The military features are somewhat important. The charter to which reference is here made was granted in 1892, and, like the general laws, begins with a number of definitions. The road is located under the direction of the secretary of state, under whose guidance, likewise, stations, equipment, and improvements are ordered. Maximum and minimum rates are not provided, but all rate schedules are subject to the approval of the secretary. Railway property may be used for establishing telegraph lines, and all employees in the telegraph service must be provided with free transportation. The secretary of state becomes financially responsible for capital outlays, but the company pays a fixed rate of interest, and keeps such accounts as the secretary of state may require. All moneys must be handed to the secretary and accounts audited by him. Net earnings are to be divided between the secretary of state and the railway company in proportion to the amount of stock held by them respectively. Junctions with other railways may be established if this is necessary for the perfection of the railway system of India. This same subject is more fully dwelt with in the general laws, which will next be considered.

Like the general law of Canada, the Indian Railways' Act begins with a number of important definitions, including such terms as "ferry," "inland water," "railway administration," "railway servant," "inspector," "goods," "rolling stock," etc. Administrative power over railways is vested in a railway commission, composed of 3 members, 1 law and 2 lay commissioners. One of the lay commissioners must be experienced in railway affairs. The law commissioner shall act as chairman. The commission has jurisdiction in cases arising out of complaints of violation of the law, agreements required or authorized to be referred to arbitration, and such other cases as may be brought before it on application through the governor-general in council. In hearing cases the commission may exercise all the powers which are exercised in the hearing of an original civil suit by a high court. A majority decides, and the "final order in the case shall be by way of injunction and not otherwise." As in case of Canada, no appeal lies from the commission upon any question of fact on which 2 of the commissioners are agreed. In case of an appeal from the order of the commission, the court, of which the law commissioner was a judge, shall hear the same. The governor-general in council

may make rules regulating proceedings before the commissioners and enabling them to carry into effect the provisions of the law, and he may also prescribe fees to be charged for proceedings before the commissioners. Special reports on each case are to be submitted by the commission to the governor-general.

Acting through the commission, the governor-general exercises supervisory powers in the construction and maintenance of railways. The latter may, by notification in the official paper, invest, absolutely or subject to conditions, any local government with any of the powers or functions of the governor-general in council, under the law, with respect to any railway; and he may also by that, or a like notification, declare what local government shall, for the purposes of the exercise of powers or functions so conferred, be deemed to be the local government in respect to the railway.

The sanction of the governor-general is necessary before the opening of a railway, and follows an inspection of the road with respect to rolling stock, track, in regard to width, weight of rails, strength of bridges, etc., adequacy of equipment, and a satisfactory showing that the railway can be opened to the public without danger.

Joint traffic arrangements are specially provided for as follows:

"Any railway company * * * may from time to time make with the governor-general in council, and carry into effect, or, with the sanction of the governor-general in council, make with any other railway administration, and carry into effect, any agreement with respect to any of the following purposes, namely:

"(a) The working, use, management, and maintenance of any railway;

"(b) The supply of rolling stock and machinery necessary for any of the purposes mentioned in clause (a) and of officers and servants for the conduct of the traffic of the railway;

"(c) The payments to be made and the conditions to be performed with respect to such working, use, management, and maintenance;

"(d) The interchange, accommodation, and conveyance of traffic being on, coming from, or intended for the respective railways of the contracting parties, and the fixing, collecting, apportionment, and appropriation of the revenues arising from that traffic;

"(e) Generally the giving effect to any such provisions or stipulations with respect to any of the purposes hereinbefore in this section mentioned as the contracting parties may think fit and mutually agree on:

"Provided that the agreement shall not affect any of the rates which the railway administrations parties thereto are, from time to time, respectively authorized to demand and receive from any person, and that every person shall, notwithstanding the agreement, be entitled to the use and benefit of the railways of any railway administrations parties to the agreement, on the same terms and conditions, and on payment of the same rates as he would be if the agreement had not been entered into."

The law calls for periodical reports from railway companies and establishes maximum loads for freight cars. Established rates must be posted where they are easily accessible to shippers, and in case of disputes over terminal charges the governor-general may direct the commissioners to make a decision. Discriminations and preferences are prohibited under the law. The granting of passes is made unlawful. In addition, the law grants the necessary police powers, and includes other provisions relating to safety in traffic and the fixing of responsibility in case of accidents.

New South Wales.—The railways of New South Wales, like those of other Australian States, are owned chiefly by the government, although private railways still exist, and charters for the same are from time to time granted in the different States. To illustrate the nature of the private charters granted there, the chief points of such a charter granted by the parliament of New South Wales in 1893 will here be outlined.

In the first place, it may be noted that the title of the act itself contains as full a description of the proposed route as is found in most of the better charters granted in American States. A detailed description of the route is appended to the charter as a part of the act. This will be reproduced in Appendix I to this report, to which reference is here made. Quite in harmony with long-established custom in England and English colonies, the charter opens with a preamble, which is likewise reproduced in the appendix. The earlier sections of the charter authorized a certain person to construct three railway extensions. The gauge is made to conform with that of government railways; crossings, gates, fences, and drains are provided for, and the general technical features of the undertaking brought into harmony with the plans upon which government railways are constructed. In this, as in other matters, the railway commissioners have advisory powers. The charter establishes maximum rates for passengers and freights, and

further provides that these maximum rates may, if necessary, be increased with the approval of the railway commissioners. A large part of the charter is taken up with matters relating to the exercise of the right of eminent domain. The appointment of arbitrators is provided for, and these in turn appoint an umpire, who has final decision upon matters in which the arbitrators disagree. The manner in which the valuation of property shall be ascertained and apportionment of the costs of arbitration are described. On the whole, these provisions are essentially similar to those found in the better charters of American States. An important right is reserved to the State by giving railway commissioners "running powers" over this private railway; provided, however, that the exercise of this privilege shall never seriously interfere with the ordinary traffic upon the railway nor deprive the public of the use of such railway. The incorporator is empowered to make the necessary rules and by-laws governing the times of the arrival and departure of trains, the loading or unloading of cars, preventing the smoking of tobacco and the commission of any other inconvenient and disagreeable thing connected with railway traffic, to issue proper tickets and prescribe rules for the use of the same—in short, the incorporator is given full power to manage the railway, subject to the approval of governmental authorities. Another right reserved by the State is that of purchase. At any time, on giving due notice, the incorporator may be required to sell his railway property to the government upon payment of a fair valuation of the same, including compensation for compulsory sale not exceeding 10 per cent. In case of differences as to the value of the railway property, a method of arbitration is provided for in accordance with the public works act of 1888. All private railways are, as has been before indicated, subject to the railway commissioners.

The railway commissioners are organized under the government railways and tramways act of 1888. This act opens with definitions covering such terms as "commissioners," "governor," "justices," "magistrates" and "minister," "prescribed railway vessel," and so on. As a whole, the act deals with the management rather than with the construction of railways, an attempt being made in the legislation of New South Wales to separate the latter from the former. The railway commission is composed of 3 persons appointed by the governor. The commissioners are empowered to appoint the necessary assistants. All government railways are placed absolutely into the hands of the commission. The ownership of railways and tramways, piers and wharves, lands, telegraph posts and lines, and all other things constituting a part of the railway system are vested in fee simple in the commission. All railway property is exempted from taxation.

There is nothing extraordinary in the duties assigned to the commissioners, these embracing all things necessary for the successful operation of the railway system. They are enjoined from giving preferences to persons, corporations, or industrial sections, and in no case can special rates be quoted to one person or interest which is not at the same time open to all others. "The reasonable facilities" clause of the English act of 1854 is in substance inserted. The commissioners have power to issue passes to members of the legislative council, the legislative assembly, officers of parliament, persons of distinction visiting the colony or officially engaged in some public duty, and to certain former officeholders enumerated in a schedule appended to the act, and including cabinet officers, justices, executives, presidents of councils, and speakers of assemblies.

While the commissioners are concerned primarily with the management of railways, they must be consulted with respect to the regulation and construction; and before the second reading in the legislative assembly of any bill authorizing the construction of new lines of railway the commissioners shall transmit to the minister a statement showing their estimate of the traffic on each proposed new line and any other returns likely to be derived from such new line. This estimate of the commissioners must be placed before the assembly by the minister before the bill can be read a second time. Ample provision is made for disputes arising out of bills of lading and rates charged for freight traffic. Quarterly reports must be made by the commissioners to the minister and annual reports to the parliament.

The telegraph lines of the State are under the control of the commissioners.

All the Australian States have been remarkably free from railway accidents; nevertheless this commission has ample power to investigate such accidents as may occur and order whatever improvements may be possible and necessary to avoid their recurrence in the future. Thirty-two different subjects are enumerated in the law regarding which the commissioners may make rules and by-laws. It is unnecessary to enumerate these different topics; suffice it to say that they cover all phases of railway traffic and do not differ from similar regulations on other roads.

One of the most interesting features of the law is the establishment of an elaborate system of railway service. All employees, excepting occasional supernumeraries, are obliged to pass a satisfactory examination under a board of examiners appointed by the governor. A record of all examinations and appointments must be kept and, in case the number of successful candidates in an examination exceeds the number of vacancies to be filled, the names of such successful candidates are placed upon the books and their appointments follow as vacancies may occur in the order of their relative ranks. Original appointments are made upon probation for a period of 6 months, after which such appointments may be made permanent on presentation of a certificate from the officer at the head of that branch of the service, stating that such probationer performed the duties of his position in an efficient and satisfactory manner. Promotions to the higher grades of the railway service are made on the basis of competitive examinations. Officers at the head of the different branches of the railway service have power, for good cause, to reduce employees in rank, and even to dismiss them from office; however, such employees have the right, under the law, to sue the commissioners in any court for such dismissal, or for any other cause. The usual police provisions and punishments for fraudulent and other misdemeanors are contained in the law.

France.—For nearly a quarter of a century the railway history of France has been the history of the "conventions" or contracts made between the Government and the 6 great railway companies. In no country has territory been parceled out so systematically, and no pretense is made of active competition between the different lines, for each controls quite absolutely its own district.

The earliest history of French railways is very similar to our own. Up to 1833 charters were granted containing practically no restrictive features and no reserved rights of the State. In later years the State usually reserved the right of repurchase or caused a railway to revert to the State after a certain period of time; these provisions are entirely wanting in the earliest French charters. Passenger traffic was not then considered of importance, and charters contain no reference to it. A very simple schedule of freight rates was used; and the entire project left in the hands of the company.

In 1833 a turning point was reached, for in that year a law "on expropriation for causes of public utility" was enacted, after which a declaration of public utility, which has remained an essential preliminary step to this day, was necessary before a railway could be chartered. Frederick List, whose name is identified with the early railway history of Germany and of the United States, had elaborated a complete system of French railways, which, however, did not in those early years appear to be within the resources of the State. He succeeded in interesting the Government, and it was perhaps in part as a result of his agitation that 500,000 francs were set aside for the study of railways in France. In 1835 a new set of conditions was inserted in French charters. Corporate life was limited to 99 years and the powers, duties, and privileges of the corporation carefully described in from 40 to 50 different sections. The Government had evidently seen the necessity of departing from the earlier method of *laissez faire*. As early as 1835 a plan was proposed for the construction of certain main lines by the Government and the building of branch lines through private effort. With some modifications this was enacted into a law in 1842, under which railway companies provided the rolling stock, while the Government contributed heavily to the cost of construction. The crisis of 1847 compelled the State to assume the operation of several of these roads in order to prevent the complete cessation of traffic. As a result of this reaction, the Government refused to give direct financial aid; although in 1851 governmental authorities encouraged railway building with much vigor through the establishment of great railway corporations. The number of railway companies was never so great as in England and the United States—due in part perhaps to the early reaction against the theory of free competition. In 1846 there were but 33 railway companies in existence; in 1855, 24; in 1857, 11; and in 1859, excepting 8 subordinate lines, only 6, constituting the great companies of to-day. The feverish activity which had prevailed in railway circles during the early fifties received a setback during the crisis of 1857, as a result of which railway building practically ceased for a time. The investigation of the railway crisis of 1857 led to the contracts of 1859 between the Government and the railways. The conventions of 1859 divided the railways of France into 2 groups, known as the old and the new networks, respectively; to the former, including the 6 great railways of the country, the Government guaranteed a certain normal amount, while to the latter it guaranteed a certain rate of interest. From 1859 to 1876 numerous other agreements were made with a view of correcting the errors which had crept into the estimates of 1859. In 1876 France entered upon a

career of State railways. Freycinet, whose "programme" of 1878 became law the following year, was the champion of this system. His programme involved a careful elaboration of the present railway systems through the construction of new lines by the State. He estimated that 10 or 12 years would be sufficient to carry out his programme and practically to complete the "normal railways"—that is, standard-gauge main lines. In the attempt to carry out the programme, railway construction was prosecuted simultaneously in all parts of the country. There was a lack of concentration of effort and, as a result of the division of energy in so many different parts of the land, progress in construction was checked whenever the treasury found itself in difficulties. It was soon found that the execution of Freycinet's programme was impossible, and in 1883 the Government entered into the conventions or contracts under which the great railway systems of France do business to-day.

Under the contracts of 1883 the railway companies bound themselves to complete the construction of the roads embraced in Freycinet's programme, and to construct the so-called "third network." The former division into old and new network was abandoned. Eventually, companies might come into possession of other lines in case a declaration of public utility was issued. The Government reserved control of further extensions of the different systems. The chartered railways were henceforth to be constructed by the State, but the companies must advance 25,000 francs per kilometer and supply the rolling stock. The remainder of the capital necessary for construction was to be advanced by the companies to the State, but the State agreed to pay the interest and amortize the stock of the company in 74 years. In case the earnings of the company are inadequate, and the State must pay out of the treasury sums of money to make up the guaranteed rate of interest, such sums with interest must be returned by the company out of future earnings. Indebtedness incurred under the contracts of 1859 on the part of the companies was to be liquidated under the new contracts by assuming that advances had been made to the respective companies by the State to the extent of their indebtedness under the earlier contracts.

Reference to the sections on classification of foreign railways will recall the administrative division of French railways into three classes. General laws governing the incorporation of railway companies for the construction of each of these classes have been enacted by the national legislature. These laws, while distinct from one another, are identical in their arrangement and very similar in their contents. The differences existing between the general laws governing railways of general interest of normal width, and railways of general interest with narrow tracks are only such secondary variations, which naturally result from the different degrees of importance represented by these 2 classes of roads. And in comparing the general law for the construction of local railways, the differences noticeable are still of minor significance, the latter law containing only 69 sections, while the other 2 laws contain 70. In the case of local railways, Part IV of the law containing, among other things, a classification of freight and charges for transportation, rates must be supplied for every road chartered, while, in case of the other 2 classes of railways, these rates are prescribed in the laws themselves. In this connection the fact should also be recalled that in some of the early American charters the rates established involved 2 parts, one being assumed as a charge for "toll," or the privilege of using the road, and the other a charge for transportation, or a return for services actually performed. In all 3 of the French laws this division of the aggregate price of transportation, into a charge for toll and a charge for transportation, is maintained.

Under these general laws the minister of public works has supervisory power over the railways of the country. All projects for the construction of new lines must first receive his approval. The petition for a charter must be accompanied by a map and profile stating distances, grades, and curves, and, in addition, it must contain a memoir in which the necessity of the projected railway and its beneficial influence on social and economic life are established. The minister of public works has power to order the establishment of stations, freight houses and to supervise the construction of tracks. The law prescribes that all material used shall be of good quality, and certain minimum requirements, such as weight of rails, are indicated. The conditions under which the right of eminent domain can be exercised are described, and all incorporators are bound to maintain the entire road in good condition. The Government reserves the right to purchase the entire railway, and the manner in which the price is to be determined is prescribed in the law. The relation between railways and the post-office is prescribed, as well as the right of the Government to maintain telegraph lines on the right of way. It general, it may be asserted that the 3 laws illustrate the French love of system. First, a systematic classification was established, and then a law enacted to govern the railways in each class.

With the exception of the Orleans system, a State railway controlling transportation in that district, the railways of France are in the hands of 6 great companies. The few lesser companies are not of sufficient importance to be seriously considered in the study of French railways. A view of the railway map of France shows at a glance a clear-cut division of that country into sections, each absolutely controlled by some one railway administration. In no country has the theory of railway competition been so completely abandoned, under a system of private management, as in France. The railways of France are, in their nature, similar to the railways of every other country; but in that country it would seem strange, indeed, if someone were to arise at this time and advocate a régime of free and unrestricted competition among railways—a theory which was long ago abandoned.

Norway.—The first important Norwegian railway was constructed by an English company, with the assistance of the State, under a charter of 1850. The experiences of the State with this company were not favorable, and a policy of State railways was early entered upon, and has been continued into our own times. The English company had power to appoint one-half of the board of directors, while the State appointed the other half. In case of the so-called State railways of Norway, the administration is centered in the minister of public works and subordinate officials, the entire State system being divided into 6 circuits, each having its appropriate set of officers. The State railway companies are organizations in which private and public interests are merged. The State, as a rule, furnished the necessary lands on which the company agreed to make a certain return; the additional capital was supplied by the State, and subordinate political units and by private companies, each contributing approximately one-half of the entire capital.

The fundamental railway law of Norway is found in the acts of 1848, 1854, and the supplement of 1898, the latter being very brief and not important.

The law of 1848 sets out with the stipulation that private persons desiring to begin the construction of railways must submit a plan for the approval of the King, acting through the proper officials. Having been satisfied as to the usefulness of the projected road, the probability of the satisfactory execution of the plan, together with the reasonable certainty that it will be a success, a charter may be granted, authorizing the petitioners to obtain possession of the necessary lands and materials. Iron and other essential materials in railway construction are exempted from import duties. The time for which chartered rights may be granted is not to exceed 100 years.

Section II of the act prescribes time limits during which the railway must be constructed, and prescribes the manner in which rates shall be established, keeping in view the public interests involved in maintaining the lowest possible rates. While rates are supposed to be fixed before the road is opened, in case it seems impossible to make equitable schedules of rates before the road is opened for traffic, this may be postponed until the road has been operated for a reasonable length of time. The company is bound to transport government property, mails, and munitions of war at all times in return for fair remuneration. The manner of constructing crossings is regulated, and other measures for the security of the public prescribed, including the usual inspection by order of the King before the railway is opened. The State reserves the right to purchase the railway and the manner of determining the purchase price is described. Succeeding sections deal with possible differences as to reasonable rates which may arise between the railway corporation and the Government, and a system of arbitration on rates is outlined. In this connection a law of 1830, regulating the fee system, is referred to. Other provisions of the law do not present any peculiarities worthy of special mention.

The law of 1854 deals largely with the question of appropriation and police regulations. A limit is fixed within which only fireproof houses and sheds can be erected, and other considerations of safety, regulating excavations and the construction of accessory arrangements, introduced. Penalties are provided for persons who prejudice the safety of railway traffic or do injury to railway property. Employees who neglect to do their full duty or become intoxicated become liable to fines prescribed in the law. In all these matters final authority resides in the King.

The supplement of 1898 to the law of 1848 merely states that all railways or street railways for public use not operated under the direct management of the State can only be constructed and operated under a charter expressly granted for that purpose in accordance with the terms of the law of 1848. No subordinate political unit can grant a franchise which is valid without special recognition from the King.

The charter which was submitted as typical of Norwegian charters was granted in 1899, and in many respects it is quite similar to charters granted in other countries. A number of commissioners are named and a certain amount of government subsidy is specified, together with the contributions to be made by the districts through which the proposed road is to run. The charter is granted under the same general conditions under which previous charters have been granted, in accordance with the terms of the general laws just considered. The minister of public works must approve the construction of the road from time to time as progress is made. A map and profile must be submitted, not only to the department of public works but also to military authorities before the full franchise can be granted. The charter regulates the relation between this and other railways in regard to the common use of tracks, stations, crossings, etc. Minimum curves are fixed, the width of track, weight of rail, and other matters relating to the physical requirements of construction, with the final power of decision in the department of public works. A careful estimate of costs must accompany the map and profiles, and the laws of 1848 and 1898 are expressly made a part of the charter. The incorporators are empowered to exercise the right of eminent domain, a detailed plan of all lands necessary having been previously approved by the King. Rails, locomotives, cars, coal, and other materials necessary for construction may be imported free of duty. Railway property is exempt from taxation under the law of 1848 for a period of 30 years from the date of opening. The limits for beginning and completing construction are stated, and it is further specified that Norwegians shall do the work. The incorporators and their franchises are subject to the control of the State, acting through the proper railway officials, who may order minor changes. The department of public works may also approve safety appliances, the rules regulating speed of trains, and similar matters. The capital stock of the company can not be increased without the consent of the Government. A reserve fund is provided for and pensions for employees, and these, together with the working capital of the road, are governed by regulations issued by the King. No money can be borrowed by the company, the interest on which is to be paid out of the railway income, except with the consent of the Government. The Government has the right to appoint two commissioners to assist in supervising construction, and one or two to examine accounts and to assist in controlling the operation and management of the road. The minister of public works represents the Government, to the extent of the amount of stock held by the same, at stockholders' meetings. The King may order several roads to be operated as a single system, and all rates are ultimately determined by him; that is, the company submits schedules and rules for royal approval. The rates for the transportation of troops and munitions of war are prescribed. The company is not entitled to damages resulting from war. The franchise can not be sold or transferred without the consent of the King. Should the company fail to construct the road, the Government may itself complete the same or grant the franchise to others. Similarly, if the road is not operated in a satisfactory manner, the Government may assume the duty of managing it. The company deposits permanently in the Government treasury \$5,000 in cash or negotiable paper, which is forfeited in case of violation of charter privileges. The Government reserves the right to build telephone and telegraph lines along the right of way without compensation to the company. Forms for periodical reports are prescribed. The State reserves the right to purchase the railway after 30 years, and, if necessary, at any time before the expiration of that period, on giving 1 year's notice. The purchase price is to be determined according to one of two methods prescribed in the charter.

The company must accept all future laws which may be enacted on the subject of railways, and the King has authority to construe the application of such laws.

Switzerland.—Two railway charters, granted in 1898, and submitted by the minister of railways as typical for primary and secondary roads, respectively, constitute a fitting introduction to the railway legislation of Switzerland.

The charter for the primary road was granted for a period of 80 years. All the incorporators are required to be citizens of Switzerland. The entire line is to be completed within 2 years after the beginning of the work of construction; but even after construction has been begun the federal council may demand such modifications in the plans as conditions of safety and other contingencies may make necessary. The Cantonal Government preserves the right to claim all fossils and other objects of scientific and historical interest. (This provision is similar to an analogous section in the charter of New South Wales, in accordance with which minerals and oils discovered by the incorporators remain in the possession of the State.) The charter makes it the duty of the railway officials to furnish the federal officers with all the information and other means necessary for the execution

of their duties of supervision; and any railway official who is derelict in the performance of his duties and is not dismissed by the management may be temporarily discharged by the federal council. The number of trains per day in each direction is specified, and the minimum rate of speed prescribed. In addition, the railway is subject to all the provisions of the regular Swiss railway regulations. Passenger cars are to be constructed on the American plan, and all trains must contain a specified number of classes of coaches, unless expressly permitted to do otherwise by the federal council. On demand of the council passenger coaches may be attached to freight trains. Rates of fare are fixed for each of the different classes of passengers, being 20 per cent less in case of freight trains. Children under 3 years of age must be transported free, and those from 3 to 10 years old at half fare. Freight rates for the transportation of different classes of animals are fixed in the charter, and differences in rates are allowed in case of carload and less than carload shipments. A classification of freight is also included with corresponding rates for the different classes. All rates are subject to the approval of the federal council 2 months before the railway is open for traffic. The rates may be lowered whenever more than 6 per cent net profits are realized. In case of disagreement upon this point between the railway company and the federal council, the national assembly shall decide. On the other hand, whenever rates are not high enough to provide adequately for the expense of operation, they may be raised with the consent of the federal council. The railway company is required to maintain a reserve fund and a benefit fund for its employees. In accordance with the provisions of the federal law, all railway employees are required to carry insurance. In common with provisions of the general law of 1872, this charter reserves to the State the right of repurchase at any time after the expiration of 30 years of the life of the charter on 3 years' notice, and on every 1st of May thereafter. The company is to hand over the property in first-class condition, and all rights of employees, with respect to the benefit fund and insurance, are guaranteed in case of a transfer of the property of the road to the State. Should the railway property be in imperfect condition and the reserve fund not sufficient to enable the State to repair such defective portions, a sum of money shall be deducted from the purchase price equal to such deficiency in the reserve fund. The purchase price is determined under the charter as follows: In case the railway is purchased before the year 1935, the price paid shall be 25 times the average of the net profits of the 10 years preceding the giving of notice of such contemplated purchase to the company; if the repurchase is made between 1935 and 1950, the price shall equal 22½ times the average net profits of the last preceding 10 years; and if the repurchase is made in 1950, 20 times such average net profits. The net profits are defined as that sum that remains after all expenses, including contributions to the reserve and amortization funds, have been met. In case the State does not purchase the road until the expiration of the charter period of 80 years, the company may take its choice between a refund of the original cost of construction or a price fixed by the federal court, which tribunal shall also decide all other questions with respect to redemption. In case the Canton in which the proposed railway is to be constructed has already purchased the railway, the federation nevertheless has the right of repurchase along with all other rights and privileges which may have been conferred upon the cantonal authorities.

The charter granted to the railway company organized to construct and operate the secondary road, using electricity as motive power, is essentially like the charter which has just been described, only differing in certain details. The corporate life of this company is limited to 80 years, and the approval of the federal council is necessary for the construction of the line. The width of the track is prescribed, and the period during which construction is to be completed is likewise indicated. The federal council may establish the speed of trains and approve the type of cars to be used. The minimum number of trains in each direction is fixed; and rates are indicated, though without reference to different classes of passengers. As to freight and the transportation of animals, the same classification is adopted, although the rates are somewhat higher. The State reserves similar rights of repurchase, but the price is fixed at 22½ times of the net profits from 1935 to the expiration of the charter.

The discussion of general railway legislation in Switzerland will be confined to a few of the more important landmarks, beginning with the constitutional provisions of 1848. Under this constitution the federation reserved the power to undertake public works in its own interests or of a large part of the country at public expense. For this purpose it was empowered to exercise the right of expropriation, and had power to prohibit the erection of any public works which might prejudice military interests.

From that day to the present time, Switzerland has had its series of laws culminating in the important repurchase act of 1898, under which the present scheme of nationalization of railways is being carried out. The idea of State railways had its beginning in the law of 1852, according to which the federation reserved the right to permit either cantonal governments or private companies to construct railways. The culmination of this idea found its expression in article 1 of the law of 1897:

"The federation may purchase and operate on its own account, under the name of 'Federal Swiss Railways,' all those Swiss railways which, because of their economic or military significance, serve the interests of the Eidgenossenschaft or of the major part of the same, when these can be acquired without making disproportionate sacrifices."

Thus the laws of 1852 and 1897 constitute the "boundary posts" between public and private railway enterprise in Switzerland. Under the former law, construction by the State was considered chiefly as a possibility, while under the latter it is regarded as an immediate probability. Furthermore, the law of 1897 places the entire railway system in the hands of the federation, while that of 1852 left it between the cantons and private companies.

The next important law is that of 1872, which brought order and system into Swiss railway legislation. Before that time much confusion, incoherence, and uncertainty had existed in railway statutes, all of which was done away with by the systematizing and unifying influence of the new law. Besides, the law of 1872 is in many of its essential features still operative through their incorporation in later acts. This law placed a time limit upon corporate life, granted in charters, and restricted transference of charter privileges to direct assent of federal authorities. Time limits, during which construction could be completed, were also fixed, and provisions having in view sound financial organization introduced. The Government reserved the right to order the establishment of stations, double tracks, and other facilities. Railways were obliged to submit, on completion of a line, a detailed and accurate account of the expense of construction to the Bundesrath. Mail were to be transported free, and the Government had the privilege of using the roads during times of war. The manner of establishing railway rates was prescribed, and system and unity were introduced into the classification of rates, as well as into the physical organization of the railway system.

Another important step toward uniformity was accomplished in the enactment of a "normal concession bill." As the name indicates, this law furnished a normal charter, the provisions of which, it was assumed, would be incorporated in every railway charter to be granted in the future, only individual and local variations requiring modified forms. The railway companies had been reluctant to demand the right of the State to legislate in any manner interfering with what they considered their charter privileges. Both the law of 1852 and the normal charter law assert the right of the legislature to enact general laws which supersede the special charters in so far as there is a conflict between them. The charters granted during the years following this legislation contain repurchase provisions. What these were is not essential, since the law of 1898 contains what is applicable to this subject. In 1883 and in 1896 so-called accounting laws were passed. These were a necessary preliminary to the later repurchase act, in that they brought about greater uniformity in systems of railway accounting, and, in addition, provided the data upon which calculations of the repurchase price could be made. It has also been asserted that the methods of accounting prescribed under these laws resulted in lower valuations being placed upon railway property and a consequent saving in repurchase on the part of the Government. Under the federal law of 1897, approved by a heavy majority of the referendum in 1898, the federation is empowered to repurchase all the Swiss railways in accordance with the repurchase provisions of their respective charters and the general law. The funds necessary for such repurchase are to be raised by the issuance of bonds. The entire indebtedness is to be canceled within 60 years by means of a well-elaborated plan of amortization prescribed in the law. Other plans may be adopted in case of mutual agreement between the companies and the Government. The ultimate measure of success of the Swiss scheme of nationalization can only be awaited with interest. It is at present altogether too early to pronounce judgment upon it.

In the management of their railways the Swiss have adopted a system similar to that which will be described in case of Prussia. The railway side of the administration rests in the hands of a general directory of from 5 to 7 members and 5 circuit directories, the latter being subordinate to the former. These two classes of administrative organs may be considered as the legally responsible railway authorities. Running parallel with these are two other classes of authorities, advisory and deliberative in their nature. These are the administrative

council and the circuit railway council. In the organization of these bodies the representation of political, economic, and social interests is made the chief aim.

Austria.—In order to illustrate the most important features of Austrian railway legislation, the chief provisions of a charter granted in 1868 to the Austrian Northwestern Railway will here be presented.

The minister of trade is the authority upon whom the final approval of the plan devolves, and no changes and modifications can be made without the consent of the authorities of the State. The franchise is granted for a period of 90 years, during which time the company is protected against the construction of competitive lines. The State may purchase the road at any time after 30 years of corporate life; and in case State purchase does not take place before the expiration of the charter the railway shall revert to the State without compensation to the company at the expiration of the charter limit. The incorporators are also bound by all the provisions of the general laws of 1851 and 1854. The time limits, during which construction shall be begun and completed, are established for different sections of the road and not for the road as a whole, as is common in the United States. The company must permit connections to be made with other railways at any time, and the incorporators must furnish bond in cash or negotiable securities for the faithful execution of all the provisions of the charter. Telegraph lines may be constructed by the Government on the right of way without special compensation to the company, and mails, together with necessary employees, must be carried free up to a certain limit, beyond which the stipulated amount of pay may be exacted by the company. Maximum rates are fixed in the charter for both passengers and goods on the zone system, which was elaborated and generally adopted in both Austria and Hungary in 1899. Special rates must be published as well as the regular rates, and the State authorities have power to reduce rates whenever net profits exceed a certain amount. Rates are also fixed for the transportation of troops and munitions of war. In case of famine and want, special rates known as "famine rates" may be established. The charter limits the indebtedness of the road and makes provisions for the amortization of the same.

Charters granted in 1865 and 1870 are essentially like the one just described, only that in one instance direct reference is made to the Northwestern charter, and the document containing this reference is abbreviated in a manner very similar to that in which New York charters were abbreviated by reference to the Attica and Buffalo charter. One of the companies is specially bound to build whatever branches may be necessary for the development of the territory in which the road lies. In another charter, according to the terms of which the State may become a stockholder, representation of the State in the management of the road is provided for.

These charters contain no reference to pooling, although, as is well known, pooling is legally permitted in Austria. All roads entering into a pool must be duly represented in the commission which draws up the pooling arrangements, and all such arrangements are subject to supervision by State authorities.

PART VI. - PRUSSIAN RAILWAYS.¹

Early development.—More attention is given to Prussia than to any other foreign state because of the significance which the system of state railways in Prussia has attained in the railway history of the world. Prussia has developed a system which is peculiarly her own, and which, in many respects, is the most perfect of its kind. In the earlier history of Prussian railways one can find tendencies similar to those which are discernible in the historical development of railways in every other country; but the manner in which Prussian legislation met various contingencies affords instructive lessons to those countries in which legislative bodies pursued a different course. Prussia was not the first German country to begin the construction of railways. One very important road was built in Saxony before the first great Prussian railway was built; and a short road from Nuremberg to Fürth was the first modern railway in the present German Empire. The latter will be briefly considered, because in its projection things were done which are quite typical of procedure in connection with early German railway projects. For purposes of comparative study a presentation of the present legal and administrative organization of Prussian railways would perhaps be sufficient; but in its local history there are so many instructive lessons that one can not afford to pass over Prussian railway development from its beginning to the period of radical reorganization in 1894, upon the basis of which the present system rests.

The Nuremberg-Fürth Railway.—The history of the Nuremberg-Fürth Railway dates back to 1814, when a prominent Bavarian engineer began to interest himself actively in railway projects. Not until 1832, however, when John Scharrer, a wealthy citizen of Nuremberg, revived the project, was work begun in earnest which led to the completion of the road in the immediate future. The men who were associated with Scharrer were practical business men, and the manner in which they entered upon the novel undertaking of a railway shows that their enterprise rested upon business principles. By actual count they determined the number of people that traveled between the two cities. The result showed a daily average of 1,184 persons on foot, 494 in carriages, and 108 vehicles of various kinds. From this daily average they estimated the annual movement of persons between Nuremberg and its suburb, Fürth, at 612,476 persons, and 39,420 pleasure trips. On the basis of this count a detailed plan and estimate were elaborated, fixing the capital stock of the proposed company at 132,000 gulden, on which an annual return of at least 12 per cent was estimated. The stock was sold on May 14, 1833. The largest part of it remained in the two cities between which the railway was to be built, and the Government became a shareholder to the extent of 200 gulden. Following this the shareholders secured a royal charter and a confirmation of their statutes, by which the company secured the exclusive privilege of building and operating a railway between the two cities for a period of 30 years. The organization of the company has remained intact up to the present time, and the financial history of the road has been one of the most prosperous in Germany. This is one of the few early roads which was built with especial reference to passenger traffic. Not until 1836 was freight carried in any quantity. On the 11th of July of that year the first cargo of freight was shipped from Nuremberg to the "Wirth zur Eisenbachen" at Fürth; and, quite in keeping with Bavarian custom, the cargo consisted of "2 Fässchen Bier von Lederer."

¹In addition to official documents, the writer wishes to acknowledge his indebtedness to the legal works of Klein, Eger, and Schroetter; to the historical essays of List, von Mayer, and von Fleck; to the financial compilations of Hoepfer, to the economic publications of von der Leyen; and to various essays in the *Archiv für Eisenbahnwesen*.

The Leipzig-Dresden Railway.—Although not located in Prussia, this railway is mentioned because it is the first great road that was ever built in Germany, and can, in a sense at least, be considered the technical foundation of great systems of railways in the German Empire. Roads projected before this time were more isolated and chiefly local. The Leipzig-Dresden road constitutes the corner stone of the industrial mechanism of modern Germany. All of the stock was sold in 1835, exactly 2 years after the stock of the Nuremberg-Fürth Railway had been sold. A great wave of enthusiasm followed this event which led to the projection of 9 different roads. An expropriation law for the benefit of this company was enacted in 1835, and construction was begun the following year, and a part of the line opened on April 24, 1837. The entire line was not opened for traffic until April 7, 1839.

A ministerial report.—The attitude of the Prussian Government at the opening of the railway era is clearly indicated in the report of Herr Rother, the chief of the department of trade, manufacture, and building, on "the development of highways and the building of chaussees." It is dated August 16, 1835, and addressed to King Frederick William III:

Railroads as avenues of trade, with steam propulsion, have to within very recent times, and with few exceptions, been found only in the few States of North America and in Great Britain. The reports received about dividends paid by these roads, in so far as they are undertakings on stock companies, appear to be unreliable and highly colored in the interests of stock speculation.

Herr Rother then refers to the difference in the conditions under which roads must be built in the several countries. He quotes the case of the first Austrian road from Linz to Budweis and of the French road from Lyon to St. Etienne as having yielded but a small return. (The former 25 per cent and the latter even less.) And the railway built by the Government of Belgium from Brussels to Mecheln (2; German miles), he says, can not be taken as typical for other states, or even for Belgium. He says the Continent can not yet show a railway which has been successful and which has satisfied a real want. (Serving as an avenue of trade—*Handelsstrasse*.) Another objection he raises is that there is no experience on the technical side to fall back upon. He even doubts whether he could answer in the affirmative the question whether or not the German means of communication, such as they were, needed any improvement. He points out that the tolls on macadam have been reduced so much that land transportation comes into active competition with that on water. He fears that many demands will be made on the state in consequence of industrial changes (*"Verschiebungen"*) resulting from the building of railways. Additional objections enumerated in the report are: that the small towns will gain but little, if at all, on being connected with a railway; that the expense of keeping the chaussees in repair will remain the same, while the receipts from tolls will decrease; that the use of the railway (i. e. the track) can not be extended to ordinary wagons; that the cars (*"Eisenbahnwagen"*— railway wagon) can not be used on chaussees and ordinary roads; that it appears difficult to make a railway pay, and that, finally, there is no occasion for the state to grant valuable charters or to give financial aid to such undertakings.

Rother's report may be taken as a true reflection of public opinion up to May 11, 1835. The report is dated August 16, 1835, and is thus a little behind time, on which day the stock of the Leipzig-Dresden road was sold, and a high wave of railway enthusiasm sent over the country.

The Magdeburg-Leipzig Railway.—The importance of this railway lies in the fact that the charter, under which it was constructed, was made the foundation of the Prussian railway law of November 3, 1838, which has continued in force until to-day, and which in all its essentials constitutes the present railway law of Prussia. It may be said that the Magdeburg-Leipzig Railway accomplished in the province of railway legislation what the Leipzig-Dresden Railway effected toward systematization in railway construction. In the reply of the Government to the committee of Magdeburg merchants who sought a charter as early as May 22, 1835, there can be detected the central thought of all future Prussian railway legislation: that it is the duty of the state to take such a position in relation to railways that it may at any time in the future interfere in behalf of public interests. The royal order, confirming the statutes of the Magdeburg-Leipzig Company and granting the charter privileges, is epoch-making. After extending to the corporation the privileges usually accorded to legal bodies of this kind, the order expressly limits the reserve fund provided for in the charter to 2 per cent of the total original cost. It further expressly states, and makes it a condition of the acceptance of the privileges granted to the company, that the same shall, at any time in the future, be bound by all laws, rescripts, and orders issued in relation to railways. The royal order discussed the relation of railways to the state

and to the public; and because of the quasi-public nature of the undertaking, which was thus early recognized by the German Government, all rights necessary for a proper ordering of the relations between the railways and the public were reserved to the state.

Periods of Prussian Railway development.—A general notion of the historical development of Prussian railways may be obtained from a presentation of the periods into which the same may be divided. At the outset, a word of comment may be inserted on the somewhat popular impression that in European countries the earliest railways were built largely, if not entirely, by public funds, and that in the United States they were built by private capital. The exact opposite is true. It is a well-known fact that nearly all our early railways received important aid from towns, counties, villages, and cities through which they passed. On the other hand, the earliest English and most continental roads were obliged to pay heavily for the right of way. The same was true in Prussia. Before the year 1843 only private railways existed in that state. From 1843 to 1847, inclusive, the state aided in the construction of railways by guaranteeing a minimum rate of interest on the capital stock or by investing in shares of the company. The period of the founding of state railways is marked off by the years 1848 and 1862; and is followed by an era of speculation from 1863 to 1877, during which numerous private roads were projected. From 1878 to the present time the state railway system has steadily grown in extent and importance, and, in general, it may be said that the dominating administrative influence from that day to the present time has resided in the head of the department of public works.

Constitutional basis of Prussian railway legislation.—The following are the provisions in the imperial constitution of April 16, 1871, upon which the railway legislation of Prussia rests:

ART. IV. 8. The Empire reserves the right of control and of legislation on the subject of railways, highways, etc.

ART. VIII. 5. The Bundesrath is constituted a permanent committee on railways, post, and telegraphs.

ART. XLII. Railway, which may be deemed necessary for the defense of Germany or for the interests of the general traffic, may, by virtue of a legal enactment of the Union, even in opposition to members of the Union whose territory may be crossed by such roads, without impairing their right of sovereignty, be built by the Empire or by private undertakers to whom the Empire may have granted a concession and the right of expropriation.

Every existing railway is bound to permit a junction with the newly built road at the expense of the latter.

Those legal provisions which grant to existing railways the right to control the building of parallel or competitive lines are without impairing acquired rights, hereby repealed for the entire Empire. And such a right (*Widerpruch-recht*) shall be incorporated in any concessions which may be granted in the future.

ART. XLIII. The Federal Government binds itself to cause the German railways to be managed in the interests of the general traffic as a uniform network, and, for this purpose, to cause new roads to be built and equipped according to uniform norms.

ART. XLIII. In accordance with the above, uniform regulations for the operation of roads, especially uniform railway police regulations, shall be introduced with all practicable dispatch. The federal government shall take care that the railway management, at all times, preserves the roads in such a state of repair and provides them with such an amount of rolling stock as the interests of safety and the public traffic may demand.

ART. XLIV. In consideration of the customary compensation, the railway managements shall be bound to provide for the preparation of mutually supplementary time tables for passenger trains with the requisite speed, likewise to introduce freight trains sufficient for the requirements of the traffic, and to provide for the direct transfer of passengers and goods from one road to another.

ART. XLV. The Federal Government reserves the right to control the tariffs. The same shall strive to effect, (1) the introduction of a uniform system of regulations for the operation of all German railways, (2) the unification and reduction of rates, especially in the long-distance hauls of coal, coke, wood, ore, stone, salt, pig iron, fertilizers, and similar articles applying the wants of agriculture and industry. (Note.—The constitution further provides for the transportation of these articles, as soon as feasible, at a 1-penny rate, except in Württemberg, which, by a treaty of November 25, 1870 (Berlin), with the North German Union, Baden and Hessen is exempted from the 1-penny rate for all the enumerated articles (Art. III, sec. 2 of the treaty). This exemption was necessary because of the different conditions under which transportation was carried on in Württemberg.)

ART. XLVI. In times of distress, especially with an exceptional rise in the price of the necessities of life, the railways shall be bound to introduce, temporarily, for the transportation of (especially) grain, flour, leguminous products (*Hilfsfrüchte*), and potatoes, reduced rates, to be fixed by the Emperor on recommendation of the committee of the Bundesrath; provided that such tariff shall not be reduced below the lowest rate in force on the respective roads for the transportation of raw material.

The above, as well as the provisions contained in articles 42 to 45, shall not be binding on Bavaria. However, the Federal Government reserves the right to exact of Bavaria, by means of legislative enactment, uniform norms for the construction and equipment of such roads as are important in the defense of the Empire. (This provision practically repeats section 8 of Article IV.)

ART. XLVII. The several railway managements shall be obliged to meet unconditionally the demands of the Federal authorities for the use of the railways for the defense of Germany. Especially are troops and all accoutrements of war to be transported at uniformly reduced rates.

It is almost unnecessary to add that all these provisions have been supplemented by rescripts, orders, and statutes. All the rights of the Federal Government over railways may be enumerated under 5 heads:

1. The right to legislate.

2. The right to grant charters.
3. The right to control tariffs.
4. The right to supervise the building, operation, and administration of the roads.
5. The right to employ the roads for the national defense.

All these rights in turn may be looked upon as the logical sequence of what is technically termed the (a) culture and welfare aim (*Kultur- und Wohlfahrtszweck*) and (b) right and might aim (*Recht- und Machtzweck*) of the State.

The legal basis of private railways.—A private railway is any railway not owned and operated by the Prussian State. Thus, railways built and operated in Prussia by a municipality, circuit, province, or another State are private railways in the eyes of the law as well as those owned and operated by a single individual or by a corporation. A railway may be in private possession but operated by the State. This was one of the stages in the transition from private to State railways. The law does not apply a technical term to these mixed roads. In addition to private, mixed, and State railways the law recognizes federal railways. Those in Alsace-Lorraine and a military road from Berlin to shooting grounds near by are the only railways of this kind.

The constitutional basis of charters.—By article 41 of the federal constitution the Federal Government concurrent with the several States has the right to build and operate railways. The Federal Government, within limitations already indicated, has left this right to the States. The right to build railways is an attribute of sovereignty. In case of State railways the question is not one of right but only of undertaking, while in case of private roads it is a question of right or legal privilege and of undertaking. This legal privilege is the charter. State railways require no charters, for the undertaker is the source of privileges granted in a charter to private persons. According to section 1 of the law of 1838 a charter is required for the building and operation of a railway by a physical or legal person (stock company, commune, province, circuit) or another State in the Prussian State. A charter is also required when the right to operate a road without acquiring the rights and privileges vested in the first and when a private road is to serve public interests exclusively. The aim of the law is to define a responsible person in all cases.

Economic and political premises.—The undertaking must serve public interests. It must be permissible from a military point of view. It must be useful and beneficial to the public at large, although it may stand in opposition to private and sectional interests. The law requires the undertaker to furnish objective proof of the usefulness of the proposed enterprise before an application can receive the attention of the authorities. Such proof consists of reliable statements of the present traffic and passenger frequency, an explanation—technical and economical—of the choice of this particular route, grades and curves, estimates of cost, etc.

The enterprise must not frustrate or make more difficult other and more useful projects. This principle would be violated, for instance, were a charter to be granted for a narrow-gauge or secondary road where the building of a primary road would be better.

The undertaker must offer objective proof of his ability to meet all the requirements of the charter which he seeks. This involves not only sufficient capital to build and equip the road, but also the ability to operate it successfully. Bonds are usually required as security.

The proposed railway must be technically practicable.—All these provisions are contained in a cabinet order of March 11, 1839, and, with the law which followed on November 3 of the same year, is still in force.

Preliminary considerations.—By section 1 of the law of 1838, all applications for charters must be directed to the minister of public works. The application must state the direction of the route, with an enumeration of the towns to be touched by the road. A law of August 9, 1845, revised in October, 1871, prescribed the form of maps to be submitted, together with an estimate of costs, arranged under 17 heads.

A circular letter of July 20, 1874, of the minister of public works, requires the applicant to consult with the foresters whose territories will be crossed by the proposed route. A like decree of May 2, 1887, requires the cooperation of the head of the department of mines in determining the route through mining districts.

The charter.—After all the preliminary work has been done, the detailed plan is subjected to an examination by the president of that circuit in which the management of the projected road has its seat. In this examination private and local claims are heard and recorded. This is known as the *Landes und Ortspolizeiliche*

Prüfung. All changes agreed upon among the interested parties in the examination, as well as those ordered in the subsequent examination by the minister of public works, are entered in their proper places in the plan in blue ink; and all changes not agreed upon, but recommended by the authorities, are entered, with the proceedings, in the journal, which is transmitted, together with the plan, to the minister of public works. The plan thus amended is next submitted to the war office for a special examination with reference to military interests, while mechanics and builders examine the technical details of the plan. The final examination is made by the minister of public works, who pays special attention to the project as a whole in its relation to the entire railway system. If the project is approved by him, it is recommended, together with the power of expropriation, to the king, through whose order the charter can finally be granted. The power of the minister of public works does not end with the granting of the charter, but continues during the period of construction, as well as during the entire life of the road. Changes and additions which he may recommend must be made at any time.

The legal basis of State railways.—The building of a State road is a problem of administration, and could be undertaken by the administrative branch of the Government alone were it not for one thing—the money. The building of a State railway requires a State loan or the use of other funds, and for this the vote of the Landtag is necessary. The annual budget, called *etat* in Prussia, contains sums for the building and improvement of highways, railways, a definite sum to meet the expenses of preliminary work, etc. All this is known collectively as the railway *etat*, just as there are marine, military, and educational *etats*.

A ministerial circular of June 14, 1887, requires the following points to be covered in the application for a new State railway:

1. A territorial map.
2. Contour and relief plans.
3. An explanatory statement.
4. An estimate of costs.
5. A memorial or petition.
6. An estimate of probable earnings.

The preliminary work requires no estimate of the probable net profits to be made, as in the case of private roads. But the financial side, although of secondary importance with State roads, must still be an important one. Hence, it is required that the memorial shall contain an elaborate account of the probable effect of the proposed railway on other roads owned and operated by the State, its probable effect on other State property, etc. All the preliminary work is done by order of the minister of public works. The approval of the entire project depends upon the Landtag, or rather the budget (*Etatgesetz*). However, a special royal order is required to exercise the right of eminent domain, and to name the particular authority which is to execute the plan. When the law does not specify whether a primary or secondary railway is to be constructed, either may be decided upon, depending upon the motives which led to the adoption of the plan, while in case of charters granted to private companies, primary railways are understood unless otherwise specified.

When the law of 1838 was passed, it was thought probable that several undertakers might desire to use the same track. Paragraph 27 gives the minister of public works the right, after careful examination of all the facts, to grant to second parties the privilege of transportation on the same track with the original incorporators, provided that no such privilege shall be granted within 3 years after the charter shall have been granted. Several other paragraphs of the same law are related to this one.

Influence of public interests in railway construction.—Both the economical and technical interests are drawn into consideration when the State fixes the plan. The technical unity of all railways is an absolute necessity, and follows the requirements of the federal constitution, that railways shall be operated as a uniform system. All roads are now built according to the norms prescribed in the law of July 5, 1892, which are necessarily general in character. In so far as any part of the construction of a railway, with all its adjuncts, falls outside these norms, it must be determined by the minister of public works according to paragraph 4 of the law of 1838. The location and construction of station houses, store-houses, switches, roundhouses, walls and barriers of any kind, bridges, canals, dikes, etc., require not only ministerial sanction, but also the approval of other authorities within whose jurisdiction the control of such things lies, such as the police and military authorities and building commissioners. But it must be remembered that the power of the authorities is only cooperative. Their decisions are not final, nor are they binding on the minister of public works, in whom final authority is vested.

It may be mentioned here that Germany, France, Italy, Austria-Hungary, and Switzerland agreed upon the technical unity of all international lines in February 1887. Belgium, Servia, and Greece entered this union in 1890. No uniform norms to test economical considerations (such as which route to choose, which localities to cross) have yet been adopted.

Military interests.—The law of 1838 does not mention the railways in their relation to the national defense, except in granting the charter. Article 4 of the Federal constitution reserves to the Government the right to employ railways for the national defense. But how this is to be done, how far the undertaker may be forced to meet the emergencies of war, who is to bear the expense, and similar considerations, were left entirely undefined until the Franco-Prussian war of 1870. A law of December 21, 1871, divides the land surface immediately surrounding fortifications into three belts, for the crossing of any one or all of which the consent of the commandant is necessary. Questions arising under this law are decided by a Federal commission. A law of June 13, 1873, binds railway companies to meet all the necessary requirements for the transportation of troops and supplies in case of war.

The post-office.—The discussion on the relation of the Magdeburg-Leipzig railway to the post-office was the beginning of the law of November 3, 1838. Article 27 of this law authorized the post-office to run its own trains over all roads, if necessary. As the law now stands, the railways, whether private or state, are required to furnish necessary accommodations for railway mail officials and all rooms and appliances, such as trucks, lifts, etc., needed for the railway mail service in all depots or station houses subsequently to be erected.¹ It is also required, in the absence of necessary private dwellings in the immediate vicinity, to provide rooms for officials in all station houses which are rebuilt or enlarged. Railways may be required to do such building at the request of the post-office department, for which they receive rent to the amount of 7 per cent of the cost of buildings or parts of buildings erected for the department. Laws and regulations governing other buildings apply also to these. Persons who use such rooms must furnish them and keep them in repair.

Custom-houses.—A rescript of the minister of public works, of June 13, 1878, makes it the duty of the railways to give due notice to custom-house officials and to receive an expression of their opinion in regard to projected buildings. The undertaker is further required to provide adequate space for the inspection of goods and baggage by the custom-house officials. The law is construed to mean that the undertaker must furnish and keep in repair, without special remuneration, sufficient and safe rooms for the inspection or storage of goods and for the accounting connected with the same. Dwellings for custom-house officials are not included, although the railways find it good policy to furnish them at reasonable rents in order to avoid delays.

Other public interests—Streets and roads.—Paragraph 8 of the law of 1838 gives the undertaker the right to acquire not only the necessary land surface for tracks, stations, switches, space in which to deposit excavated material, but also the ground necessary for all other buildings and roads needful for the most effective operation of the railway in the interests of the public. Under these provisions the undertaker is empowered to open new roads or streets and to cross roads and streets. All these, like other provisions of the charter, are subject to revision by the police authorities. Roads leading to stations, if used exclusively for the business connected with the railway, like all other private property, are governed by ordinary laws. The undertaker must keep them in repair and attend to cleaning and lighting. Where the roads serve public interests as well, the local authorities are responsible for police and sanitary requirements; the railway authorities are responsible only so far as these affect railway traffic.

Protection against fire.—Ministerial rescripts on this subject were issued as early as 1847 and 1848. An ordinance of 1875 prescribes uniform rules for the entire Prussian State, with the exception of the cities of Berlin and Charlottenburg. This ordinance requires special permission of the police authorities to erect buildings or to store easily combustible material within a horizontal distance of 38 meters, if the track lies in the same plane with the land surface on which such buildings are to be erected or the material to be stored. When the track lies on an elevation, the width of this belt is increased by one and a half times its height. Thus, for a track lying on an embankment 6 meters high the width of the fire belt would be increased to $(38 + 6 \times 1\frac{1}{2})$ 47 meters. These questions go before what we would call a county commissioner ("Kreislandrath"), without whose consent no buildings can be erected on this strip. But this applies only to buildings

¹ Law of February 9, 1876, amended in 1878 and 1881.

or stores in the possession of parties other than the undertaker. In case of buildings or stores of combustible material erected or located before the road was projected, special contracts are necessary. Buildings or stores may be placed within this legal limit when they do not endanger the lives or property of third parties, and when neither the undertaker nor the builder refuses to enter upon the necessary agreement. For secondary railways the limit is 25 meters, and the corresponding extension when the track lies on an embankment.

Different regulations exist in relation to forests, turf, and grain. In all Government forests a broken surface of from 2 to 4 rods in width, depending upon the elevation of the track, is continually kept clear of leaves, grass, etc. Frequently these strips are cultivated by people connected with the railway on payment of rent to the undertaker. In the State forests of upper Silesia, where there is much needle wood, in addition to this safety strip, a ditch 2 feet wide in the bottom and 8 feet at the top is dug at a distance of 10 rods from the track. All branches and twigs overhanging such ditches are kept trimmed, and the land surface between the ditch and the safety strip is kept broken. However, such a wide strip is not necessary in all places. The erection of any fireplace within 75 meters of any part of a forest of more than 100 hectares is forbidden. The undertaker and the proprietors of adjacent lands (when these are not public) usually find it to their interests to come to an agreement on these matters at the time the expropriation is executed. It is customary for the State (when the State is the undertaker) to purchase with the right of way such a safety strip and to rent it to employees. The State also employs, whenever necessary, "Brandwerther," who follow limited trains through their circuit, and sometimes also ordinary trains.

Influence of private interests in railway construction.—Paragraph 14 of the law of 1838 makes it the duty of the undertaker to build and maintain all crossings, drains, roads, fences, etc., which the Government may deem necessary, to insure the owners of adjacent property against dangers and disadvantages in the use of their property. Paragraph 14 of the expropriation law of 1874 relates to the same subject. In 1880 the minister of public works, pursuant to the decision of the Bundesrath, issued a rescript in which these paragraphs of the law were construed to include also all changes which, from time to time, must be made in order to protect private property. There exist also legal norms, by which the amounts to be paid to owners of damaged property are determined. It may be noted that even during the period of private railways, from the beginning of the railway era in Germany, the undertaker has been held responsible for injury to private property to the extent to which the Government deemed it just.

A Prussian law of 1865, supplementary to paragraph 20 of the law of 1838, gives specific instruction about the relation of railways to mines. A ministerial rescript of May 2, 1887, makes it incumbent on railway undertakers to consult the interests of mining properties. The law of 1865 prescribed only the relations between the operator of the mine and the operator of the railway. Under this law a mine owner could not prevent the building of a railway, nor was he entitled to compensation for any but direct damages. Losses which he might sustain after the railway charter had been granted had to be borne by him alone. Gleim says that if no special legislation ("Bergwerkrecht") had been enacted during earlier years (1865 and following) it is doubtful whether the subject of mines would have been taken out of general statutes governing private property.

Classification of Prussian railways.—The law of 1838 recognized only 2 classes, primary and secondary railways. Objectively considered, these did not differ in any essentials; but in the manner of their operation differences existed which found expression in the law. Secondary roads were governed by less onerous restrictions with respect to mails, transportation of troops, munitions of war, speed, the percentage of brakes to axles, and similar matters. In 1892 the so-called local railway law was enacted, which recognized additional classes, making in all 5 classes of railways. Of these 5, two are unimportant for present purposes because they include isolated private roads and so-called "Privatanschlussbahnen," the latter being defined in a negative way in the law of 1892, as railways which do not serve public traffic, but the tracks of which are connected with local railways or with railways subject to the law of 1838, in such a manner as to enable rolling stock to pass over from one track to another. Local railways had, of course, existed before 1892, but not until that time did they exist in the eyes of the law. Local railways in the technical sense are railways which are chiefly intercommunal, and not local in the larger sense in which secondary railways of the law of 1838 were considered local. Whether or not a railway falls within the jurisdiction of the law of 1838 or of that of 1892 depends upon a decision of the minister of state. The construction of local railways requires the approval of various authorities designated by the minister of public works. These authorities differ as the road lies within one parish, circuit, or province, or as it lies

within 2 or more of these. The examination which must precede the granting of a local railway charter is confined to the nature of the road and the rolling stock to be employed, with special reference to their safety and to their influence upon private property. In addition, the technical nature of the undertaking is examined and the qualifications of the persons to be employed, as well as other public interests, duly considered. This examination is granted only on application accompanied by a plan. The nature of this plan is not prescribed as under the law of 1838, and is left entirely to the incorporator or incorporators as in case of any other purely private enterprise. In case of applications for the construction of local railways, one of the chief questions is not "Does this plan contain everything required by the law?" as in case of primary or secondary roads, but "Does the plan contain anything which is not in harmony with the provisions of the local railway law?" The incorporator of a local railway is thus made to stand upon the same legal basis that any other private operator stands. The law reserves certain rights to the post-office department, and where highways are crossed or fortifications affected the incorporator must make satisfactory arrangements with the respective authorities. The same rule applies to parishes or other political units when they engage in the construction and operation of local railways. Although a local railway is looked upon by the law as a purely private enterprise, no such railway can be built until after the plan has been exhibited in specified public places for at least two weeks. The time and place of such an exhibition of plans for the inspection of the public must be advertised in accordance with the customary manner of making announcements in that locality. Any person may raise objections, either in writing or verbally, against the project, and a time must be set for the hearing of the interested parties. This hearing must be given in the presence of competent persons. On the adoption of the plan, the undertaker becomes personally responsible for its successful execution. For the first 2 years the local railway incorporator or company has full power over rates within the limits established by the charter, but after that period the proper authorities may, "with due consideration for the financial condition of the road," establish a maximum tariff rate. If at any time, in the opinion of the minister of state, a local railway attains such a degree of importance in the public traffic that it may be regarded as a part of the general network of railways, the State may, on payment of the full value of the road and after 1 year's notice, incorporate the local railway in the system of State railways. The law of 1892 prescribes rules for the determination of a fair price.

Time-tables and train service.—All time-tables of German railways are published by the administration in what is called a course book (*Kursbuch*). The small time-tables, to which Americans are accustomed, are rarely or not at all seen there, except in case of special trains. In the adoption of time-tables local wants are considered. Blanks, upon which the wishes of the respective localities are to be made known, are sent out to the various stations. Then, paying due consideration to these reports, through trains are first decided upon. Then the ordinary passenger trains are fixed, in the determination of which school time, market and factory hours, theaters, etc., are drawn into consideration. Connections between primary and secondary railways are to be so arranged as not to require night trains on the latter class. The introduction of night service on secondary railways depends upon the minister of public works, and the decisive point in the question is the income of the road per train kilometer. It is permitted to run secondary trains over tracks of primary roads, but only alternatively, and in cases where the building of additional track can thus be saved. To illustrate: A and B are important cities connected by a primary road. C is a small city lying off the main line, midway between A and B. Instead of building a road from A to C, trains may be run from A to (say) X on the main line, from which a track is built to C. The route CX is clearly a secondary road, but its trains may run over the track AX or XB, according to regulations governing all other trains of secondary roads. It is also permitted to run certain trains over primary roads, even though they do not answer all the requirements of regular primary railway trains. According to the manner in which trains are operated, they are classed as trains supplying regular wants (*Bedarfszüge*), trains for the nobility, theater, and pleasure trains. The 3 last classes are governed by special time tables and instructions. The first class of trains is divided into the following subclasses: Fast, passenger, goods (local), mixed, work, and laborers' trains. The several names sufficiently indicate their character. Military trains are a heavy strain upon the railways during maneuvers. May 1st and October 1st are the days on which the regular time tables go into effect, and all requests or changes must be submitted to the proper authorities at least 4 weeks before the date on which the table is to go into effect. Then there are special tables for employees. These contain distances and stations, time of arrival, length of stops, time of departure, time it takes

to make the run from one station to another, crossings and junctions, maximum and minimum speed. The distances given are not real, but virtual distances. It is evident that grades and curves diminish the speed of trains. This might be adjusted in time-tables by allowing more time; but it is customary to add such a number of kilometers to the real distance as the train could traverse under normal conditions during the time which is lost through curves or grades. This sum is known as the virtual distance, and is the distance given in time-tables. All passenger trains must contain at least 2 (first and second) classes of coaches. Whether or not third and fourth class coaches must be run depends upon circumstances. In South Germany the fast trains frequently run only first and second class coaches, while in North Germany they add third class also. The so-called *Personenzüge* always carry first, second, and third class passengers, and usually fourth as well, while fast trains do not carry fourth class. (Note.—Fast trains correspond to the American limited trains, and the passenger train, *Personenzüge*, to the ordinary American local passenger trains.) The heating and lighting of trains, their speed and manner of running, train police regulations, kinds of coaches and manner of forming trains, railroad clearing houses, and international train service, etc., are all treated in Prussian regulations.

How tariffs are fixed.—The great variety and number of conveyances undertaken by a railway makes it impossible to enter into a special contract with each individual applying for railway service. But even if this were possible, considering the public nature of transportation and the many public, as well as private, interests involved, legislatures have regarded it prejudicial to these interests to leave the adjustment of rates entirely in the hands of the undertakers and entirely removed from public inspection and influence. Experience has shown that it is the tendency of undertakers, not under direct control of disinterested authorities in whose power lies the "promotion of the general welfare," to yield to other great private interests and charge different rates for the transportation of the same quantity of goods when shipped by persons who stand in varying degrees of favor. The cautious German lawmakers had early surmised the evils of discrimination in rates, and the law of November 3, 1838, as well as the Federal Constitution, reserved to the Government all powers necessary for its prevention. Special reference is here made to articles 4, 45, and 46 of the Federal Constitution quoted above. They indicate in a general way the power of the National Government over all railways in the Empire. Paragraphs 26 to 40 of the Prussian law of 1838 deal with the power of the State over rates. The essential feature of these provisions, as modified by supplementary legislation and ministerial rescripts, as well as the provisions of the law of 1892 on the same subject, are indicated below.

The State, acting through the minister of public works, has the right, after the expiration of 3 years from the January 1st next following the opening of a railway, to approve (1) all tariff schedules (the 3-year limit is practically void because of the reservations the State makes in granting charters); (2) any proposed lowering, raising, or other changes in existing rates; (3) the establishment of freight tariff schedules, tariff instructions and regulations, exceptional (special) and differential rates. The degree in which the State has made use of these rights has varied with conditions. This applies only to primary railways. Secondary roads may, during the first 8 years of their existence, raise or lower rates at will, provided they do not go above a certain maximum, prescribed by the minister of public works for that period of time, and that their rates do not conflict with general tariff principles enforced on State lines. Before the passage of the law of July 28, 1892, railways of purely local significance enjoyed special privileges which are now defined for all classes of local roads. It must be recalled that prior to 1892 the law recognized only primary and secondary (*Haupt- und Nebenbahnen*) roads, and that these local roads (using local in the narrow sense) had no well-defined legal position. The law of 1892 makes the following provisions concerning rates on local railways: "That authority upon which the approval of the project devolves is required to make an agreement with the undertaker as to time-tables and rates; and the periods of time in which such agreements shall be subjected to revision, provided that the undertaker may be allowed to establish his own rates during the first 5 years, and that thereafter the State shall only fix maximum rates, in doing which due consideration shall be given to the financial interests of the road." The law gives the State this privilege, but does not make it a duty, and it is the policy of the State not to interfere with any arrangements the undertaker may see fit to make, provided he does not discriminate and does not do anything contrary to public interests. The law simply reserves to the State the right to act in behalf of the public. What Prussia reserved for herself in her laws, the Federal Government reserved to itself in

the Constitution. The latter also has the right to interfere in behalf of the general welfare, even if the several States had not reserved that right; and it is possible, too, that circumstances may arise in which the Federal authorities must overrule the State. As to military rates, the Constitution gives the Government the right to fix them (reduced at a uniform rate), but neglects to designate a particular authority. The "Reichsgesetz über die Naturalleistungen für die bewaffnete Macht im Frieden," of February 13, 1875, vests the power of fixing and revising military rates in times of peace exclusively in the Bundesrath. The Bundesrath has the same power in fixing and revising rates in times of war. In neither case is a hearing of the undertakers mandatory. Next, the relation of railways toward the post-office department may be mentioned. The railway-mail law now in force was passed on January 1, 1876, and consequently applies only to primary and secondary roads. But it was found necessary to exempt secondary roads from the provisions of this law and subordinate them to special legislation (May 24, 1879). The post-office department may cause the primary roads to meet the following conditions: (1) To transmit free of charge all letters, newspapers, money—including uncoined gold or silver, jewels, and precious stones without regard to weight—and all other mail packages weighing 10 kilograms and less. Also all railway-mail employees, going and returning. These provisions are limited only in case more than 1 car on every scheduled train is required for the transportation of the mail, in which case a nominal sum is paid by the post-office department to the railway undertaker, private or State. The post-office authorities are required also to send early notices of probable demands for additional cars. This is especially important during holiday seasons. The duties of undertakers of secondary and of local railways are legally defined, that of the former in the regulations of 1879 and of the latter in the law of July 28, 1892. Because of the numerous conditions influencing the fixing of rates on these railways the schedules are much longer and involved than those of primary roads. Similar regulations have been made concerning telegraph and custom-house officials in their relation to the railways.

Publicity of rates.—All railways—State or private, primary or secondary, or local—are required to publish their rates under the supervision of the same authorities which fix them. Such publication is required of all tariffs—passenger, freight, local, through rates, incidental fees, etc.—together with the rules and regulations governing their application and all changes that have been made in them. Tariff rates of all State roads are published in the *Staats- und Reichsanzeiger*, the official paper of the Government. However, no definite rules exist as to the particular form or place of publication. As a rule, all the important papers of the towns interested publish them, and, of course, they are required to be posted in all station houses and railway offices. Every advance in rates must be published, together with the old rates, at least six weeks before the same shall take effect. The instructions of the minister of public works for the practical application of the law of July 28, 1892, declare that local railways shall be required to publish their rates in a local paper to be designated in the charter.

Financial obligations.—*The capital stock.*—Section 1 of the law of 1838 provides that the sums of money required for the original investment (*Anlagekapital*) must be raised through the sale of stock. The amount of stock is fixed in the charter. Section 2 provides that no stock shall be issued until its full face value has been actually paid in. Partial payments are simply accepted. Every signer of stock is responsible for 40 per cent of its face value, even though he should transfer his stock to a third party. For the emission of additional stock and for the taking of loans, in which purchases on credit shall not be included, the approval of the minister of public works must first be obtained and a sinking fund established. Ministerial consent is also necessary for contracting floating debts. With issues of priority obligations and preferred stock it is different. These require special authority ("landesherrliche Genehmigung") and official publication of the amount to be issued, rate of interest, purposes for which the money is to be expended, and the method of amortization. Since 1872 these powers are exercised by the minister of public works. Before that time special privileges of this kind were granted by the Government according to a law of June 17, 1833.

Appropriation of earnings.—By the law of March 16, 1867, all railway undertakers are under obligation to submit annually, not later than May 1, a full account of their receipts and expenditures, together with the necessary papers (bills, vouchers, etc.), and by a court decision they are compelled to submit monthly reports if requested to do so. The law further provides that all taxes (*Abgaben*) shall be paid out of that part of the gross earnings over and above those parts employed in meeting the expenses for maintaining, managing, and running

the road. All sums paid into the renewal and reserve funds are to be considered part of the running expenses. The reserve fund has its origin in provisions of sections 29, 33, and 38 of the law of 1838, and is usually expressly provided for in the by-laws and charter of the company. The renewal fund was created later, but by rescripts of 1857 and 1858 it applies to all roads irrespective of the time during which they were built. It is kept distinct from the reserve fund; and, in case earnings are insufficient to meet the regular demands of both, the available earnings go to the former. The size of the renewal fund and its rate of increase depends much upon the character of the road, and is determined for each separately. The general nature of these funds being that of insurance, their accumulation becomes unnecessary in case of State roads; nor do the legal restrictions on the issue of stock apply to the latter. The various provisions for the distribution of dividends have in common the requirement that certain maximum portions of the gross earnings may be distributed as net profits. Such distribution is not obligatory. Paragraph 34 of the law of 1838 establishes normal formulæ for computing gains and for gathering necessary statistics. The most important legislation on the appropriation of earnings still in force is the "Gesetz, betreffend die Verwendung der Jahresüberschüsse der Verwaltung der Eisenbahnangelegenheiten" of March 27, 1882. It provides that the annual surplus shall be expended for the following purposes in the order given: (1) To pay the interest on the State railway debt; (2) to meet certain deficits in the State budget which would otherwise have to be met with loans, not to exceed 2,200,000 M annually; (3) to pay off the bonded indebtedness.

Taxation.—*Law of November 3, 1838.*—By section 38 of the law of November 3, 1838, railways are under obligation to pay taxes in proportion to the total capital stock, less the expense of maintenance and operation and the annual contribution to the reserve fund. Railways are exempted from the tax on industries (Gewerbesteuer). The succeeding paragraph provides that this tax shall be paid into the State treasury as a compensation for expenses incurred by the Government on account of the roads and for the amortization of the original stock. After such amortization, the undertaker may be bound to arrangements of such a nature that the receipts ("Ertrag der Bahngelder") shall not exceed the cost of managing and operating the road. These provisions of the fundamental railway law were followed by important supplementary legislation.

Law of May 30, 1853.—This law has reference only to railways owned by stock companies. Under its provisions the first tax was levied in 1854 on the net proceeds of the year 1853. The taxable net proceeds are defined as that sum which remains for distribution on the capital stock after deducting from the gross receipts the cost of administration, maintenance, and operation, the necessary contribution to the reserve fund, and the sums required for the payment of interest and loans. Capital, on which a fixed rate of interest is paid without being entitled to dividends, even if raised by means of preferred stock, shall not be included in the capital stock, but it shall be considered equivalent to loans. The rate of taxation is fixed at one-fortieth of the net proceeds, not exceeding 4 per cent of the capital stock. For net proceeds exceeding 4 per cent of the capital stock the following shall be provided:

From 4 to (inclusive) 5 per cent, one-twentieth; from 5 to (inclusive) 6 per cent, one-tenth; from 6 per cent and over, two-tenths; in addition to the one-fortieth on all net proceeds up to 4 per cent. To illustrate: Take capital stock to the amount of \$10,000, the net proceeds of which equal the sums given in Column I, then the amount of the tax equals the sums in Column II, and the sums remaining for distribution among the stockholders are given in Column III.

I. When the net pro- ceeds equal—	II The State receives—	III. And the stockhold- ers re- ceive—
\$100.00	\$2.50	\$97.50
200.00	5.00	195.00
300.00	7.50	292.50
400.00	10.00	390.00
450.00	12.50	437.50
500.00	15.00	485.00
550.00	20.00	530.00
600.00	25.00	575.00
650.00	35.00	615.00
700.00	45.00	655.00
750.00	55.00	695.00
800.00	65.00	735.00

The law further provides that all railways which are under statutory obligations to pay certain sums to the Government are subject to this tax for all sums (net) in excess of the amount paid to the Government. All railways upon which the State guaranteed interest are exempt from taxation during years in which the State advanced money by virtue of such agreement. All moneys realized through the collection of these taxes shall be employed by the State in purchasing railway stock, and all interest and dividends accruing to stock thus purchased shall be used for the same purpose; nor shall any such (purchased) stock be again put upon the market. The provisions of this law are general except as modified by special contracts with the State.

Law of May 21, 1859.—This law repeals the provisions of sections 39 and 40 of the law of 1838 and section 6 of the law of 1853 so far as they prescribe the utilization of the funds raised by taxation. It orders all receipts of such taxes henceforth to flow into the general State treasury, and consequently it dissolves the amortization fund.

Law of March 16, 1867.—The law of 1853 applied directly to railways owned by stock companies. The law of 1867 applies to all railways "not in the possession of the State or of domestic railway stock companies." It provides that the possessors shall be responsible for the payment of the tax. The rate of taxation is identical with that given in the law of 1853, but it defines the taxable net proceeds differently. It deducts from the gross receipts the cost of operating, maintaining, and managing the road, contributions to the reserve and renewal funds, but makes no allowance for sums disbursed out of the reserve fund. It states expressly that these sums shall be deducted from the gross receipts, while the law of 1853 does not say from what the sums named shall be deducted. The law of 1867 states that "the taxable net proceeds constitute that portion of the gross earnings which remains after deducting the expenses of maintenance, operation, and administration." This latter definition is law at present. As has been stated before, all railways are required to submit authentic reports, on the basis of which the authorities fix the taxable proceeds and publish it in the *Reichsanzeiger*. For State railways the excess of receipts over expenditures, after deducting 3 per cent interest, is determined by the minister of public works and likewise published in the *Reichsanzeiger*. The law of 1867 also defines original stock (*Anlagekapital*) as that sum which has been expended usefully in the construction and equipment of the road, including rolling stock. Five per cent interest is allowed (i. e., it is included in the *Anlagekapital*) on all sums expended before the opening of the road, provided no unnecessary delays have been made. If railway undertakers fail to submit reports, the authorities fix the amount of capital stock which shall be taken as the basis of taxation. It must be borne in mind that the rate of taxation depends upon what per cent the net proceeds are of the capital stock, and that the larger the capital stock the lower the rate of taxation, other things being equal. Money expended for renewals and extensions shall be included in the capital stock only so far as these have been caused by extraordinary circumstances and have not been taken out of the reserve and renewal funds. Several railways in possession of the same person are taxed as a unit. In case of parts of roads owned by foreigners, i. e., not Prussians, the capital represented by such parts shall be determined by the authorities, if the same has not been fixed in the charter.

Law of July 27, 1885 (Nothkommunalsteuergesetz).—This was an attempt to regulate the parish income tax. The law provides that railways and other industries listed in Section I shall pay a tax to the parish (*Kommunalabgaben*) in proportion to the amount of their income in that parish. This applies alike to private and to State railways. The tax is payable in that parish in which the railway has its seat of management, a station, workshops, or any other plant. The net proceeds, as defined by the laws of 1853 and 1867, shall be taken as the basis for taxation of private roads. For State roads, the excess of receipts over expenditures, plus 3½ per cent interest on the capital stock (or consols), is to be used. They are taxed as a unit, and the total of the taxable income is fixed annually and published by the minister of public works. A noticeable feature of this law is that the parish into which certain railway earnings happen to flow is entitled to a proportional share of the total income of that place. Thus a station located in a parish which has done little service to the road may have a comparatively large income, on a share of all of which it has a legal claim. It should be noticed also that local railways (section 40 of the law of July 28, 1892), not being railways in the sense of the law of 1838, are not liable for the payment of the tax provided for in the law of 1885. They are subject to the tax on trades (*Gewerbesteuer*), of June 24, 1891, from which railways subject to the laws of 1853 and 1867 are exempt.

Law of July 14, 1893.—This is an important date in the history of Prussian financial legislation. Three different laws on finance received the royal signature on that day. They were, "Gesetz wegen Aufhebung direkter Staatssteuern,"

"Ergänzungssteuergesetz,"—a tax on all mobilia, except household goods, and immobilia, minus the debts on the same—and "Kommunalabgabengesetz." The last law empowers parishes to levy direct and indirect taxes, and to exact services and payments in kind according to the provisions of the law. So far as it deals with railways it will be discussed here. All of these laws went into effect April 1, 1895, with the exception of one provision about the distribution of railway taxes among certain classes of parishes.

The same as under the law of 1885, State railways are considered as a single unit of taxation. Together with private roads, they are taxed in the parishes in which there are stations, shops, offices, etc., but not in parishes in which there are only watchmen's huts and tracks. Stock companies which receive a fixed rent for roads owned by them, but operated by the State, are not considered possessors of the road, and hence not subject to this tax. While all railways are taxable under this law, local railways, not being "railways," are not affected by it. The taxable income of State roads and of roads operated by the State is the excess of receipts over expenditures, plus 34 per cent of the invested capital (Anlage- beziehungsweise Erwerbskapital), according to official statistics. The taxable income thus determined is to be fixed and published annually. The taxable income of private roads is determined according to the laws of 1853 and 1867, only that moneys expended in the liquidation of debts, and interest on the same, shall be regarded as expenses under the law of 1867. The law of 1885 gave parishes a claim on railway incomes according to the receipts (net) of the road in that parish. The law of 1893 entitles parishes to such moneys in proportion to the sums expended for salaries and wages in the respective parishes on the basis of a 3-years' average. In the computation only one-half of the salaries of administrative officials and two-thirds of the wages of shop and linemen are included.

Prussian railway administration.—The writer discussed this subject in an article published in the *Annals of the American Academy of Political and Social Science*, for November, 1897, a part of which is here reproduced. The system is to-day what it was then, and minor changes which may have been introduced since that time do not affect the general system. Prussia has made her railways a success. Discriminations are unknown. The "special rates," which are published, together with the reasons for which they were established, like regular rates, are open to everybody. During the fiscal year ending March 30, 1900, Prussia expended nearly \$25,000,000 in extending her secondary system, and about one-fifteenth as much for primary roads; and, notwithstanding this great extension of less profitable lines, her railways yielded a net profit of about \$140,000,000.

The Prussian railway administration was reorganized on April 1, 1895. Previous to that time there had existed two distinct official bodies, or "resorts," immediately below the minister of public works. The latter was then, and is now, the executive head of the railway administration, and the two bodies subordinated to him were known as *Eisenbahndirektionen* and *Eisenbahnbetriebsämter*, respectively, the one having direct charge of the operation of the railways and the other performing purely administrative functions. Of the *Direktionen* there were 11, and of the *Betriebsämter* 75. The functions of both of these have now been consolidated in the royal State railway directories, of which 20 have been created, with their seats at Altona, Berlin, Breslau, Bromberg, Cassel, Cologne, Danzig, Elberfeld, Erfurt, Essen, Frankfurt a. M., Halle a. S., Hannover, Kattowitz, Königsberg, Magdeburg, Münster, Posen, St. Johann-Saarbrücken and Stettin. Each directory is composed of a president, appointed by the King, and the requisite number of associates, two of whom, an *Ober-Regierungsrath* and an *Ober-Baurath*, may act as substitutes of the president under the direction of the minister. Each directory has complete administrative control over all the railways within its limits, although the subordinate civil administrative organs of the State, such as the *Oberpräsident*, *Regierungspräsident* and *Landrath* have certain powers in the granting of concessions, police regulations, etc. The directory decides all cases arising out of the action of special and of subordinate branches of the administration; and, representing the central administration, it may acquire rights and assume responsibilities in its behalf. The directories may be characterized as general administrative organs, one of whose great functions is the proper coordination of all the parts of the railway system.

Below and subordinated to them are special administrative organs, upon whom falls the duty of local adaptation and supervision. There are 6 classes of these local offices, and their names indicate in a general way their functions: operating, machine, traffic, shop, telegraph, and building offices or *Inspektionen*, as they are called. Shortly before the new system went into operation the minister of public works issued special business directions for each class of offices. The contents of

each of these ministerial orders may be grouped under 3 heads: (1) the position of the office in the railway service; (2) its jurisdiction in matters of business; (3) general provisions. To give a detailed analysis of the functions of the local offices is out of the question here. It should be added, however, that all phases of the service, whether from the point of view of the railways or of the public, are carefully provided for. Thus one of the foremost duties—"die vornehmste Aufgabe"—of the local traffic office is to maintain a "living union" between the railway administration and the public. For this purpose the chief of the office is in duty bound, by means of numerous personal interviews and observations, to inform himself concerning the needs of the service in his district, to investigate and to remedy complaints and evils without delay, and to take such measures as will secure the most efficient service. It is also one of his duties to inform the public concerning the organization and administration of the railways, so as to avoid idle complaints. This single provision in the rules governing one of the local offices illustrates the spirit of them all.

Private railways, which before April 1, 1895, had been supervised by a special railway commission, are now subject to the jurisdiction of the president of a directory and his alternates. This was another step toward greater unity in the system. The directories upon whom the supervision of the private roads devolves are those at Altona, Berlin, Breslau, Cassel, Cologne, Elberfeld, Erfurt, Essen, Frankfurt a. M., Halle, Hannover, Königsberg, Magdeburg, Münster, St. Johann-Saarbrücken and Stettin. As there are 20 directories, and only 16 supervise private railroads, it is evident that jurisdictions for private roads are not identical with those of directories. Nor does each directory have an equal number of miles of private or State roads within its jurisdiction. This depends largely upon the geographical distribution of the railways and upon the intensity of the traffic. Thus, the Berlin directory supervises 587 kilometers of State roads, while Halle has 11,884 kilometers. The other directories lie between these two extremes. It may be added that on April 1, 1895, the private roads represented together only 2,200 kilometers (not including Anschlussbahnen, and 71 kilometers rented to private parties) against 27,060 kilometers¹ of State roads, of which 10,470 kilometers contained two or more tracks.

All Prussian railways, then, whether State or private, are subject to the jurisdiction of a carefully graded administrative system—local, intermediate, and central—each part of which is connected with every other part in such a manner that, without interfering with the ability to act promptly in cases of emergency, every act not only finds its responsible agent, but the central organ can also make its influence felt in the remotest branch of the system and at the same time not transcend its responsibility to the public.

Advisory councils and other bodies.—Whether we regard the interests of the railways and of the public as identical or not, there are certainly times when harmony between the two does not exist. This may be due to the failure of each to understand the other, or to some wrongful act which one of them may have committed. Whatever the cause, if such circumstances do arise any organ which can promptly and prudently remove the friction performs an admirable service in the interests of public traffic. Such an agent is found in Prussia in the advisory councils and other bodies which cooperate with the legally responsible parts of the railway administration. These councils are created by law, and are required to meet regularly for the purpose of cooperating with the State administration upon all the more important matters pertaining to the railway traffic, especially time-tables and rate schedules.

The first German advisory council was organized in the federal domain of Alsace-Lorraine. Through an impulse given by the chamber of commerce of the city of Mülhausen a conference between the representatives of the chambers of commerce of Alsace-Lorraine and the general imperial railway directory at Strassburg was held at Mülhausen on October 21, 1874. Organization, composition, and functions of the council were agreed upon during the first session. Originally its membership was confined to the chambers of commerce of Alsace-Lorraine, but later representatives of the various agricultural and industrial bodies were also admitted. All matters falling within the domain of at least 2 chambers of commerce could be brought before the council.

The proceedings of this conference made such a favorable impression upon the federal railway commissioner that he attempted, although without immediate success, to induce the other German railways, both State and private, to assist in this movement toward a closer union and a better understanding between the commercial and railway interests by instituting similar councils. The circular

¹ Increased to 37,161 km. by the close of 1900.

letter of the commissioner, addressed to the railways on January 11, 1875, is one of the most significant steps in the development of the councils.

"This arrangement," says the letter, "primarily strives to establish an intimate connection between the places intrusted with the administration of the railways and the trading classes. It will keep the representatives of the railways better informed as to the changing needs of trade and industry and maintain a continued understanding between them; and, on the other hand, it will impart to commerce, etc., a greater insight into the peculiarities of the railway business and the legitimate demands of the administration, and consequently, by means of earnest and moderate action, it will react beneficially upon both sides through an exchange of views."

This statement sounds the keynote of the whole movement. For a time the railways were not very ready to respond, and the movement made little progress until the policy of the State to purchase private railways was about to be inaugurated. The Prussian Landtag made its approval of the first bill for the nationalization of railways dependent upon certain *wirtschaftliche Garantien* (economic guarantees) which it demanded of the Government. A resolution to this effect was adopted by the Landtag in 1879. The ministry of trade and industry had already taken active steps during the previous year. In 1880 a bill embodying the motives of the resolution of the Landtag was introduced, and after having undergone various changes and modifications was approved and published as the law of June 1, 1882.

Prussia was thus the first, and, up to the present time is the only, country in which advisory bodies of this nature were placed upon a legal basis. The law is entitled *Gesetz, betreffend die Einsetzung von Bezirks-eisenbahnräthe und eines Landes-eisenbahnraths für die Staatsbahnverwaltung*. As the name indicates, it creates a class of advisory boards or councils known as *Bezirks-eisenbahnräthe* (circuit councils), and one national council, called *Landes-eisenbahnrath*. The national council is the advisory board of the central administration, and the circuit councils of the railway directories. Since the reorganization of the railway administration, April 1, 1895, 8 circuit councils have been in existence, with their seats in Bromberg, Berlin, Magdeburg, Hannover, Frankfurt a. M., Cologne, Erfurt, and Breslau. It will be remembered that there are 20 directories, so that a circuit council serves as an advisory board for more than one directory. The national council is composed of 40 members, holding office for 3 years. Of these, 10 are appointed and 30 are elected by the circuit councils from residents of the province or city, representing agriculture, forestry, manufacture, and trade, according to a scheme of representation published in a royal decree. Of the appointed members, 3 are named by the minister of agriculture, domains, and forests; 3 by the minister of trade and industry; 2 by the minister of finance; and 2 by the minister of public works. An equal number of alternates is appointed at the same time. Direct bureaucratic influence is guarded against by the exclusion from appointment of all immediate State officials. The elective members are distributed among provinces, departments, and cities, by the royal order to which reference has just been made, and both members and alternates are elected by the circuit councils. The presiding officer and his alternate or substitute are appointed by the King. In addition, the minister of public works is empowered to call in expert testimony whenever he may think it necessary. Such specialists, as well as regular members, receive for their services 15 marks (about \$3.60) per day and mileage.

The national council meets at least twice annually, and deliberates on such matters as the proposed budget, normal freight and passenger rates, classification of freight, special and differential rates, proposed changes in regulations governing the operation of railways, and allied questions. It is required by law to submit its opinion on any question brought before it by the minister of public works; or, on the other hand, it may recommend to the minister anything which it considers conducive to the utility and effectiveness of the railway service. Its proceedings are regularly submitted to the Landtag, where they are considered in connection with the budget, thus establishing "an organic connection" between the national council and the parliament. In this way the proceedings are made accessible to everyone, and an opportunity is given to approve or disapprove what the council does, through parliamentary representatives. The system is one of reciprocal questioning and answering on part of the minister of public works, the national council, and the parliament.

The circuit councils are equally important and interesting. Since January 1, 1895, 9 of these have been in existence. Their membership, which varies considerably with the different councils, was fixed by the minister of public works in December, 1894. Any subsequent modifications which may have been made

have no bearing on what we are considering here. At that time the council at Magdeburg had only 24, while that at Cologne had 75 members. The nature of their composition can best be illustrated by presenting an analysis of the membership of one such council. The council of Hannover, comprising the railway directories of Hannover and Münster-Westphalen, seems to be a fair type. In that council we find 1 representative from each of the chambers of commerce of Bielefeld, Geestemünde, Hannover, Harburg, Hildesheim, Lüneburg, Minden, Münster, Osnabrück, Ostfriesland and Papenburg, Verden and Wesel; 1 representative from each of the following corporations or societies: Society of German Foundries in Bielefeld, German Iron and Steel Industrials in Ruhrort, Craftsmen's Union of the Province of Hannover, Branch Union of German Millers in Hannover, Union of German Linen Industrialists in Bielefeld, Society for Beet Sugar Industry in Berlin, Society for the Promotion of Common Industrial Interests in the Rhine Country and Westphalen, in Düsseldorf, and the Society of German Distillers in Berlin; 4 representatives from the Royal Agricultural Society in Celle; 3 from the Provincial Agricultural Society for Westphalen, in Münster; 1 from the German Dairy Society in Schluden and Hamburg, the Society of Foresters of the Hartz, the North German Foresters in Hannover, the Union of Forest Owners of Middle Germany in Birnstein, and from the Society for the promotion of Moor Culture in the German Empire; and, lastly, 1 from the Society of German Sea Fishers in Berlin. This one illustration is probably sufficient to show the thoroughly representative character of the circuit councils. If a circuit comprises railways covering territory of other German States, the chambers of commerce, industrial, and agricultural societies of such territory may also be represented in the council. The minister of public works has power to admit other members, and frequently does so when the nature of the questions upon which the council deliberates makes it desirable. Thus, at a meeting in which the rates on coal and coke—to be noted hereafter—from the Rhenish mining districts to the seashore were to be considered, there were present an Ober-präsident, accompanied by an assessor, a deputy of a Regierungspräsident, a Landrath (these three are civil administrative officers presiding over a province, circuit, and department, respectively), a representative of the Upper Mine Office at Bonn and at Dortmund, of the Royal Mine Directory at Saarbrücken, of the Royal Railroad Directory at Hannover, of the Dortmund and Gronau and Enscheder Railroad Company (private), in addition to the regular representatives and voting members.

The circuit council, as has been indicated above, stands in a relation to the railway directory similar to that of the national council to the minister. The law makes it mandatory upon the directory to consult the circuit council on all important matters concerning the railways in that circuit. This applies especially to time-tables and rate schedules. On the other hand, the council has the right, which it freely exercises, of making recommendations to the directory. In case of emergency the directory may act according to its own judgment independently of the council, but it is required to report all such cases to the standing committee of the council and to the council itself. This provision supplies the elastic element, which enables the railways to meet momentary wants. The standing committee of the council is an important body. It meets regularly some time before the full council holds its sessions, and its proceedings form the basis of the deliberations in the council. The committee receives petitions, memorials, and other communications. The bearers of these are invited to appear before the committee and to advocate their cause. Questions are asked and answered on both sides, and after all the questions have been presented the committee votes upon the petition or request, usually in the form of a resolution adopted by majority vote, recommending the council to accept or reject the demands made in the petitions. The action of the committee is reported on each question by a member designated for that purpose to the full council at its next session. While the decision of the committee is usually accepted by the council, it in no way binds that body. Before the council meets, each member has an opportunity to examine the arguments presented before the committee, and the facts upon which its decisions are based. If the advocates of the petitions before the council present new evidence, or if the recommendations of the committee are shown to be unsound, the council simply reverses the decision of the committee. Of the nature of these petitions I shall speak later.

These advisory councils have spread into Bavaria, Saxony, Württemberg, Hesse, Oldenburg, Mecklenburg-Schwerin, Austria, Italy, Russia, Denmark, Roumania, and, in a much modified form, into France. An examination of the councils in these countries shows the same principle underlying them all—the representation

of all the different economic interests in the conduct of the railways. In composition and organization they are much alike. They owe their existence, however, except in Japan and Switzerland, not to law, but simply to administrative orders.

There are still other bodies which, although not created by law and not confined in their activity to Prussia, have long exerted a powerful influence throughout the Empire. Foremost among these stands the Generalkonferenz (general conference). Under its guidance the modern German system of rates, called Reformtarif, has been systematically developed. The general conference meets annually, and discusses matters relating to tariffs, fees, operating regulations, etc. Thus, at a recent meeting the conference disposed of no less than 53 different items, relating mostly to the classification of goods and the adjustment of rates, all of which, as in case of the circuit councils, had been previously considered in subordinate bodies whose deliberations lie at the basis of the proceedings in the general conference. It is composed of members representing all the German railways, and votes are distributed according to the number of miles of road the members each represent, and the total number of votes, increasing, of course, with the growth of the German system. At the meeting referred to, the total number of votes was 322, of which 51 were not represented. Of these 51, 28 belonged to roads having 1, 10 to those having 2, and 1 to those having 3 votes. The Prussian State railways had 139 votes, the Bavarian State railways 28, those of Saxony 16, the State roads of Alsace-Lorraine 11, the State roads of Baden 10, and so on down, the remainder representing the smaller State and private railways. These figures show the predominating influence of Prussia in the conference.

Bodies subordinate to the general conference have already been alluded to. These are the Tarif-Kommission and the Ausschuss der Verkehrsinteressenten (tariff commission and committee of those interested in transportation). The tariff commission is a standing committee whose members represent Prussian State roads, 2 Swiss roads, and 1 of the railways of Mecklenburg. It meets 3 times a year, and occupies itself with petitions and other communications from shippers. The committee of shippers (Verkehrsinteressenten) is composed of members representing agriculture, trade, and industry; and some of the matters brought before it are previously discussed by a subcommittee. Both of these bodies occupy themselves almost exclusively with freight rates and matters immediately connected with them. Out of 23 items brought before them during a 2-days' session in 1893, 22 were deliberated upon in joint session, although each body voted separately. The discussions in these sessions are so thorough that the recommendations made are, in the great majority of cases, approved by the general conference. Those conclusions of the commission which are adopted in the form of a declaratory statement become binding upon members unless protests are made. Subjects discussed in the conference and commission may, and frequently are, brought before the councils.

Among the various railway traffic and rate unions which might be mentioned none have exerted an influence on rates at all comparable to that which has been exercised by the Society of German Railway Administrations. Founded as a Prussian society in 1846, it became in quick succession a national and an international organization, embracing the railways of Germany, Austria, Hungary, Roumania, Luxemburg, Holland, Belgium, Bosnia and Russian-Poland. Both State and private railways are eligible to membership. A series of 8 standing committees covers the special branches of the service, and if extraordinary matters arise they are referred to special committees. Questions upon which the society is to act must be published at least 3 months preceding the meeting. The proceedings have long been published in an official paper, and, through custom, exert a powerful influence. The attainment of uniformity in construction and other matters has been one of its great aims. In Europe the necessity for international uniformity is much greater than with us, and in the domain of freight traffic this has been well attained by means of an international treaty, signed at Berne on October 14, 1890, by diplomatic agents from Belgium, France, Germany, Italy, Luxemburg, Holland, Austria, Hungary, Russia, and Switzerland. It is officially known as the "Convention internationale sur le transport de marchandises par chemins de fer."

The history of this international agreement dates back to 1874, the same year that Mülhausen inaugurated the movement which lead to the institution of advisory councils. In that year 2 Swiss citizens, residents of Bâle, directed to the governments of the surrounding States inquiries concerning their willingness to enter into an international freight treaty. Drafts of such a treaty were worked out in both Germany and Switzerland and discussed in a congress at Berne in 1878. This congress submitted the draft of a treaty to the different governments for examination. Many objections were raised and improvements made. Further conferences, dealing also with questions of technical uniformity,

were held in 1882 and 1886, and on October 14, 1890, the draft approved by the third congress was formally drawn up as a treaty and approved. The original treaty has been modified and supplemented in various ways, partly by agreements among all these countries and partly by agreements among several of them. Every 3 years, or sooner, if one-fourth of the treaty-making States demand it, a general congress must be called together to consider improvements in the agreement.

As its name indicates, the Bernese treaty applies only to international freight traffic. Excepting articles the transportation of which is regularly monopolized by the post-offices of the contracting States, the treaty governs all shipments of goods from or through one of the States to another. It provides for uniform through bills of lading, prescribes routes for international traffic, fixes liability in cases of delay and loss, prohibits special contracts, rebates, and reductions, except when publicly announced and available to all, and prescribes certain custom-house regulations. Not the least important feature of the treaty is the creation of a central bureau, organized and supervised by the Swiss Bundesrath, with its seat in Berne. The duties of the bureau are five:

1. To receive communications from any of the contracting States, and to transmit them to the rest of them.
2. To compile and publish information of importance for international traffic, for which purpose it may issue a journal.
3. To act as a board of arbitration on the application of the countries concerned.
4. To perform the business preliminaries connected with proposed changes in the agreement, and, under certain circumstances, to suggest the meeting of a new conference.
5. To facilitate transactions among the railways, especially to look after those which have been derelict in financial matters. After notice has been given by the bureau, the State to which the railway belongs or by whose citizens it is owned can either become responsible for the debts of the road or permit the exclusion of the road from international traffic.

The expenses of the bureau are met by contributions of the contracting States in proportion to mileage.

The original agreement provided that any of the States might withdraw at the end of 3 years, on giving 1 year's notice. No such notice has ever been given. Any violation of the treaty can be punished in the courts, and a judgment having been rendered in one country the courts of the others are bound to assist in its execution, unless the decision conflicts with their own laws. But so far as the question of fact is concerned there is no appeal, and a German court is bound to accept the findings of a court in France. Germany, Austria, Hungary, Russia, Switzerland and, to a less extent, France have embodied provisions of the international code in their internal code, thus leading to unification beyond the limits of international traffic. To what extent the Bernese treaty may influence other phases of the national and international laws of the States of central Europe can not well be foreseen. That States differing widely in forms of government, geographical position, and commercial interests have voluntarily made themselves amenable to a common code of law under these circumstances, again impresses one with the great power and many-sided influence of railways and the healthy development of closer international relations. The code is binding for a domain embracing nearly 3,000,000 square miles and 200,000,000 people. It ranks in importance with the international postal, telegraph, and copyright unions.

Proceedings of advisory councils.—The leading features of the Prussian railway administration relating to rates have now been presented. It remains to illustrate by means of a few side lights from the proceedings how a part of the machinery acts. To convey a somewhat detailed view of the workings of the administrative organs directly concerned with the operation of the railways would unduly extend this paper; besides, it would be a little technical and not essential from the economic point of view. So we shall content ourselves with a brief account of some of the deliberations of the advisory and other bodies directly occupied with questions about rates. We shall save time by first obtaining a general idea of the German system of rates, for which purpose the general plan of the German reform tariff is here given:

GERMAN TARIFF SCHEME.

1. Fast freight by the piece.
2. Fast freight by the carload.
3. Piece goods.
4. General carload class A1, in shipments of at least 5,000 kilograms.

5. General carload class B, in shipments of at least 10,000 kilograms.
6. Special tariff A2, in shipments of at least 5,000 kilograms.
7. Special tariff I, II, and III, in shipments of at least 10,000 kilograms.

The rates and what pertains to them are officially published in volumes not unlike our monthly magazines. This tariff scheme was first introduced in 1877, and through the influence mainly of the general conference it has become gradually more unified. It is obvious that the price of transportation of goods becomes less as they fall into a class farther down the list. The general carload classes include goods of higher value not enumerated in any of the special tariffs, while the special tariffs I, II, and III embrace less valuable goods—their value falling by degrees—so that, generally speaking—

Special tariff I includes manufactured goods.

Special tariff II includes intermediate products.

Special tariff III includes raw materials and bulky goods of small value, such as certain waste products of gas factories, tanneries, paper factories, slaughter-houses, etc.

Special tariff A2 is for goods belonging to special tariffs I and II in consignments below 10,000 and above 5,000 kilograms. Goods belonging to special tariff III, but weighing less than 10,000, though at least 5,000 kilograms, are transported at the rates of special tariff II. Then there are special rules and rates for such things as explosives, precious metals, vehicles, timber, fish, bees, meat, carrier doves, etc. Questions as to classification and the transference of goods from one class to another often arise. Here is a typical case:

The Chamber of Commerce of Lennep, a Rhenish city, petitioned the general conference to transfer manufactured horseshoes—"raw hoof irons," the Germans say, but which will here be designated simply as "horseshoes"—from special tariff I to special tariff II. A prominent business firm brought the question before one of the railway directories, and from there it was carried before the minister of public works. The minister consulted the permanent tariff commission and the committee of shippers, and finally the question was brought before the advisory councils.

The petitioners asserted that the manufacture of horseshoes was a new industry which, after many costly experiments, had only recently gained a firm foothold; that the trade had been gradually growing, especially with the East, and that consignments had been sent to Russia, Italy, Austria, and other countries. In domestic trade the use of these horseshoes had been promoted by military authorities and street-car companies, because it lessened cost and relieved the blacksmith of much purely mechanical work. It enabled him to do better work more cheaply and with greater uniformity. The charge that it hindered the education of skillful blacksmiths was untrue.

Extensive statistical tables were introduced to show that the life of the industry depended upon the desired change in rates. Horseshoes were subjected to the same rates as fine iron and steel goods, while they properly belonged to intermediate products in special tariff II. Many of the factories were unfavorably located, and it was one of the highest duties of the State to promote industrial activity in regions which lie away from the great channels of trade, if it could be done without too great a sacrifice on part of the public. The desired concessions on part of the railroads would do this. It was unjust for the representatives of the Saxon State railways to assert, as they had done in the tariff commission, that the change in the classification of horseshoes would benefit the Rhenish industry only. Particularistic designs should not be suspected in a movement which was deeply rooted in economic necessities. The representatives of the Bavarian railways had considered fiscal reasons only, but these alone could not be decisive. It would not be businesslike for the State, in order to gain a temporary advantage, to sacrifice the very source of this gain. The railways would fare worse with high rates and a stagnant industry than with lower rates and a prosperous industry, and it was safe to assert that the desired change would, through an increased output, ultimately yield a greater income to the railways. The established system of rates would not be prejudiced; besides, when the question of system is balanced against that of the welfare of an industry the latter should prevail. The nationalization of railways was undertaken not for fiscal, but for economic reasons.

These were the main features of the petition. The petition, together with the records of previous deliberations on the question, was brought before the standing committee of one of the circuit councils, by which the arguments were reviewed and new evidence introduced. Can these horseshoes be classed with rod iron? Are they an intermediate product? Could not plowshares and other articles

demand a like change? What is the relation of the proposed change to the competition of Swedish iron? Is it true that the manufacture of horseshoes injures the craft of blacksmiths? Will it lead to a wider use of horseshoes and consequently to an improvement of agriculture? Such were the questions which the committee considered, and in response to which evidence of individuals and of societies was presented and subjected to the most rigid examination by specialists of various classes. From the committee the question went, as all questions considered by the committee do, before the full council, by which the report of the committee was reviewed and the horseshoe problem finally disposed of.

In a similar manner both the committee and council deliberated upon a petition of the Agricultural Society of Rhenish Prussia to place street sweepings in the special class with fertilizers and to reduce rates for shorter distances, because sweepings are used only within from 10 to 20 kilometers of the cities. The sweepings, it was asserted, had considerable value for agriculture, but that the difficulty of disposing of them had led some cities, notably Hamburg, to destroy them, thus depriving agriculture of a valuable agent. The composition and value of sweepings were examined and compared with other fertilizers now available, and the probable effect on the use of these considered. At the same session of the committee the change in time-tables for the summer period was regularly considered. Twenty-eight items were presented by the 14 different members, involving the time and frequency of passenger trains. All propositions which received a majority vote in the committee were brought, of course, before the full council.

In speaking of the composition of circuit councils reference was made to the question of rates on coal and coke. One of the railway directories brought before the standing committee of the circuit council a question first submitted in a petition of the chamber of commerce of Bielefeld and subsequently indorsed, either in part or entire, by other organizations. The petition sought a temporary suspension of rates applicable to coke and coal sent from the Rhenish mining districts to the German seashore and to foreign countries. The suspension was to remain in effect until the prices in the coal market should return to a normal level.

In the consideration of this question the railway directory asked the committee and council to deliver an opinion on each of the following points: (1) Is the level of prices of coke and coal in the Rhenish-Westphalian district an abnormal one? (2) How must the prices of coke and coal be constituted in order that their level may be characterized as normal? (3) Should a permanent or temporary suspension of existing freight rates on coke and coal be recommended in order to effect a reduction of prices within the country? (4) What markets and what rates come into consideration in case of the temporary or permanent suspension of the rates in question? Shall the rates to foreign countries or also the rates to the seashore be changed? (5) What will be the probable effect of the proposed suspension of rates with reference to the sale and the price of coal and coke within the country?

In both the committee and in the council this problem was thoroughly dissected. Naturally there were differences. Abnormal prices were thought to be prices which include an element of profit out of proportion to the other constituents of price. On the one hand, a profit of 40 per cent was shown to exist, which, however, the experts present at once proved to be confined to two specially favored mines. In computations to ascertain the average selling price of coal there was a difference of several marks, which called forth the most rigid examination of the statistics and other evidence upon which the figures were based. The railway authorities showed that in 5 years the outlay for coal for locomotives had risen from 44 to 7 per cent of their total expenses, while coal was still rising, and the coal men showed that their cost of production had risen because of advances in wages and expenses connected with insurance. It was said that the present low rates for the transportation of coal had been introduced at a time when the coal industry had lain prostrate, and that now all other industries were suffering from the high price of coal, and that this advance in freight rates on coal and coke would check exportation and force down prices at home. A decrease in exportation was deplored by representatives of the German marine. In conclusion, among both the advocates and the opponents of the change, the opinion was expressed that there was reason for rejoicing in the thorough airing which this question had received; that it would lead to a better understanding of actual conditions, and that the coal industry would hereafter be more inclined to give due consideration to the condition of other German industries.

We come now to the consideration of a question which, perhaps even more forcibly than what has just been related, illustrates the comprehensiveness and fair-mindedness with which the railway authorities investigate the problems which affect wide economic interests. It is a petition submitted by the minister

of public works to the national council for an expression of opinion. The printed evidence sent to the council alone covers about 500 folio pages. The problem submitted by the minister to the national council was this: Giving due consideration to the financial condition and the financial interests of the State, is it conducive to the general economic interests of the country (1) to introduce special reduced rates for all kinds of manures and fertilizers, irrespective of their nature, and, if so, what rates? (2) to introduce special reductions, and to what extent, for the transportation of (a) potassium salts—without discrimination or only "raw salts"—and phosphate; and (b) lime, in pieces or powdered, used for fertilization?

This was submitted in October, 1893. During March of that year the Herrenhaus had passed a resolution requesting the Government to introduce reduced special rates for fertilizers, a number of which were specified in the resolution. As stated in support of the resolution, the necessity for it lay in a cheapening of elementary utilities in order to maintain and promote agriculture and to increase the receipts of the railway from the traffic with the interior. The same resolution had previously been adopted by the budget commission of the Landtag.

In response to this resolution the minister of public works sought information from the minister of agriculture, domains, and forests, and all the different agricultural experiment stations as to the occurrence and production of natural and artificial manures in different parts of the country, their price and value in use, and the nature of their application. Various commissions reported on the prices at which different fertilizers could be profitably used on different soils. The agricultural authorities showed where and to what extent these soils existed, and elaborate statistics of the railways and manufacturers told how much had actually been consumed. In this lay the vital issue—the capacity of the land to absorb profitably artificial manures, and the adaptability of the farmer to secure them. The national council said that a simple expression of its appreciation of the great economic significance of the use of both natural and artificial manures was not sufficient, but that an exact and conscientious examination of the effect of existing rates on the widest and most effective use of these was necessary. The deliberations of the committee of shippers, the tariff commission, the general conference, and the evidence submitted through the minister of public work were all thoroughly sifted by the standing committee of the national council before the case went before the full council for its final verdict.

Marbles, slates, and pencils even have been the object of the most serious deliberations of bodies so large and so dignified as the general conference and the national council. A memorial was addressed to one of the railway directories by the marbles, slate, and pencil industry of Thuringia, praying for a detariffization of these articles. The memorial gives a detailed account of the manufacture of marbles, slates, and pencils in Thuringia, and points out the places where it meets competition. It gives the cost of production, output, markets, prices, and the rates of transportation. The conditions of the laboring population are described, and the probable effect of a change in rates on their welfare is analyzed. (One may be pardoned for turning aside to state that the laborers there engaged in the manufacture of slates, although exposed to the danger of completely undermining their health, receive often no more than 12 cents for a day's work of 18 hours.) The railway directory to which the memorial was sent addressed a letter of inquiry to the manufacturer of slates and pencils in Westphalia, whose business would be affected by the competition of Thuringia, calling for information on various points relating to this industry. This reply, together with the memorial and supplementary material, was submitted, through the minister of public works, to the national council.

One can not read these documents without being impressed with the sincere desire of the railway authorities to do justice to all competitors and at the same time to make such changes as will better the conditions of people like these laborers in Thuringia. Whether or not the benefits arising from a change in rates would really accrue to these people was most carefully considered. The material submitted for consideration in deciding this question, as in case of the preceding questions, furnished evidence on every point which was raised. The moderation with which the petitions are drafted, the high plane upon which the debates are carried on, the thorough conscientious and judicial mindedness with which the arguments are balanced in reaching a decision, all manifest a tone not unlike that of the decisions of our best courts of justice.

Summary and remarks.—Prussia began with a general law. In this respect her history is the direct opposite of that of our States. Treating this general law as a nucleus, legislation, royal and ministerial orders and rescripts, and custom have developed two distinct groups of railway administrative organs, each representing distinct sets of interests, yet both working cooperatively. On the one hand

we have a group of organs which represents railway interests in particular and which takes the railway point of view. The minister of public works, the railway directories, the general conference and tariff commission, and the Society of German Railways fall into this group, although the two latter stand in a measure on the border line, and of them are none confined exclusively to railway interests. Legal responsibility is fixed in the first two. On the other hand, we have the national and circuit councils with their standing committees and the committee of shippers. These primarily take the social and economic point of view. They are not legally responsible for the conduct of the railways, but act as advisory bodies. They represent all the different interests of the nation, and through them every citizen has not only an opportunity but a right to make his wants known.

The marble and slate industry of Thuringen is relatively insignificant, yet of vital importance to the inhabitants of that section of the country. We have seen how complete an examination the petition of these people received at the hands of the highest authorities of the land. A fair and prompt hearing can be denied to no man, rich or poor. The railways are made real servants. All the administrative, legal, and advisory bodies are organically connected with one another and with the Parliament. The lines may be drawn tant from above as well as from below. The elaborate system of local offices makes the system democratic, and the cabinet office and the directories give it the necessary centralization. The system presents that unity which a great business requires, on the one hand; and, on the other, that ramification and elasticity which the diverse and manifold interests of a great nation need for their growth and expansion.

In the formation of the councils the elective and the appointive elements are so well proportioned that it is impossible to "pack" any one of them. In this respect each body is a check on the other. It is easy to reproach the system with "bureaucracy," but to give adequate support to such a stigma would be an impossible task. We need only recall the analysis of the membership of one of the councils. Farmers, dairymen, fishermen, foresters, miners, manufacturers—the long array of human professions have here their representatives. One representative may shape his views according to some particular philosophy of the State. Another will at once restore the balance by presenting the opposite. One member may make extreme statements about some branch of trade or industry. Another will furnish exact information for its refutation. I doubt whether we can find anywhere in the world deliberative or administrative bodies in which the tone and the many-sidedness of the proceedings, the amount and variety of special knowledge displayed, and the logic of the debates present more points of excellence than in these councils and other bodies.

If from the point of view of the railways nothing should come of these proceedings—a most violent assumption—the information brought together would alone make them invaluable. No investigating committee of Congress or legislature ever had a better array of talent in every field at its disposal and under its control as is found in one of these councils or commissions.

It is not my purpose here to present new schemes, or to suggest ways and means by which existing institutions of our own country might be modified to perform similar functions. But let me ask whether, if our coal and iron industry, or fruit and cattle raising, or any other industry, were to receive an examination like that given to the Rhinish coal and coke industry, many things might not be different from what they now are? Imagine a well-organized assembly whose members could speak for the railways, for wheat and cattle, for fruit and steel, for forests and for mines, and is it not probable that the effects anticipated in the circular letter of 1875 would make themselves felt also in the United States? Both our railways and the public have repeatedly gone to extremes because neither understood the other. A system like the Prussian reveals the railways to the public and the public to the railways. It tends to remove blind prejudice and violent measures on both sides. By reflecting accurately the existing conditions, these conferences lead to tolerance, forbearance, and mutual concessions. The conclusions reached often have as salutary an effect on industrial situations as suspended judgments of our courts on defendants. It would be difficult to find in Prussia to-day, among the representatives of any class or interest, objections to the entire railway system which are not relatively insignificant. Both the public and the railways have gained more and more as the system has developed.

It will doubtless have been noticed that in the discussion of the council proceedings the decisions and their effect were not stated. It was my purpose simply to show the nature of the councils, and either a negative or an affirmative vote would throw no additional light on the problem. Without a full presentation of local details it could mean little to state that the council voted to place sweepings into the special tariff with fertilizers.

PART VII.—VIEWS AND OPINIONS OF RAILWAY MEN.

Among the questions contained in letters sent out to railway presidents and other officers were the following:

"What, in your judgment, are the elements of strength and of weakness in American railway charters?"

"What provisions should a model railway charter of the future contain?"

In most instances these letters were answered by the officers addressed. In a number of cases they were referred for reply to counsellors or other officers.

The extracts given below are representative of the replies received. As a class the railways represented belong to the important systems of the continent. It is probable that nothing of vital importance touched upon in any letter received is not reflected in the expressions quoted below.

"In a general way, I should say that an important point would be gained if all railroad charters were issued under general laws instead of specific legislation for each charter, and uniformity between laws of the States be brought out as far as practicable. This would avoid the creeping in of many faults which get out under special legislation."

W. G. RAOUL,
President The Mexican Nat. R. R. Co.

* * * * *

"In my judgment, there should be some provision in each State that would make it impossible for speculative roads to be built. By speculative I mean that class of roads that are organized for the purpose of crippling an already existing road in the hope of so annoying the property already in the field that in self-defense they pay a good round price in order to get rid of a competitor when the original line is serving the public well and a parallel line would probably wreck the stronger line. I think it is the history of railroads that the weaker can pull down the stronger."

W. J. CARPENTER,
President Chicago and Eastern Illinois Railroad Company.

* * * * *

"Personally, I believe that the time has come when future railroads should be built under the supervision and control of some State board, and that the laws should be such that they could not be overcapitalized and no roads should be built to parallel another road already in existence, unless it could be proven that the business in the territory through which the new road was to run was sufficient to justify and make a paying investment on a legitimate amount of capital invested."

R. S. KAYLOR,
Commissioner of Railroads and Telegraphs, Ohio.

* * * * *

"The general incorporation laws of this State seem to be fairly well adapted to our condition and situation, and, while affording ample protection to the interests of the State, they are sufficiently liberal to encourage the organization and successful operation of railway companies.

"Under the constitutions of this State railway companies are subject to legislative control."

THOMAS BURKE,
Counsellor, Seattle, Wash.

* * * * *

"All railroads in the State are operated and controlled under the provisions of a general railroad law. No special charters have been granted railroad companies

since 1865, the constitution of the State prohibiting special legislation of any character. There are 2 or 3 charters granted prior to 1865, and which are still in existence, but the companies comply with the provisions of general law. The operation and control of railroads of this State are satisfactory, and there seems to be no good reason for changing the present status regarding these matters."

JAMES HARDING,
Commissioner of Railroads, Missouri.

* * * * *

"If it be intended to effect an improvement in the incorporation acts of the individual States, I can think of no greater improvement than a uniformity of such laws in all the States, so that a corporation would not come under different laws at the crossing of every State line."

J. B. REDFIELD,
Assistant Secretary Chicago and Northwestern Railroad Company.

* * * * *

"I am frank to say, however, that I believe the best thing possible for owners of railway enterprises—and hence for their property—as well as the best for the people at large will never have been done until all the great lines doing a through business shall have come under the control substantially of a single organization, for until then there will always be bickerings, jealousies, rate cuttings, rebates, and drawbacks of all kinds and unjust discriminations in favor of particular patrons, and a host of other evils too numerous to mention. Under one organization, which would mean one broad general policy, the charging of greater rates for a short than for a long haul would not be, as it were, a necessity of the situation, excepting perhaps where the road came into direct competition with water lines; everybody would be charged the same price for the same transportation, and the saving in the expense of management would be enormous. I believe that \$100,000,000 would hardly pay the additional expense entailed by the expenditures made in New York for railroad offices, employees, etc., which are made necessary under the present system in order to solicit and compete for business for the different railroads, involving an enormous aggregate for rebates, and an enormous loss on account of rate cutting, which does not help the public at large, but is wasted in incipient and constant warfare. As it is to-day, a man who has 10 carloads of freight to ship will be sought by probably 20 men on the average from different railroad offices, who in their scramble for the business are almost sure to cut the rate to the disadvantage and detriment of the vast body of shippers—especially the smaller ones—who should by right have precisely the same privileges and opportunities that fall to the lot of some favored man who has large enough shipments to make and to attract the cupidity of the various carriers."

C. P. HUNTINGTON,
President Southern Pacific Railway Company.

* * * * *

"Answering your letter of July 11, we have to say that railroad companies are organized in this State under the general incorporation laws of the State. No special charters are permitted by the constitution of the State. By the terms of the constitution the legislature reserves the right to regulate railway transportation and to prescribe reasonable maximum rates which transportation companies should charge for freight and passengers. The constitution also gives the legislature power to require by law that railway companies shall interchange cars and transport products in bulk from one point in the State to another point in the State. The legislature, however, has not passed any law to make this provision of the constitution effective. The only fiscal limitation on railway corporations in this State is that they should not issue bonds to more than twice their capital stock.

"Foreign corporations have the same rights in this State as local corporations, upon complying with the law which requires a foreign corporation to file its articles and appoint an agent upon whom service of process can be made. * * * We think that a defect which should be corrected in all railway law now existing is the want of uniformity. Modern railways are the means of carrying on interstate commerce, whether the physical property be located within one State or more than one. Any State legislation which assumes to affect transportation within the boundaries of a State necessarily has its effect upon interstate business. For this reason we do not think it would be any stretch of the spirit of the Constitution of the United States to place the whole transportation business of the country under a Federal law which would be uniform throughout the

country and would exclude local legislation by the several States. Such a uniform law providing for uniform regulation and control by a commission having judicial powers would in our judgment go far toward relieving transportation companies of many of their difficulties, and at the same time giving better service to the public. Under authority of such commission competition and pooling could be controlled, better service given to the public and at cheaper rates, while the stockholders would receive more regular dividends, and would be protected against wild-cat financing."

CROWLEY & GROSSCUP,
Counselors, Tacoma, Wash.

* * * * *

"Under present conditions in the United States, the issuance of charters by each State is, it seems to me, pernicious in its results. The laws of the different States vary considerably, but in the most of them a charter can be secured for a small fee. This, in my judgment, has resulted in many blackmailing schemes, and has probably resulted in more railroad bankruptcies in this country than from all other causes combined.

"In my opinion charters should only be issued by the Federal Government, except for street railways and such enterprises as are known to be absolutely local in their sphere of operations. To accomplish this result will, no doubt, be very difficult while the doctrine of State rights is so firmly held by many people.

"This, it seems to me, ought not to stand in the way of a discussion of what ought to be accomplished. My view is that a commission, the members of which are appointed on the same basis as the members of the United States court, should constitute a body before which all applications for railway charters should be laid. This commission should be nonpolitical in its character, and composed of civil engineers, lawyers, and men of business qualifications, limited to say 5 in number, and charters for railroads should only be issued on the recommendation of this commission followed by legislative enactments.

"Some new method for the issuance of charters is certainly very necessary, not only in the interests of investors, but also in the interests of the people, as the present practice has resulted in the building of many cheap and unnecessary railways, which have much increased the expense of transportation over what it would have been had the railways constructed been built on strict requirements, necessary attention having been given to securing a line of the least expense in operation, which, in most cases, has been grossly disregarded. The result is that the people have to support these railways, improperly built, and therefore incur an enormous tax which might have been avoided under judicious governmental supervision."

A. A. ROBINSON,
President Mexican Central Railway Company.

* * * * *

"I think the only addition I would make to what he (Mr. E. W. Meddough—see next quotation) suggests is that the charter should provide somewhat in detail as to the character of the road that should be built; in other words, should specify the alignment, curvature, width of embankments, maximum gradients, character of masonry, bridges, number of ties per mile, weight of rail, and character of crossings over highways, whether level, overhead or subways, and the same as to intersections of other railway lines, all of which should be in accord with the specifications prescribed by the board of railroad commissioners for the State, or other board vested with such authority. This would prevent, more than any other provision that could be enacted, the building of superfluous and unnecessary lines not demanded by public necessity, but built for purposes of speculation and blackmail—something which has in the past prevailed to a great extent and which is responsible for the competition and unremunerative rates prevailing on many of the railways of the United States."

CHARLES M. HAYES,
General Manager Grand Trunk Railroad System.

* * * * *

"The 'elements of weakness' in American railway charters are more numerous than the 'elements of strength.' Very few special charters have been granted within the last thirty years. Railway corporations which have come into being within that period have been organized under general incorporation acts, and are

subject to constitutional or statutory provisions reserving to the legislature the power to amend, alter, or repeal. This reservation deprives the corporation, in some degree, of the contract immunity from legislative interference. However, even with this reserved power, there is a limit beyond which the legislature can not go. Unreasonable rates of transportation can not be prescribed. The legislature can not interfere with or control the corporation in the management of its affairs not affecting the safety, health, or reasonable convenience of the public. Whether or not a legislatively prescribed rate is reasonable is a judicial question, and the carrier may always have recourse to the courts for its determination. But the test of reasonableness is not fully settled.

"And so it may contest the validity of any legislative act touching the management of its internal affairs. But here, too, there is uncertainty. The boundary line between matters of such public concern as to warrant legislative interference, and matters of which corporation has exclusive right of control, is not clearly defined nor easily definable.

"The almost unlimited taxing power of the States under these general acts of incorporation as respects railway property is, perhaps, the most to be feared in the future. The power has been abused in most of the States, and the manifest tendency is everywhere to impose on railroad property a gradually increasing portion of the common public burden. This policy is, of course, popular with the people, as the higher the tax on railroads the lower the tax on other property, and the legislators represent their constituents. If there exists any judicial remedy for this it is not apparent.

"Now railroad property differs from other property in that it is devoted to the service of the public. A railroad once built must remain and be operated so long as it will pay operating expenses, even though its owners never realize \$1 on their investment.

"Rates of transportation may be fixed by the legislature. These conditions would justify, if they do not in justice demand, consideration by the Government in prescribing a system of railway taxation. Under existing methods the public take toll at both ends. They get low rates of transportation and a high rate of taxation—both through legislation.

"A model railway charter would irrevocably fix the percentage on the capital investment which a railway company should receive from its earnings—thus prescribing a limit to legislative curtailment of rates. It would define, as accurately as well-chosen general language can, the boundary line between legislative right of interference with or control of the business and the corporation's right of exclusive management. Something helpful can be done in this direction, I am sure.

"It would prescribe a definite basis of taxation, having reference to the exceptional character of the property and the fact of its permanent dedication to the public use, and this basis would be irrevocable.

Finally, it would make the issuance of a free pass or the gratuitous transportation of property cause of forfeiture of the charter."

E. W. MEDDAUGH,
Solicitor Grand Trunk Railway System.

* * * * *

"But my idea of the charter for a railway would be that every point which might possibly arise in the future should be definitely determined in the charter, such as power of eminent domain, the privileges attached to the use of water from streams or artificial ponds, with condemnation of lands for such uses if necessary; also the right to use any material on the right of way at any point on the line where it might be needed, with the rates and fares for freight and passenger traffic fixed, or at least a minimum fixed, so that no future legislature or railway commission could interfere therewith. Whether such a charter as this could be obtained from any legislature in the United States I very much doubt, but a charter with such provisions would be to my mind much better than to leave the railways to the mercy of succeeding legislatures or railway commissions."

C. J. IVES,
President Burlington, Cedar Rapids and Northern Railway.

* * * * *

"In reply to your question, I would say that the elements of strength in American railroad charters rested, for many years, on the well-known Dartmouth College case, but that decision has been frittered away by the courts and belittled by Federal and State legislation to such an extent that there is little left of it, and

to-day the weakness in American railroad charters is that, as contracts, they seem to bind the corporations without binding the States which granted them.

"To my mind the ideal charter would be one which, whatever its provisions might be, should state them clearly, and forever equally bind both the State and the corporation to their fulfillment."

STUYVESANT FISH,

President Illinois Central Railroad Company.

* * * * *

"I may add that the railroads of this State, under its general railroad laws, which are subject to alteration, amendment, or repeal at any time, have received reasonably fair treatment at the hands of the legislature. While the transportation facilities, with respect to territory and population, are very extensive by rail in comparison with other places, as well as by water, the railroad transportation companies of this State have been very unprofitable investments. The ——— company, under its special charter, is practically the only railroad which has not been a losing venture. It has never defaulted, and has paid interest and small dividends upon the very reasonable amount of its bonds and capital, and by virtue of the arrangement which it has made for the operation of other lines, under the general railroad law, it has conducted their operations and unquestionably saved several of them from bankruptcy. The industries of the State have grown, and there have been but few complaints from shippers.

"With respect to the portion of the State served by this company, operating under its charter, whether by reason of the fact that it is the most fruitful and populous territory reached, or whether by reason of the facilities extended by the company, it is certain that this portion of the State has excelled the rest in the increase of population and value of property."

HENRY RUSSELL,

Counsellor, Michigan Central Railroad Company.

* * * * *

"The railroads in this Commonwealth have very little more power than ordinary business corporations, the right of eminent domain being the most important, and that exercised under very rigorous restrictions. All railroads in this State are now subject to the general laws and are under the supervision of a board of railroad commissioners, of which the power is very plenary. The general law in reference to Massachusetts railroad corporations and the powers of the railroad commissioners are set out in chapter 112 of the Massachusetts Public Statutes and the amendments thereto contained in the acts from 1882 to 1899. In addition to this chapter, railroads are subject to section 3, chapter 105 of the Public Statutes, which makes every act of incorporation subject to amendment, alteration, or repeal, at the pleasure of the general court. In view of these general laws the original charters under which these railroads are operated are of little or no material value. The incorporation, organization, laying out of route, issuing of stock, exercise of eminent domain, rates of fares, and all the smaller details of railroad operations are provided for in the general statute applicable in all cases.

"In the original charters of at least two of the railroads organized here, a right in the State to purchase the railroad at any time for the amount of investment with 10 per cent a year added was reserved. This, however, is superseded by a general right to take possession of any railroad in the State reserved to the Commonwealth in sections 7 and 8 of the aforesaid chapter 112."

LUCIUS TUTTLE,

President, Boston and Maine Railroad Company.

* * * * *

APPENDIX I.

PREAMBLE AND DESCRIPTION OF A PART OF THE ROUTE FROM A NEW SOUTH WALES CHARTER.

AN ACT to authorize the construction of an extension of the railway commonly known as the Rosehill Railway, in three sections, from a point about 9 chains 75 links from the northern end of the Rosehill station platform, crossing the Parramatta River, traversing the districts of Rydalmere, Pennant Hills, Dundas, and Castle Hill, and terminating at Dural. (Assented to 13th June, 1893.)

Whereas Benjamin Crispin Simpson, of Sydney, in the Colony of New South Wales, civil engineer, being the present proprietor of the railway from Clyde station to the Parramatta River, known as the Rosehill Railway, is desirous of constructing an extension of such railway in three sections, from a point about nine chains seventy-five links from the northern end of the Rosehill station platform; then crossing the Parramatta River; then traversing the districts of Rydalmere, Pennant Hills to a point north of the Pennant Hills road, being three miles twenty-eight chains from the starting point, and being the first section of the said extension; thence traversing Dundas and Castle Hill to a point in the district of Castle Hill five miles twenty-four chains from the end of the first section, being the second section of the said extension; thence to a further point in the district of Dural three miles forty-one chains or thereabouts from the termination of the second section, being the third section of the said extension; such railway to run through certain private lands and certain streets described in the schedule annexed hereto: And whereas it is desired to construct such railway extension for the purpose of making the Rosehill Railway of greater use, and for the further purpose of opening up a most fertile and valuable district now without railway facilities, and of giving better access to the inhabitants thereof and the public generally to Sydney and surrounding country: And whereas the increased facilities of communication and traffic which would result from the construction of the said proposed railway extension would be for the public convenience and benefit, and it is desirable to authorize by legislative enactment the construction and maintenance of the said proposed railway extension subject to the provisions hereinafter contained: Be it therefore enacted by the Queen's most excellent majesty, by and with the advice and consent of the legislative council and legislative assembly of New South Wales in parliament assembled, and by the authority of the same, as follows:

DESCRIPTION OF A PART OF THE ROUTE CONTAINED IN A PRIVATE RAILWAY CHARTER OF NEW SOUTH WALES OF 1893.

The schedule.—First part.—Commencing on the Rosehill Railway at a point about nine chains seventy-five links from the northern end of the Rosehill station platform; thence in a northeasterly direction across the land enclosed for the said railway and belonging to the said Benjamin Crispin Simpson; thence bearing northeasterly through the property believed to belong to the Rosehill Racecourse Company to a road called South avenue; thence across that road bearing northeasterly to the southern boundary of land believed to belong to Septimus Alfred Stephen, and believed to be leased to Charles Edward Jeanneret for a tramway line; thence across the said leased land bearing northeasterly to a road called North avenue; thence across the said road bearing northeasterly to lands believed to belong to Robert Hudson bearing northerly to the western boundary of a reserved road; thence curving to a northeasterly direction along such road to the southwestern boundary of lands believed to belong to William L. Ferris and I. Ferris; thence in a northeasterly direction across the said lands to the southern bank of the Parramatta River; thence in a northeasterly direction across the said

Parramatta River to the southern boundary of lands believed to be dedicated by the Government for an asylum for the insane; thence across the said lands in a northeasterly direction to their eastern boundary; thence in a northeasterly direction through lands believed to belong to the trustees of Subiaco Convent to the southern boundary of a street called Victoria street; thence in a northerly direction across the said street to its northern boundary; thence in a northerly and northeasterly direction through lands believed to belong to the trustees of Subiaco Convent to the western boundary of land believed to belong to Jonathan Wooster; thence in a northeasterly direction across the said lands to the southern boundary of a road called Kissing Point road; thence in a northeasterly direction across the said road to its northern boundary; thence in a northeasterly direction across land believed to belong to Robert McCann to its eastern boundary; thence in a northeasterly direction through land believed to belong to G. McKillop to the western boundary of a reserved road; thence in a northeasterly direction across the said road to its eastern boundary; thence in a northeasterly (curving to a northerly and northwesterly) direction through lands believed to belong to Neil Harper to the western boundary of a road believed to be called Adderton road; thence in a northerly direction across the said road to its eastern boundary; thence in a northerly direction through land believed to belong to George Hodge to its eastern boundary; thence in a northerly direction through lands believed to belong to Charles R. Mobbs to the eastern side of the road; thence curving to a northeasterly direction along the said road and through land believed to belong to Neil Harper, and also through land believed to belong to Enoch Smith to the eastern boundary of the said road; thence curving to northerly and northwesterly directions through lands believed to belong to Charles W. Mills to its northern boundary; thence in a northerly and northwesterly direction through lands believed to belong to Frederick C. Cox to its eastern boundary; thence in a northeasterly direction across land believed to belong to William Cox to the southern boundary of a road called Pennant Hills road; thence in a northeasterly direction across the said road to its northern boundary; thence still in a northeasterly direction across land believed to belong to Frederick C. Cox to the southern boundary of the road; thence across the said road in a northeasterly direction to its northern boundary; thence bearing northeasterly across land believed to belong to Edwin Harris, and terminating at a point in the said land three miles twenty-eight chains distant from the point of commencement of the first section hereinbefore described.

APPENDIX II.

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS.

ALABAMA.

ART. XIV.—*Corporations.—Private corporations.—Railroads and canals.*

SEC. 21. All railroads and canals shall be public highways, and all railroad and canal companies shall be common carriers. Any association or corporation organized for the purpose shall have the right to construct and operate a railroad between any points in this State, and to connect at the State line with railroads of other States. Every railroad shall have the right with its road to intersect, connect with, or cross any other railroad, and shall receive and transport each the other's freight, passengers, and cars, loaded or empty, without delay or discrimination."

SEC. 22. "The general assembly shall pass laws to correct abuses and prevent unjust discriminations and extortion in rates of freights and passenger tariff on railroads, canals, and rivers in this State."

SEC. 23. "No railroad or other transportation company shall grant free passes or sell tickets or passes at a discount other than as sold to the public generally, to any member of the general assembly, or to any person holding office under this State or the United States."

SEC. 25. "No railroad, canal, or other transportation company, in existence at the time of the ratification of this constitution, shall have the benefit of any future legislation by general or special laws, other than in execution of a trust created by law, or by contract, except on the condition of complete acceptance of all the provisions of this article."

ART. XI.—*Taxation.*

SEC. 6. "The property of private corporations, associations, and individuals of this State shall forever be taxed at the same rate." * * *

"Law requiring auditor to assess and collect taxes on the roadbed and rolling stock of railroads, and relieving these items from county taxation was valid."—*M. & G. R. Co. v. Peebles*, 47 Ala., 317.

ARKANSAS.

ART. XII.—*"Municipal and private corporations.*

SEC. 1. "All existing charters or grants of special or exclusive privilege under which a bona fide organization shall not have taken place and business been commenced in good faith at the time of the adoption of this constitution shall hereafter have no validity."

SEC. 2. "The general assembly shall pass no special act conferring corporate powers, except for charitable, educational, penal, or reformatory purposes, where the corporations created are to be and remain under the patronage and control of the State."

SEC. 5. "No county, city, town, or other municipal corporation shall become a stockholder in any company. * * * or obtain or appropriate money for or loan its credit to any corporation." * * *

SEC. 6. "Corporations may be formed under general laws, which laws may, from time to time, be altered or repealed. The general assembly shall have the power to alter, revoke, or annul any charter of incorporation now existing and revocable at the adoption of this constitution, or any that may hereafter be created, whenever, in their opinion, it may be injurious to the citizens of this State, in such a manner, however, that no injustice shall be done to the corporations."—(See *Ry. v. Gill*, 54-101.)

SEC. 7. "Except as herein provided, the State shall never become a stockholder in, or subscribe to, or be interested in, the stock of any corporation or association."

ART. XVII.—*Railroads, canals, and turnpikes.*

SEC. 1. Identical with section 21, Article XIV, Alabama.

SEC. 3. All individuals, associations, and corporations shall have equal right to have persons and property transported over railroads, canals, and turnpikes, and no undue or unreasonable discrimination shall be made in charges for, or in facilities for, transportation of freight or passengers within the State, or coming from or going to any other State. Persons and property transported over any railroad shall be delivered at any station at charges not exceeding the charges for transportation of persons and property of the same class in the same direction, to any more distant station. * * *

SEC. 4. The leasing, control, consolidation, or purchase of a parallel or competing line forbidden. Officer of one road can not hold office in such lines. Question as to what is competing or parallel lines to be decided by jury, as in civil cases.

SEC. 5. No officer, president, director, agent, or employee of any railroad to be interested, directly or indirectly, in furnishing materials, supplies, or business to company.

SEC. 7. The general assembly shall prevent by law the granting of free passes, by any railroad or transportation company, to any officer of this State, legislative, executive, or judicial.

SEC. 8. All charters held subject to constitution, and no amendment of charter or special law for benefit of corporation to be passed unless so held.

SEC. 9. General assembly can take property and franchises of incorporated companies and subject them to public use, the same as property of individuals.

SEC. 10. General assembly to pass laws to correct abuses and prevent unjust discriminations. Penalties and forfeitures to be provided.

SEC. 11. Rolling stock and all other movable property to be considered personal property.

SEC. 13. Annual reports to be required.

ARIZONA.

The organic code contains no provisions on railways.

CALIFORNIA.

ART. XII.—*Corporations.*

SEC. 1. "Corporations may be formed under general laws, but shall not be created by special act. All laws now in force in this State concerning corporations, and all laws that may hereafter be passed pursuant to this section may be altered from time to time or repealed."

SEC. 7. "The legislature shall not extend any franchise or charter, nor remit the forfeiture of any franchise or charter for any corporation now existing, or which shall hereafter exist under the laws of this State."

SEC. 8. State can use property of corporations for public use same as that of individuals.

SEC. 17. Same as section 21 of the constitution of Alabama, and section 1 of that of Arkansas.

SEC. 18. Same as section 5, Article XVII, of constitution of Arkansas, with the addition "except such interest in the business of transportation as lawfully flows from the transportation of stock therein."

SEC. 19. Free passes and discounted tickets forbidden. Penalty: Forfeiture of office.

SEC. 20. Pooling forbidden. If rates are reduced for purposes of competition, the same shall not be raised "without the consent of the governmental authority in which shall be vested the power to regulate fares and freights."

SEC. 21. Same as section 8, Article XII, Arkansas.

SEC. 22. State divided into three sections, according to population. One railroad commissioner for each section, elected by the people for four years. Have power to establish rates for transportation of passengers and freight. Same to be published. Examine books, records, etc.; and may issue subpoenas; hear and determine complaints; punish for contempt of orders "in the same manner and to the same

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS. 998

extent as courts of record;" shall prescribe uniform system of accounts. Disobedience of orders of commissioner punished by fines not to exceed twenty thousand dollars. Agent or employee receiving rates in excess of those fixed fined five thousand dollars or one year in county jail. Legislature can extend power of commissioner.

SEC. 23. Divides State into districts.

COLORADO.

ART. XV.—Corporations.

SEC. 1. All special charters granted, but under which business had not begun, not valid after adoption of this constitution.

SEC. 2. No charter of incorporation shall be granted, extended, changed, or amended by special law, except for such municipal, charitable, educational, penal, or reformatory corporations as are or may be under the control of the State; but the general assembly shall provide by general laws for the organization of corporations hereafter to be created.

SEC. 3. Identical with last eleven lines of section 6, Article XII, Arkansas.

SEC. 4. Almost identical with section 21, Article XIV, Alabama, with the omission of last phrase "and transport," etc.

SEC. 5. Same as section 4, Article XVII, Arkansas, but referring to consolidation only.

SEC. 6. Identical with section 3, Article XVII, Arkansas, up to "Persons and property transported."

SEC. 7. Benefit of future legislation denied until acceptance of provisions of constitution filed, in binding form.

SEC. 8. Identical with section 9, Article XVII, Arkansas.

SEC. 15. Unlawful for any corporation "to require of its servants or employees, as a condition of their employment any contract * * * whereby such person, company * * * shall be released from liability * * * on account of injuries while in the service of such company." * * *

CONNECTICUT.

Amendments, Article XXV: "No county, city, town, borough, or other municipality, shall ever subscribe to the capital stock of any railroad corporation, or become a purchaser of the bonds, or make donations to, or loan its credit, directly or indirectly, in aid of any such corporation;" debts contracted prior to adoption of this amendment not affected.

DELAWARE.

ART. VIII.—Revenue and taxation.

SEC. 8. County or municipal aid to private corporations or persons prohibited.

ART. IX.—Corporations.

SEC. 1. No corporation shall hereafter be created, amended, renewed, or revived by special act, but only by or under general law, nor shall any existing corporate charter be amended, renewed, or revived by special act, but only by or under general law. * * * Charters forfeited for violation of law.

SEC. 2. Acceptance of constitution by corporations necessary before charter can be renewed or amended.

SEC. 6. Each shareholder entitled to one vote in elections for directors or managers.

FLORIDA.

ART. IX.—Taxation and finance.

SEC. 7. State aid by means of taxation to corporations forbidden.

SEC. 10. State credit not to be pledged or loaned to private corporations; State not to become a stockholder. City, county, borough, township, etc., also forbidden to aid such corporations.

ART. XVI.—*Miscellaneous.*

SEC. 30. "The legislature is invested with full power to pass laws for the correction of abuses and to prevent unjust discrimination and excessive charges by persons and corporations engaged as common carriers in transporting persons or property, or performing other services of a public nature, and shall provide for enforcing such laws by adequate penalties and forfeitures."

SEC. 31. Free passes and discounts of fares forbidden to members of legislature and State officers.

GEORGIA.

ART. IV.—*Section 2. Regulation of corporations.*

SEC. 1. Railroad tariffs. Assembly given right to regulate freight and passenger tariffs and to fix penalties for violations of regulations.

SEC. 2. Right of eminent domain retained over corporation property.

SEC. 3. Charters revived or amended become subject to the constitution: * * * "Provided, That this section shall not extend to any amendment for the purpose of allowing any existing road to take stock in or aid in the building of any branch road."

SEC. 4. The purchase of stock of one corporation by another for purposes of decreasing competition can not be authorized and all such contracts declared void.

SEC. 5. Rebates forbidden, directly or indirectly. Penalties may be imposed.

IDAHO.

ART. III.—*Legislative department.*

SEC. 19. Prohibits special or local laws.

ART. VIII.—*Public indebtedness and subsidies.*

Four sections, prohibiting subscription to stock and other forms of aid on part of any political unit.

ART. XI.—*Corporations.*

SEC. 1. Previously granted but inoperative special charters void.

SEC. 2. Special legislation, except for municipal, charitable, etc., purposes, prohibited.

SEC. 3. Legislature may revoke charters, but no injustice shall be done.

SEC. 4. Like section 3, Article XI, Illinois.

SEC. 5. Railways common carriers; legislature may control, regulate rates; railways may connect, intersect with one another.

SEC. 6. Undue or unreasonable discriminations forbidden; excursion and commutation tickets may be sold, provided they are the same to all persons. Long and short haul provision.

SEC. 7. Must accept constitution.

SEC. 8. Legislature may apply right of eminent domain to property of railway corporation.

SEC. 10. Appoint legal representative.

SEC. 14. Can not escape jurisdiction of State courts through consolidation.

SEC. 15. Contracts restricting liability void.

SEC. 18. Combinations to influence price prohibited.

KENTUCKY.

SEC. 59. Special legislation forbidden.

SEC. 179. City, county, etc., aid to corporations forbidden.

SEC. 190. Corporations must accept the constitution before asking for benefits of future legislation.

SEC. 191. All charters under which organization has not taken place at time of adoption of constitution void.

SEC. 192. No corporation to engage in business other than expressly named in charter; not to hold estate other than is proper and necessary for carrying on its legitimate business "for a longer period than 5 years, under penalty of escheat."

- SEC. 195. Property of corporations subject to right of eminent domain.
 SEC. 196. Unjust discrimination prohibited.
 SEC. 197. Free passes forbidden to city, town, county officers, members of assembly, or judge. Forfeiture of office the penalty.
 SEC. 198. Trusts, pools, combinations, or other organizations to "depreciate below its real value any article, or enhance the cost of any article above its real value" forbidden.
 SEC. 201. Purchase or lease or operation of competing lines or line forbidden; also pooling of earnings with *any common carrier* forbidden.
 SEC. 203. Lease or transfer of franchise to escape liability forbidden.
 SEC. 207. Identical with section 3, Article XI, Illinois.
 SEC. 209. Railroad commissioners, three in number, elected by people for same term as governor. State divided into three districts.
 SEC. 210. Common carriers forbidden to own, operate, or engage in any other business "except such as shall be necessary to carry on its business." * * *
 SEC. 212. Rolling stock subject to execution and sale. Earnings and personal property subject to process of attachment.
 SECS. 213, 215. Freight of all shippers to be transferred with equal promptness and same charges independent of destination.
 SEC. 214. Exclusive contracts with shippers forbidden.
 SEC. 216. Right of intersection guaranteed.
 SEC. 217. Fixes penalties at from \$2,000 to \$5,000 and forfeiture of franchise.
 SEC. 218. Greater charges for shorter than for longer hauls forbidden.

ILLINOIS.

ART. XI.

- SEC. 1. No corporation to be created by special laws.
 SEC. 2. All charters not in force within 10 days after the adoption of the constitution void.
 SEC. 3. "The general assembly shall provide, by law, * * * every stockholder shall have the right to vote in person or by proxy, for the number of shares of stock owned by him, for as many persons as there are directors or managers to be elected, or to cumulate such shares, and give one candidate as many votes as the number of directors multiplied by the number of his shares of stock shall equal; or to distribute them on the same principle among as many candidates as he shall think fit." * * *
 SEC. 10. Rolling stock and all other movable property considered personal property subject to execution and sale.
 SEC. 11. Consolidation of competing lines forbidden. No consolidation without 60 days' notice. Majority of directors to be citizens of State.
 SEC. 12. Railroads subject to such regulations as may be prescribed by law.
 SEC. 13. No increase of stock unless 60 days' notice of same has been given.
 SEC. 14. * * * "Property and franchises of incorporated companies already organized, and subjecting them to the public necessity the same as of individuals." * * *
 SEC. 15. "The general assembly shall pass laws to correct abuses and prevent unjust discriminations and extortion in the rates of freight and passenger tariff on the different railroads of the State, and enforce such laws by necessary penalties to the extent, if necessary for that purpose, of forfeiture of their property and franchises."

ART. XIV.

- SEC. 1. Regarding money paid into State treasury by *Illinois Central Railroad*.
 SEC. 2. County, city, town, village, etc., aid to corporations forbidden in future (i. e., after 1870, the time of the adoption of this constitution)

INDIANA.

ART. XI.—Corporations.

- SEC. 13. Corporations other than banking shall not be created by special act but may be formed under general laws.
 SEC. 14. Individual liability of incorporators.

IOWA.

ART. VIII.—Corporations.

- SEC. 1. No corporation to be hereafter created by special law.
 SEC. 2. Property of corporations subject to taxation as that of individuals.
 SEC. 3. State not to be a stockholder.
 SEC. 12. Subject to the provisions of this article, the general assembly shall have power to amend or repeal all laws for the organization or creation of corporations. * * *

KANSAS.

ART. XII.—Corporations.

- SEC. 1. Special legislation prohibited, and all general laws may be amended or repealed.
 SEC. 2. Individual liabilities in case of corporations, * * * "but such individual liabilities shall not apply to railroad corporations, not corporations for religious or charitable purposes."

LOUISIANA.

ART. 262. "The general assembly shall not remit the forfeiture of the charter of any corporation now existing, nor renew, alter, or amend the same, nor pass any general or special law for the benefit of such corporation, except upon the condition that such corporation shall thereafter hold its charter subject to the provisions of this constitution."

ART. 265. No corporation to engage in business except such as directly authorized by charter "or incidental thereto," nor hold any real estate for a longer period than 10 years.

ART. 267. Stock neither to be decreased nor increased "except in pursuance of general laws," nor without the consent of persons holding the larger amount in value of the stock. * * *

ART. 271. Identical with Article XIV, section 21, Alabama, beginning with "Any association."

ART. 272. Identical with Article XIV, section 21, Alabama, up to "Any association."

ART. 274. Consolidation upon 60 days' notice, but company always to remain in jurisdiction of the State.

ART. 275. "General laws shall be enacted providing for the creation of private corporations, and shall therein provide fully for the adequate protection of the public and of the individual stockholder."

ART. 283. "A railroad, express, telephone, telegraph, steamboat, and other water craft, and sleeping car commission is hereby created;" composed of three members, elected by districts.

ART. 284. Powers of commission: Compel attendance of witnesses and production of books and papers; adopt, change, and make just rates and regulations; prevent discriminations; hear complaints; supervise matters of bridges, depots, switches, etc., etc.; adjust rates between branch and trunk lines.

ART. 285. Appeals from decisions of commission may be taken to Supreme Court.

ART. 286. Penalties provided.

MAINE.

ART. IV.—Part third. Legislative power.

SEC. 13. "The legislature shall, from time to time, provide as far as practicable, by general laws, for all matters generally appertaining to special or private legislation."

ART. IX.—General provisions.

Credit of State not to be loaned.

MARYLAND.

ART. 3.—Legislative department.

SEC. 48. Corporations may be formed under general laws; but shall not be created by special act, except for municipal purposes, and except in cases where no general laws exist; * * * a committee of three to be appointed by governor to draft general laws.

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS. 997

MASSACHUSETTS.

Contains no constitutional provisions relating to railways.

MICHIGAN.

ART. XV.—*Corporations.*

SEC. 1. Corporations to be formed under general laws only.

SEC. 7. Individual liability of stockholders.

SEC. 10. No corporation, except for municipal purposes, or for the construction of railroads, plank roads, and canals, shall be created for a longer period than 30 years.

SEC. 12. Limitation for holding real estate ten years, "excluding such as is actually occupied by such corporation in the exercise of its franchise."

MINNESOTA.

ART. IX.—*Finances of the State, banks and banking.*

SEC. 14b. Limitation of municipal aid to railways to 10 per cent of assessed valuation.

SEC. 15. Adopted November 4, 1870. Limitation at 5 per cent of taxable property.

ART. X.—*Of corporations having no banking privileges.*

SEC. 2. None, except municipal corporations, to be formed under special acts.

ART. IV.

SEC. 33. Special legislation prohibited. Also the amendment of special laws. Latter may, however, be repealed.

SEC. 34. Provision made for general laws.

Amendment to sec. 19, Art. IX, of Apr. 15, 1858.

State loans to be given only to roads in whose aid Congress has given loans to State of Minnesota. Loans in form of State bonds, bearing 7 per cent interest, payable semi-annually in New York City, to an amount not exceeding \$5,000,000. Conditions of these loans prescribed at some length.

MISSISSIPPI.

ART. VI.

SEC. 87. Special legislation forbidden.

SEC. 88. General laws for the granting of charters to be passed.

ART. VII.—*Corporations.*

SEC. 178. Corporations to be formed under general laws only. Legislature has power to change or revoke any charter (now revocable or hereafter granted) "whenever, in its opinion, it may be for the public interest to do so: Provided, however, that no injustice shall be done to the stockholders." Charters not to be granted for more than 99 years. Companies holding charters for a longer period may surrender excess. Legislature may otherwise tax the "increased value of such property and franchises arising from such longer duration of their charters."

SEC. 179. Charters to be held subject to constitution.

SEC. 180. Future charters subject to constitution; all charters under which organization not effected within one year after adoption of the constitution to be void; also all charters under which work not begun within two years after granting.

SEC. 182. Power of taxation not to be surrendered or abridged by any contract.

ART. VI.

SEC. 183. Municipal aid forbidden.

SEC. 184. Identical with section 21, Article XIV, Alabama.

SEC. 185. Rolling stock considered personal property and subject to execution and sale.

SEC. 186. Provides for regulation of rates and fixing of penalties.

SEC. 188. Free passes to "members of legislature, State, district, county, or municipal officers, except railroad commissioners," forbidden.

SEC. 190. Property and franchises of corporations may be subjected to public use.

SEC. 193. Contracts waiving right of suit for damages void.

SEC. 194. Same as section 3, Article XI, Illinois.

SEC. 197. Lease, purchase, or operation of a railroad of this State by a foreign corporation forbidden.

SEC. 198. The legislature shall enact laws to prevent all trusts, combinations, contracts, and agreements inimical to the public welfare.

ART. XIV.—*General provisions.*

SEC. 258. State aid of corporations prohibited.

MISSOURI.

ART. IV.—*Legislative department.*

SEC. 47. Municipal aid to corporations prohibited.

SEC. 53. Special legislation forbidden.

ART. X.—*Revenue and taxation.*

SEC. 5. "All railroad corporations in this State or doing business therein shall be subjected to taxation for State, county, school, municipal, and other purposes, on the real and personal property owned or used by them, and on their gross earnings, their net earnings, franchises, and their capital stock.

SEC. 21. Payment of \$50 to State treasurer for first \$50,000 of stock, and \$5 for every \$10,000 additional, required before charter granted.

ART. XII.—*Corporations.*

SEC. 4. Right of eminent domain to apply to property and franchises of corporations.

SEC. 6. Same as section 3, Article XI, Illinois.

SEC. 7. Similar to section 192, Kentucky, and article 265, Louisiana.

ART. XII.

SEC. 12. Discrimination prohibited on long and short hauls.

SEC. 13, 14. Same as section 21, Article XIV, Alabama. Unjust discriminations also prohibited, and legislature to pass laws establishing reasonable maximum rates for freight and passengers.

SEC. 16. Rolling stock and all other movable property held subject to execution.

SEC. 17. Consolidation of competing or parallel lines forbidden; also lease, purchase, etc.; also officeholding in rival company.

SEC. 18. No corporation can become a foreign company by consolidation.

SEC. 21. Benefits of future legislation denied except on condition of acceptance of constitution.

SEC. 22. No officer of railroad to be directly or indirectly interested in furnishing supplies, etc., to company.

SEC. 24. Free passes forbidden to State, county, and municipal officers, etc.

MONTANA.

ART. XV.—*Corporations other than municipal.*

SEC. 1. Charters under which organization not yet completed void.

SEC. 3. Assembly has power to alter, revoke, or annul any charter of incorporation existing, or which may hereafter be granted, when, in its opinion, it may be injurious to citizens of State.

SEC. 4. Same as section 3, Article XI, Illinois and others.

SEC. 5. Railroad common carriers; legislature has power to control and regulate all rates, all roads, the right to build, operate, and intersect other roads.

SEC. 6. Same as section 17, Article XII, Missouri and others.

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS. 999

SEC. 7. Same as section 3, Article XVII, Arkansas, and discrimination among persons forbidden.

SEC. 8. Constitution to be accepted before benefit of future legislation obtained.

SEC. 9. Right of eminent domain to apply to property and franchises.

SEC. 12. "No street or other railroad shall be constructed within any city or town without the consent of the local authorities having control of the street or highway proposed to be occupied by such street or other railroad."

SEC. 15. No corporation can become a foreign corporation by consolidation.

SEC. 16. Contracts waiving right to damages void.

SEC. 20. Formation of trusts by combination within or without the State forbidden. Legislature to enact appropriate legislation.

NEBRASKA.

ART. XI.—*Corporations—Railroad corporations.*

SEC. 2. Rolling stock and all other movable property subject to execution and sale.

SEC. 3. Identical with section 11, Article XI, Illinois, omitting last sentence.

SEC. 4. All roads public highways; legislature may establish reasonable maximum rates for passengers and freight; liability of companies never to be limited.

SEC. 6. Right of eminent domain to apply.

SEC. 7. Abuses to be regulated by law; penalties to the extent of forfeiture of property and franchise may be imposed.

NEVADA.

ART. VIII.—*Municipal and other corporations.*

SEC. 1. Special legislation forbidden.

SEC. 6. State credit not to be extended to corporations.

SEC. 10. "No county, city, town, or other municipal corporation shall become a stockholder in any joint stock company, corporation, or association whatever, or loan its credit in the aid of any such company, corporation, or association, except railroad corporations, companies, or associations."

NEW HAMPSHIRE.

No constitutional provisions relating to railways.

NEW JERSEY.

ART. IV.—*Legislative.*

SEC. 11. Special legislation for corporations forbidden.

NEW MEXICO.

The organic code contains no provisions relating to railways.

NEW YORK.

ART. III.

SEC. 18. Forbids legislature to enact any special law "Granting any corporation, association, or individual the right to lay down railroad tracks."

ART. VII.

SEC. 1. State credit withheld.

ART. VIII.

SEC. 1. "Corporations may be formed under general laws, but shall not be created by general act, except for municipal purposes; and in cases where, in the judgment of the legislature, the objects of the corporation can not be attained under general laws. All general laws and special acts passed pursuant to this section may be altered from time to time or repealed."

SEC. 10. County, cities, towns, and villages not to give money or loan credit.

ART. XIII.

SEC. 3. Granting or promising to grant, or accepting passes, franking privilege, or any discrimination in rates for the benefit of any public officer prohibited.

NORTH CAROLINA.

ART. V.—*Revenue and taxation.*

SEC. 4. State credit not to be given to railroads unless they are unfinished at the time of the adoption of the constitution, or such in which the State has a pecuniary interest, unless the question be submitted to the people and approved by them.

ART. VIII.—*Corporations other than municipal.*

SEC. 1. Corporations other than municipal to be organized under general laws. All such laws and special acts may be repealed or altered.

SEC. 2. Debts to be secured.

SEC. 3. Defines corporations.

NORTH DAKOTA.

ART. 2.—*Legislative department.*

SEC. 69. Special legislation in favor of railroads forbidden.

ART. 7.—*Corporations other than municipal.*

SEC. 133. Charters held subject to constitution.

SEC. 134. Property and franchises subject to right of eminent domain.

SEC. 137. No corporation to engage in business other than that directly authorized.

SEC. 139. Consent of local authorities concerned necessary.

SEC. 141. Consolidation—same as section 6, Article XV, Montana.

SEC. 142. { Same as section 5, Article XV, Montana.

SEC. 143. {

SEC. 146. Same as section 20, Article XV, Montana.

OHIO.

ART. XII.—*Corporations.*

SEC. 1. No special laws conferring corporate powers to be passed.

OREGON.

ART. IV.—*Legislative department.*

SEC. 23. Various kinds of special legislation prohibited, but corporations not mentioned.

ART. XI.—*Corporations and internal improvements.*

SEC. 2. Organization of corporations by special act forbidden. All laws may be changed or repealed, "but not so as to destroy or impair any vested corporate rights."

SEC. 6. State not to be stockholder in any company.

SEC. 7. Credit of State not to be loaned.

SEC. 10. New county debts limited to \$3,000.

PENNSYLVANIA.

ART. IX.—*Taxation and finance.*

SEC. 6. State credit not to be pledged nor State to become a stockholder.

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS.. 1001

ART. XVI.—*Private corporations.*

- SEC. 2. All charters to be held subject to constitution.
- SEC. 3. Right of eminent domain applicable to property and franchises.
- SEC. 6. No corporation to engage in business other than expressly authorized and not to hold real estate except such as may be necessary for carrying on its business.

ART. XVIII.—*Railroads and canals.*

- SEC. 1. Identical with section 21, Article XIV, Alabama.
- SEC. 6. No officer of corporation to be interested in the contracts for supplies and material.
- SEC. 7. Preferences as to rates and facilities forbidden.
- SEC. 8. Free passes forbidden "to any person except officers or employees of the company."

RHODE ISLAND.

Amendment to Article IX.

- SEC. 1. General assembly to provide for the creation and control of corporations by general law; but no corporation to acquire the right of eminent domain or franchise except by special act.

SOUTH CAROLINA.

ART. XII.—*Corporations.*

- SEC. 1. Corporations to be framed under general laws.
- NOTE.—All acts pledging the credit of the State for the benefit of corporate body were repealed by special "ordinance" of March 15, 1868.

SOUTH DAKOTA.

ART. XVII.—*Corporations.*

- SEC. 1. Special legislation forbidden.
- SEC. 3. Charters held subject to constitution.
- SEC. 4. Right of eminent domain to extend to property and franchises.
- SEC. 7. No corporation to engage in business not specifically named.
- SEC. 9. Legislature has power to alter, revise, or annul any charter for public good "in such manner that no injustice shall be done to the incorporators. No law hereafter enacted shall create, renew, or extend the charter of more than one corporation."
- SEC. 13. "Rolling stock and all other movable property" subject to execution and sale.
- SEC. 14. Same as section 6, Article XV, Montana, except relating to consolidation of railroads only, and omitting clause referring to office holding.
- SECS. 15, 16. Same as section 21, Article XIV, Alabama, but referring to railroads only. Legislature given right to control rates of freight and passengers.
- SEC. 17. Same as section 7, Article XI, Nebraska.
- SEC. 20. Monopolies and trusts forbidden. Adopted as an amendment at election of 1896.

TENNESSEE.

ART. II.—*Legislative.*

- SEC. 33. "No bonds of the State shall be issued by any railroad company which at the time of its application for the same shall be in default in paying interest upon the State bonds previously loaned to it or that shall hereafter and before such application sell or absolutely dispose of any State bonds loaned to it for less than par."

ART. XI.—*Miscellaneous provisions.*

- SEC. 8. All special legislation forbidden.

TEXAS.*ART. III.—Legislative department.*

- SEC. 51. State aid to individuals and corporations forbidden.
 SEC. 52. County, city, town, etc., aid also prohibited.
 SEC. 54. State liens upon railroads can not be changed.
 SEC. 56. Special legislation forbidden.

ART. X.—Railroads.

- SECS. 1, 2. Same as section 21, Article XIV, Alabama, except applying to railroads only, and also giving legislative power to correct abuses, prevent discriminations, and fix penalties.
 SEC. 4. Rolling stock and other movable property subject to execution and sale.
 SEC. 5. Consolidation with or office holding in competing or parallel lines forbidden.
 SEC. 8. Benefit of future legislation withheld until constitution subscribed to.
 SEC. 9. No railroads hereafter constructed to pass within 3 miles of a county seat without passing through same, and establish a depot, "unless prevented by natural obstacles, such as streams, hills, or mountains," provided city (or town) grants right of way and land enough for depot purposes.

ART. XIV.—Public lands and land office.

- SEC. 3. No public lands to be granted to railroads, and never more than 16 sections per mile. And no land granted until 10 miles of road in operation.

UTAH.*ART. VI.—Legislative department.*

- SEC. 26. Special legislation forbidden.
 SEC. 31. Lending of State credit or that of counties and municipalities forbidden.

ART. XII.—Corporations.

- SEC. 1. Corporations to be formed under general laws, and all such laws may be changed or repealed.
 SEC. 2. Existing corporations to accept constitution.
 SEC. 3. Legislature shall not extend or validate any franchise.
 SEC. 10. Corporations limited to authorized objects.
 SEC. 12. All railroads common carriers, and to carry freight and passengers without discrimination.
 SEC. 13. Competing roads not to be consolidated.
 SEC. 14. Rolling stock, etc., considered personal property.
 SEC. 15. Legislature to prescribe maximum rates.
 SEC. 17. Employee of a corporation can not hold municipal office in the municipality which granted the franchise.
 SEC. 20. Trusts and combinations forbidden.

VIRGINIA.*ART. X.—Taxation and finance.*

- SEC. 12. State credit can not be granted.
 SEC. 14. State can not become a stockholder.
 SEC. 15. State can not become a party to internal improvements.

WASHINGTON.*ART. I.*

- SEC. 8. No law granting irrevocably any privilege, franchise, or immunity shall be passed by the legislature.
 SEC. 28. Special legislation forbidden.
 SEC. 39. "Public officers" forbidden to use passes, etc.

CONSTITUTIONAL PROVISIONS RELATING TO RAILWAYS. 1008

ART. VII.

SEC. 5. State credit not to be loaned.

ART. XII.

SEC. 1. Creation of corporations by special laws forbidden and all such laws may be altered or repealed.

SEC. 2. Charters or franchises not to be extended or forfeiture remitted.

SEC. 9. State can not be a stockholder.

SEC. 10. Right of eminent domain to apply.

SEC. 13. Almost identical with section 21, Article XIV, Alabama.

SEC. 14. Pooling of earnings forbidden with any *common carrier*.

SEC. 15. Discrimination in rates forbidden.

SEC. 16. Consolidation of competing lines forbidden.

SEC. 17. Rolling stock, etc., personal property.

SEC. 18. Legislature to pass laws for regulation of fares and freights.

SEC. 20. Free passes to members of legislature and public officers forbidden.

SEC. 21. No discrimination against express companies.

SEC. 22. Trusts and monopolies forbidden.

WEST VIRGINIA.

ART. XI.—*Corporations.*

SEC. 1. Corporations to be organized under general laws.

SEC. 4. Identical with section 3, Article XI, Illinois.

SEC. 8. Rolling stock, etc., considered personal property.

SEC. 9. Railroads declared public highways. Legislature to make laws establishing reasonable maximum rates and the preventing of abuses and discriminations.

SEC. 10. Legislature to require railroads running within one-half mile of a town or village to establish a depot.

SEC. 11. Consolidation with parallel or competing lines forbidden.

SEC. 12. Right of eminent domain to apply to property and franchises of railroads.

NOTE.—About half a dozen other constitutions contain provisions of a similar nature. Usually 3 miles is the distance taken, and the county seat the point concerned. They are to pass through latter in one instance “if no natural obstacle intervenes.” (See sec. 9, *Art. X, Texas*.)

OKLAHOMA.

Organic act, section 6. * * * “This further provided that the legislature shall not authorize the issuing of any bond, scrip, or evidence of debt by the Territory, or any town, city, or county therein, for the construction of any railroad.”

NOTE.—The organic codes of New Mexico and Arizona contain no mention of railroads.

WISCONSIN.

ART. XI.—*Corporations.*

SEC. 1. Corporate powers not to be granted by special act, and all general laws changed or repealed at will of legislature.

ART. IV.

SEC. 31. Special legislation forbidden for granting corporate powers, except to cities.

ART. VIII.

SEC. 3. State credit withheld.

WYOMING.

ART. I.—*Declaration of rights.*

SEC. 30. Monopolies and perpetuities.—Perpetuities and monopolies are contrary to the genius of a free state, and shall not be allowed. Corporations being creatures of the State, endowed for the public good with a portion of its sovereign powers, must be subject to its control.

ART. III.—*Legislative department.*

SEC. 27. Special and local laws prohibited. The legislature shall not pass local or special laws in any of the following enumerated cases:

A long list of subjects is here enumerated, including "the right to lay down railroad tracks, or any special privilege, immunity, or franchise whatever, or amending existing charter for such purpose." In all other cases where a general law can be made applicable no special law shall be enacted.

SEC. 39. Political units prohibited from aiding railway construction, or loaning credit or otherwise contracting an indebtedness.

ART. X.—*Corporations.*

SEC. 1. Corporations organized under general law.

SEC. 2. All franchises subject to control of legislature.

SEC. 3. All previously granted special charters, not yet in actual operation, declared void.

SEC. 4. Laws, contracts, and agreements limiting liability, illegal.

SEC. 5. Full acceptance of constitution before business can be transacted.

SEC. 6. Corporations engage in only one line of business specified in charter.

SEC. 7. Agencies of transportation and communication declared to be common carriers.

SEC. 8. Combinations to prevent competition or influence prices prohibited.

SEC. 9. Right of eminent domain and public use to apply to corporate property. In addition the constitution of Wyoming contains nine sections specially devoted to railways, as follows:

SEC. 1. Grants power to construct, operate, intersect, connect, etc., without discrimination.

SEC. 2. Railways and telegraphs declared common carriers, "and as such must be made by law to extend the same equality and impartiality to all who use them, excepting employees and their families and ministers of the Gospel, whether individuals or corporations."

SEC. 3. Shall make annual report to auditor of the State.

SEC. 4. May exercise right of eminent domain, but legislature reserves power to subject franchise and property to public use.

SEC. 5. All political units enjoined from aiding by donations, loans, credit, etc.

SEC. 6. Constitution must be accepted before business can be done.

SEC. 8. Foreign corporations must appoint legal representative in State.

SEC. 9. Depots to be established when railways run within four miles of a town. "No railroad company shall deviate from the most direct practicable line in constructing a railroad for the purpose of avoiding the provisions of this section."

TAXATION OF TRANSPORTATION COMPANIES.

A Report Prepared under the Direction of the Industrial Commission, by
ROSWELL C. McCREA.

CHAPTER I.

DEVELOPMENT OF THE TAXATION OF TRANSPORTATION COMPANIES.

In its report, issued in 1880, the railway tax committee¹ asserted that "there is no method of taxation possible to be devised which is not at this time applied to railroad property in some part of this country." When this statement was made the States were passing through a middle experimental stage in their taxation of transportation companies; and though twenty years have since elapsed, another period of more definite experiment has only just begun. A chaos of tax systems almost, if not quite, equal to that which confronted the committee still prevails. But confused and confusing as railway tax laws have been and still are, both legislation and judicial decision give evidence of progress toward a better state of things. Even prior to 1879, the year of the activity of the committee, clearer comprehension of tax problems to be solved had already set on foot a movement for reform; and the past two decades have witnessed changes still more notably in the same direction. It is the general trend of these changes which this chapter attempts to describe.

In the developing of its transportation facilities the United States has acted as a group of communities at widely different stages of industrial development. After the East had in a measure settled the question of an adequate transporta-

¹ The report of this committee was entitled *Taxation of Railroads and Railroad Securities*. The committee, the members of which were C. F. Adams, Jr., W. B. Williams, and J. H. Oberly, was appointed at a convention of State railroad commissioners to report methods of taxation respecting railroads and railroad securities.

tion system the railway growth of the West was still in its incipient stage. Correspondingly, the East after continuous experiment was the first to devise definite methods of railroad taxation, some mistakes in the developing of which the States of the West were subsequently enabled to avoid. But in the main the general course of the development has been the same in both sections, and the same conservative attitude toward innovation is to be noted throughout.

In tracing the course of this development it will be convenient to group the successive steps within two periods. To be sure, it will not be possible to assign any definite chronological limits to these separate stages; but the distinctive features in the process of change are so prominent as to group themselves broadly within the two periods which are here adopted.

The first of these stages was characterized by the policy of subsidy and exemption from taxation and by the introduction of tax methods which were made to operate very leniently toward the railroads. This period may be said to have ended with the close of the first decade after the civil war. The second or present stage has been characterized chiefly by the adoption and extension of definite methods of railway taxation, in the main distinct from the general-property tax as ordinarily administered in the taxation of individuals.

A. FIRST PERIOD—PUBLIC AID AND TAX EXEMPTIONS.

1. *State construction of railroads.*—One reason for the slight progress which has been made in the field of railway taxation is to be found in the comparatively recent origin of the railway systems themselves. The building of railroads in the United States had scarcely begun before 1830, and, from the financial standpoint, it was not until after the period of the civil war that the ultimate success of the railroad experiment was assured. In 1830 population was sparse and the capital of the country was limited. At that time the States themselves were quite widely engaged in works of internal improvement, but with the introduction of railways the States appear to have been averse to engaging directly in this new form of enterprise, with the result that the construction of railway lines was left chiefly to individual initiative.¹

2. *State and local aid.*—Capital, however, in addition to the mere fact of its scarcity, was hard to secure for investment in an enterprise which gave no prospect of substantial or immediate returns. Under these circumstances, it was but natural that the various State legislatures should be impressed rather with the expediency of stimulating railway investments by special auxiliary enactments than of restricting their extension by the imposition of taxes. Accordingly, with a view toward encouraging the growth of a service which was seen to be of vital

¹ There are some instances of independent action on the part of States in the construction and ownership of railway lines, as well as cases where State policy looked definitely toward State ownership; but such instances are both relatively rare in number and almost entirely limited to the early period of railway construction. For instance, in Pennsylvania the canal commission was authorized in 1827 to estimate the expense of constructing a railroad from Harrisburg to Chambersburg, and in the following year the same commission was empowered to contract for the construction of a railroad from Philadelphia to Columbia. For a number of years after various appropriations for purposes of railroad construction are to be found in the State's general appropriation bills.

In Georgia during the thirties the State, through the agency of a board of State commissioners, constructed the Western and Atlantic Railroad. This road was operated by the State until 1870. It has since been operated under lease by private parties. The rental for 1900 amounted to \$420,012.

During the thirties Michigan projected an elaborate plan of railway construction under the direction of a board of internal improvement. This plan provided for the building of a northern, a central, and a southern road. The northern project was abandoned in 1841 and a wagon road constructed instead; but large sums were expended on the central and southern lines up to 1846, when they were sold to private parties and incorporated, respectively, as the Michigan Central and Michigan Southern lines. In both cases the State reserved the right to repurchase after January 1, 1867.

In Massachusetts, to illustrate further, the State took an active interest, almost akin to ownership, in the construction of the Troy and Greenfield Railroad and Hoosac Tunnel. In 1872 the legislature provided that the interest of the State in the Hoosac Tunnel should never be sold; and since that time large sums have been devoted to the improvement of that line (e.g., in 1883, \$264,652; in 1884, \$66,000).

In a number of instances early State policy in incorporating railroad companies looked toward the possibility of subsequent State ownership. For instance, during 1831 and 1833 New York, in granting the charters of the New York and Albany, the New York and Erie, the Utica and Schenectady, and other roads, reserved the right of purchase, to take effect within a period of five years, beginning ten years after incorporation. In Massachusetts charters of the early thirties the right of purchase was reserved for ten years (e.g., in the charters of the Franklin, the Boston, Providence and Taunton, the Boston and Lowell, and other roads). Similar provisions are to be found a few years later in charters granted by Kentucky and Michigan. In the latter State at least a single instance of actual purchase is to be found, namely, in 1841, when the State purchased the River Raisin and Lake Erie Railroad and joined it to the Southern State road.

A recent instance of contemplated State ownership is furnished by Arkansas where, in 1897, a State board was created to locate, establish, and operate State railroads and telegraphs.

public importance, special aids,¹ partial or even complete exemptions from taxation, and lenient tax methods were frequently made the subjects of general statute and special charter provisions.

By 1860 the practice of granting aid to railways was widely prevalent. The outbreak of the civil war put a temporary check to the practice; but in 1865, particularly in the South,² it became even more marked than before the war. By 1875, however, the practice began to fall into disfavor. In 1874, for instance, the legislature of Georgia provided that no more State aid should be given except where a road had a vested right to the same. In 1875 Alabama repealed her railroad-aid act of 1865, and Illinois in 1877 legislated that counties could not be held liable after 1880 for any aid which they had promised railroads.

In a few instances, however, the practice has persisted up to quite recent years. Such has been the case in Kansas, where, as late as 1887, the legislature empowered the counties, cities, and townships of the State to aid railways by granting them subsidies and subscribing to their stock; in Maine, as late as 1891 and 1893, when Washington County was authorized to guarantee, for thirty years, 5 per cent interest on \$650,000 bonded debt of the Maine Shore Line Railroad, as well

¹ Aid granted to railroads was of different types. The following classification, accompanied by brief illustrations, will serve to differentiate those types:

State aid.

(1) By general enactment.

(a) Grants of land.

e. g., Iowa, 1853. Railroads were empowered to occupy any State lands without the payment of damages.

(b) Grants and loans of money and security.

e. g., Alabama, 1868. The State agreed to indorse the first-mortgage bonds of railways to the extent of \$12,000 per mile for each 20 miles of road, as completed, and \$16,000 per mile for each 5 miles as completed, beyond the first 20 miles.

(2) By special enactment.

(a) Subscriptions to stock.

e. g., Massachusetts, 1836. State treasurer authorized to subscribe to 10,000 shares of stock in the Western Railroad Company.

(b) Grants of land.

e. g., Minnesota, 1862 and 1863. Numerous grants to the Minnesota and Pacific, the Root River and Southern Minnesota, the St. Paul and Pacific, and other railroad companies.

(c) Grants and loans of money and security.

e. g., Maine, 1836. The State agreed to pay the necessary incidental expenses of surveying the Belfast and Quebec Railroad; expenses not to exceed \$5,000, to be refunded the State three years after completion of road.

Massachusetts, 1837. Five million dollars loaned to the Eastern Railroad Company.

California, 1863. The State agreed to pay the Central Pacific Railroad Company, on completion of 20 miles of line, \$10,000 for each mile constructed; only \$100,000 to be paid during the first two fiscal years.

Local aid (authorized by State enactment):

(1) By general enactment.

(a) Subscriptions to stock.

e. g., Illinois, 1843. Counties and municipalities authorized to subscribe to railway stock.

(b) Grants and loans of money and security.

e. g., California, 1870. Counties authorized to issue railroad-aid bonds, not to exceed in aggregate amount 5 per cent of the taxable value of property in those counties; aid to be granted any companies after 5 miles of road have been constructed.

(2) By special enactment.

(a) Subscriptions to stock.

e. g., Kansas, 1855. Cities and counties authorized to subscribe to shares of stock in the Kansas Central Railroad Company.

(b) Grants and loans of money and security.

e. g., Alabama, 1869. City of Mobile authorized to issue bonds to aid the Mobile and Great Northern Railroad Company.
Michigan, 1864. County of Bay authorized to issue bonds to aid in the construction of a railroad from Bay City to East Saginaw.

² For instance, in Arkansas we find the following in 1867: The State promises aid to any railroad at the rate of \$1,000 per mile of line constructed up to the maximum limit of 100 miles, the State to be paid interest on the same and to be secured by a lien on the railroad; and again in 1868 authorization of aid was made to the amount of \$15,000 per mile to such roads as had not received grants of United States lands, and of \$10,000 per mile to such as had secured such grants, upon condition (1) that the total aid should not apply to more than 850 miles of road; (2) that a tax equal to the amount of interest on the State-aid bonds should be levied against the railroads until the bonds should be canceled, and (3) that five years after the completion of any road receiving such aid 2 per cent additional should be levied upon the whole amount of State aid.

To illustrate further, the legislature of Georgia in 1868 authorized the indorsement of the bonds of the Macon and Augusta Railroad Company to the amount of \$10,000 per mile of road, as well as of those of the Georgia Air Line to the amount of \$12,000 per mile of road, with an aggregate maximum of \$500,000, besides granting aid to numerous other lines.

In the North, too, the revival of the aid-granting policy is exemplified in numerous land grants, such as those in Michigan and Minnesota from 1865 to 1870, and in loans of funds, such as that by Massachusetts of \$3,000,000 to the Boston, Hartford and Erie Railroad Company, of \$2,000,000 to the Boston and Albany, and of \$300,000 to the Lee and New Haven Company in 1868.

as to subscribe to the stock of the Washington County Railroad Company, and in Iowa, where local aid has been authorized as late as 1894.¹

It would be impracticable to estimate the relative amounts of State and local aid which have been granted to the railroads of the country. It is a notorious fact that immense sums have been so granted by both classes of authorities. But surface indications point to the fact that aid from local authorities has exceeded in amount that from the State governments. A single typical instance will serve to give a notion of the extent to which possibilities of securing aid were embraced by the railways. In Illinois, as reported by the State auditor of public accounts in 1872, over \$1,900,000 had been granted under the act of 1865, and over \$1,400,000 under the act of 1869.

3. **Exemption of railroads from taxation.**—The practice of granting exemption from taxation never became so prevalent as that of direct aid. It reached its height probably during the decade or two subsequent to the civil war, when, generally in the form of specific grant, it came to be used sometimes as a supplement to, and in some cases as a substitute for, the policy of more direct aid. During the past two decades the practice has persisted where local conditions have warranted its continuance; but of recent years the tendency has been so far in the direction of its entire abolition that only a few survivals are any longer to be found. In New Hampshire, for instance, railroad lines are still exempted from taxation for a period of ten years after their construction. In New Mexico a similar provision is in force, except that the exemption is for a period of but six years. Another isolated example is to be found in Louisiana, where the Constitution of 1898 provided for the ten-years exemption of all railroad lines constructed in that State before 1904.

The whole tendency among the States of recent years has been to wipe out the last vestiges of railroad exemption privileges. Only a few instances of this tendency need be cited. In North Carolina, prior to 1891, three of the most important railways in the State were exempted from taxation. In that year, however, as the result of persistent effort on the part of State authorities, these exemptions were surrendered. In Arkansas the Cairo and Fulton Railroad (now part of the St. Louis, Iron Mountain and Southern) was exempt from taxation under its charter until it should yield a net profit of 10 per cent on its investment. The realization of this financial condition the railroad management was careful to avoid, so that the term of the exemption was indefinitely extended. A few years ago, however, the company reorganized. The State was not slow to realize its opportunity, and after a suit at law the company lost its exemption.

In Michigan, to illustrate further, the legislature of 1891 passed a law promising ten years exemption from taxation to all railway lines which should be constructed in that State north of the forty-fourth parallel of latitude. In 1897 the legislature repealed this law, and the State authorities proceeded to levy a tax on all of those roads which had already been built in that section of the State. The companies affected contested this action in the courts, but the procedure of the State was sustained on the ground that the exemption was a mere gratuity repealable at will. This doctrine had already been laid down in the courts of the United States, where it was held that a State legislative act, exempting the property of railroads from taxation, is not, when a mere gratuity on the part of a State, a contract to continue the exemption.² In Michigan, too, those railroads which had formerly been taxed under special charter privileges were, by legislative enactment, in 1891 brought under the general railroad tax laws, though the provisions of this act were not carried into effect until 1898.

The courts of the States and of the United States have been one in their endeavors to bring all railroads under the provisions of general railroad tax laws. Exemptions from taxation constituting a contract on the part of a State not to tax, are held never to arise by implication, and are construed narrowly in favor of the State.³ It has been laid down, moreover, that immunity from taxation is not transferable, with the result that the reorganization of a railroad company or the sale of a railroad property effects the wiping out of an exemption.⁴ Furthermore, consolidation of lines, except where express provision has been made to the contrary, results in the loss of exemption.⁴

¹ Arkansas, as late as 1897, granted lands to the Mississippi, Hamburg and Western Railroad and the Springfield, Little Rock and Gulf Railroad.

² See *Tucker v. Ferguson* (22 Wall., 527) and *West Wisconsin Railroad v. Supervisors* (93 U. S., 586).

³ *Railroad Co. v. Commissioners* (103 U. S., 1). For full list of cases, see Taylor, *The Law of Stock Corporations*, sec. 499 and note.

⁴ *Maine Central R. R. Co. v. Maine* (96 U. S., 499). For full list of cases, see Pierce, *The Law of Railroads*, pp. 486-7.

With State policy and legal tendency, therefore, not only opposed to the extension of exemption, but even operating toward its complete abolition, the practice has come to be of but slight significance.

4. Low taxation of railroads.—The practice of leniently taxing railroads was an important one until the close of the civil war period. It originated in the same conditions which gave rise to those two means of stimulating internal improvement which have just been outlined. Instances of the practice are too numerous to mention; but it may be said in passing that they generally took the form of taxes at a low rate (upon the bases of earnings, capital stock, and transportation property), in effect amounting to partial exemptions from taxation. A hasty survey of a few typical developments of the tendency to tax less and less leniently as time went on will serve to bring the early policy into clearer relief.

The early history of railway taxation in Georgia reveals a variety of methods applied at different times to various companies. Prior to 1850 exemption from taxes was the rule. At that time the Memphis Branch Railroad, the Central Railroad, and the Georgia Railroad (which will serve as types) were required by the State to pay taxes, respectively, of 3½ cents on each \$100 of capital stock paid in, 1½ per cent on net income, and 1½ per cent on net income in addition to 3½ cents on each \$100 increase of capital stock. In 1854 all railroads except those exempted by their charters, were required by legislative enactment to pay annual taxes on their capital stock and assets. In 1858 a tax of 1½ per cent on net income was added to the tax on capital stock, besides, in 1863, a graduated tax ranging from 5 per cent to 25 per cent upon all net income in excess of 8 per cent on the capital stock. In 1866 the rate of the tax on capital stock was fixed at one-half of 1 per cent. In 1868 certain roads were exempted from the payment of this tax; but all were still required to pay the tax on net earnings. In 1874 a tax on property values was provided for in addition to the net earnings tax, and in 1888 a definite property tax on the lines of the present day method was adopted.

In New Jersey, likewise, the early railroad taxes were levied on a variety of principles in accord with special charter provisions.¹ Justice Parker, in the case of *State Board of Assessors v. Central Railroad Company*,² outlines with clearness the course of railroad taxation in New Jersey:

"In the infancy of this class of corporations, when struggling for existence, the amount of tax they were required to pay into the State treasury was small. The State favored them by limiting the annual tax to be paid by such corporations to the one-half of 1 per cent on the cost of their respective roads. This tax was for State purposes, and they were not assessed for local taxes. The wise and liberal policy adopted by the State was founded in part on the fact that the enterprises in which such companies were engaged were at that time of doubtful success, and in part on the belief that if successful they would contribute vastly to the public good. As time progressed, these corporations extended their business operations and acquired additional property, often of great value, until in some sections of the State, especially in the cities, the exemptions from local taxation became so great as to encumber the property of citizens liable to be taxed with a heavy burden. To prevent injustice arising from the inequality of taxation, and to equalize as far as possible the public burdens, the legislature, on the 2d day of April, 1873, passed an act the avowed object of which was to establish just rules for the taxation of railroad property. This act made a radical change in the system. * * * The act of 1876, providing for State taxes on railroads, was passed after the adoption of the constitutional amendment. This act is almost identical with the act of 1873. The chief object of the act of 1876 seems to have been to make the system of railroad taxation conform to the constitutional amendment that took effect in 1875, which prescribed that the assessment should be on true value instead of cost. Where the acts of 1873 and 1876 did not conflict, the former stood, and under those two acts, both the State and local taxes on railroad property in this State were assessed and collected up to the enactment of the law of 1884."

The act of 1884 established the present system of New Jersey.

In Wisconsin the act of 1854 provided for a uniform tax of 1 per cent on the gross earnings of all railroads. In 1860 all railroad property requisite to purposes of operation was declared exempt from taxation. In 1862 the license tax on gross earnings was raised from 1 to 3 per cent. In 1874 it was raised to 4 per cent, where it remained until 1876, when a graduated tax was provided for upon lines which have been followed in modeling the present system.

¹ e. g., The charter of the Somerville and Eastern Railroad (1854) provided for a tax of one-half of 1 per cent on the cost of the road; that of the Northern Railroad Company (1864), for the payment of the sum of 4 cents for each passenger, and of 8 cents for each ton of merchandise carried across the State.

² 19 Vroom, 294.

B. SECOND PERIOD.—INCREASING AND MORE UNIFORM TAXATION.

This stage in the development of railroad tax systems is characterized chiefly by the decadence of the policies of subsidy and exemption from taxation, and by the application of general regulations to the taxation of all railways upon lines increasingly stringent and uniform. As has already been intimated, early railroad tax methods were in many instances made the subjects of special charter provisions. But in probably the majority of cases, the States recurred, very naturally, to methods already employed in the taxation of individuals, and taxed railroads under the provisions of the general property tax.

With but slight exception (as in the case of Pennsylvania,¹ which from the outset avoided the general property tax in this respect), the early practice of the States was the assessment of all real and personal property by local officials, in the same manner as with the similar property of individuals. The adoption of this plan was not altogether unwarranted by the conditions of the time. Up to 1850, the corporations of the country were nearly all of a purely local character. At that time none of the great trunk lines had been formed. But changed conditions soon began to appear. In 1851, for instance, various lines were brought together to form the New York Central Railroad; and in the few years following, the Baltimore and Ohio, Pennsylvania, and Erie lines were formed. As the result of changed conditions brought about by consolidations such as these, new tax requirements arose. Inadequate as had been the general property tax under local authorities, even under earlier conditions, it was now very soon shown to be entirely ill-adapted to this new office. Utter lack of uniformity in the operation of the system resulting from its local administration, facility of evasion, and failure of levies to measure even roughly the taxpaying ability of the different companies, among other difficulties, necessitated from time to time the adoption of modifications and substitutions, which have at length resulted in present systems.

In the course of this process, certain changes of quite general prevalence among the States have been effected. In the first place, there has been widely evidenced a tendency to tax transportation companies upon a different basis, or, to say the least, in a different manner from that which has been followed in the taxation of individuals. Thirty years ago the local general property tax was the main method applied to railroad taxation. Twenty years ago changes had already been so far effected that railroads were taxed on their property upon the basis of varied local assessments in less than one-fourth of the States. And more recently the application of the early method has been so far abridged that it is now to be found in its original form in but four States and one Territory. These which still cling to the primitive method are Louisiana, New Mexico, Oregon, Rhode Island, and Texas, and in the case of Texas there is a supplementary tax based on a different principle.

There is still prevalent in many sections of the country, however, an attitude favorable to the taxation of individuals and of corporations upon the same principle and in the same manner. Such, for instance, is the notion which pervaded the deliberations of the extra session of the Michigan legislature in 1898, convened to consider the subject of railroad taxation. Such, likewise, is the express requirement in a number of State constitutions. But the preponderance of practice is in the other direction; even in the cases of those constitutional requirements which have just been mentioned their practical force has been, in large measure, destroyed by the decisions of the Federal Supreme Court in a series of cases which hold that State constitutional provisions declaring that a certain large class of persons and corporations shall be taxed by general laws, uniform as to the class upon which they operate, allow a rule for railroads different from that which applies in the taxation of individuals.²

By way of explanation, however, it must be stated that in the majority of those cases where changes have been effected, the property tax has not been abandoned, but modified. There has been embodied in this growth simply an attempt to adapt the property tax to the most obvious requirements of a system of railroad taxation. The result of this process of adaptation has been the establishment of methods for railroad taxation which differ essentially both in their operation and in their administration from those employed in the taxation of individuals, and even of other corporations; railroad property is made a special class for purposes of taxation in that it is subject to assessment by State, not local, authorities.

¹ Pennsylvania, at first, like many other States, employed special railway taxes. For instance, in the charter of the Pennsylvania Railroad Company, incorporated in 1846, a tax of 5 mills per ton-mile upon all merchandise transported, except the ordinary baggage of passengers, was provided for.

² See State Railroad Tax Cases (92 U. S., 575).

The New Jersey tax commission of 1897, in its report, very well points out the distinct character of the two systems in a statement which is generally applicable:

"It will be readily seen that these two systems, thus described and contrasted, are not coordinate; there is no tribunal in the State clothed with powers in which the values of the one class can be contrasted with the values of the other; they run in parallel lines, so to speak, being two separate, independent systems."¹

In fact, the incorporation of the feature of assessing the value of the railroad franchises, in addition to that of visible property, in the systems of many of the States, has so far obscured, or at least modified, the workings of the original property tax as to effect by existing methods a substantial divorce from the methods applied in the taxation of individuals.

As an offshoot of this tendency toward railway tax systems, distinct from those employed in the taxation of individuals, has come a process of change in the direction of a growing degree of centralization in railroad tax administrative machinery. With the widening scope of railway consolidation effective local administration of railway taxation has come more and more to be a matter of practical impossibility. Experience has shown that the problem is by so much further toward solution as the progressive steps toward the formulation of a tax system tend to broaden the field of the application of that system; legislative practice has of necessity followed these lines.

In the legislation of many of the States one of the accompaniments of the centralizing tendency which is becoming more and more noticeable is the practice of authorizing certain State officials to examine the books and papers of transportation companies for information in the making of assessments. There seems to be a growing desire to reach by taxation every company's full earning capacity, and the adoption and extension of this device of examining railroad accounts is an attempt toward the attainment of that end. Whether its workings are effectual as at present applied is questionable. The commissioner of railroads of Michigan, for instance, asserts that "that provision of the statute which gives the commissioner the right to examine books and papers is a humbug. It takes six months to examine a little broken bank in Lansing. How long would it take to examine the affairs of a great railroad?"² But aside from any consideration of the inefficient character of the regulation, the fact of its increasing prevalence is evidenced in State legislation. The growing advocacy of a uniform system of railway accounting deserves to be noted as tending in the same direction. Possibilities of railroad regulation, beyond the mere matter of taxation, are involved in these plans.

C. SPECIAL LINES OF DEVELOPMENT.

We must now consider a little more closely certain special features of the changes which have been brought about in the formulation of distinct systems for the taxation of transportation companies, namely, those changes which, developing from cruder methods, have resulted in transportation taxes upon the bases of property, capitalization, and business receipts, the latter two, broadly speaking, characterizing the States east of the Mississippi and north of the Ohio, and the first the remaining sections of the country. There are differences of opinion as to the relative advantages of the different methods. Thus, some writers and public men, approaching the question from the standpoint of justice in tax distribution among the various companies, look upon earnings taxes as the most desirable; others, impressed with the difficulties which appear to lie in the way of successfully administering taxes on earnings, favor taxes based on capitalization, and still others, who think that corporations ought to be taxed upon the same basis as individuals, favor the property tax. These differences of opinion will come out from time to time in what follows.

1. Taxes on property modified.—In the majority of the States, as we have already indicated, departures from early tax methods took the form of a modification of the original property tax as employed in the taxation of individuals. Systems based on cash valuation of property or of property and franchise by State officials came into use. In 1880 the general property tax, although lying at the bottom of the systems employed in most of the States, was, in its primitive form of local assessment, the exception rather than the rule, and during the two decades which have since elapsed the system of cash valuation by State boards or officials has made still further inroads into those States where the local property tax was formerly in vogue. Such, for instance, has been the case in Arkansas, in Iowa, and in other States where the demand for greater uniformity in administration has necessitated this change.

To be sure, the origin of this method in the general property tax and its subsequent development along the lines of that system do not warrant the expectation

¹ Report of the New Jersey tax commission of 1897, p. 10.

² Supplement to the Michigan Senate Journal, extra session of 1898, p. 11.

of close approach toward correctness of principle in its formulation or of high degree of efficiency in the details of its operation. It is not surprising, when we consider the rapid growth of the country's external and internal traffic, that tax legislation has failed to adapt itself completely to the new requirements which have arisen because of this speedy growth. American legislative activity, particularly in the field of taxation, has always been conservative, and it is but a natural consequence of the conservative tendency to regard the tax on property values as the "measure of justice and equality" that the old principle has been embodied in the railway tax systems of most of the States.

The system of railroad taxation based on cash valuation of property or of property and franchise is rather complex in its administration. As regards details, its operations are not identical in any two of the States, but its main features are everywhere the same.¹

In about a third of the States the process of departure from early methods took the form of a series of substitutions for, rather than modifications of, the general property tax.

2. Taxes on capitalization.—In a number of States systems based on the various forms of capitalization were adopted. Prior to 1880 considerable progress had already been made in this direction.² In Connecticut, for instance, a tax based on valuation of corporate capital and floating and funded indebtedness came to be employed; in Maine, one based on market valuation of capital stock was adopted, and in New York, one providing railroad taxation in common with corporations generally, upon the basis of capital stock according to dividends, was established. Since 1880, as regards railroad taxation, but little advance has been made in the introduction of these methods into new States. Their most significant extension has been in the cases of the various other classes of transportation companies; but these will be mentioned later.

One of the most serious obstacles to which taxes based on capitalization have been exposed in the past has been the restriction which has been put upon the taxation of corporate bonded debt by decisions of the United States Supreme Court. In 1872 that body decided, in effect, that a State tax on that portion of a company's bonded debt which is held by nonresidents of that State is unconstitutional.³ It is a well-known fact that the bonded capitalization of the railroads of the country is nearly equal in amount to their capital stock, and that, therefore, a tax which rests in its immediate incidence merely upon the capital stock of a railway corporation, reaches only a portion of the real investment. To this fact may probably be traced the origin of an influence which has acted as a deterrent to the wider adoption of taxes based on capitalization.

In a comparatively recent Oregon case, however, the Supreme Court arrived at the decision that a tax levied within a State upon a foreign held mortgage, which is secured by real estate situated within that State, is constitutional.⁴ Should this doctrine be held to apply to corporate forms of mortgage indebtedness, a noteworthy change in the status of the tax on corporate capitalization would be effected. Such, at any rate, has been taken to be the implication of the decision by the committee of the New York legislature of 1899, which drafted a bill providing for the taxation of debts and obligations secured by mortgage of real estate situated within the State.⁵

3. Taxes on receipts.—Another method of railroad taxation which was formulated in the place of the general property tax, was that of the tax on business receipts. Prior to 1880 taxes based on this principle had already been established in a number of States. Thus, Michigan, Minnesota, and Wisconsin had graduated gross receipts taxes.⁶ In Pennsylvania, too, a tax on gross receipts, in addition to the earlier general corporation tax on capital stock, was established; and

¹ For outline of this method, see p. 14.

² Numerous precedents had already been set in the taxation of corporations other than railroads. For instance, Georgia, in 1805, and Massachusetts, in 1812, passed acts imposing taxes on the capital stock of banks. A number of States, too, had already applied this method in the early taxation of railroads. Such was the case in Kentucky, where, for instance, the Licking and Lexington, the Louisville and Frankfort, and other railroads incorporated in 1847 and thereabouts were required by charter provision to pay taxes based on their capital stock. Such also was the case in Georgia, as we have already seen, as well as in Massachusetts, Maine, Michigan, and other States, where special provision was made with a view toward dealing leniently with roads which were in a struggling condition.

³ Case of State tax on foreign held bonds (15 Wall., 300).

⁴ Savings Society v. Multnomah County (169 U.S., 421).

⁵ Report of joint committee on taxation of the New York legislature of 1899, p. 12.

⁶ Here again precedents had been set in the taxation of corporations other than railroads. Such were the early taxes on the premiums of insurance companies (generally gross premiums or gross receipts); e.g., the New York tax of 1829, of 10 per cent on the premiums of foreign fire insurance companies, and the similar taxes of 1825 in Vermont, of 1832 in Massachusetts, of 1839 in Maryland and of subsequent years in other States. From 1840 to 1880, gross receipts taxes on railways were employed in a number of States, but were subsequently abandoned. Such were the Alabama tax of 1865 and the Iowa taxes of 1868 and 1870.

in Delaware and Virginia, net earnings taxes were adopted to supplement the existing taxes of those States. Since 1880 the gross receipts tax has been still further extended. For example, in 1881 Maine abandoned the tax on capital for one based on gross receipts; in the same year New York supplemented its existing system by a gross receipts tax; and in 1882 Vermont, like Maine, provided for a tax on gross receipts. But in Vermont, as the result of constitutional exigencies, this tax has since been made alternative with one based on property valuation. The former method, however, still prevails in practice. Since 1880 several other States, following the example set by Pennsylvania and New York, have adopted gross receipts taxes supplementary to previously existing systems.

But those cases in which taxes on receipts or earnings have been openly introduced into State tax systems are not the only ones in which these methods are applied. In States where the property valuation prevails the State boards whose duty it is to determine valuations very often have considerable discretionary power. The tax laws which apply in these cases frequently provide that the assessment boards shall value railroad property with a due regard to its earning capacity. In such instances, the possibility of arriving at a valuation which will bear an approximately constant relation to earning capacity, though only infrequently realized, still exists. And still further, in those States where the franchise is valued in addition to property, both earnings and capital are often considered in arriving at a valuation. The application and extension of methods such as these are to be regarded as at least an indication of a drift of sentiment toward tax methods based on railway earning capacity. That clause in the constitution of North Dakota which explicitly recognizes the tax on gross receipts as one suited to railway taxation must also be regarded as indicative of possibilities in this connection.

The stand which has been taken by the Supreme Court of the United States in the matter of the taxation of receipts from interstate traffic, however, has probably placed a serious impediment in the way of a much wider extension of the railway gross receipts tax than at present exists. In a series of litigations, the Supreme Court held that a State tax on gross receipts resulting from interstate traffic, except when levied as a franchise tax, is an interference with interstate commerce, and is therefore unconstitutional.¹

Owing largely to the influence of these decisions, as well as to causes of a local nature, there appears to have set in within the past five years a tendency away from the gross receipts tax in two States which have in the past been its main strongholds. In Wisconsin, and to a greater degree in Michigan, the existing systems have been subject to opposition.

In the case of Wisconsin, the feeling in the matter is well voiced in the report of the Wisconsin tax commission of 1898. They say:

"Most of the forms of tangible property are already taxed in full proportion to their value. In the case of banks, manufacturing, and trading corporations, corporate property appears to be as highly taxed as that of private individuals; but we do not think that this is true of any class of corporations taxed on the basis of earnings or on the mileage basis."²

There is at least a single reason why taxes on earnings are apt to be at a relatively lower rate as measured by property than direct property taxes. Under the general property tax, as it is commonly administered, assessed valuations are generally only fractions (varying often from one-half to three-fourths) of the true value of the properties subject to assessment. Upon the surface of things, therefore, the rate of tax on property appears relatively higher than it really is.

In Michigan the agitation against the existing tax on gross receipts has been very spirited.³ In 1897, and again in 1898, the railroad commissioner of the State in his reports arraigned the State system as unjust and ineffective; he recommended in its stead the adoption of a tax based on property valuation. The governor of the State and other prominent men have been untiring in their efforts to bring about such a change. As a result during the legislative session of 1897, the "Atkinson bill" was introduced. It failed to pass at that session, and was made the issue for a special session. After various experiences it was passed by the legislature of 1899. This bill, which was largely modeled after the Indiana law, provided for a railway-tax system based on cash valuation of property and franchise, upon general lines similar to those which characterize that system wherever it prevails. The law, however, was very short lived; for not long afterward the supreme court of the State in two test cases⁴ declared it unconstitutional.

¹ Compare *Fargo v. Michigan* (121 U. S., 230), and *Philadelphia and Southern Steamship Company* (122 U. S., 326), with *Maine v. Grand Trunk Railway Company*, 142 U. S., 217.

² Report of Wisconsin Tax Commission of 1898, p. 157.

³ See p. 19.

⁴ 78 Northwest Reporter, 125.

How much this agitation is the result of merely transitory political influences, and how far it is the outcome of strictly economic causes, it would be difficult to determine. Whatever may be the verdict on that question, it is evident that the political struggle against the existing system has not yet spent its force; and in view of the fact that the people of the State, in the fall election of 1900, voted in favor of a constitutional amendment rendering property taxation possible, it ought not to be a matter of surprise if a measure substantially the same as the Atkinson bill were yet to find its way into the statute books of Michigan.

The experience of Maryland has been quite the opposite of that in Michigan and Wisconsin; for under the law of 1896 the gross-receipts tax on railroads was noticeably expanded.

4. Apportionment of taxes between States.—In connection with the taxation of transportation companies upon all of the bases which have been mentioned above, there has been rapidly spreading an administrative device for the prorating, according to mileage, of taxable elements of an interstate character. In the case of the tax on cash valuation of property the necessity for the adoption of this plan arises, of course, only in the taxation of rolling stock. The plan generally followed in such cases is to tax rolling stock upon that portion of its value which is represented by the proportion of mileage traversed within a State to the total mileage covered.

Under the tax on capital, in the case of foreign corporations, the legal requirement that only such portion of the capital stock of any company as is employed within a State shall be taxed by that State has resulted in the general adoption of the plan. The taxation of sleeping-car companies in Pennsylvania furnishes a good example of this practice. In that State the capital stock of every such company is assessed by a State official, taking as the basis of assessment such proportion of the capital stock as the number of miles of railroad over which the cars of the company are run in Pennsylvania bears to the mileage in that and other States over which its cars are run. The legality of this method has been repeatedly affirmed by the United States courts.¹ In the case of domestic corporations, although the practice of prorating is not necessitated by legal decisions, recognition of the practical justice attainable under the method has led to its general adoption.

Under the gross receipts tax, so far as concerns foreign corporations, any attempt by a State to tax receipts other than those resulting from purely intrastate traffic encounters a direct prohibition in the decision of the United States Supreme Court. In the case of domestic corporations the right of any State to measure the value of a franchise which it has granted by total receipts, even including those from interstate traffic, has been upheld by the courts.² But the plan generally followed in such a case has been that of taxing only a mileage proportion of the gross receipts. Such, for example, is the method followed in Maine, where receipts from business of an interstate character are prorated according to the ratio which mileage traversed in doing business within the State bears to total mileage covered both within and outside of the State.

There appear to be no cases where companies doing an interstate business are taxed on their entire gross receipts. Where the prorating method is not expressly provided for statutes usually declare that the tax shall apply to "receipts from business done within this State." In practice there appear to be two ways of carrying this out, either by taxing all companies (both foreign and domestic) upon their receipts from business done wholly within the State, or by taxing all companies by the prorating method, foreign companies not caring to appeal to the courts to avoid the resulting addition to their taxes.

D. MISCELLANEOUS TRANSPORTATION AND TRANSMISSION COMPANIES.

One of the practices which is constantly becoming more and more prominent in the enacting of State tax laws is that of making specific provision for the taxation of transportation and transmission companies other than railroads. Of recent years this has been particularly the case with those companies which do a business upon the various railway lines of the country, complementary and subsidiary to the railway business. In legislating for the taxation of these companies the States have very noticeably avoided the property tax. It appears to have been quite generally recognized that a tax on the mere value of the property of these companies would be entirely ineffective in reaching their true taxable capacity. That this evil does actually arise under the property tax is amply affirmed in the experience of those States which still cling to that tax. But changes are con-

¹ See *Pullman Car Company v. Pennsylvania* (141 U. S., 18).

² *State tax on railway gross receipts* (16 Wall., 289); *Maine v. Grand Trunk R. R. Co.* (142 U. S., 217).

stantly being effected, and the general practice of recent years has been manifestly pointing to the abandonment of old methods and tending toward the adoption of others, which have already proved tolerably efficient in a number of the States.

1. Express companies.—In the case of express companies the need for specific tax provision has been very marked. Under the local general property tax these companies have almost entirely escaped taxation. The attorney-general of Montana not long ago made a statement bearing on this point, which is typical of the operation of this method wherever it is employed. He says:

"Take, for instance, one of the principal express companies operating in this State (Montana); in one county it undoubtedly does a business of several hundred thousand dollars, and the property owned by it in the county subject to taxation will not aggregate in value \$5,000. The system now prevalent, which ignores the franchise and simply assesses the tangible property, is practically a farce."

Many States have sought to remedy this state of things by specific legislation on the subject, and in most cases where this has been done the gross receipts tax has been adopted. Of quite recent years, however, the legislative trend appears to be toward a form of tax based on capital stock. Indiana adopted such a tax in 1893; Wisconsin pursued a similar plan in 1899, and Iowa in 1900. Ohio several years ago changed over from a gross receipts tax to one nominally based on cash valuation of property, but in reality fixed very largely on the basis of net earnings. The practical difficulty of making adequate provision for the taxation of these companies, at least in the light of various legislative efforts in the matter, is not a slight one. It will be interesting to note the experience of Texas, which is not far from typical in this respect.

The first law in that State upon the subject, enacted in 1879, in line with Southern tendencies, provided for a specific annual tax of \$700, to be paid by every company doing business within the State. In 1883 the amount of the tax was reduced to \$500. This law continued in force for seven years, when the amount of the tax was raised to \$1,000. This act was, in turn, repealed in 1895, when the present law, taxing these companies on the basis of their gross receipts, was enacted. The workings of this law appear thus far to have been attended with satisfactory results.

2. Palace-car companies.—The taxation of sleeping, palace, and dining car companies has claimed considerable attention during the past twenty years. In a number of States taxes based on cash valuation of rolling stock have been adopted. But in the majority of cases where the taxation of these companies has been the subject of legislation the gross receipts tax has been adopted. The tax on capital has also gained ground, as is shown by the enactment of the Indiana law of 1893 and the Wisconsin law of 1899. The experience of Texas in this matter, as in the case of express companies, is an interesting one. The first law on the subject, passed in April, 1879, provided for an annual tax of \$3 per mile of road in the State over which cars were hauled. Three months later the system was changed to one of a tax of one-half of one per cent on the value of cars used in the State. In 1881 this law was repealed, and the law levying \$2 per mile was reenacted. A year later the tax was reduced to 50 cents per mile. All of these laws having proved unsatisfactory the present law was passed in 1893. This, with the supplementary law of 1897, provides for a tax of one-fourth of one per cent on the annual value of the gross receipts of the companies concerned, in addition to a tax of 25 cents on each one hundred dollars' valuation of the capital stock employed within the State.

3. Fast-freight lines.—The problem of the taxation of fast freight and car lines has of recent years received a considerable share of attention. In the framing of laws for their taxation the tax on capital appears to have been the prevailing model. Such was the case with the Wisconsin law of 1899, as well as with the law passed in Minnesota in 1897, where all other transportation companies are taxed on the basis of gross receipts.

4. Summary.—Upon the whole, the most marked tendency to be noted of recent years in the legislation for the taxation of express companies, sleeping-car companies, and freight-line companies has been one which points to the increasing adoption of taxes on capital. The Maryland law of 1893, which already had noteworthy precedents in the general corporation tax systems of Pennsylvania and New York, appears to have set an example which has been followed quite widely in the States northwest of the Ohio River. The gross receipts tax, largely as the outcome of the intervention of the Federal judiciary, has of late been but little adopted.

The most notable practice among the States in the taxation of telegraph companies has been that of taxing them on a valuation of telegraph lines, determined on the principle of a fixed sum per mile of wire. This plan and that of the tax on gross receipts constitute the two methods which prevail in the majority of the States. With telegraph companies, as with railroads, the decisions of the United States Supreme Court have been unfavorable to the taxation of interstate receipts.¹

Legislation for the taxation of telephone companies has been upon much the same lines as with telegraph companies, except that not infrequently as regards the former, instead of the method of levy at a specific sum per mile of wire, the plan of a fixed tax per instrument in use has been followed.² In a number of States, moreover, telephone companies have been made subject to taxes on gross receipts, where telegraph companies have been taxed on some other basis.³ This has been due, at least in part, to the fact that the telephone business is still mainly of a local character, with the result that a tax on the gross receipts of a telephone company, which are predominantly of an intrastate character, does not, as in the case of telegraph companies, encounter the limitations which have been imposed by Federal court decision.

E. OTHER EXPANDING PRACTICES.

1. Taxation of foreign corporations.—There yet remain to be noted several changes in the practice of taxing transportation companies, which are coming more and more to characterize the taxation of corporations generally. Chief of these is the growing practice of treating domestic and foreign corporations upon the same general footing. This has come to be the case almost universally with the tax on cash valuation of property. In the case of the tax on capital, State policy and practice are tending in the same direction; and even where the gross receipts tax prevails, although exceptions in practice still exist, State authorities are more and more striving to conform to this rule. The State courts are being instrumental in bringing about the same result. For example, in New Jersey the supreme court has decided that it is not competent for the State to lay a tax upon a foreign corporation in a mode which differs in principle from that which it applies to the taxation of its own corporations.⁴ In California it has been held by the court that in case a corporation does an interstate business, such that the State has no power to keep it out, the assumption is that the State must apply to it the same principle of taxation as is applied to domestic corporations.⁵ Further, the Louisiana constitution of 1898 provides that foreign corporations may be taxed in a different mode from domestic corporations, but that the principle which is applied must be the same in both cases.

With regard to those laws which have been enacted in many States, under a variety of names, for the levying of a fee upon corporate charters, similar facts are to be noted. In New York, for instance, according to the decision of the courts, the State tax on organization applies to foreign corporations beginning to do business within a State, as well as to those of domestic origin. The Vermont laws of 1890 and 1894 make provision to the same effect, as do, also, the more recent laws of Texas and Washington.

2. Taxes on incorporation.—Another practice which is of growing significance is that of levying taxes upon the incorporation and organization of corporations and joint-stock companies. Fifty years ago legislation of this character was far from general. At present laws of this type are to be found in nearly two-thirds of the States. The same, in the main, holds with regard to the levying of many of the so-called "license taxes" on corporations, and also, since 1878, with respect to the introduction of the franchise feature into the systems of many States.

3. Taxes on securities.—Finally, that change of attitude which is resulting in the abandoning of the tax on security holders must be noted. Not many years have passed since the practice of attempting to collect a tax from the holders of corporate securities was almost universal. Of recent years, particularly in the case of railroad securities, a large proportion of the States have given up the attempt, and, instead, have sought to tax the corporations directly to the full

¹ *Telegraph Company v. Texas* (105 U. S., 460), and *Ratterman v. Western Union Telegraph Company* (127 U. S., 411).

² *E. g.*, Connecticut, Mississippi (according to number of subscribers), and Tennessee.

³ *E. g.*, in Alabama, Kentucky, North Carolina, Vermont, and Wisconsin.

⁴ *Erie Railway Company v. State* (31 N. J., 531, 543).

⁵ *San Francisco v. Liverpool Insurance Company* (74 Cal., 113).

extent of their apparent taxable capacity. The laws of California and of Arizona, for instance, have gone so far as to forbid explicitly the taxation of both corporation and security holder, the law in the latter State asserting that "shares of stock in a corporation possess no intrinsic value over and above the actual value of the property of the corporation for which they stand." The increasing prevalence of this attitude, in addition to the fact of the practical impossibility of collecting a tax from the holders of securities, are both indicative of the abandonment of the practice.

CHAPTER II.

ANALYSIS OF PRESENT METHODS OF TAXING TRANSPORTATION COMPANIES.

State practice in taxing transportation companies is a varied one. There seem, however, to be three principles upon which the different State systems have been based—the property-tax principle, the income-tax principle, and the fee principle.

The essence of the property-tax principle is that all property shall be taxed at its true cash value—i. e., the price it would bring upon sale in the open market. The essence of the income-tax principle is that taxes shall be levied in proportion to income. Both property and income taxes are compulsory payments for the support of Government, and with both the aim is to adapt, as far as possible, the amount of levy to the taxable capacity of the various taxable subjects. The fee principle is different. The fee is a payment for benefit received. It may or may not bear a constant relation to taxable ability, and it may be either recurring in its levy or levied once for all. It may equal the full amount of benefit received or it may be less than the amount of benefit.

A. THE PROPERTY-TAX PRINCIPLE.

The property-tax principle underlies the systems of most of the States. It is embodied in two distinct forms. The predominant type is found in the property tax pure and simple, where direct assessment of property, as in the case of individuals, is the rule. Less prevalent, but no less significant, is the form exemplified in the various taxes on capitalization, based on indirect or inferred valuations of corporate property.

1. **The property tax.**—This is the most common method of taxing transportation companies. In a few cases it is subject to purely local administration, but in most of the States valuations are made by State boards or officials. The workings of the latter method, though not in detail identical in any two of the States, coincide in some such general characteristics as the following: Certain designated officials of the various railroad companies are required to return sworn statements or schedules to State officials, setting forth in detail the length of line with all its tracks, and the proportion thereof in each tax district of the State, all personal property of every kind, all rolling stock, and often a detailed description of the construction of track and roadbed, the time spent in that construction, and the value of materials employed. There is also required a full statement of all real estate owned or used in each tax district; of all stations, houses, or other buildings, and all equipment connected therewith; of the amount of capital stock, including its market value, or if there is no market value, the actual value of the shares, in some cases including a list of the shareholders and their places of residence, in addition to a statement of the total amount of all indebtedness, generally excluding current expenses. In some States the schedule must contain a statement of the respective companies' entire gross receipts, entire operating expenses, and entire net earnings, with a supplementary statement of the amount of such receipts, expenses, and earnings resulting from business done exclusively within the State. Neglect to furnish these sworn schedules is generally attended with heavy penalties, and false statements are punishable as perjury. Furthermore, in many cases, the State officials, to whom these reports are made, are empowered to require additional statements when necessary, and even, as provided in a number of States, to summon witnesses, to examine them under oath, and to compel the production of corporation books and papers. The work of assessment on the basis of these returns is generally intrusted to a specially con-

stituted State board, by whom the valuation is determined and in most cases* apportioned among the local taxing districts for the computation and collection of the tax. Railroad real estate not directly employed in traffic operations is generally both assessed and taxed by local officials.

The chief advantages of this general method may be summed up as follows: The duties of assessment are in the main performed by experienced and competent officials, thus minimizing the liability to unequal assessments, as between localities and between companies, under a property tax; the popular demand that corporations be taxed upon the same basis as individuals is realized; the method is in accord with both State and Federal constitutional provisions, besides being both reasonably productive and constant in its yield from year to year.

The reports of special State tax commissions in the main say little about the property tax except by way of condemnation, upon both practical and theoretical grounds; but the general attitude of State administrations and legislators toward the possibility of devising better methods appears to be much the same as that of the controller of Florida, when he says:

"The law provides for a uniform and equal rate of taxation, and that all property shall be assessed at its 'full cash value,' but it seems to be almost impossible to devise laws, however plain and explicit, that will result in an equal distribution of the burdens of government according to the value of the property owned and the ability of the person taxed to meet the obligation."¹

The chief defects of the method may be summed up by saying that it is cumbersome in its administration and not proportional to the earning power of the different companies taxed. The latter is its main failing. To illustrate: In Illinois, where the system of valuation is as exacting in its provisions and probably as thorough in its execution as in any other State, equality in distribution has not been reached. The following table² will verify this statement:

Railroad.	Assessed valuation.	Net earnings.	Ratio of net earnings to assessed valuation.	Index number.
			<i>Per cent.</i>	
Chicago and Alton.....	\$5,511,641	\$6,022,315	109.27	98.4
Chicago, Burlington and Quincy.....	7,865,938	8,724,997	110.92	100.0
Rock Island and Peoria.....	893,752	669,068	74.86	67.5
Lake Shore and Michigan Southern.....	660,706	461,690	69.87	62.9
St. Louis, Indiana and Eastern.....	101,707	65,563	64.48	58.1

It is interesting to note that with the above roads, which have been chosen indiscriminately, the tax varied inversely with the amount of earnings. Further investigation along the same line developed the fact that, though exceptions are too important to establish a general rule, the general trend was in this direction.

Similar facts are to be noted in Kansas, although in that State, owing largely to more fluctuating business conditions, the property tax approaches even less than in Illinois the attainment of equality. A few instances are given in the following table:³

Railroad.	Amount of taxes.	Net earnings.	Ratio of net earnings to taxes.	Index number.
			<i>Per cent.</i>	
Atchison, Topeka and Santa Fe.....	\$646,113	\$3,958,008	614	73.3
Chicago, Rock Island and Pacific.....	277,566	1,683,540	606	72.4
Missouri Pacific.....	395,371	1,065,353	269	82.1
Kansas City, Fort Scott and Memphis.....	88,125	564,678	641	76.6
St. Joseph and Grand Island.....	45,258	878,606	837	100.0
St. Louis and San Francisco.....	77,265	82,395	107	12.8

¹ Report of the controller of Florida for 1898, p. 10.

² Figures are for the year ending June 30, 1898, and are compiled in the case of Illinois from the reports of the Illinois State board of equalization, and of the railroad and warehouse commission, for 1898; and in the case of Kansas from the reports of the State auditor and of the State board of railroad commissioners for 1898. Net earnings here, as elsewhere, are taken to represent gross receipts less expenses of operation.

"The following table shows the percentage of taxes paid in Ohio to net income arising in Ohio in the year 1892 by a number of railway companies which are believed to be representative ones:"

	Percentage
Lake Shore and Michigan Southern Railway Company	11.22
Cleveland, Columbus, Cincinnati and St. Louis	10.62
Pennsylvania System	6.90
The Valley Railway	8.83
Cleveland and Canton	7.05
Cleveland, Lorain and Wheeling	6.39
Cleveland and Pittsburgh	8.48
Toledo and Ohio Central	6.54
Columbus, Hocking Valley and Toledo	5.16
Cleveland and Marietta	8.25
Cincinnati, Portsmouth and Virginia	17.94
Baltimore and Ohio Southwestern	6.57
New York, Chicago, and St. Louis	11.99
Wheeling and Lake Erie	7.99
Cincinnati, Hamilton and Dayton	9.35

Over periods of time the property tax is likewise ineffective as a measure of tax-paying capacity. It is inelastic in that it fails to adapt itself even to measurably permanent changes in the profitableness of the railway business. The Ohio tax commission of 1893 in its report brings out certain facts which bear directly on this point:

"The valuation of the Lake Shore and Michigan Southern Railroad Company in the year 1878 was \$12,996,609; in the year 1892 it was \$12,457,745. In the year 1878 the gross earnings of the whole Lake Shore System were \$13,505,159, whereas in the year 1892 the gross earnings were \$22,415,382 and the net earnings were \$6,612,192, as against \$5,493,165 in 1878.

"The comparison for the same respective years of the valuations of the Cleveland and Pittsburgh Railway Company is equally striking. In 1878 the whole valuation was \$5,731,000; in 1892 it was \$4,495,000. On the other hand, the company did 50 per cent more business in 1892 than in 1878, its gross receipts being \$2,372,166 in 1878 and \$3,429,278 in 1892.

"The Pittsburgh, Fort Wayne and Chicago Railway Company was assessed in Ohio in 1878 at \$10,732,001, and in 1892 at \$10,525,948, while the gross receipts in 1878 were \$7,830,000 and \$11,659,142 in 1892."

These illustrations have been chosen in instances where identity in point of mileage of line from 1878 to 1892 was substantially preserved. The year 1878 was selected because it differed in point of valuation in no material way from other years of that period. The real value of the property of these lines, if determined on the basis of earnings, undoubtedly increased during this period; and had account of this increase been taken the valuation would unquestionably have more nearly approximated a constant relation to earnings. Other States show results fully as bad.

In the administration of the tax on the cash valuation of property the method of arriving at a valuation by capitalizing earnings at a certain percentage must not be confused with the property-valuation method. Such a method practically amounts to a tax on earnings, and in its effect avoids some of the objectionable features of the property tax. Such a method has already been followed in New York and has been pronounced legal by the courts of that State. In Ohio it has had a limited application, and in a few other States it is occasionally employed in measuring the value of franchises for taxation, but instances are so isolated as to be of but slight importance.

The general property tax as locally administered is peculiarly liable to facility of evasion and lack of uniformity in its operation. The latter failing is typically illustrated by an instance cited in the report of the New York railway tax commission of 1879, where it is stated that in two adjoining counties of the State (New York) the valuation of the same railroad, as determined by the assessors of the two counties, varied \$24,000 per mile. Other counties varied as much as \$20,000 per mile.

2. Taxes on capitalization.—(a) *Tax on capital stock at par.*—This tax is, of slight significance from the standpoint either of present or of probable future State practice.

(b) *Tax on capital stock at actual or market value, and on capital stock plus bonded debt.*—In those States where these methods have been followed results have been reasonably satisfactory.

The Massachusetts tax commission of 1897, commenting on the system of that State, remarks that "little complaint is heard regarding those taxes—a signal

¹ Report of the Ohio tax commission of 1893, p. 58.

² *Ibid.*, p. 52.

proof that the taxpayers accommodate themselves, if not with ease, at least without serious complaint, to burdens which are steady, regular, predictable, and for which, in consequence, they are able to make calculations and adjust their affairs.

"The corporation tax is particularly simple, and is assessed with unerring exactness in the case of large and well-known corporations, whose shares are regularly dealt in, and consequently have a publicly recorded value. Railways, banks, the larger manufacturing corporations, and others whose stocks are frequently quoted, are taxed without a word of inquiry and without a possibility of escape."¹

Moreover the tax is economical in its administration and tolerably constant in its yield. Applied to railroads, the Massachusetts tax, like the corporation taxes of Pennsylvania and New York, has fairly well kept pace with increasing railway earnings.

In some cases State law requires that capital stock shall be valued at its actual value. This is the law in Pennsylvania as well as in New York. Actual value must be distinguished from market value, although in practice the two are likely to be the same where market values are easily ascertainable. The New York courts have emphasized the importance of observing the distinction. Judge Comstock says:

"There is no property so liable to speculation as stock in corporations. * * * Stocks may be and frequently are inflated or depressed by those who wish to sell or buy. They are subject, moreover, to all the vicissitudes of the money market. * * * Actual value is the result to be arrived at, for such are the words of the statute, and the inquiry, therefore, must have a primary regard to the property and estate which alone impart such value."²

Where, as in Pennsylvania, bonded debt is taxed, difficulties arise because of the restriction of the tax to resident bondholders.³ The extent of the injustice arising from this cause may be inferred from the following table⁴, prepared by the Committee on Railroad Taxation of the Pennsylvania Tax Conference.

Bonds and stocks of certain railroads of Pennsylvania and the amount of bonds held in Pennsylvania.

	Total bond issue.	Amount held in Pennsylvania.	Appraised value of stock.	Per cent of railroad in Pennsylvania.
(1)	\$450,000	\$116,000	\$450,000	All.
(2)	352,000	63,000	1,400,000	All.
(3)	72,800	2,700	383	All.
(4)	230,000	384	All.
(5)	240,000	8,000	48,000	All.
(6)	2,900,000	127,000	0.50
(7)	2,280,000	2,100,000	2,900,000	All.
(8)	200,000	200,000	80,000	All.
(9)	1,800,000	1,800,000	600,000	All.
(10)	275,000	All.
(11)	3,400,000	6,000	2,000,000	All.

"A moment's inspection of the above table—and a great many more examples might have been given—will show that it is impossible that the system of taxing railroads in Pennsylvania could act equitably as between these roads. Take the fourth example: This is a road with \$230,000 of bonds, not one of which is held in the State, and capital stock of the appraised value of \$384. The State taxes on this road outside of the tax on gross earnings were, in 1893, 5 mills on \$384, or \$1.92. The eighth road does not differ much in its character from the fourth, and is worth about the same. This road has \$200,000 of bonds, all held in the State, and \$80,000 capital stock. Its State taxes outside of the tax on gross earnings were \$1,200. The last road but one paid no State taxes on capital stock or bonds, as all of its bonds were held by nonresidents and its stock was worthless. The road with \$2,900,000 of bonds, 50 per cent of whose mileage is in the State, would pay nothing on bonds and the capital-stock tax on but \$62,350. This is certainly not equitable taxation."⁵

¹ Report of Massachusetts tax commission of 1897, p. 69.

² *People v. Commissioners of Taxes and Assessments* (23 N. Y., 192).

³ *Railroad company v. Pennsylvania* (15 Wall., 300).

⁴ This is a portion of a table on p. 16 of the Report of the Committee on Railroad Taxation, Pennsylvania Tax Conference.

⁵ Report of Committee on Railroad Taxation, Tax Conference of Pennsylvania Interests, p. 16.

Compared with other classes of property in the State, the Committee on Railroad Taxation concluded that in 1892 the railroads paid less and in 1893 fully as much as other property. The general opinion of the committee as regards railway taxation in the State was as follows:

"There are glaring inequalities in the taxation of Pennsylvania railroads, some paying on a fair valuation very much more than the average, others less. * * * This inequality grows out of the complex system of taxation of railroads in vogue in Pennsylvania."¹

The Connecticut system, levying a tax on capital stock and total indebtedness, as a "tax on property," avoids the difficulty which arises in taxing nonresident bondholders. The tax conference of Pennsylvania interests proposed a bill on the lines of the Connecticut system as a substitute for the present Pennsylvania system. The auditor's department has since looked into the effect of such a move upon the taxation of corporations from the standpoint of productivity. A summary of the results of that investigation, so far as it applied to railroad taxation (187 railroads reporting), is as follows:

Year.	Taxes under present law.				Under conference bill.	Increase.
	On stocks.	On loans.	On gross receipts.	Total.		
1895	\$1,122,868	\$170,039	\$382,772	\$1,975,669	\$2,097,238	\$121,569
1896	1,037,490	441,517	339,755	1,818,763	1,867,229	48,466

The decision of the United States Supreme Court in the Multnomah County case must not be forgotten as suggesting possibilities in the way of greater uniformity in the State taxation of corporate bonded debt.

In New York the joint committee on taxation, reporting a bill on January 15, 1900, for the taxation of mortgage debts, made the following statement in this connection:

"Can corporate bonds and other mortgage debts, when owned by nonresidents, be taxed by this State? The owners are beyond our territorial jurisdiction, and of course no personal liability for a tax can be imposed upon them. But the debts themselves are within our power if we can reach the debtor or the security. This is shown by the familiar practice of attaching or garnisheeing debts owed to residents of other States or countries in judicial proceedings. The Supreme Court of the United States has held that an attachment in Iowa of a debt owed by a citizen of Iowa to a citizen of Kansas was valid (although personal jurisdiction of the Kansas person was not obtained), and that payment of the debt under the order of the Iowa court was made binding by the Constitution of the United States upon the courts of Kansas. (*Chicago, etc., Railway Co. v. Sturm*, 174 U.S., 710.) It is said that the situs of intangible property is at the domicile of the owner, and for some purposes the statement is correct. The rule, however, belongs to the common law. It does not possess constitutional authority. The legislature is competent to change it. The Supreme Court of the United States has sustained against nonresidents a statute of Oregon imposing taxes on mortgages. (*Savings Society v. Multnomah County*, 169 U.S., p. 421.)"²

B. THE INCOME TAX PRINCIPLE.

The income tax principle lies at the bottom of the transportation tax systems of a number of the States, where various taxes on receipts and earnings have been established.

1. Tax on gross receipts.—This is the tax on transportation companies recommended by the railway tax committee in 1880, as well as by the Maryland tax commission of 1896 and the Maine tax commission of 1899. The New York committee remarks that "the requisite of a correct system of railroad, as of other taxation, is that it should, in so far as it is possible, be simple, fixed, proportionate, easily ascertainable, and susceptible of ready levy." The committee recommends the tax on gross receipts as "perfectly simple, * * * thoroughly proportionate, * * * and can by no possibility be evaded." A little farther on in the report the systems of Michigan and Wisconsin were characterized as "most intelligent and in conformity with correct principles." The Maine tax commission likewise recommends the tax on gross receipts as a method "doubtless as

¹ *Ibid*, p. 18.

² Report of the Joint Committee on Taxation, N. Y. legislature of 1900, p. 12.

fair as any, for by that method the levy is graduated to the amount of business the road is doing."

The report of the Maryland tax commission of 1886 concerned itself largely with railroad taxation. The commission recommended a graded license fee on gross earnings. In a supplementary minority report the following remarks were made:

"The plan recommended by the other members of the commission is, perhaps, as good as any, which is in entire harmony with our existing system of taxation, and deserves the careful consideration of the legislature. If it is decided, however, to inaugurate a new system, experience points to the Wisconsin method as preferable. The roads are thereby exempt from local taxation, and a license fee for the operation is charged, varying according to the gross earnings per mile. The license fees are expected to defray the entire expenses of the State government, and this plan is being followed elsewhere and everywhere with the same satisfactory results. It is simpler than the assessment by local authorities as well as State authorities, and the railroads are almost too powerful to be handled by the local authorities, who are likely to be worsted in their contests with vast corporations."

But, of recent years the opposition which has developed in Michigan and Wisconsin against their systems of gross receipts taxation has been considerable. This agitation, to which we referred above, has arisen largely out of a comparison of the results of the gross receipts tax in those States with the apparently more successful results of the method of cash valuation in several adjoining States.

A quotation from the message of the governor of Michigan to the fortieth legislature of the State well presents the attitude of the opposition in Michigan:

"The method is unjust. The tax upon earnings or income operates in favor of the railroad companies. When the times are hard and the earnings smaller, the tax is less. In the meantime the State's burdens are no less, and may, perhaps, have increased, and the relief accorded to the railroad companies during those hard times and depression must be borne by the property owners generally. Thus, during times of depression, when the people are less able to pay, their burdens are increased, and just to the extent that the railroad companies' burdens are diminished.

"What would be the result if the State attempted to collect the entire burden of a tax upon earnings or income? How much would the farmer or merchant have contributed from 1893 to 1897? The result would have been that the State would have received but little, if any, income and would have been bankrupt and unable to meet its obligations."

The report of the Michigan railroad commissioner for 1897 states the same position a little differently:¹

"It is apparent that the present system of taxing railroads is unjust.

"First. Because it is inequitable as compared with the tax upon other property and because it is unjust to tax one kind of property upon its earning capacity and refuse the same privilege to other property.

"Second. Because the State, under the present law, is powerless to determine whether the earnings reported by the companies are accurate or not, the whole machinery for determining or reporting the same being practically within the control of the railroad companies.

"Third. Because a partial control thereof by the State is inadequate to protect it.

"Fourth. Because the system as applied to roads doing an interstate business is a usurpation of the power of Congress to regulate commerce between the States, and to that extent is void."

The Wisconsin tax commission of 1898 had the following to say about the system of that State:²

"Our work has led us to the conclusion that all the corporations which are taxed on the basis of earnings or on a mileage basis pay relatively less taxes than other persons and less than they would pay on the basis of value. * * * (But) we are now prepared either to recommend that the system of taxation be changed to the method of assessment by a State board or the specific rates of taxation which should be fixed if the present method should be continued. * * *

"We recommend that if the present mode of taxing railroads be continued a new and closer classification of rates be fixed for the purpose of preventing the inequalities which arise under the system now in force (as well as) that the present plan of taxing railroads on the basis of mileage be discontinued."

¹ Report of the Railroad Commissioner of Michigan for 1897, p. xli.

² Report of the Wisconsin Tax Commission of 1898, p. 188.

The systems of both Michigan and Wisconsin provide for taxes graduated according to receipts per mile of line. That this method results in many inequalities will be seen from the following extract from the report of the Wisconsin tax commission of 1898:¹

"So long as the system of taxing on the basis of gross earnings exists it is evident that careful attention should be given to the subject of classification.

"There are several instances which illustrate that the existing classification sometimes leads to singular results which would seem to call for some correction.

"The taxes paid by the Green Bay and Western Railroad in 1897 were \$3,745, and its gross earnings were reported at \$442,319, or \$1,965.86 per mile. Under the existing law, if the road had earned \$35 more per mile it would have paid a tax of \$13,500 instead of \$3,745. That is, a difference of less than \$8,000 of gross earnings by this road made a difference in its taxes of nearly \$10,000.

"As a further illustration, the taxes paid by the Kewaunee, Green Bay and Western road were \$609.33, and its gross earnings \$72,083, or \$1,964.12 per mile. If the road had earned \$36 more per mile it would have paid a tax of \$2,202 instead of \$609.33. That is, a difference of about \$1,300 on its gross earnings made a difference in its taxes of nearly \$1,600."

Apart from practical considerations of this nature, it is to be doubted whether the method attains its object. This practice may in part be based upon those grounds which are commonly urged in favor of progressive taxation, but its chief justification is to be found in the notion, mistaken or otherwise, that the larger, relatively, the gross earnings of a company are per mile, the larger is the proportion attributable to net earnings, and as a consequence, the greater its taxable capacity. That the truth of this notion is not verified by the statistics of the larger railroads operating through several States of the country may be seen from the following table:²

Railroads.	Mileage.	Earnings from operation.	Operating expenses.	Net earnings.
Pennsylvania.....	2,817.61	\$61,043,133	\$41,512,615	\$19,630,418
New York Central and Hudson River.....	2,409.88	43,577,927	27,573,281	16,104,646
Erie.....	1,855.36	29,051,011	20,241,353	8,769,658
Cleveland, Cincinnati, Chicago and St. Louis.....	1,893.62	13,117,111	9,481,876	3,625,235

Since, however, the matter of a graduated tax is essentially a State problem, which involves both large and small roads, a different result might be expected from an examination of the figures of lines or portions of lines operating in single States. But the following table³ shows that the evidence is almost as contradictory here as in the case of entire railway systems.

¹ Report of Wisconsin tax commission of 1898, p. 182.

² Figures are compiled from the Statistical Report of the Interstate Commerce Commission for 1897, and cover the fiscal year ending June 30, 1897.

³ Figures for Wisconsin are compiled from the statistical report of the Interstate Commerce Commission for 1897; those for Illinois from the report of the Illinois railroad and warehouse commission for 1896.

¹ Freight service only on this road

It is often urged (as in the message of the governor of Michigan, cited above) that the gross-receipts tax furnishes a source of revenue which fluctuates violently from year to year. The following table, setting forth the amounts of railway taxes and their proportions to total State revenues in Michigan and Wisconsin for six consecutive years, will throw some light on this point.

Year.	Michigan. ¹					Wisconsin. ²				
	Railroad taxes.	Index No.	Total State receipts.	Index No.	Ratio of railroad taxes to total.	Railroad taxes.	Index No.	Total State receipts.	Index No.	Ratio of railroad taxes to total.
1891	\$778, 43	82	\$3, 181, 308	60	24. 47	\$1, 140, 046	79	\$5, 563, 267	81	31. 99
1892	742, 271	79	3, 210, 832	61	23. 12	1, 220, 674	85	3, 232, 283	73	37. 20

¹ Figures are compiled from reports of State treasurers, and cover years ending June 30.

² Figures are compiled from reports of State treasurers, and cover years ending September 30.

The degree of fluctuation here is not so great as in the case of total State revenues.

The question of the degree to which a gross receipts tax approaches a perfect measure of net earning capacity is an important one from the standpoint of justice in tax distribution. The following table will illustrate this point. The figures are compiled from the statistical report of the Interstate Commerce Commission for 1897. The figures for net earnings are assumed to represent the relative tax-paying ability of the different groups of companies, and are determined by deducting from gross receipts all the expenses of conducting transportation (not including interest payments and taxes). The territorial groups are those employed by the Interstate Commerce Commission in their annual statistical reports, and cover the whole country. Group I comprehends the New England States; Group II, the Middle States (excepting the northwestern section of Pennsylvania, the dividing line running through Pittsburg), Maryland, and the northern section of West Virginia; Group III, Ohio, Indiana, and the southern peninsula of Michigan (the dividing line running through Pittsburg and Chicago, the northwestern section of Pennsylvania being included); Group IV, South Carolina, North Carolina, Virginia, and the major part of West Virginia; Group V, the remaining Southern States east of the Mississippi; Group VI, the States and portions of States east of the Missouri River and west of the eastern border of Illinois and the Great Lakes; Group VII, Montana, Wyoming, Nebraska, the northern third of Colorado, and the portion of the Dakotas west of the Missouri River; Group VIII, Kansas, Arkansas, Oklahoma and Indian Territories, Missouri (south of the Missouri River), the southern two-thirds of Colorado, the extreme northern corner of Texas, and New Mexico (north and northeast of Santa Fe); Group IX, Louisiana, Texas, and New Mexico (southeast of Santa Fe); Group X, the remainder of the country.

Group	Net earnings.	Gross receipts.	Ratio of net to gross receipts	Index number.
			<i>Per cent.</i>	
Group I	\$28,812,276	\$95,237,489	30.24	77.4
Group II	107,610,565	332,677,113	32.34	82.8
Group III	49,670,562	175,821,656	28.19	72.2
Group IV	16,112,926	49,075,806	32.83	84.1
Group V	29,357,134	91,673,137	31.01	79.4
Group VI	91,023,164	236,169,682	38.54	98.7
Group VII	16,847,451	43,153,626	39.01	100.0
Group VIII	31,563,285	98,017,221	32.19	82.4
Group IX	11,804,146	46,429,510	25.42	65.1
Group X	24,939,600	75,894,483	32.86	84.2

A comparison for four successive years is as follows:

Year.	Net earnings	Gross receipts.	Ratio of net to gross receipts.	Index number.
			<i>Per cent.</i>	
1894	\$385,929,977	\$1,216,178,602	31.73	97.2
1895	387,168,919	1,207,803,595	32.06	98.2
1896	412,687,278	1,279,191,107	32.26	98.8
1897	406,611,109	1,247,179,783	32.65	100.0

The objection may be raised that these illustrations are far from revealing the justice or injustice of the gross receipts tax as between individual roads. The objection is a valid one. They do, however, strike an average figure for groups of roads situated in different sections of the country, in which varying economic conditions predominate. By this means a general survey of the workings of a general gross receipts tax as regards tax distribution may be obtained. If individual roads were chosen the apparent injustice of the tax would be even greater, for there are roads which have large gross receipts and no net income—taxes and operating expenses swallowing up all of the earnings. Others are operated for varying percentages of the gross earnings, leaving a varying remainder for net income. In such cases gross receipts would furnish a very inconstant index of tax-paying ability.

2. Tax on net earnings or income.—From the standpoint of actual practice this tax is of but slight significance, but it has often been so strongly urged that a brief consideration will not be amiss.

First, with regard to what elements should enter into net income as a basis for taxation, Professor Seligman makes the following statement:¹

"Gross receipts consist of all earnings from transportation of freight and passengers, receipts from bonds and stocks owned, rents of property, and all miscellaneous receipts from ancillary business enterprises or otherwise. From these aggregate gross receipts we should deduct what are classified by the Interstate Commerce Commission as operating expenses; that is, expenses for conducting transportation, for maintenance of roadway, structures, and equipment, and for general expenses of management. No deduction should be made for fixed charges, i. e., for taxes or for interest on the debt, or for the amount used in new construction, in betterments, in investments, in new equipment, or for any of the expenditures that find their way into profit and loss account."

A tax on this basis Professor Seligman regards as the "most logical form of corporate taxation." The Ohio tax commission of 1893 likewise decided with regard to a franchise tax on corporations that "from the economic standpoint and from the standpoint of exact justice, the best method is to obtain the net earnings."²

A tax on the net income of transportation companies would undoubtedly have a number of considerations in its favor. For instance, compared with the tax on gross receipts, it would avoid the possibility of acting as a check on expenditure for improvement of service, particularly in the maintenance and repair of equipment. Then, too, in the event of the adoption of a uniform and correct system of railway accounting its administration would be very simple; but chief of all, as the Ohio tax commission claim, it would, if rightly administered, be proportional in its effect upon the different companies taxed, i. e., it would effect an equitable tax distribution.

Out of the inference that in the railway business as traffic increases net income bears a ratio to expenditure which in the long run constantly grows proportionately larger, it has already been claimed that a tax on net income would be a better revenue yielder than the tax on gross receipts. The following table does not bear out this view:

Gross and net receipts of railways of England and Wales.³

Year.	Gross receipts	Net receipts, ^a	Ratio of net to gross receipts	Index number.	Year	Gross receipts	Net receipts, ^b	Ratio of net to gross receipts.	Index number.

^a Taxes are not deducted here in arriving at net receipts.

^b Prior to and including this date, steamboat, canal, and harbor expenses were not deducted from gross receipts in arriving at net receipts.

Objections⁴ to the tax on net income have arisen chiefly from the administrative standpoint. Chief among these has been the contention that receipts might be largely exhausted in the payment of large salaries, thus effecting a distribution of corporate income and avoiding the payment of a large portion of corporate taxes. This might readily happen with small corporations, where the managers are the chief holders of the corporate stock; but in the case of railways this need

¹ Seligman, *Essays in Taxation*, p. 201.

² Report of Ohio Tax Commission of 1893, p. 51.

³ Figures are compiled from the British "blue books."

⁴ Seligman, *Essays in Taxation*, pp. 199, 200.

scarcely be apprehended. The numerous holders of corporate securities would most certainly object to the curtailing of their dividends which would result from such a practice.

The practice of the more advanced European nations is in line with this form of corporate taxation. In England corporations are taxed under the provisions of the general income tax law (Schedule D), on their "net profits," determined substantially on the lines of the definition of net income laid down above. Railroads in addition to this tax pay a "corporation duty," corresponding to the "death duties" on individuals, in addition to a duty of 5 per cent on receipts from passenger traffic.

In France corporations in general pay a tax of 3 per cent on "les intérêts, dividendes, revenus et tous autres produits des actions de toute nature," besides the usual real estate and license-taxes. Railroads in addition pay a "public conveyance" tax on passenger and express traffic. This does not, however, operate as a direct tax on the corporation, for the tax is added to the price paid for passenger tickets and to the amount of express charges. Corporations generally commute for the payment of the usual stamp tax and the tax on the transfer of securities by the payment of an annual tax on the amount of their capital stock.

Most of the States of Germany tax corporations on income. Prussia for more than 45 years has followed the plan of a tax on net income with its railroads.

Italy, like England, taxes corporations on net income under the same law which applies the system to the taxation of individuals. All interest and dividends are included in the assessment.

In the United States the possibility of applying such a method would depend to a degree on the attitude of the United States Supreme Court. The question arises whether or not this form of taxation, so far as it applied to income from interstate traffic, would encounter the same objections as the tax on gross receipts.

In the case of State Tax on Railway Gross Receipts¹ the court said: "It is not denied that net earnings of such corporations are taxable by State authority without any inquiry after their sources." * * * If this statement is to be taken as an accurate index of the tendency of the court in the matter, it would be needless to inquire further. The decision in this case has, however, since been largely discredited; and even though the validity of this particular statement has not been called into question, it would not be well to base any general conclusion upon it alone.

The only other case which sheds any light on the question is that of Philadelphia and Southern Steamship Company v. Pennsylvania.² In this case, which had to do with the Pennsylvania tax on gross receipts, the court say:

"As a tax on transportation * * * it can not be supported where that transportation is an ingredient of interstate or foreign commerce, even though the law imposing the tax be expressed in such general terms as to include receipts from transportation which are properly taxable. *It is unnecessary, therefore, to discuss the question which would arise if the tax were properly a tax on income. It is clearly not such, but a tax on transportation only.*"

The most that can be said, therefore, is that a tax on the net income of transportation companies would probably not be regarded as an interference with interstate commerce, even though such income were in part the product of interstate traffic.

C. THE FEE OR BENEFIT PRINCIPLE.

Besides the various taxes proper which are levied upon corporations, there are certain impositions in the nature of fees—payments for special benefits rendered by the State. Payments of this latter character are rendered to Government in return for the right to become a corporation and the right to do business in a corporate capacity.

The fee principle lies at the root of a variety of impositions levied under a variety of names; and in some cases it is almost impossible to distinguish that part of a levy which is imposed under the fee principle from that which is levied under the tax principle. In such cases the payment for benefit received is involved in the total tax payment, and is the justification for a departure from the test of tax-paying ability in tax distribution. The most important of these levies is the franchise tax.

"The right or privilege given by the State to two or more persons of being a corporation—that is, of doing business in a corporate capacity"³—constitutes a

¹ 15 Wall., 284.

² 122 U. S., 326.

³ E. g., see Home Insurance Company v. New York (434 U. S., 594.)

franchise. The franchise tax is levied with a view to securing for the State some return from the valuable privilege which it has granted.

The California constitution of 1879 first brought franchise taxation prominently into notice. Since that time the method has been incorporated into the tax systems of a majority of the States, and its legality has been confirmed by the decisions of the United States courts.¹

The right to tax a franchise is limited to the State granting it, for the corporate franchise as such may not be taxed except under the law of the State which created it. But State practice generally applies the same methods to both domestic and foreign corporations by imposing taxes, as in New York, on "the corporate franchise or business."

The franchises of corporations granted by the United States Government are not taxable by the States. The State taxation of franchisees, moreover, must not interfere with interstate commerce. Aside from these limitations the power of the States to tax franchises is practically unrestricted. As a consequence different bases of measuring the value of the franchise have been applied at the same time in different States, and at different times in the same State. Gross receipts, dividends, profits, indebtedness, capital stock, capital stock minus value of property, capital stock minus value of realty, etc., have all been employed for this purpose.

In Illinois the value of the franchise and capital stock subject to taxation is declared to be the capital stock and debt in excess of the value of the tangible property which is otherwise taxed. In practice, however, in the case of railroads, the valuation of the tangible property has been such as to leave no excess to be taxed as the value of capital stock.

In New Jersey the method followed is not substantially different from the Illinois method, although it is subject to variation from time to time.

The California method provides for the taxation of the excess of capital stock over value of property. In Massachusetts "a fair cash valuation" of the corporate capital stock is taken as the "true value of its corporate franchise." In Kentucky capital stock less the assessed value of tangible property in the State measures the value of the franchise. The Mississippi law vaguely declares that the State railroad assessors in appraising the value of the corporate property shall "take into consideration the value of the franchise" and "the capital stock engaged in business in this State." The provision in the Vermont law is equally vague, although in that State transportation companies generally have paid a tax on gross receipts in lieu of the tax on "rights, corporate franchise, and property." In Kansas, Tennessee, and in other States, earnings, capital stock, and debt are all taken into consideration in valuing the corporate property and franchise for taxation.

It will thus be seen that the "franchise tax" does not stand for any definite method of levy. From the legal standpoint, however, it has a high importance from the service which it renders in avoiding certain restrictions which, without it, would arise in the administration of the ordinary methods of corporate taxation.

Thus, the constitutions of a number of States require that taxes on property shall be uniform. It is often desirable in the taxation of corporations to have recourse to methods which if applied to property as property taxes would be held unconstitutional owing to lack of uniformity in their operation. The legal fiction of the "franchise tax" obviates this difficulty. Then, too, as we have already indicated, State taxes on property the subject of interstate traffic or on receipts the product of interstate business are unconstitutional, but when such a tax is levied as a franchise tax its validity is indisputable.

Furthermore, if a tax is a franchise tax, exemptions for certain otherwise exempt or extraterritorial property can not be claimed as under the property tax.

Lastly, if a tax is a franchise tax certain objections to double taxation are removed. For instance, under the property tax the capital stock of a corporation may be taxed only on that portion employed in carrying on its business within the State in which the tax is levied. Under the franchise tax the entire capital stock is liable even if in part invested in property situated within another State and taxed by that State.

The so-called "license" and "privilege" taxes closely resemble the franchise tax. Examples of this are the New Jersey "license tax on the corporate franchises" of telegraph, telephone, express, and parlor car companies, the Wisconsin "license tax" on the gross earnings of railroads, the Mississippi "privilege tax" on railroad and car companies, and the Tennessee "privilege tax" on railroad, express, telegraph, and telephone companies.

¹E. g., see *Home Insurance Company v. New York* (434 U. S. 594).

D. LOCAL TAXATION.

There are four main plans followed in adjusting the relations of local taxing jurisdictions to transportation companies: (1) That of locally taxing all transportation property. (2) That of taxing locally only such property as is not directly employed in conducting transportation. (3) That of no local tax, but a distribution locally of a portion of the proceeds of State taxes, and (4) that of no local tax and no local distribution.

A variety of opinion exists with regard to the desirability of these different methods. The advisability of separating the objects of State and local taxation has been widely emphasized. The Pennsylvania tax conference, for instance, reported on this point substantially as follows:

"In many States the State government gets its revenue from a State tax on county valuations. This was originally the case in Pennsylvania; but a 'series of amendments and judicial decisions—partly by accident and partly by design'—resulted in the separation of State and local sources of revenue. A system of ad valorem State taxation, under which each county's quota is made to depend on the valuation of property in each county, renders a proclivity to low valuations irresistible. In neighboring States the assessed value of taxable property has reached a very low ratio, and 'it requires constant contention on the part of the taxing officers in those States to prevent it from getting still lower.' The following are the aggregate values of real estate in the States named for 1890 or 1891:

New York: Controller's Report, 1890, page 106.....	\$3,272,423,743
Ohio: Auditor's Report, 1891, page 198.....	1,151,038,031
Indiana: Auditor's Report, 1891, page 215.....	735,118,117
Illinois: Proceedings of Board of Equalization, 1891, page 35.....	375,291,398
Iowa: Auditor's Report, 1891, page 79.....	376,181,276
Kentucky: Auditor's Report, 1891, page 249.....	236,233,808
West Virginia: Auditor's Report, 1891, page 48.....	121,202,365

"There is also a complaint against the undervaluation of taxable property in Pennsylvania, but it must be conceded that our total aggregate valuation of \$2,002,942,127, as shown by the report of the secretary of internal affairs for 1891, bears a far higher ratio to the actual selling value of our real estate than is shown by the reports of the other States named."

In the same report figures are given for State and local taxes in Pennsylvania in 1892, which may be grouped together as follows:

	State, county, and local.	County and local	Per cent, county and local.
Total taxes.....	\$47,328,842	\$35,995,616	76.05
Railroad taxes.....	2,666,331	834,905	31.31

Upon the question of local assessment the conference committee conclude:

"While a difference of opinion exists as to whether taxation should be levied upon such property by the State or by the local boards, it seems to us manifest that it should be assessed and valued by officers whose jurisdiction extends over the entire State. Each railroad, canal, telegraph, or pipe line should be valued as a whole, and if any apportionment is made it should be an apportionment of the average valuation per mile, or of the avails of taxation. This plan has been adopted by a large majority of our sister States."

In New York the joint committee on taxation of the legislature of 1890 looked with favor upon the abolition of the local property tax on railroads, but found it impracticable to recommend its abolition. The committee said:

"We believe, as a fundamental principle of government, that a political entity, in this case the State, should have an independent jurisdiction, into which it alone may go, and from which it may realize sufficient revenue for its own support. Another result of the separation of the State from local taxation would be the strict accountability to which local officials would be held in raising and disbursing moneys used for the support of local government."

"The committee, therefore, has sought for subjects of taxation which, together with the indirect revenue now collected by the State, will be sufficient for the support of State government."

"It was believed at the outset that this purpose might be accomplished by withdrawing from local taxation steam and surface railroads, telegraph, telephone, electric light and power companies, gas, water, and pipe-line companies, and banks and

trust companies, and by levying upon such corporations a definite rate of taxation for State purposes. In order to determine the feasibility of such a plan it became necessary to ascertain what proportion of the total tax raised by the political divisions of the State upon the property of such corporations was paid by them, and the committee with very great labor caused to be gathered the entire sums paid by the corporations named in three of the counties of the State, to wit: Oswego, Cattaraugus, and Chenango. The result was indeed startling in many of its aspects. It was found that in the county of Oswego, in the year 1897, the sum of \$627,759.82 was raised by taxation for all purposes, and that of this sum the steam railroads alone paid 9.03 per cent, and that in the county of Cattaraugus, in the year 1898, \$484,358.22 was raised by taxation for all purposes, and of this sum the steam railroads alone paid 11.89 per cent, and that in the county of Chenango, in the year 1897, \$317,837.69 was raised by taxation for all purposes, and that of this sum the steam railroads alone paid 7.97 per cent. In some school districts in the counties named the steam railroads alone paid 50 per cent of the taxes. While the labor involved in the exact ascertainment of the taxes paid by the corporations named was so great that more counties could not be analyzed, it is safe to say that these three counties furnish a criterion for the rest of the State."

The following table will summarize the committee's investigation on this point. It must be borne in mind that the figures will have to do only with such taxes as are locally assessed;

County.	Total tax levied	State tax	Local tax <i>a</i>	Per cent State to total.	Ratio of local to total tax.
Oswego <i>b</i>	\$627,759.82	\$65,397.85	\$562,361.97	10.42	<i>Per cent.</i> 89.58
Chenango <i>b</i>	317,837.69	40,713.68	277,094.01	12.82	87.18
Cattaraugus <i>c</i>	484,358.22	49,038.99	435,319.23	10.13	89.87
Total	1,429,955.73	155,150.52	1,274,775.21	10.85	89.15

Taxes on real and personal property of—				
County.	Railroads	Proportion of total paid by railroads.	All corporations <i>d</i>	Proportion of total paid by all corporations.
		<i>Per cent.</i>		<i>Per cent.</i>
Oswego <i>b</i>	\$56,689.23	9.03	\$85,193.31	13.57
Chenango <i>b</i>	25,311.67	7.97	44,482.80	13.99
Cattaraugus <i>c</i>	57,506.43	11.89	97,804.49	20.19
Total	139,506.33	9.76	227,480.63	15.90

The Maine tax commission viewed with disfavor the separation of State and local taxation. They say:

"It is believed by many that it may be possible to assess upon corporations an amount sufficient for State expenses, and thus the necessity for a property tax for State purposes be avoided. If this were possible within the limit of just taxation of corporations, it would, to a considerable extent, relieve the general tax burden of the people. But there are other questions besides that of a slight decrease of taxation to be considered in this connection. Would it be a wise and salutary thing to sever the financial ligament which now closely unites the State government with the town, and, in fact, with every individual? Would it be beneficial to the people at large to have the power and influence of corporations so immensely extended as they would be in case the State were dependent alone on them for its revenues?

"It appears to us that such a policy would not be wise, and that to resort to it would be to sacrifice an important principle, a paternal and unifying element of State government, at a very cheap price."¹

¹ Report of Maine Tax Commission of 1889, p. 56.

Upon the matter of a distribution of a portion of the proceeds of State taxation among the local districts, the Pennsylvania tax conference said:

"In this State we are drifting into a practice of collecting revenue into the State treasury far in excess of the needs of the State government, with the purpose of distributing the surplus among the townships and municipalities in aid of local taxation. The wisdom of such a policy is questionable. It is an unnecessary circumlocution, and exposes the public revenues to additional dangers of waste and misappropriation. There will be an irresistible tendency in the legislature year by year to increase the appropriations in aid of local charities and other objects whose benefits are not evenly diffused, thus decreasing the amount available each year for schools and roads. The honest and economical administration of public affairs can be better promoted, and the self-reliance of the people better preserved, by remanding the whole process of collecting and disbursing local public revenues to the local authorities as far as possible. To centralize the fiscal department of all branches of civil administration at the capital, making the local authorities dependent on the legislature for the means to defray their necessary expenses, is a vital thrust at the doctrine of local self-government.

In New Jersey the act of 1884, among other things, provided for the taxation of "main stem" or "first-class property," and for property other than main stem or "second-class property," by State authorities, with a subsequent distribution of the tax on "second-class property" among the local districts. "This system of taxing property, used for railroad and canal purposes, may be described in a sentence as a property tax by the State, through State assessors or officers, in its entirety as a unit, for the use of the State, with a distribution of a part of the tax by the State to the local taxing districts for the support and maintenance of the local or municipal governments."¹

The New Jersey tax commission of 1897, whose report deals largely with local taxation, concludes that the method of distribution works injustice in that State. The commission says: "Assuming as a fact that the property used for railroad and canal purposes does pay as much tax, that is, as many dollars, relatively to a like amount of property owned by individuals and other corporations, it does not follow as a logical sequence that the distribution by the State to the local taxing districts is just or fair. On the contrary, it has been shown by evidence and facts before us that the act of 1884 in its practical operation works some injustice to the local districts of the State, not only in the relative amount of land withdrawn completely from the local or municipal tax comprised in the 'main stems' commonly known as first-class property, but also in the amount of tax which the local taxing districts receive from the land commonly designated as second-class property."²

And further: "A study of local or municipal taxation in the United States will show that land is the chief source, the principal object of local taxation. * * *

"Whenever this principle is violated in a system of taxation, it throws the local or municipal governments out of joint. In the city of Washington, where the land occupied by the buildings of the National Government was exempt from taxation, the burden became so onerous on the individual owners of land that at one time it threatened financial disaster to the District of Columbia, until the Federal Government assumed part of the expenses of the local government, or contributed to such expenses in lieu of the land which was held by the Federal and foreign governments exempt from local or municipal taxation. The lands used for railroad purposes in the principal terminal cities of the United States, such as New York, Boston, Buffalo, Chicago, Philadelphia, and Pittsburg, are taxed locally for the use of the local governments."³

* * * "When it is shown that * * * the geographical position of some of the local taxing districts in the State is such that in those taxing districts it is necessary, for the proper and legitimate development and operation of the railroad companies, to acquire and hold, in addition to their main stem, large tracts or blocks of land, there is no reason in good morals or sound principles of taxation why the State should deprive the local municipalities of the taxes derived from tracts or blocks of land held and used for railroad purposes, in addition to the main stems, and known as second-class property under the act of 1884. It is the illogical result of an otherwise logical system."⁴

² *Ibid.*, p. 13.

³ *Ibid.*, p. 18.

⁴ Report of the New Jersey tax commission of 1897, p. 20.

In Massachusetts the method of distribution followed by that State was regarded with disfavor by the tax commission of 1897.¹ The commission says:

"There are, however, some questions as to the present mode of distributing the proceeds of the taxes on corporate excess to which we think it necessary to call the attention of the general court. They are distributed, it will be remembered, among the several cities and towns according to the ownership of shares by their inhabitants. We have already referred to some anomalous results of this method of distribution. It causes disproportionately large sums to be turned over to a few towns much resorted to by people of means. But, even apart from these difficulties, there are others which make it doubtful whether under any circumstances corporate excess should be made a direct source of revenue to the towns and cities.

"With many corporations there is a very large corporate excess. All railways, by an old decision of the courts, are exempt from local taxation on their right of way; and, in any case, the value of their real estate and machinery, taxable locally, is not a great proportion of their total valuation. This is even more strikingly true in the case of street railways. The cities and towns where the shareholders happen to reside, perhaps distant from the places where the enterprises are carried on, get the main benefit of the taxes."²

In West Virginia the railroad taxes are paid into the State treasury, and a portion locally distributed upon the basis of the situs of the railroad property taxed. The New Hampshire method is a cross between the Massachusetts and West Virginia methods. In that State the tax on the general property of railroads (excepting real estate not in the right of way, which is locally assessed and taxed) is paid to State officials, who subsequently distribute among the towns one-fourth of the proceeds of the tax according to the value of railroad property in those towns, and of the residue, to each town such proportion as the number of shares held by its residents bears to the total capital stock of the various railroad companies.³

In Wisconsin State court decisions have been adverse to the taxation of railroad property, whether by State or local authorities,⁴ and a similar state of affairs now exists in Minnesota.⁵

E. UNIFORMITY IN RAILWAY TAXATION AMONG THE STATES.

The table which follows will throw some light upon the question of the extent to which current State tax methods approach uniformity in their treatment of the individual railway systems of the country. Three of the trunk lines have

¹ The following table, taken from page 67 of the report of the Massachusetts tax commission of 1897, will show the effect of the distribution carried out in that State

	Population, 1885.	Tax distrib- uted, 1896.	Tax dis- tributed per capita.
State	2,500,183	\$2,585,795.63	\$1.03
Thirty-two cities	1,635,767	1,778,359.23	1.08
All towns	864,416	807,436.40	.93
Eighteen towns	62,529	332,310.77	5.31
Three hundred and three towns	801,887	475,125.63	.59

The 18 selected towns get five times as much as the average for the State, per head of population, of the proceeds of the tax on corporate excess. As compared with the remaining towns, less fortunate in the ownership of securities by their inhabitants, these few towns get nearly ten times as much per head of population.

² Report of Massachusetts tax commission of 1897, p. 70.

³ The following table will illustrate the working of the New Hampshire method of distribution. The figures for population are compiled from the census returns of 1900; those for the amounts of the tax distributed, from the New Hampshire treasurer's report, June 1, 1900:

	Population, 1900.	Tax distrib- uted, 1899.	Tax dis- tributed per capita.
All cities and towns in State	411,598	\$210,105.94	\$0.51
Fifty-eight towns and cities	114,558	13,296.66	.11
Twenty-seven towns and cities	153,882	84,921.96	.55
Six towns and cities	43,139	90,278.09	2.09

CHAPTER III.

DOUBLE TAXATION.

The problems arising out of double taxation are essentially the product of the complex industrial system of the present day. New complications in property rights have arisen, which, under the continued application of the principles of the property tax, have resulted in much injustice and confusion.

Double taxation arises from two sources—either from the repeated taxation of the same class of subjects by the same governmental authority, or from the taxa-

tion of the same class of subjects by competing authorities. The latter is the outcome of the modern mobility of capital and labor; the former results largely from the fact that property and certificates of ownership in property in their various forms have both become the objects of taxation.

It might be well to remark at this point that double taxation is not necessarily unjust taxation. This fact is often overlooked in the use of a "phrase which is itself brimful of duplicity and highly convenient for sophistical reasoners."¹

A. DOUBLE TAXATION BY THE SAME JURISDICTION.

1. Double taxation of property and indebtedness.—It is almost superfluous to state that this question arises only under the property tax. One of its phases is the taxation of corporate property and corporate indebtedness.

In the taxation of individuals it is not an unusual practice in the assessment of property either to deduct indebtedness from the final valuation or to exempt indebtedness from taxation when the total property is taxed. This is done, for instance, in the case of mortgages on real estate in several States, to avoid what might otherwise be unjust double taxation. The analogy, however, must not be carried over into the taxation of the capital stock and indebtedness of a corporation; a distinction between corporate and individual indebtedness must not be overlooked. In the case of individuals it would generally be unjust to tax both property and mortgage debt, because the real taxable property, when the mortgage is taxed, is only the surplus above indebtedness. Corporate bonded debt is a portion of the corporate capital. To tax indebtedness of this character in addition to the capital stock is not double taxation, for the capital stock is representative of only a portion of the corporate property. To tax corporate property as well as indebtedness, however, is another question, which gives rise to considerations very similar to those involved in the taxation of both property and capital stock. This will come up later.

It is not uncommonly the practice among the States to forbid the exemption of funded debt when capital stock is taxed. A number of States, notably California, Connecticut, Illinois, and Maryland, permit individuals to deduct indebtedness, but forbid the same practice on the part of corporations. This policy was upheld in the California courts in a decision which pointed out clearly the distinction between individual and corporate indebtedness.² The Utah statute which forbids the deduction of bonds in the listing of credits illustrates an analogous practice.

There is really no injustice in such a policy. Injustice, in fact, in most cases arises from the opposite practice. As an illustration of this fact may be cited the case of "a company which never paid a dollar of State tax upon capital stock prior to 1895. The New York, Pennsylvania and Ohio Railroad Company, with a capital stock of \$41,999,350 and \$129,853,080 bonded and other indebtedness outstanding, the cost of the road and equipment being \$170,987,500, was the owner of 429.59 miles of railroad, extending from Salamanca, N. Y., to Dayton, Ohio, it being the connecting link between the east and the west of the Erie Railway system and competing with the Lake Shore, Baltimore and Ohio, and Pennsylvania railroads. Of the total mileage, 126.18 were within the State of Pennsylvania. As stated before, this company had never paid to the State a tax on capital stock or bonds, because it was claimed that this property was 'bonded' far beyond its actual value, and therefore the capital stock was worthless. The bonds were owned by nonresidents of the State, and therefore not taxable. * * * This case is given as an example, showing how many corporations have heretofore escaped taxation by reason of a funded debt, which is capital invited by the stockholders with the hope that they will derive additional benefit from such added capital."³

In New York, as concerns the local taxation of capital stock, it has been held by the courts that in estimating the value of the capital stock of a corporation its indebtedness is to be considered; but the valuation having been fixed, only the value of the real estate and not the amount of indebtedness is to be deducted therefrom.⁴ Where, however, the "capital stock is of no actual value" because of indebtedness exceeding assets, it must not be assessed.⁵ This is applicable only to domestic corporations.

¹ Report of the Joint Committee on Taxation, New York legislature, 1900, p. 10.

² Central Pacific Railroad Co. v. Board of Equalization, 60 Cal., 35.

³ Report of the Auditor General of Pennsylvania for 1897, p. vi.

⁴ People, ex rel. Broadway and C. R. R. Co., v. Commissioners of Taxes (1 Thomp. & C. 635).

⁵ People, ex rel. West Side and Yonkers Railway Co., v. Commissioners of Taxes (31 Hun., 32).

The taxation of the interest on bonds involves the same principle as the taxation of the bonds themselves. Interest on bonded debt as fully as dividends on stock constitute an integral part of the corporate income and are, as much as the latter, a product of the corporate investment.

2. Double taxation of property and stock.—A second phase of the double taxation of the same class of subjects by the same jurisdiction is the double taxation of property and of capital stock. To tax a corporation on its property and at the same time to levy a tax on its securities, as if they were substantive and independent property, is in effect unjust double taxation. It can not be denied that corporate property and capital stock are not identical. As brought out in *Commonwealth v. Hamilton Manufacturing Co.*,¹ "the market value of the shares of a corporation * * * does not necessarily indicate the actual value or amount of property which a corporation may own. The price for which all shares would sell may greatly exceed the aggregate of the corporate property, or it may fall very far short of it. Undoubtedly the amount of property belonging to a corporation is one of the considerations which enter into the market value of its shares, but such market value also embraces other essential elements. * * * It is the estimate put on the potentiality of a corporation, on its capacity to avail itself profitably of the franchise, and on the mode in which it uses its privileges as a corporate body, which materially influences and often controls its market value."

While this is true, it will readily be granted that the value of the property is bound up in the value of the capital stock, i. e., that the property is at least a part, if not the whole, of the corporate investment which capital stock is supposed to represent. So far as the two are representative of the same taxable capacity, therefore, the taxation of both by the same authority would be unjust double taxation.

In general, the legislation and legal decisions of the various States have been adverse to double taxation of this character. The courts of Maryland have from the beginning followed the principle that a tax on capital stock covers a tax on property, and that, therefore, the taxation of both at the same time is unjust. In a number of States (e. g., Alabama, Illinois, Indiana, and Vermont) this principle is recognized and only the excess of capital stock over property is taxed. A recent law in Wyoming provides that the property of domestic corporations shall be assessed and taxed in the same manner as the property of individuals; "but the capital stock of such corporations, representing, as it does, simply the interests of the owner thereof in the property of such corporation, shall not be taxed." In California the taxation of both property and capital stock has been declared by statute to be double taxation, so that neither the corporation nor the shareholder is taxed on capital stock or shares. Colorado follows the dictum that the taxation of tangible property and of shares of stock is not double taxation. The opposite is the practice in Illinois, as well as in Florida and Idaho, where it has been declared that, when corporations are taxed on their property, shares of stock in those corporations shall not be taxed. In Kansas, shares of stock are taxable to holders after property deductions have been made. In New Jersey, shares of stock are not assessed against holders when the corporation is taxed on its property and franchise. In New Mexico, statute provision declares that when a corporation is taxed, either on its property or on its capital stock, shareholders are not to be taxed on their shares. The same provision is made in South Carolina, Tennessee, Utah, Washington, West Virginia, and a few other States; though in Tennessee a legal decision² arrives at the conclusion that the State may lay such a tax, notwithstanding the statute to the contrary. In all of these cases, however, a distinction must be drawn between capital stock and shares in the hands of holders. This will be brought up again later.

Early legal opinion in Pennsylvania was not adverse to a tax on both corporate property and capital stock. In *Pittsburg, etc., R. R. Co. v. Pennsylvania*,³ the court delivered the opinion that "the power of the legislature is as ample to tax twice as to tax once, and it is done daily, as all experience shows. Equality of taxation is not required by the constitution." But the general trend of subsequent decisions has been in the opposite direction. For instance, it has been held⁴ that the capital stock of corporations representing tangible property outside of Pennsylvania is not taxable in Pennsylvania; and further,⁵ that "capital stock represents the franchises as well as the property of the company," affirming several previous

¹ 12 Allen, 303.

decisions to the effect that the property of a corporation essential to the carrying on of its business is included in its capital stock and must not, therefore, be separately taxed.

Those State methods which tax capital stock after making deductions for the value of property locally taxed (as in Massachusetts), act as a discrimination against individuals, which is not necessary as a guard against double taxation. Individuals are taxed on their property by both State and local authorities. The analogous practice in the case of corporations would be local taxation on its present basis, and State taxation of capital without property deduction. The decision in *Commonwealth v. Cemetery Co.*¹ very well expresses this view: "A tax on capital stock is a tax for State purposes only, so that local taxation upon the property in which the capital stock of a company is invested is not double taxation."

B. DOUBLE TAXATION BY COMPETING JURISDICTIONS.

This problem is one in which possible complications are numerous. It is one which may arise in its different forms between foreign States, separate commonwealths, or separate local districts. In the present instance those questions which come up among the several States are the important ones.

A variety of practice has sprung up in this respect, and a practical solution of the difficulties of the situation is by no means simple. Professor Seligman believes that the easiest way out of the confusion would be that of levying the tax in those districts where economic interest is involved. Such a plan would necessitate a division of the tax between the place of domicile of a corporation and the place or places in which business is done and earnings derived. With transportation companies such a plan might be followed out somewhat in the following manner: Regarding the domicile of the company as the place of its incorporation, let the incorporation tax—possibly an annual sum—represent that portion which should go to the State of domicile of the corporation; then let the main tax, or tax proper, be paid to the State or States in which the corporate business is carried on. Such a plan could be completely realized only after substantial interstate agreements have been reached or the National Government has taken a hand in the matter. There is thus far no complete uniformity in the practice of the States on any of the various phases of the question.

1. Interstate taxation of corporate property.—The first phase of the problem arises in the interstate taxation of corporate property. As concerns real estate the interstate feature of the problem is a simple one, the universal rule being that such property shall be taxed where situated. An early New York decision² to the effect that real estate is not to be assessed at a company's principal place of business, but where it lies, shows the general attitude on this question. The difficulty arises in the taxation of personal property. Here the practice varies between the taxation of this class of property according to its actual situation, as well as according to the residence or domicile of its owner; i. e., in legal terminology, according to the principle of *situs* or that of *mobilia personam sequuntur*.

In New York, property located out of the State can not be made the subject of taxation by its power; and, conversely, the personal property of a nonresident, situated within the State, may be taxed by it, except as modified by statute provision.³ It has been further held, however, that to exempt the personal property of a corporation because it is outside of the State, the change of location must be permanent and unequivocal.⁴ A similar decision has been reached in Illinois.⁵ In Missouri, likewise, "the actual situs of personal property, and not the domicile of the owner, determines under the law where it shall be taxed."⁶

In Pennsylvania the same principle has been recognized in the taxation of capital stock. The court has decided that capital stock invested in real estate and in other railroads outside of the State, as well as in vessels, barges, etc., wholly used outside of the State, is not subject to taxation in Pennsylvania, but in the State where it exists and is used.⁷ In Maryland, Kansas, Michigan, South Carolina, and other States the principle of *situs* is likewise applied. As stated in a prominent

¹ 170 Pa., 227.

² *Hudson River Bridge Co. v. Patterson* (11 Hun., 527).

³ *People ex rel. Hoyt v. Commissioners of Taxes* (23 N. Y., 224). It would appear from the decision that ships at sea, registered at a port within the State, and consequently having no situs elsewhere, are justly taxable to the resident owner.

⁴ *People ex rel. Pacific Mail Steamship Co.* (64 U. S., 541).

⁵ *Supervisors, etc., v. Davenport* (40 Ill., 197).

⁶ *St. Louis v. Taylor's Admrs.* (47 Mo., 594).

⁷ *Commonwealth v. Delaware, Lackawanna and Western R. R. Co.* (145 Pa., 96).

legal treatise,¹ "Personal property, permanently remaining in a State, has a situs therein for the purposes of taxation although belonging to a foreign corporation."

In other States, however, the practice of taxing domestic companies on their entire property, regardless of its location, is in some cases applied, so that the same property is taxed twice by different States. With railroads the difficulty is no longer of particular significance so far as concerns tangible personality subject to measurably permanent location, but with rolling stock the question is more complicated. The difference between the two kinds of property is recognized in the Tennessee law taxing railroad companies. Real estate and personality having stable location are taxed as "localized property," and assessed in the locality where situated; property having no actual situs—i. e., rolling stock—is known as "distributable property," and is assessed against the company employing it on a pro rata mileage basis. In those States where rolling stock is assessed as part of a general railroad-property valuation, the same method is generally employed.

In *Marye v. Baltimore and Ohio Railroad Co.*,² it was decided that the situs of rolling stock may be fixed in whatever locality such property may be brought and used by its owner by the law of the place where it is found. In this particular case the right of Virginia to tax the rolling stock of the Baltimore and Ohio Railroad Company was not allowed on the ground that the Virginia law had application only to domestic corporations. But in respect to the general right of a State to tax the rolling stock of foreign corporations employed within its limits, the court said that "it would certainly be competent and legitimate for the State to impose upon such property, thus used and employed, its fair share of the burdens of taxation imposed upon other similar property used in the like way by its own citizens."

In the State railroad freight tax cases,³ the court, referring to the principle of *mobilia personam sequuntur*, says that "it may be doubted very reasonably whether such a rule can be applied to a railroad corporation as between the different localities embraced by its line of road; * * * the rule is merely the law of the State which recognizes it * * * [and] therefore, subject to legislative repeal." In *Baltimore and Ohio Railroad Co. v. Allen*,⁴ it was held that in the case of a leased line, rolling stock used thereon has its situs there. In *Pullman Palace Car Co. v. Twombly*,⁵ it was decided that cars used on a railroad, and owned by a nonresident of any State in which they are employed, are not exempt from taxation in that State by reason of their being instrumentalities used exclusively for interstate commerce.

From these decisions it will be seen that the power of the States to tax rolling stock used at all within their borders is not subject to narrow restrictions. The right to do this upon a pro rata mileage basis in the case of companies engaged in interstate commerce is undisputed; and State practice, as already indicated, is following this plan.

The rule as to vessels engaged in foreign or interstate commerce is, that their situs for purposes of taxation is their home port of registry, or if unregistered, the residence of their owner.⁶ Somewhat analogous is the Pennsylvania decision⁷ that corporate property like barges, dredges etc., without permanent location in any place, is taxable only in the State of the corporation's domicile.

2. Interstate taxation of corporate securities.—The second phase of the double taxation of the same class of subjects by competing authorities is the interstate taxation of corporate securities. The evils resulting from double taxation of this character have been so generally recognized as to call for express legislation on the subject in a number of instances. In New York the law of 1880 (chap. 42) provided for the taxation of corporations on their entire capital stock. In 1885 this was so amended as to extend only to that portion of the capital stock employed in business within the State. A court decision⁸ in 1887, however, on the basis of the law of 1880, held that the entire capital stock, and not the portion of it employed within the State, was the legal measure of business done within the State. Subsequent legislation came around to the principle of the law of 1885 for both foreign and domestic corporations.

In Pennsylvania the practice has uniformly been that of taxing only that portion of the capital stock represented by business done in the State. This was given judicial sanction in *Commonwealth v. Standard Oil Co.*, where it was held

¹ *Pierce on Railroads*.

² 127 U. S., 117.

³ 92 U. S., 607.

⁴ 22 Fed. Rep., 376.

⁵ 23 Fed. Rep., 658.

⁶ *Hays v. Pacific Mail Steamship Co.* (17 Howard, 596).

⁷ *Commonwealth v. American Dredging Co.* (122 Pa., 386).

⁸ *People v. Horn Silver Mining Co.* (105 N. Y., 76).

that the "power of taxation is limited to subjects within the jurisdiction of the State," and that the laws of the State were not intended to tax the entire capital stock of a foreign corporation, "but to tax the property of such company, that is, its capital stock, to the extent that it brings such property within the State in the transaction of its business." In the case of transportation companies this has generally been determined upon a mileage basis. The validity of this method as applied in Pennsylvania was affirmed in *Erie Railway Co. v. Pa.*¹ and again in *Pullman Palace Car Co.*,² where it was held that the capital stock of a transportation company, represented by its equipment used interchangeably within and without a State, is taxable upon a pro-rata mileage basis.

The same conclusion had already been reached at a much earlier date in *Minot v. P. W. & B. R. R. Co.*,³ where it was held that the taxation of capital stock on the pro-rata mileage basis is "a rule which, though an arbitrary one, is approximately just, at any rate is one which the legislature of Delaware was at liberty to adopt."

In Connecticut, where both capital stock and indebtedness are taxable, transportation companies are assessed upon the proportional mileage basis; and in Massachusetts, where the corporation tax law generally applies to entire capital stock, transportation companies are assessed on only a mileage proportion.

The application of this method in the taxation of telegraph companies has been upheld in the United States Supreme Court⁴ as analogous to its use in the case of railroads. Upon the whole, the method has been quite satisfactory in avoiding interstate complications, though from the standpoint of justice in apportionment a ton-mileage basis might prove preferable in the case of railroads. Administrative difficulties might, however, counterbalance any advantages from this source. In the case of telephone companies, the number of instruments in use has already been adopted in certain cases, as not only the more just method, but the most practicable from the administrative standpoint.

Just at present the practical usefulness of the method in its application to the taxation of express companies, as provided for in the laws of several States, is being threatened in a contention which is now pending in the Federal court in Indianapolis, and which is likely to reach the United States Supreme Court for final determination. One of the express companies operating in Indiana claims that under the Indiana law of 1893, providing for the taxation of these companies, the State board of tax commissioners, in arriving at the value of capital stock subject to taxation, shall take into consideration "its entire mileage—ocean, lake, and river, foreign and domestic," and that this valuation shall be that proportion of the aggregate value which the length of its lines and routes within the State of Indiana bears to the whole length of the lines and routes of the company—ocean, lake, and river, foreign and domestic.⁵ Should this contention be upheld by the courts, the taxable value would be so materially reduced as to afford a very insignificant revenue. A more explicit statement in the law, as to what is meant by "such lines or routes as are outside the State of Indiana," might have avoided this difficulty.

In certain States, as in Illinois, the endeavor to avoid the repeated State taxation of capital stock has resulted in the exemption of the capital stock of foreign corporations on the presumption that they have already been taxed on their capital stock in the State of their domicile. In other States, as in Rhode Island, shares of stock in a corporation are not taxable when the corporation is liable to taxation in another State; in Vermont the law goes even further and provides that shares in a corporation shall not be taxed when either that corporation or the holders of shares in that corporation are taxed in another State.

One of the phases of the interstate taxation of corporate capital, which was referred to in an earlier chapter, is the question of the taxation by a State of that portion of a corporation's capital stock and bonded debt which is held by nonresidents of that State. On this question the Supreme Court of the United States has made a distinction between bonds and shares of stock which has been fruitful of many difficulties in the State taxation of corporate bonded debt.

So far as concerns the taxation of capital stock or of shares of the same, the United States courts have uniformly maintained, in line with the decision in the Delaware Railroad tax case, that a State tax on shares of stock, even though

³ 18 Wall., 492.

⁴ *Western Union Telegraph Co. v. Mass.* (125 U. S., 580).

⁵ Biennial Report of State Board of Tax Commissioners of Indiana, 1899. A recent letter (Feb. 1, 1901) from the auditor of State gives the information that the case has made very slow progress. He states that it is the intention of the State to contest for its rights, even if it is necessary to go to the United States Supreme Court.

held by nonresidents of a State, is a tax on the corporation and not on the stockholder, and is therefore valid. In *New Orleans v. Houston*¹ it was further held that the assessment of a tax upon the shares of holders appearing on the books of a company, which the company is required to pay irrespective of any dividends or profits payable to the shareholder out of which it might repay itself, is substantially a tax upon the corporation itself. In *United States v. Railroad Company*,² however, the court held that a tax on dividends or interest paid by a corporation is a tax on the income of the stockholder or the bondholder and not on the income of the corporation. The state of the law in the taxation of capital stock (or of the shares constituting that capital stock), therefore, is that capital stock may be taxed by a State regardless of the residence of the holders of shares.

The legal status of a tax on bonded debt (or, as the courts would say, on the bonds which constitute it) has been quite different. Here it has been held that a State can not tax the bonds of a corporation held by nonresidents, on the ground that bonds are debts owed by a corporation, the property of its creditors, and therefore taxable only in the State of the domicile of those creditors.³ In *Bells Gap Railroad Company v. Commonwealth*,⁴ as distinguished from the decision in *New Orleans v. Houston*, the court decided that a tax on bonds, though paid by the corporation, "is a tax on the bondholder and not on the corporation," in which the matter of collection was simply a matter of convenience.

It is difficult to see, from the economic standpoint, why bonds should be treated differently from stocks in the matter of taxation. From this point of view the early Pennsylvania decision in *Maltby v. Reading and Columbus Railroad Company*⁵ would seem to have the sounder basis. In this case the court says: "Corporate stocks are property here though owned beyond our jurisdiction. * * * But loans are not stocks, and yet the loans and stock of a railroad company resemble each other in many respects. Both are subscribed under the authority of a special law, and both are so far capital that they are employed for the same general purpose. The certificate of stock * * * is mere paper evidence of property existing here. * * * Is the bond * * * anything more? * * * It is founded upon and derives its value from a mortgage, but that mortgage is here, and the franchises and properties which the mortgage binds are here within our jurisdiction. * * * Now, although loans and stocks are distinguishable for many purposes, yet the legislature created no very great solecism in treating loans as taxable property within our jurisdiction. * * * Corporate loans, though in some sense mere debts, are like moneys at interest, taxable as property."

If, however, the decision of the United States Supreme Court in *Savings Society v. Multnomah County*⁶ should be held to apply to corporate bonds as well as to individual mortgages, the former attitude of the court will have been reversed.⁷

But leaving the Multnomah County case out of consideration, the course of the Supreme Court has not been entirely consistent. In *Railroad Company v. Collector*,⁸ a case which arose over the Federal revenue law of 1864 taxing dividends, coupons, etc., the court held that the law was not invalid because under its provisions the tax was withheld from the dividends and interest of stockholders and bondholders not residing in this country. The same decision was reached in *U. S. v. Erie Railway Co.*⁹ In this case Justice Field points out in a dissenting opinion the conflicting nature of the above two decisions with that in *U. S. v. Railroad Co.*,¹⁰ where it was held that such a tax was a tax on the creditor and not on the corporation, making the tax under the law in question, according to the opinion arrived at in the case before the court, a tax on nonresident aliens.

As matters stand, leaving the Multnomah County case still in doubt, the States may tax only that portion of a corporation's bonded debt which is held by residents. Under the Pennsylvania law, as laid down by the courts,¹¹ the burden of proof as to the residence of its bondholders rests with the corporation—i. e., corporate loans in the operation of the law are assumed to be held by residents in the

¹⁰ 17 Wall., 322. The same general doctrine is to be found in *Haight v. R. R. Co.* (6 Wall., 15), and in *R. R. Co. v. Jackson* (7 Wall., 262).

¹¹ *Commonwealth v. Lehigh Valley R. R. Co.* (129 Pa., 429).

absence of proof to the contrary. This advantage is more than counterbalanced, however, by the disadvantage under which the State is placed in the collection of the tax on resident holders of bonds in a foreign corporation; for the courts of the State have held that a State can not, consistently with the Constitution of the United States, impose upon a foreign corporation, when paying the interest on its bonds in another State, the duty of deducting from the interest paid out, the amount assessed upon that portion of the bonded capital held by residents of the first-mentioned State.¹

Should future developments along the line of the *Multnomah County* case fail to solve these difficulties, there still remains a way of partially avoiding them by adopting the practice of Connecticut in the matter. There transportation companies are taxed on a valuation equal to such portion of the market value of the capital stock and debt as is, in the economic sense, employed in business within the State. In the case of railroads this is determined upon a pro rata mileage basis.

3. Interstate taxation of receipts.—The interstate taxation of corporate receipts, earnings, or income is another phase of the double taxation of the same class of subjects by competing authorities. This question has received considerable attention at the hands of the United States courts. The first case of importance arose in 1873 over the Pennsylvania law laying a tax on merchandise according to tonnage. In this case² it was decided that any State tax upon freight taken up in one State to be carried into another State is an interference with interstate commerce, and is therefore unconstitutional. In the same year it was decided in another case³ that a State tax on the gross receipts of a railway is not unconstitutional, even though those receipts accrue in part from freights for transportation from State to State. Although the company which was thus taxed was a domestic corporation, it does not appear on the face of the decision that the court was desirous of making any express distinction between domestic and foreign corporations. The court says: "While it must be conceded that a tax upon interstate transportation is invalid, there seems to be no stronger reason for denying the power of a State to tax the fruits of such transportation after they have become intermingled with the general property of the carrier than there is for denying her power to tax goods which have been imported after their original package has been broken and after they have been mixed with the mass of personal property in the country." In the present case "the tax is laid upon the gross receipts of the company; laid upon a fund which has become the property of the company, and possibly expended in improvements or put out at interest."

Had the decision reached in this case, at least in its probable implication, been followed in subsequent cases the present difficulties which are constantly arising when a State seeks to lay a tax upon the gross receipts of a foreign corporation from business other than that transacted wholly within that State would have been avoided; but a narrower interpretation has since been put upon this decision by the Supreme Court. In a later case⁴ it was held that a tax on the gross receipts of a foreign corporation is unconstitutional if those receipts are in part the proceeds of interstate traffic. In the decision it was stated that in the earlier case the tax was upheld because the company in the controversy was a domestic corporation, and that, therefore, the tax was a franchise tax. In *Philadelphia and Southern Steamship Company*⁵ the same ground was taken; but it was further held that the decision in the *Railway Gross Receipts Tax Case* was legally unsound in so far as it was based on the analogy of goods removed from the original package (as held in *Brown v. Maryland*, 12 Wheat., 419). Other later decisions take the same ground.

In a more recent case,⁶ decided in 1891, the Maine tax was upheld on the old ground that the tax was a franchise tax, the real party in the litigation being a domestic corporation.⁷ It was implied in the decision, however, that the distinction between domestic and foreign corporations is not an absolutely necessary one. Judge Field, in delivering the opinion of the court, said:

"The privilege of exercising the franchises of a corporation within a State is generally one of value, and often of great value, and the subject of earnest contention. It is natural, therefore, that the corporation should be made to pay some proportion of the burdens of the government. As the granting of the privilege rests entirely within the discretion of the State, whether the corporation be of

⁷ *The Atlantic and St. Lawrence Railroad Company*.

domestic or foreign origin, it may be conferred upon such conditions, pecuniary or otherwise, as the State in its judgment may deem most conducive to its interest or policy. It may require the payment into its treasury each year of a specific sum, or may apportion the amount exacted according to the value of the business permitted, as disclosed by its gains or receipts of the present or past years. The character of the tax or its validity is not determined by the mode adopted in fixing its amount for any specific period or the times of its payment. The whole field of inquiry into the extent of revenue from sources at the command of the corporation is open to the consideration of the State in determining what may be justly exacted for the privilege. The rule of apportioning the charge to the receipts of the business would seem to be eminently reasonable, and likely to produce the most satisfactory results both to the State and the corporation taxed."

Whether telegraphic messages may be considered the subjects of interstate commerce might at first be questioned. Such, however, is in effect the burden of the decisions of the United States Supreme Court. These companies are in respect to the taxation of their receipts subject to substantially the same provisions as railroads. According to the decision in *Telegraph Company v. Texas*,¹ any telegraph company accepting the provisions of Title 65, United States Revised Statutes, becomes an agent of the United States as regards Government business; and any State law imposing a tax on messages is void, both as to Government messages and to messages sent out of the State. In *Ratterman v. Western Union Telegraph Company*,² a decision of general application to transportation companies was reached, to the effect that though a tax on gross receipts from both intrastate and interstate commerce is invalid, the tax is valid so far as it applies to the intrastate portion of those receipts.

To sum up, the legal status of the gross-receipts tax is substantially as follows: Domestic corporations may be taxed on their gross receipts regardless of the source of those receipts, provided they are not entirely the proceeds of interstate commerce. Foreign corporations may be taxed only on the intrastate portion of their receipts. The distinction from the legal standpoint arises out of the fact that in the former case the tax is a tax on franchise, and in the latter case a tax on business—i. e., a tax on interstate traffic—which is in violation of the interstate commerce clause in the Federal Constitution.

The receipts of the large transportation companies are to a large extent the proceeds of interstate traffic. Any transportation tax system which confines the incidence of a tax to purely intrastate receipts is in the main an inadequate one. As we have just seen, however, such is the necessary practice in the taxation of foreign corporations. As concerns the taxation of net income, it is probable that the question of the validity of such a tax would be determined upon different grounds.

C. DOUBLE TAXATION OF CORPORATION AND SECURITY HOLDER.

The simultaneous taxation of both corporation and security holder is one which may arise under competing authorities as well as under the same jurisdiction. It is a problem which may not be viewed from the standpoint of single groups of corporations (e. g., transportation companies, manufacturing corporations, etc.); from any ultimate point of view it must comprehend the entire field of investments. To tax both corporation and security holder, when a tax on investments is general, is clearly double taxation; but when a tax applies only to a special class of investments, the question can not be decided without examining into the incidence of the tax. Professor Seligman says on this point:

"If only one class of corporations is taxed, the purchaser of these corporate securities will escape taxation, because the amount of the tax is discounted in the depreciation of the security. For, let us suppose that a corporation previously untaxed has been paying 5 per cent dividends on its stock quoted at par. If a special tax of 10 per cent be imposed on these dividends, the stockholders will get only 4½ per cent. But since by the supposition other classes of corporations, or at all events other noncorporate investments, are not taxed, the price of the stock will fall to 90. People who can get 5 per cent on their capital will not ordinarily consent to take 4½ per cent. The original holders of the stock will indeed lose, but the new purchasers will not be affected, because the tax is capitalized and leads to a depreciation of the capital value of the stock. A dividend of \$4.50 on stock costing \$90 is as good as one of \$5 on stock costing \$100. A tax levied only on corporate profits, or only on some special classes of corporations, does not affect any one but those who become stockholders before the imposition of the tax. To

¹105 U. S., 460.

²127 U. S., 411.

tax the new purchaser on his security would not in such a case involve unjust double taxation.

"There is one other condition under which the simultaneous taxation of the corporation and the security holder is not unjust. In the case of a stockholder we have seen that if the tax is general, it is unjust to tax both the corporation and the stockholder. In the case of a bondholder this would ordinarily be true, when the income tax on the corporation is, for instance, deducted from the interest of the bondholder as well as from the dividends of the stockholder. In some cases, however, it happens that the corporation is willing to assume the tax as a whole, and to count the tax among its fixed charges, declaring the coupons free from tax. In such a case it is really the stockholders who pay; for the interest on the bonds is fixed, and what is not deducted from the interest must be paid out of the surplus earnings, which would otherwise ultimately go to the stockholders. The bondholders are not reached at all by such a tax, except in the very indirect way that they may be exposed to an ultimate diminution in the security of their lien. But the tax as such does not strike them at all; their property or income in the corporate bonds goes scot free. An additional tax upon the bondholder would thus really not involve any injustice to them. Here, as well as in the preceding case, a study of the real incidence of the tax becomes important. What is apparently double taxation may turn out not to be such."¹

Where, however, the practice of taxing all forms of business enterprises up to the limits set by their earning capacity prevails, an additional tax upon security holders would be unjust, upon the ground that the direct taxation of the total investment had already reached the taxable capacity of the individual sharers in that investment.

To the tax administrator, however, the fact which has greatest weight against the taxation of securities is the practical impossibility of reaching those securities for purposes of taxation. It would be needless to dilate upon the causes or character of this difficulty. It will be sufficient to state that the most prominent of the obstacles which arise in the administration of the general property tax spring from this source. The experience of all the States has made it clear that "property of this character will go into hiding, and that no penalties will prove sufficient to bring it out."

In State practice the status of the taxation of corporation and security holder is a variable one. In Arizona and California, statute provision expressly declares this to be double taxation and forbids the practice; and in many other States the practice has been guarded against either by statute or by judicial interpretation. In Pennsylvania the attitude of the courts has changed since the earliest decisions on the subject were arrived at. In *Lycoming County v. Gamble*,² it was held that "shares of stock and the capital stock of a corporation are distinct and different things," and that, therefore, both were taxable. In *Whitesell v. Northampton County*,³ it was decided that "the corporation, as an artificial person, is taxable, and * * * the stockholders are also taxable personally for the shares of stock individually held by them." In *Pittsburg, Fort Wayne and Chicago Railway v. Commonwealth*⁴ it was held that "double taxation is not unlawful in Pennsylvania." But the tendency of the court on the question has changed. In *Commonwealth v. Fall Brook Coal Company*,⁵ for instance, the court held that "a tax upon the capital stock in the hands of a corporation and a tax upon the owners of the parts or shares into which the capital stock is divided, upon their respective holdings, is double taxation, and will not be supported except by express enactment." And further, "where a railroad company has paid a tax upon its capital stock under the acts of 1889 and 1891, its shares are not taxable in the hands of their holders. Pennsylvania practice is now in line with this decision. In the early practice of Tennessee, as laid down in *Memphis v. Easley*,⁶ a tax on the corporation did not preclude the taxation of the security holder also. The courts subsequently abandoned that position. The same change, either through statute provision or judicial decision, has taken place in a number of other States; as, for instance, in Indiana and in Illinois (State banks excepted.)

In some States, on the other hand, double taxation of this type is still sanctioned. Iowa and Missouri, for instance, follow this plan, though making an

¹ Seligman, *Essays in Taxation*, p. 105. For a full discussion of the question, see the same author's work on *The Shifting and Incidence of Taxation*.

exception of manufacturing corporations, as do Louisiana, Maine, North Carolina, Wyoming, and other States with corporations generally.

Some States apply different rules to different corporations. Vermont, for instance, expressly exempts railroad stocks, and Kentucky stocks in telegraph, telephone, and express companies. Then, too, in some States (e. g., Louisiana, Maine, Minnesota, Kansas, and Rhode Island) certain property deductions are made in determining the taxable value of shares.

In Massachusetts a distinction is made between domestic and foreign corporations. The former pay a tax on capital stock as a whole, and shareholders are exempt. Resident shareholders in the latter are, as far as possible, assessed and taxed by the local tax officers. The Massachusetts tax commission of 1897 made the following comment on this system.

* * * "If all the States followed the Massachusetts method in taxing corporations and securities, it is evident that throughout the country all shares owned by persons living outside the State where the corporation was chartered would be doubly taxed; taxed first to the corporation in the State where organized, taxed second to every owner who lived outside that State. The Commonwealth by its own corporation tax has estopped itself from denying that its system of taxing shares involves double taxation.¹

The courts of the United States were at first very leniently inclined in their decisions toward the double taxation of corporation and security holder; but that ground has since been abandoned. In *Tennessee v. Whitworth*,² the Supreme Court held that double taxation is not to be presumed in the absence of special statutory provision to that effect. In *New Orleans v. Houston*,³ the court held that a tax on the holdings of shareholders paid by a corporation, irrespective of the dividends payable to the shareholders, is substantially a tax upon the corporation itself; and again, in the same case. "It is well settled by the decisions of this court, that the property of shareholders in their shares, and the property of the corporation in its capital stock, are distinct property interests;" but the right to tax both is not to be presumed unless such "is the legislative intent, clearly expressed."

As regards the simultaneous taxation of bonds and of bonded debt, the United States Supreme Court, it will be remembered, has uniformly held (at least up to the *Multnomah County* case) that a tax on bonds, even when paid by the corporation, is a tax on the bondholder and not on the corporation. This principle is followed in the laws of Maryland and Pennsylvania. In Connecticut, on the other hand, where the tax is levied against the corporation on a valuation equal to the value of the capital stock and indebtedness, a tax on bonds, assessed against bondholders, has been declared not to involve double taxation.

The solution of the problem of how to tax securities is as involved as it is important. Upon the surface, the most practicable plan should appear to be the abandonment of the attempt to tax property of this type, and in its stead the following out of a plan to tax the corporation directly to the full extent of its taxable capacity.⁴

¹ Report of Massachusetts tax commission of 1897, p. 79.

² 117 U. S., 136.

³ 119 U. S., 265.

⁴ The discussion of this question by the Massachusetts Tax Commission of 1897, is eminently sane. Among other things, the Commission says: "It is a large and difficult question of public policy and public expediency. It arises not only as to shares, but as to bonds, as to loans on the pledge of property outside the State, as to securities of various sorts. In our great federal union, with a Government partly national, partly State, we find vast masses of property owned wholly or in part, directly or indirectly, by persons living outside the State where the property is situated. In justice to individuals, in comity toward sister States, in the practical administration of the tax system, what should be our general position as to such property? * * *

"We are not prepared to recommend the entire exemption from all taxation of foreign stocks and other securities, but we are unhesitatingly of opinion that the present method of taxing them is bad in principle as well as ineffective in practice. * * *

"We believe that the proposed system of rigid enforcement by State assessment would not accomplish its object, and that, quite apart from the desirability of the end proposed, the result would be fruitless and disappointing. * * *

"We can not conceive a system more demoralizing to the taxpayers, than that for collecting on securities, by rigid sworn returns, taxes of the present sort at the present rate. * * *

"The problem is, how to discover methods which are not punitive and of double effect in their mode of levy, which are practicable and smooth-working in their administration, and which shall secure as near an approach to justice as is attainable in view of the complex ownership of property in modern times." (Report of Massachusetts Tax Commission of 1897, p. 80, et seq.)

CHAPTER IV.

SUMMARY OF EXISTING LEGISLATION.

A. RAILROAD COMPANIES.

Of the 48 States and Territories; the tax systems of which have been outlined in the foregoing statements, 34 levy taxes on the basis of a cash valuation¹ of property, or of property and franchise, as determined by a State board of assessment. In three cases (Ohio, Mississippi, and Virginia) this tax is supplemented by taxes on receipts, and in one case (Vermont) it is alternative with a tax on receipts.

Twelve States levy taxes determined on the basis of gross receipts.² In six³ of these States this tax is only supplementary to a tax levied on some other basis, and in one (Vermont) it is alternative with a tax on the cash valuation of property and franchise. In the remaining five States the tax on gross receipts is the main feature of the system. It might be added that in Vermont, where this tax is alternative with another system, railroad companies actually pay the tax on the basis of gross receipts.

New York levies a tax on capital stock according to dividends, supplemented by a tax on gross receipts.

Massachusetts levies a tax on capital stock at its market value, with deductions for property locally taxed.

Pennsylvania levies a tax on capital stock and bonded debt, supplemented by a tax on gross receipts.

Connecticut levies a tax on capital stock and total indebtedness.

Delaware levies a tax on capital stock, supplemented by a net earnings tax, a tax on passengers, and a specific tax on cars and locomotives.

The net earnings tax, as applied to railroads, is to be found in but a single State (Delaware), and there only as a feature of a wider system.

Three States and one Territory (Oregon, Rhode Island, Texas, and New Mexico) still cling to the primitive system of the general property tax, as applied to the taxation of individuals. In Texas, however, there is an additional State tax on gross receipts.

In those cases where franchises are taxed, capital stock, earnings, and indebtedness are considered, in different States according to different rules, in arriving at a cash valuation upon which to assess the tax.

All of the more progressive States have abandoned mere property valuation as the basis for the taxation of their transportation companies.

Generally, railroad property not used for railroad purposes or not situated on the main stem is locally taxed in the same manner and at the same rate as the property of individuals.

Where railroad property is equalized or assessed by State officials and the tax is computed and collected locally, the average value per mile of road is determined for each company. The value of the railroad property in any particular tax district is then determined on a pro rata mileage basis, and the tax is levied at the usual rate for State and local purposes.

Where taxes are levied on capital stock, debt, earnings, or rolling stock, and usually where levied on cash valuation of property, railroads partly within and partly outside of a State are assessed on the portion determined by the ratio of mileage of line within the State to total mileage of line.

B. TELEGRAPH COMPANIES.

Of those States where express provision is made for the taxation of these companies by State authorities, 27 levy a tax on cash valuation of line. Of these, California, Connecticut, Delaware, North Dakota, and Wisconsin arrive at this valuation on the basis of a certain fixed value per mile of wire; Idaho, Kansas, Louisiana, Michigan, Nebraska, New Hampshire, North Carolina, Oklahoma, South Carolina, South Dakota, Washington, and Virginia levy the tax on property

¹ Alabama, Arizona, Arkansas, California, Colorado, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Mississippi, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey, New York, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Utah, Vermont, Virginia, Washington, West Virginia, and Wyoming.

² Maine, Maryland, Michigan, Minnesota, Mississippi, New York, Ohio, Pennsylvania, Texas, Vermont, Virginia, and Wisconsin.

³ Mississippi, New York, Ohio, Pennsylvania, Texas, and Virginia.

valuation, generally determined on the mileage basis; Colorado, Florida, Iowa, Mississippi, Missouri, Tennessee, Utah, Vermont, and Wyoming levy the tax on a valuation of property and franchise. In Vermont this is alternative with a tax on gross receipts. Ohio levies a tax on cash valuation of line, which is virtually a capitalization of earning capacity (earnings are capitalized at 6 per cent).

In 19 States¹ these companies pay a tax on gross receipts. In Louisiana, New Jersey, and Virginia this is called a "license tax." In West Virginia it is applicable only to foreign corporations. In Texas the tax is on the proceeds of separate messages.

In five States, Alabama, Mississippi, Montana, Tennessee, and Virginia, specific privilege or license taxes are levied. In Alabama and Tennessee this is levied at a certain sum per mile of line. This is also the case in Mississippi, except that a fixed sum is levied when the length of the line is in excess of 1,000 miles. In Montana this is a local tax levied on instruments of transmission.

In Arkansas, Kentucky, and Illinois, these companies are taxed on capital stock, and in Indiana on the capitalized value of capital stock and bonded debt, with property deductions. In Massachusetts (so far as concerns domestic corporations), in New York, and in Pennsylvania the provisions of the general corporation tax law are applicable.

In those States where there is no express provision for the taxation of these companies the property tax as applied to individuals is in force.

C. TELEPHONE COMPANIES.

The laws of 24 States provide for a tax based on cash valuation of property or of property and franchise. In California, Connecticut, and Delaware this valuation is determined upon a mileage basis. In Connecticut a valuation set on instruments is included. In Colorado, Kansas, Maine, Michigan, New Hampshire, South Dakota, and Virginia this valuation is a valuation of property generally determined upon a mileage basis. In Iowa, Tennessee, Utah, and Washington the tax is levied on the valuation of property and franchise. In Mississippi the valuation is graded according to the number of subscribers, and in Ohio it is a valuation determined upon the basis of earning capacity, as in the case of telegraph companies.

Thirteen States² levy a tax on gross receipts. In Louisiana and New Jersey this is called a "license tax."

In Florida, Georgia, Montana, Tennessee, Texas, and Virginia license taxes are levied on these companies. In Florida this is a graded tax based on the amount of capital stock. In Montana and Virginia it is levied on instruments. In Texas it takes the form of a specific annual sum to the counties. In Georgia there is a tax on instruments in addition to the annual license tax.

In Indiana these companies are taxed on a capitalized value of stock and bonds, and in Illinois on the basis of capital stock.

In Massachusetts, New York, and Pennsylvania these companies are subject to the provisions of that tax. In those States where the taxation of these companies is not the subject of express provision the general property tax applies.

D. EXPRESS COMPANIES.

In 19 States³ these companies are taxed on their gross receipts. In Louisiana and New Jersey this is called a "license tax." In West Virginia the tax applies only to foreign corporations. In New Mexico it amounts practically to a tax on net receipts. In a number of these States, also, the tax is supplemented by the usual property tax, general corporation tax, or franchise tax.

In eight States—Iowa, Louisiana, Missouri, North Carolina, Ohio, South Carolina, South Dakota, and Virginia—a tax on each cash valuation is provided for. In Missouri the valuation is upon property and franchise; in Ohio upon capitalized earnings; in South Dakota earnings are taken into consideration, and in Virginia the valuation is on property.

Florida, Mississippi, and Virginia levy specific license taxes, and North Dakota a license tax graded according to population. Tennessee levies a privilege tax based on the mileage over which business is done.

¹ Delaware, Georgia, Louisiana, Maryland, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, Vermont, Virginia, and West Virginia.

² Alabama, Delaware, Louisiana, Maryland, Minnesota, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, Vermont, and Wisconsin.

³ Connecticut, Delaware, Georgia, Louisiana, Maine, Maryland, Michigan, Minnesota, Missouri, New Jersey, New Mexico, New York, North Carolina, Ohio, Rhode Island, Texas, Vermont, Virginia, and West Virginia.

Arkansas, Illinois, Nebraska, and Wisconsin tax these companies on capital stock, and Indiana and Iowa on the capitalized value of stock and bonds. In those States where there are general corporation tax laws these companies are taxed under the provisions of those laws.

In the other States and Territories these companies are taxed under the general property tax in the same manner as individuals.

E. SLEEPING, PARLOR, AND DINING CAR COMPANIES.

These companies are taxed in 10 States¹ on gross receipts. In New Jersey the tax is termed a "licensed tax."

Alabama, Arkansas, Georgia, Iowa, Louisiana, Missouri, Nebraska, North Carolina, South Carolina, South Dakota, Tennessee, Utah, and Wyoming levy a tax on cash valuation of cars employed within their boundaries. In South Dakota earnings are taken into consideration in determining the valuation.

Arkansas, Illinois, Kentucky, Ohio, Texas, Virginia, and Wisconsin tax these companies on their capital stock; Indiana at the capitalized value of stock and bonds, and New York, Pennsylvania, and Massachusetts (so far as concerns domestic corporations) under the general corporation tax laws of those States.

Delaware levies a license tax on the Pullman Company; Mississippi, a specific privilege tax in addition to a privilege tax on a mileage basis; and Tennessee, a specific privilege tax.

In the other States and Territories these companies, when taxed at all, are taxed on their property in the same manner as individuals.

F. FREIGHT LINE AND EQUIPMENT COMPANIES.

In Maryland, Michigan, New York, Pennsylvania, and Vermont these companies are taxed on gross receipts. In Vermont the tax is alternative with a tax on property and franchise.

Minnesota, Ohio, and Wisconsin tax these companies on capital stock. In Massachusetts (so far as concerns domestic corporations), New York, and Pennsylvania the general corporation tax laws have application.

In New Jersey these companies are taxed on a cash valuation of their property, including rolling stock, and in Vermont a tax on property and franchise is alternative with the tax on gross receipts.

In the other States and Territories these companies, when taxed at all, are taxed on their property in the same manner as individuals.

G. NAVIGATION COMPANIES.

These companies are in general taxed on the value of their water craft and other property. In certain States, however, specific provision is made for their taxation, either complementary to or as a substitute for the tax on property.

In Virginia these companies are taxed on their net earnings. In Delaware canal companies are taxed on their net earnings, and all navigation companies are subject to the provisions of the passenger tax law. In Rhode Island vessels engaged in foreign trade are subject to a net earnings tax, as are vessels in general in Connecticut. In Kentucky navigation companies are subject to the usual corporate franchise tax. In Georgia a license tax is levied on steamboat companies, and in Florida a license tax on tonnage of vessels. Maine and Minnesota also levy taxes on tonnage. In Illinois navigation companies, and in Virginia and New Jersey canal companies, are taxed in the same manner as railroad companies are taxed in those States. Maryland, New York, Pennsylvania, and Vermont tax navigation companies on gross receipts. In Vermont this tax is alternative with a tax on property and franchise, and in New York and Pennsylvania it is supplementary to the general corporation tax. In Massachusetts domestic companies are taxed under the corporation tax law.

North Carolina levies a tax on capital stock, West Virginia on property and capital stock, and Missouri varied wharfage taxes in the towns and cities of the State.

¹Florida, Maryland, Michigan, Minnesota, New Jersey, New Mexico, New York, Pennsylvania, Texas, and Vermont.

H. TAX ON CORPORATE CHARTERS.

In 27 Commonwealths¹ various taxes, under a variety of names, are levied upon the incorporation, organization, consolidation, and reorganization of corporations and upon the increase or decrease of their capital stock. Properly speaking, these charges are not taxes, but fees paid in return for privileges granted by the State. This fact has been recognized in the legislation of Pennsylvania and Rhode Island upon the subject, where the fee is termed a "bonus on charters," and in several other States, where it is termed "charter fees," "license fees," or "organization fees." In Connecticut, Michigan, and Texas statute terminology confuses it with the tax on franchises, though it is very obviously not a franchise tax.

In several States this levy takes the form of an annual license charge (e. g., Alabama, Vermont, Washington). In Connecticut it applies only to domestic corporations doing their main business outside of the State, and in Texas, New York, and Vermont to foreign corporations as well as to those of domestic origin. In certain States certain specified forms of corporate industry are not subject to the general regulations of this character (e. g., bridge, canal, and railroad companies in Pennsylvania and railroad companies in Rhode Island).

CHAPTER V.

CONSTITUTIONAL AND STATUTORY PROVISIONS, BY STATES.

The constitutional provisions which are summarized in this chapter do not include all which apply to State and local fiscal relations, but only such as appear to have a particular bearing on the making and administration of State laws for the aiding of and taxation of transportation companies. These summarized provisions may or may not apply to other classes of persons and property; but neither alternative may be inferred to hold unless express statement is made to that effect.

In summarizing statute provisions, attention is given chiefly to the taxation of railroad companies, with minor reference to telegraph, telephone, express, parlor, and sleeping car, freight line and navigation companies. Generally, where transportation companies are subject to direct taxes by the State, shares of stock are not assessed to individual holders, so that tax provisions on this subject are not digested.

ALABAMA.

CONSTITUTIONAL PROVISIONS.

State aid and internal improvement.—The State shall not engage in works of internal improvement, nor lend its money or credit in aid of such; nor shall the State be interested in any private or corporate enterprise, nor lend its money or credit to any individual, association, or corporation. (Art. IV, sec. 54.)

Taxes on property.—All taxes on property shall be levied in exact proportion to the value thereof. (Art. XI, sec. 1.)

The property of private corporations, associations, and individuals shall forever be taxed at the same rate. (Art. XI, sec. 6.)

Local aid.—The general assembly shall not have power to authorize any local division to lend its credit, grant money or property, or take stock in aid of any corporation or company. (Art. IV, sec. 55.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*²—Railroad companies are required to make annual returns to the State auditor of all property employed in operating their lines. Upon the basis of these schedules, the State board of assessment value the railroad property "upon the consideration of what a clear fee simple title thereto would sell for under the conditions under which that character of property is most usually sold for." This valuation is then apportioned among the counties upon a pro rata mileage basis, for the computation and collection of the tax.

¹Alabama, Colorado, Connecticut, Delaware, Florida, Georgia, Illinois, Kansas, Kentucky, Maine, Maryland, Michigan, Minnesota, Missouri, New Hampshire, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, Tennessee, Texas, Utah, Vermont, Virginia, Washington, and West Virginia.

²Code of 1896, secs. 3964-3973.

License tax.—Railroad companies also pay a license tax on gross earnings to cover the expenses of the railroad commission.¹

*Local taxation.*²—Railroad real estate and personalty not in the right of way are locally assessed and taxed. A local tax also is levied on the basis of the valuations apportioned by the State.

Telegraph companies.³

These companies pay to the State an annual privilege tax of \$1 per mile of line when that line is 150 miles or less in length. Lines of over 150 miles pay at the same rate in addition to a specific tax of \$500. These taxes are in addition to the usual local license and property taxes.

Telephone Companies.

These companies (as well as canal, bridge, and ferry companies) pay a tax on gross income at the usual property rate.⁴

They are, besides, required to make annual reports of property and receipts, upon the basis of which a property valuation is arrived at for purposes of taxation.⁵

A license tax in towns and cities is levied as follows: In places of 20,000 inhabitants or over, \$25; less than 20,000 and more than 10,000, \$10; other places, \$5.⁶

Long-distance telephone companies report their property and receipts to the State auditor. The tax is further administered as in the case of railroads.⁵

Long-distance telephone companies are also required to pay, to the State, 50 cents per mile of line when that line is 150 miles or less in length; and further, all lines of more than 100 miles in length pay the sum of \$350.⁴

Sleeping-car companies.⁷

These companies pay the State a privilege tax of \$1,250, and are taxed in addition on property in the usual way.

Other corporations.⁸

Other corporations pay a license tax, graduated according to the amount of paid up capital stock. The tax begins with a rate of \$10 upon companies whose paid up capital stock is under \$10,000, and rises gradually to a tax of \$500 upon companies whose capital stock amounts to \$1,000,000 or over.

ARIZONA.

STATUTE PROVISIONS.

Railroad companies.⁹

*Exemption.*¹⁰—Railroads hereafter constructed shall be exempt from taxation for a period of 10 years after the passage of this act.

Listing, valuation, etc.—Railroad companies are required to make full annual reports of property used in operation to the Territorial board of equalization, by whom a valuation is set on property and franchises. Rolling stock is valued on a pro rata mileage basis. The total valuation is apportioned among the counties for the computation and collection of the usual tax rates.

Local taxation.—Property other than that of operation is locally assessed and taxed.

Telegraph companies.¹¹

These companies are assessed and taxed in the counties at a certain rate per mile of line.

ARKANSAS.

CONSTITUTIONAL PROVISIONS

The power to tax corporations and corporate property shall not be surrendered nor suspended. (Art. XVI, sec. 7.)

State aid.—The State shall never assume nor pay the indebtedness of any corporation, nor release any corporation from its liabilities to the State. (Art. XII, sec. 12.)

The liability of any railroad or other corporation to the State shall never be exchanged nor remitted. (Art. V, sec. 33.)

¹ Code of 1896, sec. 3489.

² *Ibid.*, secs. 3964-3973.

³ Laws of 1898-99, p. 169.

⁴ *Ibid.*, p. 50.

⁵ *Ibid.*, p. 170.

⁶ *Ibid.*, p. 193.

⁷ *Ibid.*, p. 165.

⁸ *Ibid.*, p. 178.

⁹ Revised Statutes of Arizona (1887), par. 2649.

¹⁰ Laws of 1899, p. 79.

¹¹ *Ibid.*, par. 2647.

Except as herein provided, the State shall never be interested in the stock of any corporation or association. (Art. XII, sec. 7.)

The State shall never loan its credit for any purpose whatever. (Art. XVI, sec. 1.)

Taxes on property.—All property shall be taxed according to its value. (Art. XVI, sec. 5.)

Rolling stock shall be considered and taxed as personalty. (Art. XVII, sec. 11.)

Reports of railroad companies.—Railroads shall make annual reports of their acts and doings to the auditor of public accounts. (Art. XVII, sec. 13.)

Local aid.—No local division shall take stock in, obtain, or grant money for, or loan its credit to any corporation, association, or individual. (Art. XII, sec. 5. See also Art. XVI, sec. 1.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*¹—Railroad companies are required to return to the secretary of State sworn schedules of property on the right of way and of rolling stock (both hired and leased), including a statement of the actual aggregate value of the various elements of railroad property. On the basis of these returns, the State board of railroad commissioners fix a valuation, which is apportioned among the local districts for the computation and collection of the usual property taxes. Rolling stock is valued upon a pro rata mileage basis. In case of failure to list, witnesses may be summoned and books, records, etc., examined.

Local taxation.—Real estate and personalty not in the right of way are assessed and taxed locally.² A local tax is levied also on the valuation apportioned by the State.

Telegraph, express, and sleeping-car companies.¹

These companies make annual returns to the State. They are taxed upon their capital stock (i. e., on a pro rata mileage proportion thereof employed within the State). The real and personal property of these companies is taxed where situated, as is the similar property of telephone companies.

CALIFORNIA.

CONSTITUTIONAL PROVISIONS.

State aid.—No grant of money or property shall ever be made by the State for the benefit of any corporation not exclusively under State control. (Art. IV, sec. 22.)

The State shall neither give nor lend, nor authorize the giving or lending of the credit of the State to any person, corporation, or association; nor shall the State subscribe to stock in a corporation. (Art. IV, sec. 31. See also Art. XII, sec. 13.)

Taxes on property and franchises.—All property in the State shall be taxed according to its value—franchises, moneys, credits, bonds, stocks, dues, and all other property included. (Art. 13, sec. 1.)

Lands and improvements thereon shall be separately assessed. (Art. 13, sec. 2.)

The legislature shall have power to provide for the payment of all taxes on real property by installments. (Art. XIII, sec. 7.)

The franchise, roadway, roadbed, rails, and rolling stock of all railroads shall be assessed at their actual value by the State board of equalization (provided for in sec. 9); which valuation shall be apportioned among the local districts on a pro rata mileage basis. (Art. XIII, sec. 10.)

Every obligation by which a debt is secured, *except as to railroads and quasi-public corporations*, shall be taxed at its value, and the collateral property shall be taxed at its value less the value of the obligation. Art. XIII, sec. 4.)

Incomes.—Incomes may be taxed as prescribed by law. (Art. XIII, sec. 11.)

Railway reports and accounts.—The State railroad commissioners shall have power to summon persons and papers, and shall prescribe a uniform system of railway accounting. (Art. XII, sec. 22.)

Local aid.—The State shall not authorize the giving or lending of the credit of any county, city, township, etc., to any person, corporation, or association; nor shall any local district subscribe to stock in a corporation. (Art. IV, sec. 31.)

¹ Sandels and Hill's Digest, (1894), secs. 6466-6476.

² Ibid., sec. 6475.

³ Ibid., secs. 6465-6467.

TAXATION OF TRANSPORTATION COMPANIES

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*¹—Railroad companies are required to furnish full sworn statements of property, stock, and business. On the basis of this information the State board of equalization assesses franchise, roadway, roadbed, rails, and rolling stock in the State on a pro rata mileage basis. Franchises derived from the United States are exempted from taxation. Upon the valuation arrived at by the board of equalization the taxes are levied and collected by the State at the average rate of taxes on property in the State. To aid in arriving at valuations, provision is made for the summoning of witnesses, corporation records, books, etc., by the State board of equalization.

*Local taxation.*¹—Railroad property other than that of operation is locally assessed and taxed. Local districts receive also a share of the tax on the values determined by the State board of equalization.

Telegraph and Telephone companies.²

The property of these companies is locally assessed and taxed as personalty at a certain rate per mile of line, fixed by local assessors.

COLORADO.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not pledge its credit or become responsible in any way for the debts of any person, company, or corporation. (Art. XI, sec. 1.)

The State shall not make any donation to nor subscribe to stock in any corporation. (Art. XI, sec. 2.)

No obligation of any person, association, or corporation to the State shall ever be exchanged, released, postponed, or diminished. (Art. V, sec. 38.)

Uniform property tax.—Taxes shall be uniform upon the same class of subjects within the same jurisdiction. All property shall be taxed at its just value. (Art. X, sec. 3.)

Corporation taxes.—The power to tax corporations and corporate property shall never be relinquished nor suspended. (Art. X, sec. 9.)

All corporations shall be subject to taxation for State and local purposes. (Art. X, sec. 10.)

Local aid.—No local division shall pledge its credit or become responsible in any way for the debts of any person, association, or corporation. (Art. XI, sec. 1.)

No local division shall make any donation to or subscribe to stock in any corporation. (Art. XI, sec. 2.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*³—These companies are required to make returns to the State board of equalization, upon the basis of which the franchise, roadbed, track, and rolling stock are valued upon a pro rata mileage basis, and said value apportioned among the counties for the computation and collection of the usually general property taxes.

*Local taxation.*⁴—Real estate (including stations and other buildings, but not track) and personalty are locally assessed and taxed. There is also a local tax on the basis of the values apportioned by the State.

Telegraph, telephone, and car companies.⁵

These companies are subject to provisions similar to those which apply to railroads.

CONNECTICUT.

CONSTITUTIONAL PROVISIONS.

Local aid.—No local division shall subscribe to stock in a railroad corporation, nor purchase its bonds, nor aid it in any way. (Amendment of Oct., 1877.)

¹ California Political Code (1897), secs. 3664-3671.

² *Ibid.*, sec. 3663.

³ Mills's Annotated Statutes, secs. 3804-3807.

⁴ Mills's Annotated Statutes, secs. 3804-3807.

⁵ *Ibid.*, secs. 3801-3803.

STATUTE PROVISIONS.

Railroad companies.¹

State taxation.—Railroad companies are required to make annual reports to the State controller, setting forth their capital stock and indebtedness. They then pay the State, as a franchise tax, one per cent on the market value of their capital stock, in addition to one per cent on the par value of their funded and floating debt, or on actual value if below par. In determining the valuation, deduction is made for any part of the indebtedness which is held in trust as part of a sinking fund, as well as for the amount of local taxes on real estate. As the valuation represents only that portion of the capital stock and debt assignable to Connecticut, the valuation is determined on a pro rata mileage basis as compared with the total mileage.

Local taxation.—Railroads are locally taxed on their real estate not directly used for purposes of operation.

Telegraph and telephone companies.²

Telegraph companies pay the State a tax of 25 cents per mile of wire. They also pay local taxes on their real estate.

Telephone companies pay the State a tax of 70 cents per instrument in addition to 25 cents per mile of wire. They also pay local taxes on real estate.

Express companies.³

These companies pay the State a tax of 5 per cent on their gross receipts from business done in the State.

DELAWARE.

CONSTITUTIONAL PROVISIONS.

Nothing specific.

STATUTE PROVISIONS.

Railroad companies.⁴

Tax on net earnings.—Railroad companies, as well as canals, make annual returns of business to the State, as by law required. They then pay to the State a tax of 10 per cent on their net earnings in the State, as determined by the proportion of mileage within the State to total mileage; besides a tax of one-half of one per cent on a pro rata mileage portion of capital stock.

Passenger and locomotive taxes.—Railroad and navigation companies pay the State a tax of 10 cents on each passenger carried by steam power on land or water in the State. The law grants permission to raise the rate of fare to the extent of the tax.

Railroad companies (excepting the P., W. & B. R. R. Co., which is otherwise provided for) may pay in lieu of the passenger tax a sum which bears the same proportion to the gross receipts from passenger business between points in the State as the sum of \$13,000 bears to the like business of the P., W. & B. R. R. Co. In addition, there is a special tax of \$100 on each locomotive, \$25 on each passenger car, and \$10 on each freight car and truck used within the State.

The Philadelphia, Wilmington and Baltimore Railroad Company pays to the State annually the sum of \$27,000 in lieu of all taxes but the passenger tax, and this latter may be commuted by the annual payment of the specific sum of \$13,000.⁵

The Delaware Railroad Company may pay \$3,000 annually in lieu of all other taxes.⁶

Local taxation.—Railroad real estate, including buildings on the right of way, is locally assessed and taxed.

Telegraph and telephone companies.⁷

These companies annually pay to the State a tax of 60 cents per mile on the longest wire in the State; 30 cents per mile on the next longest wire, and 20 cents per mile on all other wires.

Express companies.⁸

These companies pay a tax of five per cent on their gross earnings from business done within the State.

⁶ *Ibid.*, p. 54.

⁷ *Ibid.*, p. 72.

⁸ *Ibid.*, p. 73.

Pullman company.¹

This company pays an annual State license tax in lieu of other taxes.

Franchise tax on telegraph, telephone, express, and sleeping-car companies.

These companies pay an annual license tax for the privilege of exercising their corporate franchises on the basis of their gross receipts from business done in the State. The rate of the tax is one per cent, except in the case of sleeping-car companies, with which it is 1½ per cent.²

FLORIDA.

CONSTITUTIONAL PROVISIONS.

State aid.—No tax shall be levied for the benefit of any chartered company. (Art. IX, sec. 7.)

The credit of the State shall not be pledged or loaned to any individual, company, or corporation; nor shall the State become a stockholder in any company. (Art. IX, sec. 10.)

Uniform tax on property.—Taxation shall be at a uniform and equal rate. All property shall be justly valued. (Art. IX, sec. 1.)

Local aid.—The legislature shall not authorize any local district to appropriate money for, loan its credit to, or become a stockholder in any company or corporation. (Art. IX, sec. 10.)

STATUTE PROVISIONS.

Railroad companies.³

Listing, valuation, etc.—Railroad companies are required to make full annual reports to the State comptroller, setting forth the property used in operation, its value, and the amount thereof in each county and municipality. The value of the rolling stock is apportioned pro rata to each mile of track. The comptroller notifies the proper official in each county and municipality through which the road runs of the number of miles of track, its proportionate value, and the proportionate value of other taxable property. The tax is levied and collected in the various local divisions at the usual property rate.

Local taxation.—Railroad lands not in the right of way are locally assessed and taxed. Local taxes are levied in addition on the values apportioned by the State.

Telegraph companies.⁴

The property, rights, and franchises of these companies are taxed like the property of railroads.

Telephone companies.⁵

These companies pay an annual license tax, in addition to the usual local taxes on property, on the following bases:

When the capital stock is \$100,000 or more, \$100.

When the capital stock is over \$50,000, but under \$100,000, \$50.

When the capital stock is over \$25,000, but under \$50,000, \$30.

When the capital stock is over \$10,000, but under \$25,000, \$20.

When the capital stock is less than \$10,000, \$10.

Express companies.⁶

These companies pay an annual license tax of \$2,500 in lieu of all other license taxes, State or local.

Sleeping-car companies.⁷

Sleeping and parlor car companies annually pay into the State treasury a tax of \$1.50 on each \$100 of their gross receipts, as reported to the State.

Steamboats.⁸

All steamboats, passenger or freight, plying on the waters of the State, except those regularly assessed in any county of the State, are subject to a license tax of \$1 per registered ton, not to exceed \$100 nor be less than \$10.

GEORGIA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall not be surrendered or suspended by the State. (Art 7, sec. 2, par. 5.)

State aid.—The credit of the State shall not be loaned to any individual, company, or corporation, nor shall the State take stock in any company or corporation. (Art. 7, sec. 5, par. 1.)

The State shall not make any donation in favor of any person, corporation, or association. (Art. 7, sec. 16, par. 1.)

Uniform tax on property.—Taxation shall be uniform upon the same class of subjects, and ad valorem on all property subject to taxation. (Art. 7, sec. 2, par. 1.)

Local aid.—The general assembly shall not authorize any local division to become a stockholder in any company, nor appropriate any money nor loan its credit thereto. (Art. 7, sec. 6, par. 1.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*¹—Railroad companies are required to make returns of their entire property to the comptroller-general of the State. On the basis of these returns the comptroller-general determines the basis of the State levy. Rolling stock is valued upon a pro rata mileage basis. The tax is paid into the State treasury.

Local taxation.—Counties² and municipalities³ assess and tax all railroad property within their respective limits.

Telegraph and express companies.⁴

All such companies doing business in the State pay to the State a tax of 2½ per cent on the gross receipts from such business.

Telephone companies.⁴

These companies pay a tax of \$1 per instrument in use within the State.

Sleeping-car companies.⁴

These companies pay a tax on valuation of cars, determined on a pro rata mileage basis.

IDAHO.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be relinquished nor surrendered. They shall be taxed for State and local purposes on their property. (Art. VII, sec. 8.)

State aid.—The credit of the State shall not be given in aid of any individual, association, or corporation, nor shall the State become a stockholder in any corporation. (Art. VIII, sec. 2.)

Property and license taxes.—Taxes shall be uniform upon the same class of subjects within the same jurisdiction. A just valuation shall be secured for the taxation of all property. (Art. VIII, sec. 5.)

Every person and corporation shall pay a tax on property. A license tax may also be imposed. (Art. VII, sec. 2.)

Local aid.—No local division shall lend its credit in aid of any individual, association, or corporation, or become responsible for the liability of any individual, association, or corporation. (Art. VIII, sec. 4.)

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to return to the State annual lists of their entire property of operation, including rolling stock, hired, leased, or used. The State board of equalization sets a valuation upon each railway line, and apportion the same among the local districts for the computation and collection of the tax.

Local taxation.—Property not in the right of way is locally assessed and taxed. A tax is levied also on the values apportioned by the State.

Telegraph and telephone companies.²

Taxed like railroad companies.

¹ Code of 1895, secs. 779-783.

³ *Ibid.*, secs. 784-789.

⁴ Laws of 1898, p. 31.

⁵ Laws of 1898, pp. 114-118.

ILLINOIS.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall never assume the debts of nor extend its credit in aid of any corporation, association, or individual. (Art. IV, sec. 20.)

The general assembly shall never loan the credit of the State or make appropriations in aid of railroads or canals; provided that the surplus earnings of any canal may be appropriated for its enlargement or extension. (Separate section after Art. XI.)

Franchise taxes.—Taxation shall be in proportion to value of property; but telegraph and express interests, owners and users of franchises and privileges shall be taxed as directed by law, the tax to be uniform as to the class upon which it operates. (Art. IX, sec. 1.)

Reports of railroad companies.—Annual reports of all acts and doings, as by law required, shall be furnished the State by railroad companies. (Art. XI, sec. 9.)

Further objects and subjects may be taxed by authorization of the general assembly in any manner not inconsistent with the constitution. (Art. XI, sec. 2.)

Illinois Central Railroad Company, the charter arrangement of, with regard to payments to the State, shall ever remain the same. All money from this source shall be used only for the ordinary expenses of the State government. (Separate section after Art. XI.)

Illinois and Michigan Canal shall never be sold or leased except by vote of the people of the State. (Separate section after Art. XI.)

Local aid.—No local division shall ever subscribe to the capital stock of any private corporation, or make donation to or loan its credit in aid of any such corporation. (Separate section after Art. XI.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*¹—Railroad companies are required annually to return to the county clerks schedules of taxable property, with reference to its amount, kind, and value. These schedules must contain a list of the property held for right of way, length of main and side tracks, and a description of the realty, including a statement of the value of improvements and stations located on the right of way. The above property is denominated "railroad track." A list of rolling stock used on the line must be included in the schedule.

In addition to the local schedules, annual sworn statements must be filed with the auditor of public accounts, setting forth the entire property of operation, the actual value of the capital stock, the bonded indebtedness, and the total listed valuation of all tangible property in the State. On the basis of this schedule, the State board of equalization assesses the property and equalizes the valuations of the counties. These valuations as assessed and equalized are then entered by the county clerks in the railroad tax book, and the taxes are extended and collected. The rule for valuation by the State board requires that the total valuation as determined by that body shall include the value of capital stock over and above the value of tangible property, and that the value of real and personal property locally assessed where situated shall be deducted. Franchises granted by the State must be listed as personalty at their full value.

*Local taxation.*¹—"Railroad track" is listed and taxed in the several towns, villages, districts, cities, and counties upon a mileage basis, excepting the side tracks, turn-outs, station houses, depots, machine shops, and other like fixed property, which are assessed and taxed where located. Rolling stock is taxed in the various local districts upon a mileage basis.

Personalty and real estate, other than "railroad track" and rolling stock, are listed where situated, and are treated in all respects like the similar property of individuals.

*Illinois Central Railroad Company.*²—This company is required to pay semi-annually into the State treasury a tax of five per cent on the gross income of the road for the half year. It must pay also a tax on its stock, property, and assets to an amount sufficient to bring the total tax paid by the company to seven per cent of its gross receipts, with provision for a deduction when the State tax rate exceeds three-fourths of one per cent.

¹ Starr and Curtis's Annotated Statutes of Illinois, pp. 3442-3444.

² *Ibid.*, p. 3525.

Telegraph companies¹

These companies are required to pay an annual tax on the value of their capital stock above the value of property locally taxed. The tax is collected in the same manner as the railroad tax.

Telephone, express, steamboat, and other transportation companies.²

All such companies incorporated under the laws of the State return annual lists to the local assessors, and are then assessed by the State board of equalization on the value of their capital stock in excess of the value of tangible property already locally taxed.

INDIANA.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not assume the debts of any corporation whatever. (Art. X, sec. 6.)

Uniform tax on property.—There shall be a uniform and equal rate of assessment and taxation. All property shall be justly valued. (Art. X, sec. 1.)

Wabash and Erie Canal.—The State shall not be liable for any certificate of stock issued "for the completion of the Wabash and Erie Canal to Evansville," under acts of January 19, 1846, and January 29, 1847. (Art. X, sec. 7.)

Local aid.—No county shall subscribe to stock in any corporation, unless payment be made for the same at the time of subscription; nor shall any county loan its credit to any corporation, nor borrow money to take stock in the same. (Art. X, sec. 6.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*³—Railroad companies are required to list their property annually with the auditors of the various counties. Returns must be made at the same time to the auditor of the State. These returns must be very full and must contain a detailed statement concerning the entire railroad property, capital stock, and bonded debt. On the basis of these returns, the State board of tax commissioners fixes upon the property a valuation, which is apportioned among the various local tax districts, where the tax is computed and collected at the usual property rate. Rolling stock is assessed on a pro rata mileage basis; and such as is hired, leased, or used (but not owned) by any railroad company, is assessed against that company according to the proportion of the year it uses the same. All tax-assessing officers in the State are empowered to examine the books and records of transportation companies.

*Local taxation.*⁴—Real estate and personalty not used for operating purposes are assessed and taxed directly by local authorities, in addition to the local taxes on the valuations apportioned by the State authorities.

Telegraph, telephone, express, parlor, etc., car, and fast freight companies.⁴

These companies are required to make annual statements concerning property, franchise, capital stock, and mortgage indebtedness to the auditor of the State. On the basis of these returns the State board of tax commissioners determines the actual value of the capital stock of each company, add to this the value of the bonded debt, and from this gross sum deduct the value of all property outside of the State owned by such companies, but not specifically used in the conduct of their business. A mileage proportion of the resulting sum is accreted to the State for purposes of taxation. After further deduction has been made for property locally taxed in the State, the remaining sum is apportioned among the counties for the computation and collection of the tax.

Wabash and Erie Canal Company.⁵

Locally assessed and taxed on its general property.

IOWA.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be loaned to any individual, association, or corporation, nor shall the State ever assume the liabilities of any individual, association, or corporation. (Art. 7, sec. 1.)

¹ Starr and Curtis's Annotated Statutes of Illinois, p. 3424.

² *Ibid.*, p. 3415.

³ Horner's Annotated Indiana Statutes, 1895, secs. 6340-6354.

⁴ *Ibid.*, secs. 6521k-6521v.

Ibid., sec. 6306.

The State shall not become a stockholder in any corporation. (Art. 8, sec. 3.)
Corporate property.—Corporate property shall be taxed the same as individual property. (Art. 8, sec. 2.)

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make annual statements to the executive council of all property of operation, as well as the earnings and expenses of operation within the State. Upon the basis of these returns the executive council assess railroad property at its actual cash value, taking into consideration the earning capacity of the road. Rolling stock is valued on a pro rata mileage basis. Sleeping and dining cars are assessed to the railroads using the same in the same manner as the ordinary rolling stock of those roads. The valuation reached by the executive council is apportioned among the counties for the computation and collection of the tax.

Local taxation.—Railroad real estate not used for purposes of operation, grain elevators, and railroad bridges over the Mississippi and Missouri rivers are locally taxed where situated. There is also a local tax on the values apportioned by the State.

Telegraph and telephone companies.²

The State executive council determine the value of the property and franchise of telegraph and telephone companies in the State. This valuation is apportioned among the local districts and further administered like the taxes on railroads.

Express companies.³

The State executive council determine the value of the property of express companies in the State, except property not exclusively used in the conduct of business; the valuation is based on aggregate value of shares plus mortgage indebtedness. County auditors add property not used exclusively in conduct of business and the whole is taxable for both State and local purposes at the usual property rate.

KANSAS.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall never be a party in carrying on works of internal improvement. (Art. 11, sec. 8.)

Uniform taxation.—The legislature shall provide for a uniform and equal rate of assessment and taxation. (Art. 11, sec. 1.)

Local aid.—Cities, towns, and villages, in their powers of taxation, assessment, borrowing money, contracting debt, and loaning their credit shall be so restricted as to prevent abuse of such power. (Art. 12, sec. 5.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*⁴—Upon the basis of reports made by the railroad companies the State board of railroad assessors values railroad track, roadbed, right of way, water and fuel stations, buildings, machinery, and rolling stock upon a pro rata mileage basis (including the cars of other companies used on the railroads of the State), moneys, credits, and franchises. The board is empowered to examine the books and papers of railroad companies. Through the State auditor an apportionment of the valuation thus determined is made among the counties, where further apportionment is made among the smaller districts, in which the tax is computed and collected at the usual property rate.

*Local taxation.*⁴—Railroad real estate and personal property not in the right of way is locally assessed and taxed. A local tax also is levied on the basis of the valuations as apportioned by the State.

Telegraph and telephone companies.⁵

The companies file an annual statement with the State auditor, setting forth the value of their capital stock, real estate (as locally assessed), the whole length of line, the value of all personalty, and the total gross receipts for the year. A

¹Code of 1897, secs. 1334-1342. Also laws of 1900, chap. 44.

⁴General Statutes of Kansas, pp. 896-899.

⁵*Ibid.*, pp. 899-902.

property valuation is then determined by the State board of appraisers. In arriving at this valuation the value of real and personal property locally assessed and taxed is deducted. The resulting sum is then apportioned among the local districts for the collection of the tax.

KENTUCKY.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be pledged to any individual or company, nor shall the Commonwealth take stock in any company nor make donations to any company, nor shall the State construct a railroad. (Sec. 177.)

The assembly shall have no power to release any individual or corporation from indebtedness to the State, nor to any county or municipality thereof. (Sec. 52.)

Uniform tax on property.—All taxes shall be levied and collected according to general law, and shall be uniform upon all property subject to taxation within the limits of the taxing jurisdiction. (Sec. 171.)

Property shall be assessed at its fair cash value. (Sec. 172.)

Corporation taxes.—Corporate property shall pay the same rate of taxation as individual property; but the assembly may provide for taxes on income, license, or franchises. (Sec. 174.)

Railroad taxes.—The assembly may provide by law how railroads and railroad property shall be assessed and taxed. (Sec. 182.)

Local aid.—The assembly shall not authorize any local division to loan its credit to, make donations to, or take stock in any company or corporation. (Sec. 179.)

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make annual returns² of total property in the State to the State auditor of public accounts. Only a pro rata mileage proportion of rolling stock is included. On the basis of these and local returns a valuation of railroad property is determined by the railroad commission, which is also empowered by law to examine corporation books, records, etc. Upon this valuation the State tax is levied at the usual State rate on real estate.

Local taxation.—Each county superintendent of common schools furnishes every railroad company operating within his school district with a statement of the boundaries of that district. County clerks make similar statements concerning the other taxing districts through which railroad lines run. Railroad companies are then subject to taxation in each local district, as bounded by the above officers, at the usual property rate.

Telegraph, telephone, express, and passenger-car companies.

All such companies pay an annual State and local franchise tax, in addition to other taxes, on a pro rata mileage valuation of capital stock (less the value of tangible property already taxed), determined by the State board of valuation and assessment.³

The franchises of all incorporated companies are taxed by cities of the first and second classes. The value of the franchise is represented by a pro rata mileage proportion of capital stock.¹

LOUISIANA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be surrendered nor suspended. (Art. 228.)

Exemption.—Any new lines of railroad constructed and completed prior to 1904 shall be exempt from taxation for ten years from the date of their completion. Exemption shall not hold with any railroad receiving local aid, unless it waive that aid or submit the question of waiving the aid to a vote of the taxpayers on petition of one-third of those taxpayers. (Art. 230.)

State aid and State industry.—The funds, credit, or property of the State shall not be loaned or granted to any individual, association, or corporation, nor shall the State assume the liability of any individual, association, or corporation nor

¹ Harbours and Carroll's Kentucky Statutes, secs. 4096-4104.

² *Ibid.*, secs. 4077-4091.

³ Laws of 1898, chap. 38.

subscribe to stock in any corporation. Nor shall the State carry on the business of any such corporation, except that it may grant the right of way through its lands to any railroad or canal. (Art. 58.)

The general assembly shall not release the liability of any individual or corporation to the State or to any local political division thereof. (Art. 59.)

Uniform taxation.—Taxation shall be uniform on the same class of subjects in the same jurisdiction. (Art. 225.)

Railroad, telegraph, telephone, sleeping-car, and express companies.

A State board of appraisers shall assess the property of such companies. (Art. 226.)

License tax.—The general assembly may levy a graduated license tax on individuals and corporations. (Art. 229.)

Foreign corporations.—Companies, corporations, and associations domiciled out of the State, but doing business therein, may be licensed and taxed in a different mode from domestic corporations; but said different mode of license shall be uniform, upon a graduated system, and it shall be equal and uniform as to all companies doing the same line of business. (Art. 242.)

Reports.—The railroad, express, telegraph, telephone, steamboat, and sleeping car commission shall have power to compel the production of books and papers of transportation companies, to summon witnesses, etc. (Art. 284.)

Local aid.—The funds, credit, or property of any political corporation shall not be loaned or granted to any individual, association, or corporation, nor shall any political corporation assume the liabilities of any individual, association, or corporation nor subscribe to stock in any corporation. (Art. 58.)

Local taxation.—Valuations of property for State taxation shall be taken as the basis for local taxation. (Art. 225.)

STATUTE PROVISIONS.

Railroad companies.

*Listing, valuation, etc.*¹—The State board of appraisers values all railroad property. For this purpose it may require all necessary information from the various companies. Due returns are made to the local civil divisions of the property assessed and its valuation in their separate jurisdictions.

*Local taxation.*²—All railroad property is assessed and taxed in the local districts.

Telegraph, telephone, express, and sleeping-car companies.¹

These companies are taxed like railroads.

Telegraph, telephone, and express companies pay in addition a local tax graduated in amount according to their gross receipts and ranging from \$20 to \$6,250.³

MAINE.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be directly or indirectly loaned in any case. (Art. IX, sec. 16.)

Uniform tax on property.—All taxes on property shall be assessed equally according to the value thereof. (Art. IX, sec. 8.)

STATUTE PROVISIONS.

Railroad companies.⁴

State taxation.—Railroads pay an annual excise tax to the State for the privilege of exercising their franchises. Aside from the special tax for the support of the board of railroad commissioners, this tax is in lieu of other State taxes. The tax is graduated according to gross receipts per mile of line, as follows:

One-fourth of 1 per cent on gross receipts of \$1,500 or less per mile.

One-half of 1 per cent on gross receipts between \$1,500 and \$2,250 per mile.

One-fourth of 1 per cent on gross receipts for each additional \$750 per mile, the rate never to exceed $3\frac{1}{4}$ per cent.

Interstate receipts are prorated on a mileage basis.

¹ Laws of 1900, pp. 189, 190.

² Laws of 1898, pp. 363, 364.

³ *Ibid.*, pp. 408-410.

⁴ Freeman's Supplement to the Maine Statutes (1885-1896), pp. 70, 71, 347.

Local taxation.—Railroad real estate not employed for purposes of operation is locally assessed and taxed. Cities and towns receive from the State 1 per cent on shares of railroad stock held therein.

Telephone companies.¹

These companies pay the State a tax of 2½ per cent on the value of their property of operation.

Express companies.²

These companies pay a State tax of 1½ per cent on gross receipts from business done in the State, including a pro rata mileage portion of interstate business.

MARYLAND.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be loaned to any individual, association, or corporation, nor shall the State engage in any work of internal improvement nor grant any aid thereto. (Art. 3, sec. 34.)

Chesapeake and Ohio Canal Company, Chesapeake and Delaware Canal Company, Susquehanna and Tidewater Canal Company, and Baltimore and Ohio Railroad Company.—The State's interest in these companies regulated. (Art. 12.)

Local aid.—No county shall contract any debt in the construction of any railroad, canal, or other work of internal improvement, nor loan its credit in aid of any association or corporation, unless authorized by act of general assembly. (Art. 3, sec. 54.)

STATUTE PROVISIONS.

Railroad companies.³

State taxation.—A State tax as a franchise tax is annually levied upon the gross receipts of railroad companies, as follows: Eight-tenths of 1 per cent on the first \$1,000 per mile of gross earnings, or on the total earnings if they are less than \$1,000 per mile; 1½ per cent on all gross earnings above \$1,000 per mile but not exceeding \$2,000 per mile; and 2 per cent on all gross earnings over \$2,000 per mile. Earnings from interstate business are prorated on a mileage basis. Annual reports are required of the railroad companies, and railroad officials may be summoned as witnesses by the State tax commissioners, who determine the amount of the tax to be paid.

Local taxation.—All railroad property is locally assessed and taxed, rolling stock upon a mileage basis as apportioned among the counties by State officials. Railroad property is assessed and taxed for county and municipal purposes like the property of individuals.⁴

Telegraph, telephone, express, parlor-car, and other transportation companies.⁵

All such companies pay a State tax as a franchise tax of 2 per cent on their gross earnings (interstate earnings on a pro rata mileage basis).⁶

MASSACHUSETTS.

CONSTITUTIONAL PROVISIONS.

Nothing specific.

STATUTE PROVISIONS.

All transportation and transmission companies.⁶

State tax.—All domestic companies are taxed under the general corporation tax law of the State. Annual returns of capital stock, property, etc., are made by the various companies to the tax commissioner of the State, who assesses their capital stock at its true market value, as representing the true value of the corporate franchise. Deductions are then made for real estate and fixed machinery locally assessed and taxed. The remaining valuation is subject to a State tax at the average rate of the local assessors throughout the State. Railroad, telegraph,

² Ibid., p. 72.

³ Fox's Supplement to the Public General Laws (1890-1898), pp. 541-551.

⁴ Ibid., p. 525.

⁵ Ibid., pp. 542-551.

⁶ Public Statutes of Massachusetts, chap. 13, secs. 38-41.

and telephone companies¹ doing an interstate business are taxed only on a pro rata mileage proportion of their capital stock. Provision is made by law for the inspection of corporation books, records, etc., and for the examination of the officers of corporations.

Local taxation.—Local taxes are levied on real estate and machinery. Foreign transportation companies, which are not taxable under the general corporation tax law, are assessed by the local assessors upon such property as may be found, and Massachusetts shareholders are locally taxable on their shares.

There are no local taxes on the shares of corporations which pay the State franchise tax, but there is a distribution of "corporate excess" among the local districts, according to the number of shares held in the respective districts.

Construction companies.²

All companies formed in the State to construct railroads or railroads and telegraphs are required to pay a tax of one-twentieth of 1 per cent on the par value of their capital stock.

MICHIGAN.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—The State shall not be a party to, or be interested in, any work of internal improvement, except as concerns the expenditure of grants to the State of land or other property. (Art. XIV, sec. 9.)

State aid.—The credit of the State shall not be granted in aid of any individual, association, or corporation. (Art. XIV, sec. 6.)

The State shall not subscribe to, or be interested in, the stock of any company or corporation. (Art. XIV, sec. 8.)

Property taxes and specific taxes.—The legislature shall provide for a uniform rule of taxes levied on property, except on property paying specific taxes. (Art. XIV, sec. 11.)

All assessments hereafter authorized shall be on property at its cash value. (Art. XIV, sec. 12.)

The State shall continue to collect the specific taxes provided for by existing law, and may provide for the collection of specific taxes from railroads and other corporations hereafter created. (Art. XIV, sec. 10.)

All specific taxes (the existing railroad taxes are such) shall be applied for educational purposes. (Art. XIV, sec. 1.)

STATUTE PROVISIONS.

Railroad companies.³

State taxation.—Railroad and depot companies pay a "specific tax upon property and business." This tax is levied upon the basis of gross earnings, as follows:

2½ per cent on gross income when earnings per mile of road in State are \$2,000 or less.

3½ per cent on gross income when earnings per mile of road in State are from \$2,000 to \$4,000.

4 per cent on gross income when earnings per mile of road in State are from \$4,000 to \$6,000.

4½ per cent on gross income when earnings per mile of road in State are from \$6,000 to \$8,000.

5 per cent on gross income when earnings per mile of road in State exceed \$8,000.

10 per cent on gross income of depot companies in excess of \$20,000 per mile.

Interstate lines pay the tax on a pro rata mileage proportion of their gross income. The proceeds of the railroad tax are devoted to the primary school fund.

*Local taxation.*⁴—The above State tax is in lieu of all other railroad taxes except the tax locally assessed on such railroad property as is not employed for purposes of operation.

Telegraph, telephone,⁵ and express companies.⁶

These companies are taxed 3 per cent on their gross receipts from business done in the State.

¹In the case of telephone companies the prorating is done on the basis of the number of telephones in use in the State. Supplement to the Public Statutes of Massachusetts (1882-1888), pp. 308, 433.

²Supplement to the Public Statutes of Massachusetts (1889-1895), pp. 1338, 1339.

⁴Ibid., pp. 1257-1258.

⁵Public Acts of 1899, No. 179.

⁶Public Acts, Extra Session of 1898, p. 11.

Freight line, sleeping, and parlor-car companies.¹

These companies pay a State tax of 2½ per cent on their gross receipts from business done in the State.

Navigation companies.²

These companies are taxed upon the aggregate value of their capital stock, personality, realty, franchise, ships, and docks, with deduction for all bona fide indebtedness. All ships, boats, and vessels are taxed as personality.

MINNESOTA.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—All lands donated to the State for purposes of internal improvement shall be sold, the proceeds thereof to be turned into the internal-improvement fund. Moneys belonging to this fund shall not be appropriated until the act providing for such appropriation shall have been approved by popular vote. (Art. IV, sec. 32 (b).)

The State shall never contract debt for works of internal improvement, or be a party to such work except in the case of grants to the State for that purpose. (Art. IX, sec. 5.)

State aid.—The credit of the State shall never be given or loaned in aid of any individual, association, or corporation. (Art. IX, sec. 10.)

Uniform tax on property.—All taxes in the State shall be as nearly equal as may be, and taxes on property shall be equalized and uniform throughout the State. (Art. IX, sec. 1.)

Railroads.—Any law providing for the amendment or repeal of the existing system of levy on the gross earnings of railways shall be submitted to the vote of the people. (Art. IV, sec. 32 (a).)

Telegraph, telephone, express, and car companies.

The legislature may impose upon the owners or operators of such companies taxes on property or earnings, or both, which may be graded or progressive, and which shall be on a pro rata mileage basis. This shall not preclude the taxation of land or ordinary property according to the ordinary methods. (Art. IX, sec. 17.)

STATUTE PROVISIONS.

Railroad companies.³

Railroad companies are required annually to report to the State railroad and warehouse commission their gross earnings for the year, separating interstate from intrastate earnings. They are then taxed on a pro rata mileage proportion of their gross earnings. During the first three years of operation the rate is 1 per cent, during the next seven years 2 per cent, and thereafter 3 per cent. This tax is paid to the State treasurer, and is in lieu of all other taxes, either State or local, excepting local taxes on lands the subject of grant either by the State or the United States.

Telephone companies.⁴

These companies pay a tax of 3 per cent on their gross earnings to the State.

Express companies.⁵

These companies pay the State a tax of 5 per cent on their gross receipts from business done in the State, with deductions for the amount paid to railroad companies for the transportation of freight within the State.

Freight line and equipment companies.⁶

These companies pay to the State auditor a tax of 2 per cent on the actual value of their capital stock, determined on a pro rata mileage basis after making deductions for real estate locally taxed.

Sleeping and parlor car companies.⁷

These companies annually pay to the State treasurer a tax of 3 per cent on their gross receipts from business done in the State, in lieu of other taxation.

⁵ *Ibid.*, p. 572; also Laws of 1899, p. 404.

⁶ Laws of 1897, p. 308; also Laws of 1899, p. 134.

⁷ Laws of 1897, p. 307.

Water craft.¹

Owners of water craft pay into the State treasury an annual tax of 3 cents per net ton (registered tonnage) of such craft, in lieu of all other taxes. One-half of the proceeds of this tax is paid by the State to the counties in which the ports of hail of such craft are situated.

MISSISSIPPI.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be surrendered nor abridged, except that exemption from taxation for a period of five years may be granted to new enterprises of public utility. (Sec. 182.)

State aid.—No law granting a donation in favor of any object shall be enacted except by two-thirds vote of each house. (Sec. 66.)

Lands under the control of the State shall never be donated to industrial corporations or railroad companies. The legislature may, however, grant the right of way to railways across State lands as a mere easement. (Sec. 95.)

The credit of the State shall not be pledged nor loaned in aid of any association or corporation, nor shall the State assume the indebtedness of any individual, association, or corporation, nor become a stockholder in any corporation. (Sec. 258.)

No obligation of any person, association, or corporation to the State or to any local division shall be released, postponed, or diminished. (Sec. 100.)

Uniform tax on property—Railroads and other corporations.—Taxation shall be uniform on all property. But the legislature may provide for a special mode of assessment for railroads and for other corporate property not situated wholly in one county. (Sec. 112.)

The property of corporations shall be taxed in the same way and to the same extent as the property of individuals. (Sec. 181.)

Local aid.—No local division shall loan its credit to or subscribe to stock in any railroad or other association or corporation. (Sec. 183.)

STATUTE PROVISIONS.

Railroad companies.²

Listing, valuation, etc.—Railroad companies are required to make annual reports to the State railroad commission, setting forth their property, taxable and nontaxable, their capital stock, and receipts for the year, and the values of their respective franchises. The railroad commission then assesses the property of these companies, taking into consideration the value of the franchise and of the capital stock engaged in business in the State. This valuation is apportioned among the counties for the computation and collection of the tax.

*Privilege tax.*³—Railroads also pay the State an annual privilege tax. For this purpose they are divided into four classes, according to their gross earnings per mile for the year. The taxes levied on each class are as follows:

First class, \$20 per mile; second class, \$15 per mile; third class, \$10 per mile; narrow-gauge class, \$2 per mile.

Local taxation.—Railroad real estate not directly employed for traffic operations is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph, express, and sleeping-car companies.²

These companies are assessed and taxed like railroads.

Telegraph companies also pay a privilege tax of \$350 if their lines are 1,000 miles or more in length. Otherwise they pay \$25 per mile.⁴

Sleeping-car companies pay the State the annual specific sum of \$200, besides the sum of 25 cents per mile for each mile of railroad track in the State over which cars were run.⁵

Telephone companies.⁴

These companies pay a tax graded according to the number of their subscribers, varying in amount from \$5 to \$100.

MISSOURI.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall not be surrendered or suspended. (Art. X, sec. 2.)

State aid.—The State shall not lend nor pledge its credit in aid of any individual, association, or corporation. (Art. IV, sec. 45.)

The State shall not grant money or property in aid of any individual, association, or corporation. (Art. IV, sec. 46.)

The State shall not subscribe to stock in any corporation, except to secure loans previously extended to certain railroads. (Art. IV, sec. 49.)

The State shall not release its lien on any railroad. (Art. IV, sec. 50.)

The State shall not release any obligation to itself on the part of any corporation or individual. (Art. IV, sec. 51.)

Uniform tax on property.—Taxes shall be uniform upon the same class of subjects within the same taxing jurisdiction. (Art. X, sec. 3.)

Property subject to taxation shall be taxed in proportion to its value. (Art. X, sec. 4.)

Railroads.—Railroads shall be subject to taxation for State and local purposes on their property, gross earnings, net earnings, franchises, and capital stock. (Art. X, sec. 5.)

Local aid.—No local division shall subscribe to stock in any railroad or other corporation, nor loan its credit nor make donation in aid of any such corporation.

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to return to the State auditor detailed annual statements of their property of operation and its actual value. Duplicate statements are made to the county clerks of the respective counties of property therein situated. These are certified by the county courts and forwarded to the State auditor, by whom they are laid before the State board of equalization. This board then assesses the railroad property (rolling stock on a pro rata mileage basis), and apportions the valuation among the counties for the computation and collection of the tax. In the making of assessments the board has access to railroad books, records, etc.

Local taxation.—All railroad property not assessed by the State (i. e., lands, machine and work shops, roundhouses, warehouses and other buildings, goods, chattels, and office furniture) is assessed and taxed locally. There is also a local tax on the values apportioned by the State.

Telegraph and express companies.²

These companies are taxed on their franchises and property in the same manner as railroads.

Express companies pay the State, in addition, a tax of $1\frac{1}{4}$ per cent on their gross receipts from business done in the State.³

Car companies.⁴

These companies pay the State a tax of 2 per cent on the cash valuation of their cars.

MONTANA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be surrendered or suspended. All corporations shall be taxed for State and local purposes. (Art. XII, sec. 7.)

Exemption of stocks.—Stocks in any company shall not be taxed when the property represented by such stocks is taxed. (Art. XII, sec. 17.)

State aid.—The State shall never loan its credit to, grant subsidy to, or subscribe to stock in any company or corporation. (Art. XIII, sec. 1.)

No appropriation shall be made to any person or corporation not under the absolute control of the State. (Art. V, sec. 35.)

The legislature shall not authorize the contracting of debt in the construction of any railroad, nor loan the credit of the State in aid of the same. (Art. V, sec. 38.)

¹ Revised Statutes of Missouri (1899), pp. 2169-2181.

² *Ibid.*, pp. 2181-2182.

³ *Ibid.*, pp. 2184-3185.

⁴ *Ibid.*, pp. 2171-2172.

No obligation of any individual, association, or corporation to the State or any local division shall ever be released, postponed, or diminished. (Art. V, sec. 39.)

Uniform tax on property—License taxes.—Taxes shall be uniform upon the same class of subjects in the same jurisdiction. (Art. XII, sec. 11.)

The legislature shall levy a uniform rate of assessment. All property shall be taxed at its just value. The legislature may also impose a license tax on persons and corporations. (Art. XII, sec. 1.)

Railroads.—The franchise, roadway, roadbed, rails, and rolling stock of all railroads operating in more than one county shall be assessed by the State board of equalization, and the valuation apportioned among the local districts on a pro rata mileage basis. (Art. XII, sec. 16.)

Local aid.—No local division shall ever loan its credit to, grant subsidies to, or subscribe to stock in any company or corporation. (Art. XIII, sec. 1.)

The legislature shall not authorize any county to contract debt in the construction of any railroad, nor loan its credit in aid of the same. (Art. V, sec. 38.)

STATUTE PROVISIONS.

Railroad companies.

Listing, valuation, etc.—Railroad companies are required to make to the State full annual statements of their property of operation, capital stock, earnings, and indebtedness. On the basis of these returns, the State board of equalization assesses franchise, roadbed, rails, and rolling stock (whether owned, hired, or leased). The valuation thus determined is apportioned among the counties on a mileage basis for the computation and collection of the tax.

Local taxation.—Railroad real estate not on the right of way, including stations and depots, is locally assessed. There is also a local tax on the values apportioned by the State.

Railroads operating in a single county are locally assessed and taxed on their property and franchises.²

Telegraph, telephone, express, canal, stage, and navigation companies.

Telegraph, telephone, and canal companies are locally assessed on their property and franchises.³

Telegraph companies pay a local license tax of \$5 per quarter on each instrument in use, and telephone companies 75 cents per year on each instrument.⁴

Express, stage, and navigation companies are locally assessed and taxed on their property.⁴

Common carriers.⁵

The law provides for a license tax on common carriers, graduated in amount according to the amount of business done per quarter.

NEBRASKA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The legislature shall have no power to release or discharge from State taxes, nor to authorize commutation for such taxes in any form. (Art. IX, sec. 4.)

State aid.—Lands under the control of the State shall never be donated to railroad companies, private corporations, or individuals. (Art. III, sec. 18.)

The credit of the State shall never be given or loaned in aid of any individual, association, or corporation. (Art. XII, sec. 3.)

Property and franchise taxes.—Property and franchises shall be taxed according to their value in such manner as the legislature shall direct. (Art. IX, sec. 1.)

Reports of railroad companies.—Annual reports shall be made by railroad companies to the State auditor. (Art. XI, sec. 1.)

Local aid.—No local district shall make donations to any work of internal improvement except by vote of the people; aggregate donations of this character shall not exceed 10 per cent of the assessed value of property in any county unless by a two-thirds vote of the people, when a 5 per cent increase over the 10 per cent limit shall be valid. (Art. XII, sec. 4.)

¹ Booth's Montana Code, secs. 3696, 3737-3743.

² Ibid., sec. 3719.

³ Laws of 1897, p. 202.

⁴ Booth's Montana Code, sec. 3715.

⁵ Ibid., sec. 4074.

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make annual reports of their property and its value to the State. On the basis of these reports the State board of equalization assesses all property of operation and apportions the valuation thus determined among the counties, where the tax is computed and collected.

Local taxation.—Real and personal property of railroads, not in the right of way, is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph companies.¹

These companies are taxed like railroads.

Sleeping car companies.²

These companies are taxed on a pro rata mileage valuation of their cars.

Express, steamboat, and other transportation companies.³

All such companies incorporated in the State pay a franchise tax upon their capital stock, less the value of real and personal property otherwise taxed. Deduction is also made for indebtedness, except for current expenses and improvements.

NEVADA.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not donate or loan its money or credit or subscribe to stock in any company or corporation. (Art. VIII, sec. 9.)

The State shall never assume the debts of any corporation. (Art. IX, sec. 4.)

Uniform tax on property.—There shall be a uniform and equal rate of assessment and taxation on all property. (Art. X, sec. 1.)

Corporations.—All corporate property shall be subject to taxation the same as the property of individuals. (Art. VIII, sec. 2.)

Local aid.—No local division shall become a stockholder in or lend its credit in aid of any company or corporation except railroad companies. (Art. VIII, sec. 10.)

STATUTE PROVISIONS.

Railroad companies.⁴

Listing, valuation, etc.—Railroad companies make annual returns of property, which is assessed by the State board of assessment and equalization. The valuation determined by that board is apportioned among the counties for the computation and collection of the tax. In fixing values, statute provision requires that the railroad property shall not be treated as so much "land covered by right of way" nor "as so much iron," but as a complete operated line of road. Rolling stock is valued and apportioned on a pro rata mileage basis.

Local taxation.—All railroad property is locally taxed.

Common carriers.⁵

Common carriers (carriers of gold dust) pay an annual tax of \$150 in the counties where they operate.

NEW HAMPSHIRE.

CONSTITUTIONAL PROVISIONS.

Uniform taxes.—The general court shall have power to levy proportional and reasonable assessments, rates, and taxes upon all persons and estates within its limits. (Part 2, art. 6.)

Local aid.—The general court shall not authorize any town to loan or give its money or credit in aid of any corporation. (Ibid.)

¹Compiled Statutes of Nebraska (1897), pp. 912-913.

²Ibid., pp. 913-914.

³Ibid., p. 911.

⁴Cutting's compiled laws of Nevada (1861-1900), secs. 1236-1239.

⁵Ibid., sec. 1190.

STATUTE PROVISIONS.

Railroad companies.¹

Exemption.—Railroads are exempted from taxation for a period of ten years after their construction.

State taxation.—The State board of equalization assesses all railroad property. The various companies are required to submit all evidence required of them by the board. The tax is levied on the value of road, rolling stock, and equipment, and is in lieu of all taxes on stocks.

Local taxation and local distribution.—Real estate not in the right of way is locally assessed and taxed. The proceeds of the State tax on railroads is disposed of as follows:

(1) One-fourth of the tax is paid to the towns through which roads run according to the share of the capital invested in each town for buildings and right of way.

(2) To each town in the State in which any railroad stock is owned, such proportion of the residue of the tax as the number of shares owned in such town bears to the total number of shares of capital stock.

(3) The remainder is retained by the State.

In order to carry out this distribution the selectmen annually make invoice of the shares of railroad stock owned by the inhabitants of their respective towns to the State treasurer. The various railroad companies also give a list of the same to the selectmen.

Telephone and telegraph companies.¹

These companies are, like railroads, taxed on their lines and equipments.

NEW JERSEY.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be directly or indirectly loaned in any case. (Sec. VI, 3.)

STATUTE PROVISIONS.

Railroad companies.²

Listing, valuation, etc.—Railroad companies make annual returns of property, stock, and indebtedness, upon the basis of which, in addition to corporation books, etc., the State board of assessors set a valuation upon all railroad property and franchises. A tax of one-half of 1 per cent is levied on this valuation for State purposes.

Local taxation.—In addition to the State tax, the State collects a tax at the local rate upon railroad real estate in each tax district, the proceeds of which are apportioned among the tax districts in which such property is situated. Other local railroad property not used for purposes of operation is locally assessed and taxed.³

Telegraph, telephone, express, palace, parlor, and sleeping car companies.⁴

All such companies incorporated in the State pay to the State an annual license tax for their corporate franchises of 2 per cent upon their gross receipts from business done in the State.

Foreign equipment companies.⁵

These companies are assessed on their rolling stock according to the proportion of the year their cars are kept in the State.

NEW MEXICO.

STATUTE PROVISIONS.

Railroad companies.

*Exemption.*⁶—Railroads are exempted from taxation for a period of six years after their completion.

¹ Public Statutes and Session Laws in force January 11, 1901, pp. 224-226.

² General Statutes of New Jersey (1896), pp. 3322-3335.

³ Laws of 1897, p. 147.

⁴ General Statutes of New Jersey (1896), pp. 3336, 3339.

⁵ *Ibid.*, p. 3326.

⁶ Compiled Laws of New Mexico (1897), secs. 3880, 3881.

*Taxation.*¹—Railroad property is assessed and taxed like the property of individuals.

Express companies.²

These companies are taxed by the Territory at the rate of 2 per cent on their surplus of gross receipts over sums actually paid out to other companies for transportation within the Territory. One-half of the sum thus paid the Territory is distributed among the counties in proportion to the business done in each county. The tangible property of express companies is locally assessed and taxed.

Palace and sleeping car companies.³

These companies pay the Territory a tax of 2½ per cent on their gross earnings from business done in the Territory. One-half of the proceeds of the tax is distributed among the counties in the same manner as the tax on express companies. The tangible property of the companies is locally assessed and taxed.

NEW YORK.

CONSTITUTIONAL PROVISIONS.

State transportation interests.—The legislature shall not sell, lease, or otherwise dispose of the Erie Canal, the Oswego Canal, the Champlain Canal, the Cayuga and Seneca Canal, or the Black River Canal; they shall remain the property of the State forever. This shall not apply to the Main and Hamburg Street Canal in Buffalo. (Art. VII, sec. 8.)

The canals may be improved as the legislature shall provide by law. The cost of such improvement may be met by loan, appropriation from the State treasury, or an equitable annual tax. (Art. VII, sec. 10.)

Local aid.—No local division shall loan its money or credit to, become the owner of stock or bonds in, or incur indebtedness for any individual, association, or corporation. (Art. VIII, sec. 10.)

STATUTE PROVISIONS.

Transportation and transmission companies.

*State taxation.*⁴—All transportation and transmission companies, in common with other corporations and joint-stock companies, are required to make annual returns to the State controller. Upon the basis of these returns the various companies are taxed upon their franchises, on the basis of their capital stock employed in the State, at the rate of one-fourth mill on the \$1 for each 1 per cent of dividend declared, provided the dividend is at least 6 per cent on the par value of the stock. If the dividend is under 6 per cent, or if none has been declared, the tax rate is 1½ mills on each \$1 of the actual value of the capital stock.

Every transportation and transmission company, in addition to the above tax, must pay a tax "upon its corporate franchise or business in this State" of one-half of 1 per cent upon its gross earnings from business done in the State.

Provision is made for the examination of corporation books, records, witnesses, etc., by the State controller.

*Local taxation.*⁴—All companies are locally assessed and taxed on their property.

NORTH CAROLINA.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not lend its credit in aid of any person, association, or corporation but by vote of the people, except to aid in completing such railroads as may be unfinished at the time of the adoption of this constitution, (Art. V, sec. 4.)

Uniform tax on property—Franchise and income taxes.—Taxation shall be by uniform rule on all property. The general assembly may also lay taxes on franchises and income, provided the property from which income is derived is not taxed. (Art. V, sec. 3.)

¹ Compiled Laws of New Mexico (1897), sec. 4025.

² Ibid., secs. 3926-3927.

³ Ibid., secs. 4118-4121.

⁴ General Laws, Chap. XXIV, secs. 182, 184, 189.

⁵ Ibid., secs. 11, 39.

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies annually report their property of operation to the State corporation commission. The commission determines the value of this property as if it were the property of individuals. Rolling stock is valued on a pro rata mileage basis. The final valuation is apportioned among the counties for the computation of the tax. The tax for State purposes is paid directly into the State treasury. The commission is empowered to examine books, papers, etc., in determining valuations.

Local taxation.—Railroad property other than that of operation is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph, telephone, express, sleeping-car, freight-car, canal, and steamboat companies.¹

These companies are assessed and taxed like railroads.

Telegraph, telephone, and express companies pay also a tax of 2 per cent on their gross receipts from business done in the State.²

NORTH DAKOTA.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not loan its credit, make donation, or take stock in aid of any individual, association, or corporation. (Sec. 185.)

Uniform tax on property.—All property shall be taxed by a uniform rule according to its true money value. (Sec. 176.)

Railroads.—The franchises, roadway, roadbed, rails, and rolling stock of railroads shall be assessed by the State board of equalization at its actual value, and such assessed valuations shall be apportioned among the local taxing districts on a pro-rata mileage basis. (Sec. 179.)

The legislature may provide for the payment of a percentage of railway gross earnings in lieu of the above taxes on property, except the local taxes on property not in the right of way. (Sec. 176.)

Reports by railroad companies.—Railroads shall make annual reports to the State as prescribed by law. (Sec. 140.)

Local aid.—No local division shall loan its credit, make donation, or take stock in aid of any individual, association, or corporation. (Sec. 185.)

STATUTE PROVISIONS.

Railroad companies.³

Listing, valuation, etc.—Railroad companies make annual returns of their property to the State board of equalization. On the basis of these returns franchise, roadbed, roadway, rails, and rolling stock used in the State are assessed at their actual value. Corporation books and papers, as well as witnesses, may be summoned to assist in determining valuations. The valuations are apportioned among the counties for the computation and collection of the tax.

Local taxation.—Property other than that of operation is locally assessed and taxed. There is also a tax on the values apportioned by the State.

Telegraph and telephone companies.⁴

These companies are locally taxed on their property.

Express companies.⁵

These companies pay an annual license tax, as follows:

\$5 per station in places of 200 inhabitants or less.

\$10 per station in places of from 200 to 1,000 inhabitants.

\$25 per station in places of from 1,000 to 3,000 inhabitants.

\$50 per station in places of more than 3,000 inhabitants.

These companies are also locally assessed and taxed on their personal property.

¹ Laws of 1899, chap. 15, and Laws of 1900, p. 64.

² Laws of 1899, p. 52.

³ Revised Code of North Dakota (1895), secs. 1331–1333.

⁴ Laws of 1899, p. 259.

⁵ Revised Code of North Dakota (1895) secs. 1745–1748; also laws of 1899, p. 259.

1070 INDUSTRIAL COMMISSION:—TRANSPORTATION.

Sleeping car companies.¹

These companies pay an annual license tax of \$100 per car, the aggregate sum paid by any one company not to exceed \$5,000.

OHIO.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall never contract any debt for purposes of internal improvement. (Art. XII, sec. 6.)

The State shall never lend its credit to nor subscribe to stock in any association or corporation. (Art. VIII, sec. 4.)

The State shall not assume the debts of any corporation. (Art. VIII, sec. 5.)

Uniform tax on property.—All property shall be taxed according to a uniform rule at its true cash value. (Art. XII, sec. 2.)

Corporations.—Corporate property shall forever be taxed like the property of individuals. (Art. XIII, sec. 4.)

Local aid.—The general assembly shall never authorize any local division to raise money or loan its credit in aid of any association or corporation, or become a stockholder therein. (Art. VIII, sec. 6.)

STATUTE PROVISIONS.

Railroad companies.²

Listing, valuation, etc.—The auditors of the various counties are constituted a board of appraisers for railroads. The various companies make annual returns of property and upon request are required to submit books, records, etc.

Upon the basis of this information all property of operation, moneys, and credits are assessed upon a pro-rata mileage basis. The valuation thus determined is apportioned among the counties for the computation and collection of the tax.

Excise tax.—Railroads are required to pay the State an annual excise tax of one-half of 1 per cent on gross earnings from business done in the State, including a mileage proportion of interstate receipts.

Local taxation.—Real estate not in the right of way is locally assessed and taxed.

There is also a local tax on the values apportioned by the State.

Telegraph, telephone, and express companies.³

The property of these companies is valued by the State board of appraisers and assessors. In determining this valuation capital stock and earning capacity are duly considered. The value of real estate locally assessed and taxed is deducted, and the remaining valuation is prorated on a mileage basis among the counties for the computation and collection of the tax.

Telegraph and telephone companies are required to pay the same "excise tax" as railroad companies.⁴

Express companies are required to pay an excise tax of 2 per cent on gross receipts from business done in the State.

Freight line and equipment, and sleeping car companies.⁵

These companies are required to pay an annual tax to the State upon the actual value of their capital stock, representing capital and property owned and used in the State. This value is determined on a pro-rata mileage basis and deduction is made for real estate locally assessed and taxed.

OKLAHOMA.

STATUTE PROVISIONS.

Railroad companies.⁶

Listing, valuation, etc.—Railroad companies are required to make annual reports to the Territory. All property of operation, moneys, and credits are assessed at their actual cash value by the board of railroad assessors, who are empowered also to examine corporation books and records, and to summon wit-

¹ Revised Code of North Dakota (1895), secs. 1751-1755.

⁶ Laws of 1895, pp. 224-229; see also Laws of 1899, p. 219.

nesses, etc. The valuation determined upon its apportioned among the counties for the computation and collection of the tax. Cars used by a railroad but not owned by it are listed against the company to which they belong.

Local taxation.—Real estate not in the right of way is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph and telephone companies.¹

These companies are locally assessed on their property, returns of which they are required to make to both the auditor of the Territory and to the county clerks.

OREGON.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall not subscribe to stock in any company or corporation. (Art. IX, sec. 6.)

Uniform tax on property.—There shall be a uniform rate of assessment and taxation. All property shall be taxed at its just value. (Art. IX, sec. 7.)

Local aid.—No local district shall become a stockholder in any corporation or company, or raise money for or loan its credit in aid of any individual, association, or corporation. (Art. XI, sec. 9.)

STATUTE PROVISIONS.

Transportation companies.²

Transportation companies generally are assessed and taxed on their property in the same manner as individuals.

Railroad rolling stock, including all cars hired or leased, is annually reported by the managing officers of railroads at their places of business, and is apportioned among the counties on a pro-rata mileage basis. Rolling stock engaged in interstate business is assessed on a pro-rata mileage portion.

PENNSYLVANIA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power of the State to tax corporations and corporate property shall not be surrendered or suspended. (Art. IX, sec. 3.)

State aid.—The credit of the Commonwealth shall not be pledged or loaned to any individual or company, nor shall the Commonwealth become a stockholder in any company. (Art. IX, sec. 6.)

No obligation of any railroad or other corporation, held by the Commonwealth, shall be postponed or diminished in any way. (Art. III, sec. 24.)

Uniform taxation.—All taxes shall be uniform on the same class of subjects and shall be levied and collected under general laws. (Art. IX, sec. 1.)

Reports, etc., of transportation companies.—In addition to the annual reports required of transportation companies, the secretary of internal affairs may require special reports. (Art. XVII, sec. 11.)

Local aid.—No local district shall become a stockholder in any company nor loan its credit to, nor appropriate money for, any company or individual. (Art. IX, sec. 7.)

STATUTE PROVISIONS.

All transportation and transmission companies.

State taxation.—All corporations in the State are required to make annual reports to the State. They are taxed at the rate of one-half of 1 per cent on the actual value of their capital stock. This, according to judicial interpretation, is a tax on property, franchise, assets, and earning capacity. Companies doing an interstate business are taxed only on a mileage proportion of their capital stock.³

These companies also pay a tax of two-fifths of 1 per cent on the value of bonds issued by them and held by residents of the State. The tax is paid out of the interest on the bonds, so that when no interest is paid no tax is paid.⁴

¹ Statutes of Oklahoma (1893), p. 1043.

² Hill's Annotated Laws of Oregon (1892), pp. 1281-1284.

³ Pamphlet laws of 1891, p. 229, and of 1893, p. 353.

⁴ Pamphlet laws of 1895, p. 193.

1072 INDUSTRIAL COMMISSION:—TRANSPORTATION.

These companies also pay a tax of four-fifths of 1 per cent on gross receipts from business done wholly in the State.¹

Express companies are subject in addition to an annual excise tax on gross earnings from business done in the State, including a mileage proportion of interstate receipts. The rate is 1 per cent when receipts are \$100 per mile or under, 2 per cent when receipts are between \$100 and \$150 per mile, then 1 per cent additional for each \$50 additional receipts per mile until the rate reaches the maximum of 5 per cent.²

Local taxation.—Transportation property not necessary for operating purposes is locally assessed and taxed.

The New York, Lake Erie and Western Railroad Company, in addition to the regular taxes, annually pays the State \$10,000 for the privilege of maintaining a portion of its road through Pike and Susquehanna counties.³

RHODE ISLAND.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be pledged in aid of any individual, association, or corporation. (Art. IV, sec. 13.)

A two-thirds vote of both houses shall be necessary to every bill appropriating public money or property for private purposes. (Art. IV, sec. 14.)

Taxation.—The general assembly shall provide for the assessment of taxes as it may think best.

STATUTE PROVISIONS.

Railroad companies.

Railroad companies are taxed on their property in the same manner as individuals. No express provision is made for railroad taxation in the law of the State.

Telegraph, telephone, and express companies.⁴

These companies are required to make annual returns of their gross receipts from business done in the State. A tax of 1 per cent is levied on these receipts, to be paid into the State treasury in lieu of all other taxes on property of operation.

SOUTH CAROLINA.

CONSTITUTIONAL PROVISIONS.

Uniform tax on property.—There shall be a uniform and equal rate of assessment and taxation. All property shall be taxed at its just value. (Art. IX, sec. 1.)

Corporations.—The property of corporations shall be subject to taxation. (Art. XII, sec. 1.)

STATUTE PROVISIONS.

Railroad companies.⁵

Listing, valuation, etc.—Railroad companies are required annually to list with the controller-general of the State their entire property of operation, moneys, credits, etc. Annual reports are made also to the county auditors of property within the various counties. The controller-general is empowered to examine corporation books, papers, etc. A valuation is set upon the property as listed by the State board of assessors, and the valuation thus determined is apportioned among the counties for the computation and collection of the tax.

Local taxation.—Railroad real estate not in the right of way is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph, telephone, palace-car, express, and fast-freight companies.⁶

These companies are taxed on a property valuation determined by the State board of assessors in much the same manner as railroads.

SOUTH DAKOTA.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be surrendered or suspended. (Art. XI, sec. 3.)

¹ Pamphlet laws of 1869, p. 420.

² Pamphlet laws of 1897, p. 234.

³ Pamphlet laws of 1846, p. 179.

⁴ General Laws of Rhode Island (1896), pp. 133-134.

⁵ Revised Statutes of South Carolina (1893), pp. 96-97.

⁶ Laws of 1898, No. 441.

State aid.—The State shall not make donation to, loan its credit to, or assume the liability of any individual, association, or corporation, or subscribe to stock in any association or corporation. (Art. XIII, sec. 1.)

Uniform tax on property—Corporations.—All taxes shall be uniform on all property. Corporate property shall be assessed and taxed as near as may be like individual property. (Art. XI, sec. 2.)

Railroad reports.—Railroad companies shall make annual reports to the State as by law prescribed. (Art. XVII, sec. 12.)

Local aid.—No local division shall make any donation to, loan its credit to, or assume the liability of any individual, association, or corporation, nor subscribe to stock in any association or corporation. (Art. XIII, sec. 1.)

STATUTE PROVISIONS.

Railroad companies.

Listing, valuation, etc.—Railroad companies make annual reports to the State board of assessment and equalization of their earnings and property of operation. On the basis of these returns a valuation is reached, taking into consideration gross and net earnings, and is apportioned among the counties for the computation and collection of the tax.

Local taxation.—All railroad property other than that of operation is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph and telephone company

These companies make annual returns to the State board of assessment and equalization, and are taxed on their property as valued by that board. The tax is paid directly into the State treasury. Each county is subsequently allotted its share of the proceeds of the tax.

Express and sleeping-car companies

These companies make annual returns to the State auditor. They are assessed on their property by the State board of equalization and assessment. The gross earnings for the year are taken into account in determining the valuation. The tax is paid into the State treasury. Each county is subsequently allotted its share of the proceeds of the tax.

TENNESSEE.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—A well-regulated system of internal improvement ought to be encouraged by the General Assembly. (Art. XI, sec. 10.)

State aid.—The credit of the State shall not be loaned in aid of any individual, association, or corporation, nor shall the State become a stockholder in any association or corporation. (Art. II, sec. 31.)

No State bonds shall be issued to any railroad company which, at the time of its application for such, shall be in default of interest on past issues to it, or which has disposed of any past issues to it for less than par. (Art. II, sec. 33.)

Uniform tax on property.—All property shall be taxed uniformly according to its value, as the legislature shall direct. (Art. II, sec. 28.)

Local aid.—No local division shall loan its credit to any individual, association, or corporation, nor take stock in any association or corporation, except by three-fourths vote of the people. (Art. II, sec. 29.)

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies file annual schedules of property, stock, indebtedness, and earnings with the State railroad commission, by whom a valuation is set upon railroad property, with due regard for franchises, stock, bonds, and earnings. The valuation thus determined is examined by the State board of equalization and certified to the State controller. The taxes are paid into the State treasury.

In reaching a valuation the railroad commission has power to examine corporation books and papers. Railroad property having actual situs is known as localized property, and that having no actual situs is known as distributable property and is valued on a pro rata mileage basis.

¹ Annotated South Dakota statutes (1899) secs. 2189-2203.

² *Ibid.*, secs. 2194-2196.

³ *Ibid.*, secs. 2198-2203.

⁴ Laws of 1897, chap. 6.

Railroad companies not paying the State ad valorem tax pay an annual tax as follows: Companies controlling or operating 400 miles or more of road pay \$10,000 for business done in the State; from 100 to 400 miles, \$5,000; from 25 to 100 miles, \$1,000; less than 25 miles, \$100.¹

Local taxation.—Railroad real estate and personalty (having actual situs) are locally assessed and taxed.

Each county through which a railroad runs its lines may levy a tax of \$500 against such company, and each incorporated town a tax of \$25.²

Railroad terminal companies, in counties of 90,000 inhabitants or over, pay a tax of \$500; in counties of 70,000 to 90,000 inhabitants, \$400, and in counties of 50,000 to 70,000, \$300.¹

Telegraph and telephone companies.²

These companies are assessed and taxed on their property like railroads.

Telegraph companies pay also an annual privilege tax to the State, in lieu of all other State taxes but the ad valorem tax, as follows: Companies sending messages between points in the State, and operating 1,000 miles or more of line within the State, pay a tax of \$5,000; from 300 to 1,000 miles, \$1,000; from 100 to 300 miles, \$300; from 25 to 100 miles, \$35.¹

Telephone companies annually pay to the State a privilege tax for business done wholly in the State, in lieu of all other State taxes but the ad valorem tax, varying according to the population of the city or town in which it does business from 50 to 75 cents per instrument in use.¹

Express and sleeping-car companies.¹

Express companies pay an annual privilege tax to the State, in lieu of all other State taxes but the ad valorem tax, as follows: Companies operating over lines 100 miles or under in length, \$300 for business done wholly within the State; over 100 miles, \$2,000.

Sleeping-car companies are required to pay the State an annual privilege tax of \$2,500 in lieu of all State taxes but the ad valorem tax.

TEXAS.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall never be surrendered or suspended. (Art. VIII, sec. 4.)

State aid.—The credit of the State shall never be loaned in aid of any individual, association, or corporation. (Art. III, sec. 50.)

The State shall make no grant of money to any individual, association, or corporation. (Art. III, sec. 51.)

The legislature shall not release the liability of any railroad to the State. (Art. III, sec. 54.)

The legislature shall not release, postpone, or diminish any liability to the State. (Art. III, sec. 55.)

Uniform taxation.—Property, license, income, and occupation taxes.—Taxation shall be equal and uniform. All property in the State shall be taxed. The legislature may also impose license and income taxes. (Art. VIII, sec. 1.)

All occupation taxes shall be uniform upon the same class of subjects within the same jurisdiction. (Art. VIII, sec. 2.)

Railroads.—All railroad property shall be assessed in the several counties. Rolling stock may be assessed in gross in the county where a company's principal office is located, the resulting tax to be apportioned by the controller among the counties on a pro rata mileage basis. (Art. VIII, sec. 8.)

Local aid.—The legislature shall not authorize any local division to lend its credit or grant money to any individual, association, or corporation, nor to become a stockholder in any association or corporation. (Art. III, sec. 52.)

Municipal taxes.—All railroad property shall bear its proportional share of municipal taxation. (Art. VIII, sec. 5.)

STATUTE PROVISIONS.

Railroad companies.

*Ad valorem tax.*³—Railroad companies pay ad valorem taxes on their franchises and on all property owned by them in the State, each county through which a road runs assessing and collecting the State and county taxes on the number of

¹ Laws of 1897, pp. 74-77.

² *Ibid.*, chap. 8.

³ Revised Statutes of Texas (1896), pp. 1034-1036.

miles of line and superstructure within its limits. The total value of rolling stock owned and used in the State by each company is listed with the assessor of the county in which its principal office is located. The total rendition is forwarded to the State controller, who apportions the value among the counties on a pro rata mileage basis. This valuation is then added to the valuation of the other property of the road and is the basis for State and local taxes.

*Occupation tax.*¹—Railroad companies also pay to the State an occupation tax of 1 per cent on gross receipts from passenger travel. This tax is paid quarterly to the controller on a sworn statement by authorized officers of the various companies. Steamboat and stage companies pay the same tax.

Telegraph and telephone companies.

Telegraph companies pay a tax of 1 cent on every full-rate message sent between points in the State and a tax of one-half cent on other than full-rate messages, in addition to the usual local property taxes.²

Telephone companies annually pay the State a tax of 23 cents per telephone in use in the State.³

Sleeping-car and express companies.

Sleeping-car companies pay a State tax of one-fourth of 1 per cent on the value of their capital stock in use in the State. The valuation is determined on a pro rata mileage basis, and the value of all property other than rolling stock is deducted.⁴ There is also a State tax of 2½ per cent on gross receipts from passenger traffic in the State.⁵

Express companies pay a State tax of 1½ per cent on gross receipts from traffic in the State.⁶

All sleeping-car and express companies are subject to the usual local property taxes.

UTAH.

CONSTITUTIONAL PROVISIONS.

State aid.—The State shall neither loan its credit to nor subscribe to stock or bonds in any railroad, telegraph, or other private enterprise. (Art. VI, sec. 31.)

The legislature shall not release any individual or corporation from its liability to the State or to any local division thereof. (Art. VI, sec. 37.)

Uniform tax on property.—There shall be a uniform and equal rate of assessment and taxation on all property in the State. Every person and corporation shall be taxed in proportion to value of property. (Art. XIII, sec. 3.)

All persons and corporations doing business in the State shall be subject to taxation for State and local purposes on all their property. (Art. XIV, sec. 10.)

Rolling stock shall be considered and taxed as personalty. (Art. XII, sec. 14.)

Income, license, and franchise taxes.—The legislature may levy a stamp tax, and taxes based on income, occupation, licenses, franchises, or mortgages. (Art. XIV, sec. 12.)

Local aid.—The legislature shall not authorize any local division to loan its credit or subscribe to stock or bonds in any railroad, telegraph, or other private enterprise. (Art. VI, sec. 31.)

STATUTE PROVISIONS.

Railroad companies.⁷

Listing, valuation, etc.—The officials of railroads operating in more than one county are required to make annual reports to the State, setting forth all their property and its value. On the basis of these reports the various companies are assessed by the State board of equalization on their property and franchises. Rolling stock is valued on a pro rata mileage basis. The total valuation is apportioned among the counties for the computation and collection of the tax.

Local taxation.—Railroad lands not employed for operating purposes are locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph, telephone, car, and depot companies.⁸

These companies are taxed like railroads.

⁸ *Ibid.*, pp. 102-103.

VERMONT.

CONSTITUTIONAL PROVISIONS.)

Nothing specific.

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make full returns, not more frequently than biennially, to the commissioner of State taxes, who appraises the value of the railroad property, including the corporate franchise. In the case of interstate roads, the valuation is determined on a pro rata mileage basis. The rate of the tax is seven-tenths of 1 per cent.

Alternative gross earnings tax.—Railroad companies may pay in lieu of the tax on property and franchise a tax of 2½ per cent on gross earnings from business done in the State, including a pro rata mileage portion of interstate earnings.

Telegraph and telephone companies.²

Telegraph companies are taxed on the value of property and franchise as follows: 60 cents per mile of poles and the first line of wire; 40 cents per mile on each additional wire.

In lieu of this tax, telegraph companies may pay a tax of 3 per cent on their gross earnings from business done in the State.

Telephone companies pay a tax of 3 per cent on their gross earnings from business done in the State.

Express and sleeping-car companies.³

Express companies pay a tax of 4 per cent on their gross earnings from business done in the State.

Sleeping-car companies pay a tax of 5 per cent on their gross earnings from business done in the State.

Steamboat, car, and transportation companies.⁴

All such companies incorporated under the laws of the State pay a tax of seven-tenths of 1 per cent on an appraised valuation of their property and corporate franchises, or in lieu thereof a tax of 2 per cent on their entire gross earnings.

License tax.⁵

All corporations doing business in the State and all incorporated in the State pay an annual State license tax of \$10 if their respective capitals are \$50,000 or less, and of \$5 for each additional \$50,000 of capital, the total tax not to exceed \$50.

Local taxation.⁶

The real and personal estate of all transportation companies not used for operating purposes is appraised by the listers of the towns like the property of individuals.

Powers of commissioner of State taxes.⁷

This officer is empowered by law to summon witnesses, and to examine corporation books, papers, etc., to assist in reaching correct valuations for purposes of taxation.

VIRGINIA.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—The State shall not engage in nor be a party to works of internal improvement otherwise than in the expenditure of grants to the State of land and other property. (Art. X, sec. 15.)

State aid.—The credit of the State shall not be granted in aid of any person, association, or corporation. (Art. X, sec. 12.)

The State shall not be interested in the stock of any corporation. (Art. X, sec. 13.)

The liability of any corporation to the State shall not be released nor diminished. (Art. X, sec. 21.)

Uniform tax on property.—Taxation shall be uniform. All property shall be taxed according to its value. (Art. X, sec. 1.)

¹ Vermont Statutes, Title 10, secs. 557-564.

² *Ibid.*, secs. 565-568.

³ *Ibid.*, secs. 569-571.

⁴ *Ibid.*, secs. 572-574.

⁵ *Ibid.*, sec. 575.

⁶ *Ibid.*, secs. 590-592.

⁷ *Ibid.*, secs. 868-878, 888.

Business capital.—The capital invested in all business operations shall be assessed and taxed as other property. Assessments upon stock shall be according to the market value thereof. (Art. X, sec. 4.)

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make annual returns to the auditor of public accounts, setting forth their entire property and their gross receipts and net earnings from operation. The auditor is empowered to examine corporation books and papers. The board of public works appraises all railroad property. The taxes on this appraisalment are paid into the State treasury.

Gross receipts tax.—Railroad companies also pay a tax on gross receipts to pay the expenses of the railroad commission.

Local taxation.—Railroad real estate not in the right of way, including depots and other buildings, is locally assessed and taxed.

Telegraph and telephone companies.²

These companies are taxed on their property for State and public school purposes.

Telegraph companies pay in addition a license tax of \$2 per mile of poles, and 2 per cent on gross earnings from business done in the State.

Telephone companies pay in addition a license tax, as follows:

Those using 600 instruments or less, 50 cents on each instrument.

Those using between 600 and 1,000 instruments, 75 cents on each instrument.

Those using between 1,000 and 2,000 instruments, \$1 on each instrument.

Those using more than 2,000 instruments, \$1.50 on each instrument.

Express and navigation companies.³

These companies are assessed on their property by the State, and pay the usual property taxes. Express companies in addition pay an annual State license tax, as follows: Those operating over 1,000 miles or more in the State, \$500; less than 1,000 miles, \$300.

Sleeping-car companies.³

These companies are taxed by the State for State and public school purposes. The tax is based on a pro rata mileage proportion of their capital stock. They also pay the usual local property taxes.

Canal companies.⁴

These companies are assessed and taxed on their property like railroads.

WASHINGTON.

CONSTITUTIONAL PROVISIONS.

Release from taxation.—The power to tax corporations and corporate property shall not be surrendered or suspended by the State. (Art. VII, sec. 4.)

State aid.—The credit of the State shall not be extended in aid of any person, association, or corporation. (Art. VIII, sec. 5.)

Uniform tax on property.—There shall be a uniform and equal rate of assessment and taxation on all property in the State. (Art. VII, sec. 2.)

Corporations.—Corporate property shall be taxed as nearly as may be by the same methods as are followed in taxing individual property. (Art. VII, sec. 3.)

Rolling stock shall be considered and taxed as personal property. (Art. XII, sec. 17.)

Local aid.—No local division shall give any money or property, loan its money or credit, or become the owner of stock or bonds in aid of any company or corporation. (Art. VIII, sec. 7.)

STATUTE PROVISIONS.

Railroad companies.⁵

Listing, valuation, etc.—Railroad companies are required to return to the State auditor schedules of their entire property of operation, capital stock, earnings, expenses, and indebtedness. The property is then assessed for State taxes by the State board of equalization.

¹ Laws of 1897-98, pp. 78-80; also Code of 1887, sec. 1812.

² Laws of 1899-1900, pp. 535-536.

³ General Laws of Virginia, 1897-96 (Pollard), pp. 222 et seq.

⁴ Laws of 1897-98, pp. 78-80, also Code of 1887, sec. 1812.

⁵ Laws of 1897, pp. 149-153.

Local taxation.—Railroads are locally assessed and taxed on all their property, on the basis of annual lists which they are required to make in each county. Rolling stock is valued on a pro rata mileage basis.

Telegraph and telephone companies.¹

The property of these companies is taxed like the property of individuals. They are required to return annual schedules to the county assessors. These schedules are transmitted to the State auditor.

Express, transportation, and stage companies.²

These companies are taxed on their personalty in the counties where it is kept.

WEST VIRGINIA.

CONSTITUTIONAL PROVISIONS.

State aid.—The credit of the State shall not be granted in aid of any individual or corporation, nor shall the State ever assume the debts of any individual or corporation, nor shall the State become a stockholder in any company or association. (Art. X, sec. 6.)

Uniform tax on property.—Taxation shall be equal and uniform on all property throughout the State. (Art. X, sec. 1.)

STATUTE PROVISIONS.

Railroad companies.³

Listing, valuation, etc.—Railroad companies are required to make detailed annual reports to the State auditor, setting forth property of operation, capital stock, bonded debt, earnings, and expenditures. On the basis of these returns, after approval by the board of public works, who have access to corporation books and papers and may examine corporation witnesses, the State auditor sets a valuation upon railroad property and apportions the same among the local tax districts, where the tax is computed at the usual rate and certified to the State auditor. The total taxes are then paid into the State treasury.

Local taxation.—Railroad real estate not employed for purposes of operation is locally assessed and taxed. Each local district also receives its share of the taxes paid into the State treasury.

Telegraph and express companies.⁴

The property of domestic telegraph and express companies is assessed and taxed like other property in the State. Foreign telegraph and express companies pay a State tax of 2 per cent on their gross receipts from business done in the State.

Other transportation and transmission companies.⁵

Incorporated transportation and transmission companies, other than railroad, telegraph, and express companies, are locally taxed as follows: Real estate is taxed as in other cases. The value of the capital is determined and taxed by the following method: The aggregate value of personal property (not exempt from taxation) wherever situated, and including moneys, credits, and investments, is determined, and after deductions have been made for all amounts owed by such company as principal debtor, the remaining sum is taxed at the usual rate.

WISCONSIN.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—The State shall never contract any debt for works of internal improvement, nor be a party to carrying on such works, except where grants of land or property have been made to the State for that purpose. (Art. VIII, sec. 10.)

State aid.—The credit of the State shall never be given or loaned in aid of any individual, association, or corporation. (Art. VIII, sec. 2.)

Uniform tax on property.—Taxes shall be uniform, and upon such property as the legislature shall prescribe. (Art. VIII, sec. 1.)

¹ Laws of 1897, p. 154.

² *Ibid.*, p. 142.

³ Code of West Virginia, Chap. XXIX, sec. 67.

⁴ *Ibid.*, Chap. XXXIV.

⁵ *Ibid.*, Chap. XXIX, sec. 64.

- STATUTE PROVISIONS.

Railroad companies.¹

State taxation.—Railroad companies are required to make annual returns to the State treasurer, showing their gross earnings for the year, and specifying the earnings per mile of line. "License fees" are then levied on gross earnings as follows:

4 per cent on total gross earnings of \$3,000 or more per mile.

3½ per cent on total gross earnings between \$2,500 and \$3,000 per mile.

3 per cent on total gross earnings between \$2,000 and \$2,500 per mile.

2½ per cent on the excess above \$1,500 per mile, plus \$5 per mile when gross earnings are between \$1,500 and \$2,000 per mile; \$5 per mile when gross earnings are less than \$1,500 per mile.

Railroads built on pile and pontoon bridges pay at the special rate of 2 per cent on their gross earnings.

Local taxation.—There is no local tax on railroads, except that lands owned by railroad companies, but not used for railroad purposes, are assessed and taxed like similar property of individuals.

Telegraph and telephone companies.

Telegraph companies pay a State tax as follows: On a single wire, \$1 per mile; on a second wire, 50 cents per mile; on a third wire, 25 cents per mile, and on each additional wire 20 cents per mile.²

Telephone companies pay a State tax of 3 per cent on gross earnings of \$100,000 or over and 2½ per cent on gross earnings under \$100,000.¹

Express, sleeping car, equipment, and freight line companies.⁴

These companies are required to make annual returns to the State treasurer, who puts such returns before the State board of assessment. The tax is assessed on a pro rata mileage portion of capital stock, with certain deductions. In the case of express companies, deduction is made for real estate situated and taxed outside of the State and for personally not used in the express business; in the case of sleeping car and equipment companies, for real estate situated and taxed outside of the State; and in the case of freight-line companies, for real estate situated in the State.

WYOMING.

CONSTITUTIONAL PROVISIONS.

Internal improvement.—The State shall not engage in works of internal improvement unless authorized by a two-thirds vote of the people. (Art. XVI, sec. 6.)

State aid.—The legislature shall not authorize the State to contract any debt in constructing any railroad or to loan its credit in aid of the same. (Art. III, sec. 39.)

The State shall not loan its credit or make donation to any railroad or telegraph line. (Art. X, sec. 5.)

The State shall not loan its credit, make donations, or subscribe to stock in aid of any individual, association, or corporation. (Art. XVI, sec. 6.)

Uniform taxation—Listing, etc.—All taxation shall be equal and uniform. (Art. I, sec. 28.)

All lands and improvements thereon shall be listed and assessed separately. (Art. XV, sec. 1.)

Railroads.—There shall be a State board, consisting of the auditor, treasurer, and secretary of state, which shall assess at their actual value the franchisees, roadway, roadbed, rails, and rolling stock of all railroads and other common carriers. This valuation shall be apportioned among the counties as the basis of taxation. (Art. XV, sec. 10.)

Reports of railroad companies.—All railroads operating in the State must make annual reports of their business, as the legislature may prescribe. (Art. X, sec. 3.)

Local aid.—The legislature shall not authorize any county to contract any debt in constructing any railroad, or to loan its credit in aid of the same. (Art. III, sec. 39.)

No local division shall loan its credit or make donation to any railroad or telegraph line. (Art. X, sec. 5.)

No local division shall loan its credit, make donations, or subscribe to stock in aid of any individual, association, or corporation. (Art. XVI, sec. 6.)

¹ Revised Statutes of Wisconsin, secs. 1211–1213.

² *Ibid.*, sec. 1216.

³ *Ibid.*, sec. 1222a.

⁴ Laws of 1899, chaps. 111–114.

STATUTE PROVISIONS.

Railroad companies.¹

Listing, valuation, etc.—Railroad companies are required to make annual reports to the State board of equalization, setting forth all property of operation. On the basis of these reports a valuation is determined covering property and franchises, and is apportioned among the local districts for the computation and collection of the tax.

Local taxation.—Railroad real estate not employed for purposes of operation is locally assessed and taxed. There is also a local tax on the values apportioned by the State.

Telegraph and sleeping car companies.¹

These companies are taxed like railroads.

Wyoming.			

¹ There is a local tax on lands owned by railroads, such as have been subject to grant either by the state or by the United States.

² Lands used by railroad companies but not used in any way for railroad purposes are assessed and taxed like the similar property of individuals.

³ Not including "distributable property." There are, however, local license taxes on railroads.

LIST OF WITNESSES.

	Page
Adams, Alton D., electrical engineer, Boston, Mass.....	275-285
Adams, Charles Francis, former chairman Massachusetts railroad commission, Boston, Mass.....	824-830
Adams, Henry C., statistician Interstate Commerce Commission, Ann Arbor, Mich.....	373-387
Anderson, George H., secretary Chamber of Commerce, Pittsburg, Pa.....	636-652
Bacon, M. R., freight manager Michigan Alkali Company, Wyandotte, Mich.....	72-85
Barter, Henry C., secretary-treasurer International Longshoremen's Association, Detroit, Mich.....	306-317
Bemis, Prof. Edward Webster, of the Bureau of Economic Research, Mount Vernon, N. Y.....	86-103
Bethell, U. N., general manager New York Telephone Company, New York City.....	777-816
Bryant, John W., secretary Steamboat Captains and Owners' Exchange, New Orleans, La.....	387-400
Chandler, Albert B., chairman of the board of directors Postal Tele- graph Company, New York.....	193-206
Childs, James E., general manager New York, Ontario and Western Railroad, New York City.....	496-508
Clark, Thomas F., vice-president Western Union Telegraph Company, New York.....	206-241
Davant, James S., commissioner of the Memphis Freight Bureau, Mem- phis, Tenn.....	5-8
Dunlap, Samuel C., general manager Cornelia and Tellulah Falls Rail- road, Gainesville, Ga.....	1-4
Fitzpatrick, Val, third vice-grand master Brotherhood of Railway Train- men, United States and Canada, Columbus, Ohio.....	830-841
Fleming, Henry S., secretary-treasurer Anthracite Coal Operators' Asso- ciation, New York City.....	535-542
Foote, Allen Ripley, editor Public Policy, Chicago.....	103-123
Fuller, H. R., national representative of National Brotherhood of Rail- road Employees, Fifty-sixth Congress, Beaverfalls, Pa.....	8-72
Greene, Thomas L., vice-president Audit Company of New York, New York City.....	467-495
Griffith, Charles D., representative Denver Chamber of Commerce.....	848-858
Griswold, B. H., general freight and passenger agent Western Maryland Railroad, Baltimore, Md.....	611-626
Guillaudeu, William Leggett, president Old Dominion Steamship Com- pany, New York City.....	442-451
Haddock, John C., independent anthracite coal operator, New York City.....	521-534
Hall, Edward J., vice-president and general manager of the American Telephone and Telegraph Company.....	817-824
Harris, Joseph S., former president Reading Company, Reading Termi- nal, Philadelphia, Pa.....	596-611
Hayne, Daniel H., general solicitor Merchants and Miners' Transporta- tion Company, Baltimore, Md.....	413-425
Hitchcock, Romyn, civil engineer, New York City.....	890-896
Howes, Osborne, secretary Boston Board of Fire Underwriters, Boston, Mass.....	700-718
Jackson, James F., of the Massachusetts State Board of Railroad Com- missioners, Fall River.....	841-848
Langley, James Morton, representing the Merchants' Association of New York, New York City.....	850-883

Lindenberger, F. T., chairman committee on hostile legislation American Ticket Brokers' Association, Detroit, Mich	317-360
McGovern, P. J., chairman Southern Classification Committee, Atlanta, Ga	652-686
McLeod, Archibald A., former president of the Reading Railroad, New York City	561-576
Markham, M. C., assistant traffic manager Illinois Central Railroad and Yazoo and Mississippi Valley Railroad, Chicago, Ill	425-442
Nicholson, William, manager Central Railway Clearing House, Buffalo, N. Y.	718-731
Parsons, Prof. Frank, president National Public Ownership League, Back Bay post-office, Boston, Mass	123-193, 883-890
Penje, William, secretary Lake Seamen's Union, Chicago, Ill	400-412
Randall, A. L., chairman International Typographical Union committee on Government control and ownership of the telegraph, Washington, D. C.	241-265
Rice, Isaac Leopold, president Consolidated Rubber Tire Company, New York City	732-743
Ripley, Prof. William Z., professor of economics, Massachusetts Institute of Technology, Boston, Mass	285-306
Roberts, F. C., member International Typographical Union telegraph committee, Washington, D. C.	266-274
Saward, Frederick E., editor The Coal Trade Journal, New York City ..	508-520
Schiff, Jacob H., of Kuhn, Loeb & Co., bankers, New York City	769-777
Stearns, Irving A., president Coxie Bros. & Co., incorporated, Wilkes-barre, Pa.	576-596
Stubbs, J. C., third vice-president of the Southern Pacific Company, San Francisco, Cal	757-769
Talcott, T. M. R., assistant to the president Seaboard Air Line, Richmond, Va.	626-636
Teisberg, A. K., secretary State Railroad and Warehouse Commission of Minnesota, St. Paul, Minn.	360-373
Thomas, E. B., president Erie Railroad Company, New York City	548-560
Walter, Alfred, president Lehigh Valley Railroad Company, South Bethlehem, Pa.	543-548
Wheeler, William R., representing Pacific Coast Jobbers' Association, San Francisco, Cal	743-757
Wilson, Edward P., secretary various Ohio commercial organizations, Cincinnati, Ohio	687-700
Woodlock, Thomas F., railroad editor Wall Street Journal, New York City	451-467

INDEX OF TESTIMONY.

(References give names of witnesses and pages of testimony—not in digest. For index of digest see p. CCLXXXIX.)

	Page.
Accidents (see also <i>Employers' liability; Relief department; Safety appliances</i>):	
Appliances, defective, as cause	Fuller, 41
Comparison of railways, in different countries	Parsons, 153
Interstate Commerce Commission, reports to	Fuller, 41
Accounts of corporations:	
Audit and examination, difference between	Greene, 481
Balance sheets, proper items to be published, discussed	Greene, 492, 493
Depreciation, method of accounting for	Greene, 493
Methods of auditing discussed	Greene, 479-482, 483, 489-494
Accounts of public and quasi public corporations (see also <i>Uniform public accounting</i>) auditing, in England.	Bemis, 93
Accounts, public:	
Examination of, in Wyoming	Bemis, 93; Foote, 104
Public regulation, importance of	Bemis, 93; Foote, 107; Schiff, 773
Publicity of municipal, advocated	Bemis, 91
Uniform system of, for public and quasi public corporations advocated	Bemis, 91; Foote, 103-123
Accounts of railroads:	
Confusion by operation of subsidiary companies	Rice, 739, 740
Auditing, suggested plan of	Foote, 122
Expert auditors, examination by, advocated	Greene, 479
Improvements, accounts to which charged	Talcott, 635
Inspection of, desirability of	Rice, 739, 741
by Interstate Commerce Commission, discussed	Greene, 479, 480; Woodlock, 464
Uniformity of, reasons for	Adams, 382-386
advantage of requirement by Interstate Commerce Commission	Greene, 480
Age limit, Railroad employees, injustice of	Fuller, 10
Agreements of employers and employees (see also <i>Arbitration</i>):	
Longshoremen	Barter, 309-317
Railways, extent and advantage of system	Fuller, 10
Agreements of railroads (see also <i>Community of interest; Pooling</i>):	
Denver rates fixed by	Griffith, 856
Transcontinental freight rates, nature of	Wheeler, 749; Stubbs, 764
Agreements between telegraph companies, effect on rates	Chandler, 195, 198
Alabama, telegraph service in	Clark, 207
Alabama Great Southern Junction Railway Co., relation to Southwestern Investment Security Co	Wilson, 693
Alkali products:	
Classification in different districts	Bacon, 81
Freight rates on, discussed	Bacon, 72-76, 80, 81
Methods and conditions of business, discussed	Bacon, 72, 80, 85
Tariff on	Bacon, 80, 85
Allegheny, Pa., cost of electric light in	Bemis, 98
American and Hawaiian Steamship Company, description of business	Wheeler, 750; Stubbs, 763
American Economic Association, resolutions as to public accounting	Bemis, 86, 94; Foote, 108
American Federation of Labor:	
Anti-scalping laws, attitude toward	Lindenberger, 329
Government ownership of telegraph, favored by ..	Randall, 242; Roberts, 274
Lake Seamen's Union, connected with	Penje, 400

American Merchant Marine. (See <i>Merchant Marine, American.</i>)	Page.

Report for year 1900	Hall, 820-823
Service furnished compared with service in Europe	Bethell, 786-808
Stock	Hall, 819, 821
Wages paid	Bethell, 783, 784
Western Union Telegraph Company, relations to	Bethell, 812
American Ticket Brokers' Association, membership, constitution, etc.	Landenberger, 320-325
American Union Telegraph Company, absorption of, by Western Union Telegraph Company	Clark, 220-221; Roberts, 272
Amsterdam, Holland:	
Telephone service and rates in, comparison of	Bethell, 793-795
Wages of telephone operators	Bethell, 794-796
Anthracite Coal:	
Allotment of tonnage between railroads discussed	Woodlock, p. 151;
Childs, 500; Seward, 511, 515; Haddock, 527;	
Walter, 515, 517; Thomas, 550, 551; Stearns,	
581-583; Harris, 598, 601, 602; Rice, 748	
Desire of railroads to increase their proportions	Stearns, 590
New York, Ontario and Western	Childs, 496, 500
Pennsylvania Railroad, attitude toward	Haddock, 532
Reasons for existing proportions	Harris, 602
Result of gradual development, not of agreement	Thomas, 550, 554
Slight variations between railroads in recent years	Harris, 601, 602
Bituminous coal, competition of	Greene, 469, 470;
Childs, 501, 502; Seward, 510, 512; Haddock, 528-530;	
Fleming, 537, 541; Walter, 543, 548; Thomas, 555,	
McLeod, 562, 567, 569; Stearns, 583, 585; Harris, 602	
Cars, discrimination in supply of, discussed	Fleming, 536, 537;
Walter, 545; Stearns, 588; Harris, 600, 601	
Central Railroad of New Jersey, purchase by Reading Company	
Woodlock, 451, 453; Greene, 471, 475; McLeod, 572; Harris, 607-609	
Children, employment at mines	Seward, 516
Coal lands, accumulation of fund to cover exhaustion	Stearns, 584
Control by railroads	Woodlock, 451, 453; Greene, 468;
Childs, 497, 498, 503; Seward, 509; Haddock,	
521; Stearns, 588, 589; Harris, 601; Rice, 742	
Reading's purchases forced by competition	Haddock, p. 523
Reason for holding in reserve	Harris, 602, 606
Coke, competition of	Stearns, 585
Colorado, deposits in	Seward, 519; Griffith, 857
Combination and community of interest among railroads -	
Absolute ownership not sought	Woodlock, 452; Walter, 545
Attempted, 1893	Childs, 503; Rice, 737
Consolidation, desirability of	Greene, 468-471
Legal difficulties encountered by	Greene, 475
Control of future supply	Stearns, 587

Anthracite Coal—Continued.	Page
Combination and community of interest, etc.—Continued.	
Economies and advantages to public	Woodlock, 452; Greene, 468-471; Saward, 517, 519; Haddock, 534; Wal- ter, 544; Thomas, 556; McLeod, 568, 571, 575; Harris, 598
Competition not destroyed by	Childs, 503
Middlemen, possible elimination	McLeod, 568
Effect on prices and general public	Greene, 469, 470, 473; Haddock, 530-531; Stearns, 586, 587; Harris, 609; Rice, 738
Independent operators, impossibility of driving out of business	Stearns, 586, 587
Proportion of railroads and traffic controlled by	Childs, 502, 504; Haddock, 526; Stearns, 586, 589, 594; Harris, 598, 599, 608
Recent movement described	Woodlock, 451-455; Saward, 512, 513, 516; Walter, 545
Conditions of mining in different regions	Harris, 605, 606
Cost of mining, different regions	Walter, 547; Stearns, 584; Harris, 606, 607
Estimation of	Greene, 472, 474; Saward, 515; Fleming, 540; McLeod, 565, 566, 567, 570; Harris, 602, 606, 607
Increase	Saward, 511; Walter, 544; Harris, 606, 607
Proportion going to wages	Saward, 516
Cost of transportation, proportion of coal output	Walter, 544
Coxe Bro. & Co., conditions of labor	Stearns, 592-596
Output and tonnage	Stearns, 581
Prices of coal received by	Stearns, 590-593
Relations to railroads	Stearns, 577, 581
Suit against Lehigh Valley Railroad	Haddock, 525, 535; McLeod, 573
Western shipments	Stearns, 584
Culm piles, utilization of waste	Haddock, 528
Delaware and Hudson Railroad, relation to other companies	Harris, 608
Delaware, Susquehanna and Schuylkill Railroad	Woodlock, 451, Stearns, 577, 590
Electricity, competition of	Greene, 470
Erie Railroad, combination with other companies	Thomas, 552, 553
Purchase of Pennsylvania Coal Company	Woodlock, 452; Greene, 475; Haddock, 521; Thomas, 552, 553; McLeod, 572; Stearns, 589
Tonnage, amount and sources	Thomas, 548
Export trade	Fleming, 540; McLeod, 567; Rice, 742
Freight rates:	
Average rates	McLeod, 565
Compared with bituminous rates	Woodlock, 454
Haddock, 530-531; Fleming, 539; Stearns, 579, 594	
Decrease in recent years	Harris, 599, 600
Discrimination in, existence denied	Stearns, 583, 584
Distances to tide water	Stearns, 578
Independent operators, no discrimination against	Stearns, 580
Influences determining	Harris, 598
Interstate Commerce Commission, attempted regulation by	Haddock, 525, 534
Methods of establishing	McLeod, 561
New England	McLeod, 561, 562
Percentage of tide water price chiefly determined by	Saward, 509
Percentage contracts, comparison of tariff rates with	Haddock, 523, 532, 534; Thomas, 549
Relation to prices	Greene, 470
Reasonableness discussed	Woodlock, 453, 454; Fleming, 536, 539
Ton rates, per mile	Childs, 496, 497; Saward, 509
Various points	Childs, 496
Western shipments	Stearns, 583
Gas and other products, competition of	McLeod, 570
Independent operators, discrimination against, in supply of cars dis- cussed	Haddock, 524-526, 532; Fleming, 536, 537; Walter, 545; Stearns, 590, 588; Harris, 600, 601
Different positions of different classes of operators	Haddock, 521, 522, 527, 532
Number decreasing	Stearns, 579, 580
Policy of	Haddock, 531

Anthracite Coal—Continued.

Independent operators, etc.—Continued.

Possibility of acquiring lands	Childs, 503
Possibility of successful business	Stearns, 588
Prices, possible influence upon	Haddock, 532
Production, proportion of total	Greene, 468; Seward, 508, 509;
Haddock, 521, 522, 527, 532; Fleming, 585, 542; Stearns, 580; Harris, 600	
Proportion on different roads	Childs, 498; McLeod, 563
Profits of	Thomas, 556
Railroads, attitude toward	McLeod, 573; Harris, 600
Proposed construction of	Haddock, 521;
Walter, 547; Stearns, 588; Harris, 603	
Existence of grievances, discussed	Fleming, 541, 542
General satisfaction with existing conditions	Thomas, 549, 556
Direct shipments of freight by	Childs, 498
Alleged restriction of output by limiting supply of cars ..	Childs, 504;
Haddock, 524-527; Walter, 545	
Small proportion sell their own coal	Seward, 508, 509
Labor, beneficial effect of combination of operators	McLeod, 576
Condition and relation to employers	Greene, 474
Condition of, satisfactory	Seward, 515, 519
Foreign, importation of	Stearns, 596
Number of days worked	Seward, 519, 520; Stearns, 593
Labor organizations, attitude of Reading Company toward ..	Harris, 610, 611;
Fitzpatrick, 833, 834, 837-840	
Lake transportation	Stearns, 581
Lehigh Valley Railroad, anthracite coal business	Walter, 543, 548
Percentage of output	Walter, 543, 547
Relations to independent operators	Walter, 543, 545
McLeod, A. A., attempted combination of railroads, 1892 ..	Seward, 513
Middlemen, economy from elimination	McLeod, 568
Miners, nationality of	Stearns, 595, 596
Morgan, J. P., relations to	Woodlock, 452, 455
New England, shipments to	Childs, 500, 501;
Thomas, 553; McLeod, 561, 562; Stearns, 585	
New York, Ontario and Western Railroad, coal business ..	Woodlock, 452
Connection with New York Central Railroad	Childs, 501
Purchases of coal lands	Childs, 497, 498; Stearns, 589
Relation to other railroads	Harris, 598, 599, 603, 608
Reorganization and capitalization	Childs, 502
Shipments, proportion of	Childs, 500
Tonnage and freight rates	Childs, 496, 497, 500
Pennsylvania Coal Company, Erie Railroad, purchase by ..	Woodlock, 452;
Greene, 475; Haddock, 521; Thomas, 552, 553; McLeod, 572; Stearns, 589	
Pennsylvania Railroad, attitude toward agreements of railroads ..	Haddock, 532
Relation to coal companies	Stearns, 579
Relation to other railroads	Woodlock, 452; Harris, 598, 599, 608
Percentage contracts, system described	Woodlock, 454;
Childs, 496, 498, 500; McLeod, 563; Stearns, 577, 578	
Advantages and disadvantages to operators	Haddock, 523,
524, 526, 527, 532; Fleming, 537	
Cost of shipments under	Thomas, 549
Duration of	Fleming, 536
Establishment of system by Mr. McLeod	McLeod, 562, 563
Freight rates under	Seward, 509
Proportion of coal carried under	Seward, 509
Proportion of operators selling under	Haddock, 522, 532;
Fleming, 536, 537, 542; Thomas, 549; Harris, 600	
Railroads, do not apply to mines controlled by	Stearns, 579
Restriction of output under	Haddock, 524, 525, 527, 532; Fleming, 537
65 per cent contracts—	
Adoption, probability of	Childs, 496, 500;
Walter, 543; Thomas, 549; Stearns, 577; Harris, 610	
Cover life of property	Haddock, 531, 532;
Walter, 545; Thomas, 549; McLeod, 563; Stearns, 578	
Effect on independence of operators	Haddock, 531, 532
Investigation, method of	Stearns, 577

Anthracite Coal—Continued.	Page.
Percentage contracts—Continued.

New, blank form	Childs, 505, 507
Railroads, purpose of	Stearns, 578
Satisfactory to most operators	Fleming, 536, 537; Harris, 610
Time of payment to operators	Stearns, 580
Variations in percentages in various contracts	Fleming, 536
Western shipments	Childs, 500
Plymouth Coal Company, relations to railroad companies	Haddock, 523-527, 532
Powder, price of	Saward, 511
Prices—	
Agreements of railroads as to, existence of practice discussed	Woodlock, 455; Childs, 499, 505; Saward, 512, 513, 516, 517; Haddock, 526, 529; Fleming, 538, 539; Walter, 547, 548; Thomas, 550, 551; Stearns, 582; Harris, 599, 603
Reading Railroad, influence on	McLeod, 572; Stearns, 582; Harris, 604
Consultations between railroads regarding	Thomas, 551, 555
Sales agents, no recent meetings	Fleming, 539
Seasonal changes, uniformity in making	Saward, 511, 516; Haddock, 529; Fleming, 538, 539
Impossibility of control by	Childs, 505
Coal lands, influence of capitalization of	Saward, 518
Desirability of maintaining present rates	Saward, 517
Effect of combination	Haddock, 529, 530, 531, 532; Greene, 469, 470, 473; Saward, 513, 519
Effect of unlimited competition	Harris, 602, 603
Impossibility of maintaining excessive	Harris, 603; Woodlock, 455; McLeod, 568, 569
Influences tending to prevent excessive	Thomas, 555
Independent operators, methods of fixing	Haddock, 525, 526, 529
Limitation by competition of other products	Greene, 469, 470; Fleming, 537, 541; Walter, 543, 548; Thomas, 555; Childs, 501, 502; Saward, 510, 512; Haddock, 528-530; McLeod, 562, 567, 569; Stearns, 583, 585; Harris, 602
Overcapitalization of railroads, effect of	Woodlock, 453
Percentage contracts, influence of, as regards competition	Haddock, 531, 532
Reasonableness of present, discussed	Haddock, 530-531; Walter, 543; Saward, 519; McLeod, 569
Seasonal fluctuations	Saward, 511, 516
Statistics—	
Average and variations	McLeod, 565
Recent increase discussed	Childs, 499, 501, 502; Stearns, 582, 583, 586, 587; Harris, 603
Recent movement	Saward, 510, 511, 515, 516; Fleming, 541
Recent years, by months	Stearns, 590-592
Strike of 1900, effect of	Thomas, 555; Stearns, 583
Variations as between quantities	Fleming, 538; Thomas, 554
Western markets	Childs, 505
Wholesale and retail, difference between	Walter, 543
Production, consumption, distribution, by sections and States	McLeod, 561, 562
Output from year to year	Walter, 543
Productive capacity, and demand (see also <i>Restriction of output</i>)	Saward, 511, 512; Fleming, 538; Thomas, 555, 556; McLeod, 565; Stearns, 587; Harris, 601, 602
Productive capacity, influences tending to increase	Childs, 499; Stearns, 587
Seasonal variation in demand, and storage of coal	Childs, 499, 500
Supply, duration of	Greene, 475; Haddock, 529; Fleming, 540; Thomas, 555; McLeod, 565, 566, 570; Stearns, 587; Harris, 605, 606
Railroad mines, economies of operation by large corporations	McLeod, 566, 568
Publicity of accounts desirable	Greene, 481
Railroads, amount of coal mined by affiliated companies	McLeod, 568
Names and description of coal roads	Saward, 508
Profits on coal mining and transportation	Woodlock, 453, 454; Greene, 472, 474

As a competitor of New York	Langley, 859
Canadian export trade	Howes, 702
Canadian railway connections, its advantages by reason of	Howes, 701
Commercial importance	Howes, 700
Export rates through	Howes, 701
Export trade of	Howes, 700
Freight differential at	Howes, 701
Freight rates to	Howes, 700, 701
Freight steamers trading at	Howes, 701
Imports of	Howes, 700
Railroads, effect of certain	Howes, 701, 702
Enterprise at	Howes, 701
Street railway system	Jackson, 813, 814
Telephone service, compared with Amsterdam	Bethell, 791
Transportation facilities at	Howes, 701
Boston and Albany Railroad:	
Competitors of	Parsons, 132
Discriminations by	Parsons, 129-134; Howes, 702
Lease of, by New York Central	Parsons, 129
Report of Massachusetts Railroad Commission on	Parsons, 129, 130, 131
Boston and Maine Railroad:	
Freight rates on anthracite coal	Thomas, 553
Lease of the Fitchburg road	Howes, 702
Boycotts, strikes distinguished from	Fuller, 70
Brazil, per capita trade of, with the United States	Howes, 711
Bridges, danger to river navigation from	Bryant, 388
Brokers, telegraph business, favor by telegraph companies, discussed	Randall, 244; Chandler, 199; Clark, 209
Brooklyn Bridge:	
Operation of railway	Dennis, 88, 102
Rates compared with St. Louis Bridge	Parsons, 145
Brotherhood of Locomotive Engineers, insurance, cost of	Fuller, 56
Brotherhood of Railroad Trainmen:	
Employers' liability, resolution regarding	Fuller, 36
Membership	Fitzpatrick, 832
Method of considering grievances	Fitzpatrick, 831
Objects of	Fitzpatrick, 831
Reading Railroad, attitude toward	Fitzpatrick, 833
Brotherhoods:	
Benefit and insurance features	Fuller, 42
Employers' liability, resolutions regarding	Fuller, 36
Federation, desirability of	Fuller, 11
Negotiations and conciliation with employers	Fuller, 50
Objects and advantages	Fuller, 69
Strikes, effect of in reducing	Fuller, 70
Brussels, telephone service	Bethell, 788

	Page.
Budapest, Hungary:	
General progressiveness	Bethell, 791
Telephone system	Bethell, 791
Buffalo Railway Clearing House (see also <i>Central Railway Clearing House</i>):	
Duties	Nicholson, 719, 720
Establishment	Nicholson, 719
Executive committee	Nicholson, 720
Membership	Nicholson, 719
Cables, submarine:	
Capacity	Clark, 232
Cost	Clark, 218
Cost of maintenance	Clark, 218
How constructed	Clark, 232
Rates	Clark, 218
California:	
Fruit-canning industry	Wheeler, 753, 754
Industrial conditions generally	Wheeler, 754, 755
Manufacturing interests	Wheeler, 752-753
Oil, coal, and water power	Wheeler, 752
Railroad commission, character and decisions of	Stubbs, 767
Canada:	
Differential tariff	Howes, 716, 718
National policy	Howes, 717
Railroads, advantages in rates on	Ripley, 286
American rates, effect of competition on	Thomas, 552
Differentials allowed to	Ripley, 298
Interstate-commerce law affected by	Ripley, 298
Reciprocity treaty with, necessity for	Howes, 713, 715, 718
Trade of, desirability	Howes, 715-716
Extent	Howes, 713, 714, 715, 716
Trade relations with the United States	Howes, 713, 715, 717, 718
Canadian Pacific Railroad:	
Differentials in favor of	Wheeler, 748; Stubbs, 762
Discrimination of transcontinental roads in competition with	Wheeler, 748; Stubbs, 762
Illinois Central Railway, connection with	Markham, 442
Interstate-commerce law, not subject to	Markham, 442
Canals (see also <i>Isthmian Canal; Nicaragua Canal</i>):	
Kiel, volume of business	Anderson, 639
Capitalization of corporations generally (see also <i>Telegraphs; Telephones</i>):	
Discussed generally	Woodlock, 456-461
Amount of, advantage of large, as regards price of securities	Greene, 489
Excessive impossible	Schiff, 773
Heavy speculation, effect of	Thomas, 560
High dividends preferable to overcapitalization	Greene, 486
Increasing, reasons for	Greene, 486, 491
Over-capitalization, evil results	Anderson, 650, 651
Public opposition to high dividends leads to increase	Greene, 486, 491
Real value, no effect on	Schiff, 775
Bonds, conversion into stock desirable	Rice, 740
Excessive issue, undesirable	Rice, 736
Stocks, relation to	Greene, 476
Industrial combinations, compared with railways	Woodlock, 458
Investors, discrimination relative to	Schiff, 773
Method of increasing stock	Schiff, 774
Overcapitalization discussed generally	Woodlock, 459-461
Evil results	Anderson, 650, 651
Publicity as remedy for	Greene, 476
Reasons for	Benis, 88
Remedies	Anderson, 651
Patents, exploitation of	Rice, 732-734
Stocks, amount of, relatively unimportant	Rice, 736
Wages, effect of overcapitalization	Fuller, 71
Western Union Telegraph Company	Parsons, 889-890

	Page.
Capitalization of railroads:	
Chicago and Alton Railway	Woodlock, 458, 459; Schiff, 775
Compared with expense of reproduction	Thomas, 551
Covers improvements in some cases	Ripley, 306
English roads, compared with American	Thomas, 551, 559;
Erie Railroad	Thomas, 551, 559
Michigan, valuation of plants in	Adams, 374-382
Movement of, recent	Ripley, 303, 304
New York, Ontario and Western Railroad	Childs, 502
Overcapitalization—	
Amount of	Parsons, 153
Anthracoite coal roads	Woodlock, 453-456
Kansas City, Pittsburg and Gulf Railroad	Woodlock, 461, 462
Rates, effect on, denied	Woodlock, 456
Policy of railroads in respect to	Parsons, 154, 155
Proper basis discussed	Parsons, 155; Greene, 476; Talcott, 635
Cost of construction, relation to	Woodlock, 457
Earning capacity, relation to	Greene, 476
Preferred and common stock, basis for	Rice, 732, 733
Tangible assets and good will, issue of securities for	Greene, 490, 491
Rates, reasonable, relation to	Ripley, 291, 292; Teisberg, 362; Adams, 380, 381
Reading Company	Woodlock, 455, 456; Harris, 597, 598
Reasonableness in United States asserted	Woodlock, 456
Regulation by Government, discussed	Teisberg, 365; Woodlock, 460-462
By Interstate Commerce Commission, advocated	Thomas, 560
By Massachusetts State Board	Jackson, 813
Reorganization, effect on	Ripley, 291, 297-298; Greene, 487, 488; Harris, 597, 598
Stock watering by selling bonds at low figure	Ripley, 304
Street railways, compared with	Bemis, 90, 91
Surplus income, capitalization of	Adams, 380, 381
Terminals, value not included in assets, Massachusetts	Jackson, 814
Car trusts.	Adams, 386; Talcott, 635
Carload rates	McGovern, 662, 665; Langley, 863
Denver, rates to	Griffith, 855
Discrimination against small shippers	Langley, 861, 862
Arbitrary	Langley, 863
Effect on jobbing trade	Langley, 861, 862
Pacific coast, case regarding differentials	Wheeler, 745; Stubbs, 758, 761
Carnegie, Andrew, United States Steel Corporation, relation to formation of	Woodlock, 464
Carrier's risk rates, comparison with owner's risk rates	McGovern, 656, 657, 659-661
Cars, difficulty of furnishing in busy season	Teisberg, 367, 371
Discrimination in supply of anthracite coal cars discussed	Stearns, 598; Harris, 600-601; Fleming, 536-537; Walter, 545
Cartage, relation to freight rates	Nicholson, 726
Central Pacific Railroad, Southern Pacific, relation to	Stubbs, 757, 761
Central Railroad of Georgia, competitor of the Southern Railway	McGovern, 682-683
Central Railroad of New Jersey, contro' of, by Reading Railroad	Greene, 471, 475; McLeod, 572; Harris, 607-609; Rice, 737, 738
Central Railway Clearing House:	
Departments	Nicholson, 721, 722, 723
Duties	Nicholson, 720
Establishment of	Nicholson, 719, 720
Geographical extent	Nicholson, 720
Membership	Nicholson, 720
Central Traffic Association, jurisdiction	Nicholson, 726
Charleston-Asheville-Norfolk Case, defined	McGovern, 683-686
Charlotte, S. C., cotton, freight rates on	Davant, 5, 8
Chicago:	
Electric light, cost in	Bemis, 98
Gas, price in	Bemis, 89
Gas companies, capitalization of	Bemis, 89
Municipal railways, ownership of	Bemis, 87

Chicago—Continued.	Page.
Southern lumber, receipts of	Markham, 432
Southern trade, interest in	Wilson, 692
Chicago and Alton Railroad, capitalization, recent increase, discussed	Woodlock, pp. 458, 459; Schiff, 775
Chicago, Burlington and Quincy Railroad:	
Extension to Pacific coast	Wheeler, 747; Stubbs, 764
Relations to Northern Pacific and Great Northern	Wheeler, 747; Stubbs, 765
Chicago-Charleston rate, how made	McGovern, 684-686
Chicago-Norfolk rate, how made	McGovern, 684, 686
Child labor:	
Anthracite coal mines, employment in	Saward, 516
China, cotton goods, rates on shipments to	Dunlap, 3, 4
Chinese characters, effect on American industry	Wheeler, 755
Cincinnati:	
Chicago, cooperation with, for Southern trade	Wilson, 692
Freight traffic of	Wilson, 687, 700
Louisville, rivalry with	Wilson, 687
Louisville and Nashville Railway Company, relation to	Wilson, 694
Railway discriminations against	Wilson, 688, 689
Southern trade of	Wilson, 687
Cincinnati, Hamilton and Dayton Syndicate, its relation to Southwestern Investment Security Company	Wilson, 693
Cincinnati, New Orleans and Texas Pacific Railroad Company:	
Cincinnati Southern Railroad, lessee of	Wilson, 692-693
Southern Railway Company, relation to	Wilson, 693
Southwestern Investment Security Company, relation to	Wilson, 693
Cincinnati Southern Railroad:	
Construction of	Wilson, 687, 692, 693
Control of, inimical to Cincinnati	Wilson, 694
Cost of	Wilson, 693
Lease of	Wilson, 692-694
Southern Railway Company, relation to	Wilson, 693
Cities. (See <i>Municipalities</i> .)	
Civil service. (See <i>Officeholding class</i> .)	
Civil service examination system:	
Application of, to public utilities	Parsons, 151
Benefits of, in municipalities	Footo, 118, 119
Difficulties of	Bemis, 99
Municipal governments, need of, in	Bemis, 102
Municipal officers, not applicable to, in Massachusetts	Adams, 283
Necessity of, in Government business	Clark, 230-232
Telegraph employees, relation to	Roberts, 270
Classification Committees, duty of, in respect of single package	Langley, 869
Classification of freight (see also <i>Under classification of freight; Southern Classification Committee</i>).	
Discussed generally.	Ripley, 302; Hayne, 418, 419; Markham, 434, 435; Griswold, 617-619; McGovern, 652
Armour Packing Company, change in, requested by	McGovern, 671-672
Attorney-General, no authority in reference to	Langley, 860
Changes, methods of making	McGovern, 668, 671
Cincinnati, inimical to	Wilson, 698
Classes, number of	Ripley, 302; Langley, 860
Prior to Interstate Commerce Law, classes, number of	Langley, 860
Commercial conditions, must meet	McGovern, 668
Commodity rates, system described and discussed	Griswold, 617; Talcott, 632-633; McGovern, 674-676; Nicholson, 727
Advance in freight classification not affected by	Langley, 870
Definition	Langley, 860
Discrimination, not an unjust	McGovern, 675
How established	McGovern, 665, 666
Increase of	McGovern, 676
Must be exceptional	McGovern, 674, 675
Necessity of	Wheeler, 749; Stubbs, 766
Reason for	McGovern, 674
Remunerative to roads and to shippers	McGovern, 675, 676
Transcontinental traffic	Wheeler, 750; Stubbs, 763, 764
Contracts, effect on future	McGovern, 668
Cost of transportation only a small factor in	McGovern, 670

Classification of freight—Continued.	Page.
Cotton goods, difficulties of	Langley, 866
Difficulties of	Langley, 868
Factors entering into	McGovern, 670
Freight traffic, effect of, on miscellaneous	Langley, 870
General list, number of items in	Langley, 860
Interstate Commerce Commission, control over, advocated	Bacon, 74, 76, 82
Doubts of jurisdiction of	Talcott, 633; Langley, 860
Interstate Commerce Law, condition of prior to	Langley, 860
Quasi conspiracy against, advanced	Langley, 861
Jurisdiction of different	McGovern, 652; Wilson, 698; Nicholson, 726, 727
Manipulation of	Langley, 866
Objections to	Nicholson, 726
Obligation on the part of shippers to observe	Langley, 863
Official classification, territory of	Langley, 860
Official classification committee, advances made by	Langley, 860, 866
Rates, changes in as affecting	Langley, 865
Comparison of	Langley, 864
Effect on	Markham, 434, 435; McGovern, 654, 655, 667, 669
Increase of	Ripley, 302; Griswold, 618, 619; McGovern, 670; Langley, 860
Relation of, to	McGovern, 654-655; Langley, 860
Shippers, can not accommodate individual	McGovern, 669
Soda and alkali products criticised	Bacon, 72-74, 81
Southern classification, discussed generally	Guillandeu, 446;
Talcott, 632-634; McGovern, 652, 653, 655, 663, 682	
Southern classification committee, revision by	McGovern, 655-656
Territories of	Langley, 860
Transcontinental traffic, basis of	Stubbs, 763
Uniform, advocated	Bacon, 74, 76, 82-84
Consolidation of railroads	Ripley, 302
Desirability and difficulties	Ripley, 302, 303;
Griswold, 617-619; McGovern, 678; Wheeler, 749	
Disadvantages of lack of	Ripley, 302
Evils of lack of	Bacon, 74, 82
Impracticability	Talcott, 633; McGovern, 677; Stubbs, 766, 767
Instances of lack of	Bacon, 73, 74, 81
Possibility of	Bacon, 83
Proposed method of adoption	Bacon, 74, 76, 82, 84
Railroads, no tendency on part of railroads toward	Bacon, 83
Clearing house, railway:	
Advantages of	Nicholson, 721, 723, 724, 727, 729, 731
Advocates of	Nicholson, 721
Business of	Nicholson, 723
Economies of	Nicholson, 730, 731
Employees of	Nicholson, 723
Europe, existence in	Nicholson, 728
Interstate Commerce Commission, no connection with	Nicholson, 727
Passenger business, no relations with	Nicholson, 731
Railways, relation to	Nicholson, 723, 724, 727, 729, 731
System explained	Nicholson, 729, 731
Universal, for America not possible	Nicholson, 728
Coal (see also <i>Anthracite coal</i>):	
Export trade	Fleming, 540; Anderson, 643
Southern ports	Markham, 433; Talcott, 628
United States and Canada	Howes, 714, 715, 717
Freight rates on	Bacon, 75-79; Woodlock, p. 454; Griswold, 619, 620
Pittsburg to New Orleans	Bryant, 391
Importance to industrial life	Anderson, 643
Methods of marketing bituminous	Saward, 509
Methods of shipment	Fleming, 539
Output of bituminous	Saward, 512
Pacific coast, supply of	Wheeler, 752
St. Louis, traffic at	Markham, 426
Coastwise transportation (see also <i>Water transportation</i>):	
Baltimore steamship lines described	Griswold, 621, 622
Companies engaged in	McGovern, 664
Freight, distribution of	Hayne, 419

	Page.
Coastwise transportation—Continued.	
Inspection	Hayne, 417, 418
Merchants and Miners' Transportation Company, character of	Hayne, 420
Increase of traffic	Hayne, 423
Passenger and freight compared	Hayne, 418
Nationality of seamen	Guillauden, 450, 451
Obligations of companies under United States law	Hayne, 414
Old Dominion Steamship Company	Guillauden, 444-445
Railroads, ownership of steamship lines by	Talcott, 628; Wilson, 689
Rates, steamship, differential in favor of	McGovern, 663-664
Railways not affected by	Langley, 875
Trade not interested in subsidy	Hayne, 421
Wages	Penze, 412
Coffee, advanced by Southern Freight Classification Committee	Langley, 865
Coke, freight rates, recent increase discussed	Bacon, 75-79
Collins Steamship Line:	
Loss of steamers	Howe, 704
Not benefited by subsidy	Howe, 704
Colorado, alleged discrimination against	Griffith, 849-854
Anthracite coal, deposits	Saward, 519
Production in	Griffith, 857
Irrigation, development in	Griffith, 857
Manufactures in	Griffith, 850, 852
Colorado Fuel and Iron Company, freight rates on products	Griffith, 850, 852
Combination rate, defined	McGovern, 678
Combinations, industrial (see also <i>Agreements of railroads; Community of interest; Consolidation of corporations; Pooling</i>):	
Capitalization, compared with railways	Woodlock, 458
Proper basis of	Greene, 476, 477
Promotion, regulation discussed	Greene, 476, 477, 490-494
Competition, local price-cutting, prohibition opposed	Anderson, 651, 652
Effects	Bacon, 77; Parsons, 157, 158, 159
Private railways promoted by	Parsons, 157
Rates, enabled to get joint	Ripley, 293, 294
Remedies suggested	Parsons, 157, 158
Significance of	Parsons, 157, 158
Commerce and Industry, Department of, establishment advocated	Bacon, 77, 80; Anderson, 645
Commercial museums, establishment and advantages of	Wheeler, 752
Commercial organizations advocate governmental ownership and operation of the telegraph	Roberts, 267
Commission merchant, as distinguished from jobber	Langley, 871
Commissions, payment by railroads to ticket brokers	Lindenberg, 340, 345, 352, 355, 357
Commodity rates. (See <i>Classification of freight</i>.)	
Community of interest (see also <i>Agreements of railroads; Anthracite coal; Consolidation of railroads; Pooling</i>):	
Bankers, idea among	Schiff, 775
Benefits of	McLeod, 571; Schiff, 770, 771; Langley, 878
Colorado railroads	Griffith, 855
Discriminations, effect on	Stubbs, 765; Langley, 874, 875
Economies, relative, as compared with consolidation	Greene, 485
Effect of	McGovern, 678
Extent of the principle	Schiff, 771
Growth of	Schiff, 770
How brought about	Schiff, 771
Nature of policy	Woodlock, 462
Origin of idea	Schiff, 770
Plans of combining	Schiff, 776
Rates, effect on	Stubbs, 765; Langley, 876
Transcontinental railroads	Griffith, 855
Vanderbilt roads and Pennsylvania system	Woodlock, 462
Commutation tickets, brokerage in	Lindenberg, 340
Competition:	
Between markets, importance of	Grissold, 615, 624, 625
Coastwise vessels with railway lines	Hayne, 418, 419, 420; McGovern, 664
Sailing vessels	Hayne, 418-420
Continuous, law of	Schiff, 777

Competition—Continued.	
Defined	McGovern, 679
Freight rates, regulation	Griswold, 624, 625
Industrial combinations, prohibition of local price cutting opposed	Anderson, 651, 652
Ocean traffic	Stubbs, 758
Railroads, abolishment of, only remedy for rate cutting	Ripley, 290
Effect of, on facilities offered	Ripley, 294, 295
On rates	Ripley, 286, 296; Thomas, 552
Elements of	Griswold, 616
Injurious to railway interests	Markham, 433
Paralleling, wastefulness of	Thomas, 551, 559
River transportation and railroads	Markham, 425-431
Ticket brokerage favorable to	Linzenberger, 350
Undesirability of excessive	Thomas, 550, 551
Southern transportation lines	Gnillandau, 445-446; Talcott, 627
Telegraph companies, business better done through	Chandler, 204
Western Union Company and Postal Company, competitors	Chandler, 195, 201, 202
World markets, effect in keeping down freight rates	Thomas, 551, 552
Conciliation (see also <i>Arbitration</i>):	
Desirability, for settling labor disputes	Greene, 474
Congressional committees, advocate governmental ownership and operation of telegraph	Roberts, 266, 267, 268
Connecticut, railway discrimination in	Parsons, 133
Consolidated Gas Company of New York:	
Capital and business of	Bemis, 87
Relations with United Gas Company of Philadelphia	Bemis, 87
Consolidated Rubber Tire Company, capitalization and patents	Rice, 733, 734
Consolidation of corporations (see also <i>Combinations, Industrial</i>):	
Economies in	Bemis, 86
Electrical industries, economies of	Foote, 116, 117
Gas, effect of, on price of	Bemis, 89
Gas companies in Greater New York	Bemis, 87
Lighting plants, advantages of	Foote, 116
Proposed method of regulation	Foote, 117
Telegraph companies	Clark, 213, 214
Tendency toward	Bemis, 86
Consolidation of railroads (see also <i>Community of interest</i>):	
Advantages to railways and community	Greene, 473, 484, 487; Adams, 829
Massachusetts	Jackson, 847
Classification of freight, effect in promoting uniformity	Greene, 485
Capitalization, effect on	Rice, 740
Desirability	Adams, 829
Discriminations, effect on	Greene, 487; McGovern, 683
Economies effected by	Greene, 485; Thomas, 559
Effects discussed	Rice, 742
Extent of	Parsons, 149
Finances, confusion of, through leased roads	Rice, 739
General, not desirable	McGovern, 682, 683
Great Northern, Northern Pacific, and Burlington	Wheeler, 747; Stubbs, 765
Law forbidding, Minnesota	Teisberg, (354)
Pooling, does not do away with the desirability of	Wheeler, 748
Prohibition, influence in leading to	Woodlock, 462;
	Greene, 473; Thomas, 558; Anderson, 641
Preferred stock, attempt to pay dividends on, by means of	Greene, 472
Rates, effect on	Woodlock, 463; Greene, 484, 487
South, suggested extent of, in	McGovern, 682
Tendency toward	Bacon, 77-79; Woodlock, 462; McGovern, 682-683
Southern States	Dunlap, 2
Transcontinental railroads, effect of	Wheeler, 747; Stubbs, 765
Union Pacific and Southern Pacific	Woodlock, 462; Wheeler, 746; Stubbs, 764
Wages, effect on	Fuller, 71
Construction of railroads (see also <i>Cost of construction</i>):	
New Zealand, how regulated in	Parsons, 151
Paralleling, instances of	Griswold, 616, 622
Legislation restricting, advocated	Thomas, 551, 559
Cooperative associations, California fruit producers	Stubbs, 768

	Page.
Cooperative Telephone Company, of Grand Rapids, Wis.	Parsons, 883
Copenhagen, telephone service, rates, etc.	Bethell, 803
Copper wire, use in telephones	Hall, 817
Cornelia and Tallulah Falls Railway, business described	Dunlap, 1, 2
Corporations (see also <i>Accounts; Combinations, industrial; Consolidation of corporations; Publicity; Promotion</i>):	
American, methods of business compared with foreign	Greene, 493, 495
Directors, responsibility of	Greene, 495
Dividends, how declared	Schiff, 773

 Depreciation of corporate property, method of accounting for Greene, 493
 Detroit:
 Electric lighting Bemis, 98; Foote, 114
 Grand Army building in Foote, 115
 Telephone service Bethell, 807
 Differentials between cities (see also *Discriminations between places*):
 Amounts Griswold, 614, 615, 620
 Depreciated Langley, 873
 How fixed McGovern, 664
 Scale of, from Chicago to Eastern seaports Langley, 872
 Seaboard cities, origin Griswold, 612, 615
 Practice discussed Griswold, 614, 615, 620, 623
 Unified control of railroads not likely to remove Griswold, 623, 624
 Disasters, lake vessels, how caused Penje 408
 Discharge of employees, injustice in certain cases Fuller, 12
 Discipline, employees', methods discussed generally Fuller, 10-12
 Discriminations, general (see also *Export rates; Import freight rates*):
 Community of interest, effect on Langley, 874, 875
 Detrimental to the South Langley, 865
 Excursion rates Langley, 859
 In passenger rates, ticket brokerage diminishes Lindenberger, 332
 Stability of rates, desirability Thomas, 550
 Affected by railroad consolidation Greene, 487; McGovern, 683
 Discriminations between persons (see also *Underbilling; Underclassification of goods*):
 Alkali products, existence denied Bacon, 84, 85
 Causes Parsons, 128, 132, 133
 Colorado, conditions in Griffith, 855
 Competition prevented only by abolishing Ripley, 290
 Competitive points, chiefly at Ripley, 297
 Cooperation of railways to maintain rates Wilson, 691-692
 Decrease of rate cutting Woodlock, 464; Griswold, 614; Anderson, 640
 Different kinds of Parsons, 126
 Effect generally Parsons, 126, 137; Ripley, 288-289
 Created by monopolies Parsons, 132
 Large shippers in favor of Parsons, 131, 132
 Empty cars, effect small Griswold, 622
 Evils of Parsons, 126

	Page.
Discriminations between persons—Continued.	
Existence of, discussed	Ripley, 286-287; McGovern, 674
Extent of	Wilson, 695-696
Fast-freight lines, rate cutting by, possibility discussed	Griswold, 613, 614
Freight boxes	Langley, 876, 877
Georgia, existence denied	Dunlap, 2, 4
Government ownership, removed by	Parsons, 129, 133, 134
Illustrations of	Parsons, 126-133
Legislation, failure to reach	Wilson, 697
Methods	Parsons, 128, 133; Ripley, 287, 288
Underclassification and underbilling	Ripley, 288
Minnesota, existence of	Teisberg, 366
Oil companies	Parsons, 130
Penalty, suggested modification	McGovern, 673-674
Practiced by manufacturing interests	Howes, 716
Public opinion, indifference toward	Wilson, 697-698
Rate cutting deprecated	Nicholson, 728
Effect in causing	Ripley, 287; Wheeler, 748
Effect on traffic discussed	Griswold, 615
Railroads, attitude toward	Ripley, 286, 291
Remedies for	Bryant, 390; Griswold, 615
Water transportation	Griswold, 614
Reduction of, reasons	Griffith, 855
Southern railways	Wilson, 688-689
Stability of rates in Southern territory	Wilson, 689, 690, 698
Telegraph companies, practices discussed	Clark, 210-211, 228; Randall, 244, 257; Roberts, 273
Uniformity of rates, desirability	Nicholson, 727, 728; Schiff, 770, 771
Unjustifiable in carload and less than carload rates	Langley, 863
Discriminations between places. (See also <i>Basing-point system; Differentials; Southern States.</i>)	
Generally	Bryant, 387, 390
Abolishment, effect of	Ripley, 295
Atlanta and Birmingham rates, compared	McGovern, 680
Atlanta and Savannah rates, compared	McGovern, 681
Causes of	Parsons, 128, 132, 133
Chicago to Charleston, rates, how made	McGovern, 684-686
Chicago-Norfolk, rates, how made	McGovern, 684, 686
Cities, effect on	Parsons, 126, 127, 136
Competition of markets will not permit serious	Anderson, 638
Competitive points, character of	Markham, 436-437
Differentials, establishment of	Markham, 429
How fixed	McGovern, 664
Eastern and Western rates	Langley, 872, 873
Effect of	Parsons, 150; Ripley, 295
Freight traffic, Southern points, course of, from	Guillauden, 447
Long and short haul, alkali products, discrimination referred to	Bacon, 85
Discrimination justified by water transportation	Wheeler, 716; Stubbs, 757, 758
Justified within limits	Davant, 6-8
Georgia railroads, conditions on	Dunlap, 1-4
Intermediate points, effect of discrimination on	Davant, 8; Nicholson, 725
Minnesota law	Teisberg, 365
Practical workings of	Ripley, 295, 296, 297
Railroad competition as justifying discriminations	Stubbs, 760
Southern and New England cotton mills	Davant, 5-8
Transcontinental traffic, discrimination in, justified	Stubbs, 758
Long and short haul clause, basing-point system, relation to	Wilson, 697
Effect of	Ripley, 295, 296
Evaded by railways	Bryant, 387, 390; Griswold, 625, 626
Observance	Talcott, 630-632; Griswold, 616
Southern railways, abrogation by	Guillauden, 447; Wilson, 696
Suspension of	Bryant, 390
Methods	Parsons, 128
Montgomery and Mobile rates compared	McGovern, 681
Noncompetitive places, high rates, etc	Bryant, 390
Pacific coast, rates from Eastern cities to	Wheeler, 743-750; Stubbs, 756-761
Pittsburg, injured by	Anderson, 639, 640, 647

Discriminations between places—(Continued.)	Page.
Practice condemned	Griswold, 617
Rights of localities to their natural advantage	Wheeler, 745
Rural communities, effect on	Parsons, 126, 127, 136
Southern States conditions in	Ripley, 298-299; Wilson, 696; Guillauden, 447
Principle of rate system	McGovern, 678
Standard Oil Company, favored by	Parsons, 130
Ticket brokerage depends on existence of	Lindenberger, 355
Transcontinental rates due to competition of Canadian Pacific	Wheeler, 745
	Stubbs, 762
District of Columbia, capitalization of street railways in	Bemis, 89
District of Columbia supreme court, telephone case, decision of, criticised	Parsons, 176-179
Dividends of corporations:	
How they should be declared	Schiff, 773
Proportion of, on Southern railways	Markham, 436
Western Union Telegraph Company	Roberts, 270
Drunkenness, diminution among railway employees	Anderson, 638
Earnings of railroads:	
Bonds, low-interest, leaves more for stockholders	Greene, 486
Increase, recent, causes of	Greene, 486; Nicholson, 728
Net, per mile	Bemis, 91
Passenger receipts	Bemis, 91
Proportion of on Southern railways	Markham, 436
Earnings of telegraph companies:	
Advantage of cable lines over land lines	Chandler, 202
Western Union Telegraph Company	Clark, 216; Roberts, 270
Eastern Trunk Line Association:	
Freight differentials in	Langley, 873
Railways embraced by	Langley, 873
Electric light:	
Capitalization of private plants	Bemis, 88
Changes from private to public operation of	Bemis, 98, 99
Cost of public plants in American cities	Bemis, 88, 98
Gas, relative cost of, as compared with	Adams, 282, 283
Public and private service compared	Parsons, 146; Adams, 283
Massachusetts	Adams, 278-280
Electricity:	
Application to street-railway systems, effect of	Adams, 825, 828
Economic value for light and power	Footes, 103
Elevators:	
Combination, not known to exist	Teisberg, 370
New Orleans	Bryant, 393
Policy of railroads towards, Minnesota	Teisberg, 370-373
Private policies, Minneapolis	Teisberg, 367, 368
Sites on railroad land, law providing, Minnesota	Teisberg, 370
State regulation, Minnesota	Teisberg, 367-370
Superior, Wis., under Minnesota regulations	Teisberg, 373
Elkhill Coal and Iron Company, purchase by Ontario and Western Railroad	Childs, 497
Employees, railway (see also <i>Employment; Labor</i>):	
Comparison with voting population	Parsons, 161
Government ownership, effect on	Parsons, 163, 164
Number of	Parsons, 163
Rules regulating conduct	Fuller, 10, 12
Strain of work, increase in	Fuller, 12
Employers' liability:	
Discussed generally	Fuller, 35-40
Common-law doctrine, injustice in present conditions	Fuller, 35
Court decisions, summary of	Fuller, 37-40
Defects, liability for, decisions regarding	Fuller, 38
Employees should have same rights as general public	Fuller, 35, 40
Federal courts not bound by decisions of State courts	Fuller, 37
Fellow servants, discriminations drawn by courts in Pennsylvania	Fuller, 37-40
Liability for acts, advocated	Fuller, 35, 40
Legislation and court decisions regarding, in Pennsylvania	Fuller, 36-40
Legislation, confused condition of	Fuller, 40

Employers' liability—Continued.	Page.
Regarding contributory negligence, advocated	Fuller, 42
By Congress, advocated	Fuller, 40
Extension of, effect in preventing accidents	Fuller, 35
By States	Fuller, 35
Railroad brotherhoods, resolutions regarding	Fuller, 36
Railroads, unjust efforts to evade	Fuller, 49
Relief department, release from, obtained by	Fuller, 13, 52, 59-69
Employment on railways (see also <i>Employees; Labor</i>):	
Age limit	Fuller, 10
Application, form of	Fuller, 13, 14
Employers, correspondence with former	Fuller, 12-15
Litigation with railways, questions concerning, criticised	Fuller, 13, 15
Terms and condition of entrance, generally	Fuller, 10, 15
Engines, safety appliances should be required	Fuller, 41
England:	
Auditor of accounts in	Bemis, 93
Canadian differential tariff, benefited by	Howes, 716, 718
Capitalization of corporations, regulations regarding	Woodlock, 460, 461
Capitalization of railroads	Woodlock, 461; Thomas, 551
Federated British Empire, possible	Howes, 717
Postal service in	Clark, 208
Public and private monopolies in	Bemis, 94
Public utilities, ownership in	Bemis, 102
Regulation in	Bemis, 93
Railroads, service and rates compared with American	Woodlock, 460, 461
Sailors, wages in	Penje, 412
Ship subsidy, policy of	Howes, 707
Street railways in, operation of	Bemis, 102
Telegraph system, discussed generally	Clark, 216-220, 225
Compared with United States	Parsons, 886, 887
Deficit of	Clark, 211-213, 215, 225, 231; Parsons, 888, 889
Expenses of	Clark, 220
Favored by government	Parsons, 126
Statistics of	Clark, 213, 220
Telephone conditions	Bethell, 797-803
Telephone service, operation of	Bemis, 100
Trade with New Orleans	Bryant, 394
Erie Railroad:	
Anthracite coal business	Thomas, 548-555
Capitalization	Thomas, 551, 559
Freight rates on	Thomas, 560
Overcapitalization	Woodlock, 453, 456
Purchase of Pennsylvania Coal Company	Woodlock, 452; Greene, 475;
Haddock, 521; Thomas, 552, 553; McLeod, 572; Stearns, 589	
Stocks, prices of	Woodlock, 456
Erie and Wyoming Valley Railroad, purchase by Erie Railroad	Thomas, 552
Europe:	
Labor, low cost of	Hall, 819
Telegraph service in	Clark, 207, 208
Telegraph service rates	Randall, 214
Telephone service in	Bethell, 784, 785, 787, 807; Hall, 819
Examination, physical, of railroad employees	Fuller, 10, 13, 14
Excursion tickets:	
Dealt in by brokers	Lindenberger, 319
Discrimination in rates	Langley, 859
Export rates:	
Advantage in making, lower than domestic	Greene, 484, 485, 487, 494
American producers, justifiability and advantage to	Thomas, 557
Canadian roads, not lower on	Ripley, 299
Discriminations, bearing on personal	Ripley, 301
Grain and steel rails	Anderson, 643
Import rates compared with	Langley, 870
Interstate Commerce Commission, position in respect to	Ripley, 299
Justification of making lower than domestic	Greene, 484, 485, 487, 494
Local rates, comparison with	Ripley, 300
Supreme Court, position in respect to	Ripley, 299, 300
Uniform from east of the Mississippi to the Pacific	Ripley, 299

	Page
Export trade:	
Adaptation of goods to demand, desirability of	Wheeler, 752
Anthracite coal	McLeod, 567
Coal	Fleming, 510
Fruit, canned goods, California	Wheeler, 753, 754
Importance to domestic prosperity	Greene, 484, 485, 487, 494
Routes, Southern	Talcott, 628, 629
United States	Markham, 431
Express companies should be under Interstate Commerce Commission	Adams, 386
Failures in business, reasons for	Foote, 113, 116
Fast-freight lines:	
Accounting of	Nicholson, 724
Bills, system of prorating	Nicholson, 729, 730
Business of	Nicholson, 724, 725, 728, 729, 731
Character, former and present	Griswold, 613, 614
Discontinuance	Nicholson, 728
Division of earnings	Nicholson, 725
Expenses of, how paid	Nicholson, 731
Origin of	Nicholson, 724, 731
Ownership of	Nicholson, 724
Rates paid	Nicholson, 725
Relation to railroads	Nicholson, 724, 725, 728, 729, 731
Vanderbilt railway system	Nicholson, 724, 725
Federal incorporation law deprecated	Greene, 482
Fellow servants. (See <i>Employer's liability.</i>)	
Fishery industry:	
Described	Howes, 717
Not desirable to Americans	Howes, 717
"Floating cotton," defined and discussed	Markham, 440
Flour:	
Oriental trade in	Wheeler, 751
Rates on, compared with export rates on grain	Thomas, 557
Receipts of, at New Orleans	Markham, 427
Flour Mills:	
Consolidation of, in Minnesota	Langley, 870
In Pennsylvania district	Langley, 870
Food, of sailors, Merchants and Miners' Transportation Company	Hayne, 416
Foreign born:	
Anthracite coal mines	Stearns, 595, 596
Longshoremen, Great Lakes, nationality of	Barter, 310, 311
Proportion of, as lake sailors	Penje, 411
Foreign vessels:	
At New Orleans	Bryant, (398, 399)
Crews of	Bryant, 400
Forgery, name of purchaser of ticket, discussed	Lindenberger, 354, 355
Franking privileges. (See <i>Telegraph.</i>)	
France:	
Railroads, government rights of purchase	Adams, 386
Relation of State to	Adams, 386
Telephone service condition	Bethell, 787, 788
French cities compared with similar American cities	Bethell, 787
Trade with the United States	Howes, 714
Franchises:	
Methods of acquisitions, telegraph companies	Chandler, 196
Perpetual, in England	Bemis, 94
How to abolish	Bemis, 99
Street railways, indefinite, have worked satisfactorily	Adams, 829, 830
Value, railroads, method of computing	Adams, 375-379
Frazier v. Pennsylvania Railroad Company, employers' liability case,	
discussed	Fuller, 39
Frederick, B. L., letter regarding railway relief departments	Fuller, 52
Free ships, not the same as free trade	Howes, 712
Freight committees, local	Griswold, 612, 613
Freight inspectors:	
Duties of, in relation to freight traffic	Langley, 867
Experts in their business	Langley, 864
Rules governing their duties	Langley, 867
Railroad associations, employed by	Langley, 868
Venality, opportunities of, for	Langley, 868

	Page.
Freight rates (see also <i>Classification; Discriminations between cities;</i> <i>Export rates</i>):	
Absolute amount less important than uniformity	Teisberg, 366
Adaptability of	Schiff, 774
Advances in	Langley, 860
Railroads' reasons for	Langley, 869
Alkali products, discussed	Bacon, 72-76, 80, 81
Average	Markham, 430, 435
Comparison of	Parsons, 133
Average ton and passenger mile	Parsons, 137
Blanket description, case regarding	Wheeler, 715; Stubbs, 759
Boston	Howes, 700
From West	Howes, 701
Boston trade, effect on	Howes, 701
Brokerage m. if possible, would be advantageous	Lindenberger, 340
Canadian railroads, effect of competition	Thomas, 552
Changes should not be made oftener than yearly	Bacon, 76, 88
Sudden, instances of	Bacon, 74
Classification of freight, how affected by	Markham, 434, 435; McGovern, 654, 655, 677
Relation of, to	Langley, 860
Coal, Philadelphia and Baltimore	Griswold, 619, 620
Coal and coke, recent increase discussed	Bacon, 75-79
Commodity rates, how affecting	Nicholson, 727
Community of interest, effect of a	Markham, 432-433; Langley, 874, 875
Comparison of, American and European	Parsons, 133, 136, 137
Difficulty	Parsons, 137-139
Competition of world markets, effect on	Thomas, 551, 552
Competitive influences restricting	Griswold, 624, 625
Consolidation, effect on	Markham, 432, 433; Woodlock, 463
Cost of construction should not be considered in determining	Woodlock, 457
Cost of duplication, relation to	Woodlock, 457, 458
Cotton, from Southern ports to Liverpool	Markham, 442
Cotton goods, discussed	Dunlap, 3, 4
Rates as affected by inspectors	Langley, 866
Cutting of (see <i>Discriminations between persons, rate cutting</i>)	Ruple, 286
Decrease, railway	Markham, 429-431; Schiff, 774
Causes	Teisberg, 361; Markham, 429-431
Comparisons	Parsons, 136
During twenty years	Thomas, 560
Denver, from Eastern cities	Griffith, 850, 851, 855
Differentials	Griswold, 611, 615, 620, 623
Depreciated	Langley, 873
How fixed	McGovern, 664
Scale of, from Chicago to Eastern seaports	Langley, 872
Discriminations in, between East and West	Langley, 872, 873
Distance, relative to	Talcott, 630, 631
Freight committees, local power	Griswold, 612
Government ownership, effect	Parsons, 137-139, 143, 145
Grain, decrease, effects	Teisberg, 367
Decrease, Minnesota	Teisberg, 364
Rebates to elevators, Minnesota	Teisberg, 372
Import and export compared	Langley, 870
Increase of	Wilson, 698-699
Effect in restricting business	Bacon, 75
Recent, discussed	Bacon, 74-79; McGovern, 655-658
Influence on country's development	McGovern, 686
Influences affecting	Markham, 428-430; Guillauden, 446, 447
Inland and through, compared	Langley, 870
Interstate Commerce Commission, not a function of	Langley, 881
Should have power to disapprove	Langley, 882
Iron and steel products, Colorado	Griffith, 850, 852
Jobbing trade, effect on	Langley, 871
Local, compared with through	Markham, 437
Reduction of	Markham, 437
No reduction of, in New England	Parsons, 186
Mississippi River	Bryant, 391-393; Markham, 428-430
How regulated	Bryant, 391

Freight rates—Continued.	Page.
Mississippi River—Continued.	
Rates affected by	Markham, 428-430
Reduction of	Markham, 430, 431
New York Central Railroad, maximum on	Schiff, 774
Ocean competition prevents compensatory	Stubbs, 758
Ocean rates, influence on railways	Markham, 429
Ocean transportation	Wheeler, 750
Overcapitalization, effect on	Woodlock, 456
Paper	Griswold, 619
Policy in making	Parsons, 134, 135; Markham, 434; Wilson, 698
Complexities of	Markham, 428
Postage stamp, California fruit	Stubbs, 760
Power of railways to reduce rates	Wilson, 691; Langley, 882
Proportional and through compared	McGovern, 677
Rate wars, abolition desirable	Teisberg, 365
Transcontinental railroads, competition with ocean transportation	Wheeler, 744
Reasonableness, American, lower than in any other country	Woodlock, 463;
	Thomas, 551
Desirability	McGovern, 667, 668
How determined in Minnesota	Teisberg, 362
Maintenance of excessive, by monopolistic power in politics	Thomas, 554
Basis of determination	Ripley, 291, 292; Adams, 280, 281
Soda ash, baking soda, etc., discussed	Bacon, 72-76, 80, 81
Southern States, Baltimore to Northern and Southern ports	Griswold, 620, 621
From the East and West compared	Wilson, 687, 689
From New York to	Guillauden, 445, 446
Increase discussed	Langley 863; Dunlap, 2-4
Always high in	Langley, 864
Stability of, in the South	Wilson, 689, 696, 698
More desirable than excessively low	Thomas, 550
State regulation, Minnesota	Teisberg, 361-363
Systems of making	Langley, 860
Transcontinental traffic reduction in	Stubbs, 765
Trunk-line territory, percentage system	Griswold, 625
Uniform, advocated	Bacon, 83; Ripley, 288, 289
Unreasonable might compel Government ownership of railroads	Anderson, 642
Wages, effect of rate wars	Fuller, 71
Water transportation, influenced by river rates	Markham, 437, 441
Railway and river compared	Bryant, 387, 389, 390;
	Markham, 436; Guillauden, 444; Griswold, 620, 621
Freight traffic:	
Amount of, from South to North	Langley, 864
Effect of freight classification on miscellaneous	Langley, 870
Limit as to amount	Schiff, 772
Southern territory, division of by railways	Wilson, 690
Through traffic, Western, Southern Railway, participation	Griswold, 613
Frogs, blocking should be required by law	Fuller, 41
Fruit industry:	
California Cooperative Associations	Stubbs, 768
At New Orleans	Bryant, 397, 398
Pacific coast, nature and importance	Wheeler, 753, 754
Transcontinental freight rates	Stubbs, 767
Fruit trust:	
Effect of, on prices	Bryant, 397, 398
Extent of	Bryant, 397, 398
Fuel, sale of, by employers at cost	Holmes, 145
Future contracts, how affected by changes in freight classification	McGovern, 668
Gainesville, Jefferson and Southern Railway, business described	Dunlap, 1, 2
Gas:

Powers, discussed	Wilson, 690, 691
Relation to railways	Wilson, 690, 691
Southern States, attitude toward Southern classification on inter-	
state traffic	Langley, 863
Tennessee, rates not fixed by	Davant, 7
Railroad Conductor:	
Editorial regarding relief departments	Fuller, 58-59
Extracts from	Fuller, 20, 21, 27
Rails, steel, export freight rates	Anderson, 643
Raisins:	
California, condition of industry	Wheeler, 753, 754
Cooperation of California producers	Stubbs, 768
Rates. (See <i>Discriminations; Export rates; Import rates; Freight rates; Passenger traffic.</i>)	
Reading Railroad:	
Anthracite coal business	Harris, 596-611
Influence on prices	Stearns, 582
Tonnage	Saward, 514, 515; Haddock, 527; Harris, 598, 601, 606
Baltimore and Ohio, relation with	Harris, 608, 609
Bankruptcy and reorganization	Harris, 601, 605
Black list of discharged employees asserted	Fitzpatrick, 885
Capitalization generally	Woodlock, 455, 456; Harris, 597, 598
Of coal lands	Greene, 472;
	Saward, 517, 519; Haddock, 533; McLeod, 566; Harris, 604, 605

	Page.
Reading Railroad—Continued.	
Central Railroad of New Jersey, purchase of stock	Woodlock, 454, 455;
	Greene, 471, 475; McLeod, 572; Harris, 607-609
Coal lands, purchase of, forced by competition	Haddock, 523
Earlier attempts to control Jersey Central and Lehigh Valley	Greene, 471, 475;
	McLeod, 572; Harris, 607-609; Rice, 737, 738
Labor organizations, antagonistic to	Fitzpatrick, 833, 834, 837-840
New England territory, extension into, in 1893	McLeod, 567, 574
Receivership and reorganization	McLeod, 572, 573
Relation to subordinate and preceding companies	Harris, 597
Reorganization and capitalization	Greene, 472; Harris, 597, 598
Rice, I. L., connection with	Rice, 737-839
Receivers, policy in selection of	Greene, 489; Rice, 741
Reciprocity treaty:	
Manufacturing industries in Canada opposed to	Howes, 718
Necessity of, with Canada	Howes, 713, 715, 718
Refrigerator cars:	
California fruit, transportation of	Wheeler, 754
Operation by separate companies, desirability of	Stubbs, 769
Trans-continental fruit transportation	Stubbs, 767, 769
Regulation. (See <i>Accounts; Interstate Commerce Commission; Public utilities; Railroad commissions.</i>)	
Relief departments of railroads:	
Discussed generally	Fuller, 43-69
Brotherhoods' replies of lodges regarding	Fuller, 60-67
Congress laws passed by, regarding	Fuller, 69
Cost of insurance in	Fuller, 53, 58
Disapproved by employers	Fitzpatrick, 833
Labor organizations, tendency to prevent membership in	Fuller, 13,
	49, 57, 60-67
Liability for damages, in lieu of	Fitzpatrick, 833, 836
Lobbying by railroads, legislation on	Fuller, 50-52
Membership, application for blank forms	Fuller, 13, 17-53
Obligatory	Fuller, 43, 17, 48, 52, 53, 59-69; Fitzpatrick, 832, 836
Prohibition of compulsory, advocated	Fuller, 10
Payments by employees	Fuller, 43, 53, 58
Pennsylvania railroad	Anderson, 637, 638
Release of employers from liability by means of	Fuller, 43-53, 59-69
Reorganization of railroads:	
Business depressions, rendered necessary by	Greene, 487
Capitalization, effect on bonds and stocks	Ripley, 291, 297, 298;
	Greene, 187, 488
Causes	Talcott, 636
Committees, methods of establishing and procedure	Greene, 188, 489
Courts, policy regarding	Greene, 189
Fixed charges, effect on	Ripley, 298
Minority stockholders, protection of rights of	Greene, 188, 489
New York, Ontario and Western Railroad	Childs, 502
Reading Railroad	Greene, 472; McLeod, 572, 573; Harris, 597, 598
Richmond Gas Works.	Demis, 97
River transportation (see also <i>Mississippi River; Water transportation</i>):	
Amount	Anderson, 638, 646
Boats, where built	Bryant, 397
Decrease of traffic	Markham, 425-426
Freight rates, coal, Pittsburg to New Orleans	Anderson, 642
Improvements, beneficial effects	Anderson, 646
Navigation, dangers to	Bryant, 387, 388
Season, shortening and reasons	Bryant, 393, 394
Southern rivers	Griswold, 621; Talcott, 628, 629
Statistics of traffic	Bryant, 388, 389; Markham, 426-427
Rocky Mountain States, alleged discrimination in rates	Griffith, 849-851
Rotterdam, telephone rates and service	Bethell, 793, 795, 797
Roustabouts on Mississippi River boats	Bryant, 395-397
Rubber, raw material, sources of	Rice, 735
Rural free delivery, compared with telegraph service.	Roberts, 272
Russia, policy of railways in	Parsons, 187
Safety (see also <i>Accidents</i>), comparison under public and private management	Parsons, 158

Safety appliances:	Page.
Allowed to become defective	Fuller, 41
Engines, requirement on, advocated	Fuller, 41
Signals, interlocking, Minnesota	Teisberg, 363
Sailors:	
Ocean, Germany and Great Britain, regulation concerning	Penje, 401
Great Lakes, accommodations	Penje, 409, 411
Characteristics	Penje, 411
Conditions of, generally	Penje, 401-408
Earnings	Penje, 402
Food	Penje, 409
Insufficiency of crews	Penje, 405, 408
Methods of procuring	Penje, 402, 403
Nationality	Penje, 401, 402
Number of seamen, small	Penje, 400
Regulation necessary	Penje, 403
Wages	Penje, 401, 405-409
Ocean deep-sea sailor, disappearance of	Gullauden, 450, 451
Merchants and Miners' Transportation Company, contract with	Hayne, 413, 416
Food of	Hayne, 416
Nationality of	Hayne, 417
Policy toward	Hayne, 422
Shipping articles as a contract	Hayne, 413, 414
St. Louis.	
Discrimination in favor as against Memphis	Davant, 8
Southern trade, opposition to Cincinnati and Chicago for	Wilson, 692
Favorable relation to	Wilson, 694, 695
Trade	Markham, 426, 427
St. Louis and Mississippi Valley Transportation Company, organization	Markham, 426
St. Louis Bridge rates compared with Brooklyn Bridge	Parsons, 115
St. Louis Traffic Bureau, case regarding transcontinental rates	Wheeler, 711, Stubbs, 757-763
Saloons owned by employers, evils	Barter, 308, 309, 316
San Francisco discrimination rates from Eastern cities, case regarding	Wheeler, 713-718; Stubbs, 757-761
Import rates, effect on	Stubbs, 761
Manufacturing interests in	Wheeler, 752, 753
Ocean traffic	Wheeler, 744, 750; Stubbs, 758, 763
Telephone service compared with Stockholm	Bethell, 803, 807
War Department, alleged discrimination in letting contracts for supplies	Wheeler, 756
San Francisco Board of Trade, nature and organization	Wheeler, 743
Savannah freight rates compared with Atlanta rates	McGovern, 681
Scandinavians as sailors	Penje, 401, 402
Scotland, public and private monopolies in	Bemis, 94
Scranton Coal Company, purchase by Ontario and Western Railroad	Childs, 497
Scrap dividends prohibited in Massachusetts	Jackson, 844
Seamen's Union, International, American Federation of Labor, relation to	Penje, 401
Membership	Penje, 401
Old Dominion Steamship Company, relation to	Gullauden, 450
Statutory amendments suggested by	Hayne, 422, 423
Securities, American, scarcity in Europe	Schiff, 776
Senate Committee on Interstate Commerce, report on railway discriminations	Parsons, 126, 128
Ship subsidies (see also <i>Merchant Marine, American</i>):	
Advocated	Anderson, 644
Bill, doubtful effects of	Bryant, 399, 400
Coastwise trade not necessary for	Hayne, 421
Depreciated	Howes, 704-709, 711
France, policy in	Howes, 706-708
Great Britain, policy toward	Howes, 706-708
New Orleans, sentiment in respect to	Bryant, 399, 400
Ships. (See <i>Water transportation</i>.)	
Shipwreck benefit of Lake Seamen's Union	Penje, 400
Signals, interlocking, Minnesota	Teisberg, 363

	Page.
Sinking fund, difficulty presented by, in case of receivership	Ripley, 306
Sliding scales:	
Anthracite coal field	Stearns, 593, 594
Longshoremen	Barter, 315
Socialism, relation to government ownership	Foote, 113, 115
Soda, conditions of manufacture and business discussed	Bacon, 72-76, 80, 81
South African war, effect on Boston trade	Howes, 700
Southeastern Freight Association:	
Functions	Guillauden, 443
Geographical extent	McGovern, 654
Southeastern Mississippi Valley Association, geographical extent	McGovern, 654
Southern classification (see also <i>Classification of freight</i>):	
Advances made in	Langley, 860, 862
Character discussed	Markham, 441
Increase in rates under, 1900	Langley-McGovern
Classification issues	McGovern, 655
Coffee, action of in respect of	Langley, 865, 866
Financial functions not possessed by	McGovern, 655
Letter from	McGovern, 652
Methods	McGovern, 653
Objects	McGovern, 653
Organization and membership	McGovern, 652, 653
Policy toward Southern business	McGovern, 663
Railway mileage covered	McGovern, 682
Territory of	Langley, 860
Underbilling, no power to prevent	McGovern, 673
Southern Pacific Company:	
Central Pacific, relation to	Stubbs, 757, 764
Colonist rates	Wheeler, 755
Description of railroad system	Stubbs, 757
Import traffic and rates	Stubbs, 762
Nature and powers of corporation	Stubbs, 757
Politics, interference in	Wheeler, 754
Relief department, referred to	Fuller, 48, 69
Transcontinental rates, action in suit regarding	Stubbs, 758
Union Pacific, consolidation with	Woodcock, p. 462
Southern railroads:	
Conditions generally	Dunlap, 1-4
Consolidation, probable effect	Wilson, 692
Disadvantages of	Markham, 441
Discriminations between persons, stability of rates	Wilson, 696
Discriminations between places, causes of	Parsons, 123, 132, 133
Division of traffic to South	Wilson, 690
Interest of, in developing Southern territory	Langley, 862
Mileage of	McGovern, 682
Compared with Northern railroads	Langley, 864
Policy generally	Guillauden, 448
Rates, injustice of, to Ohio River territory	Wilson, 692
Short lines unprofitable	Dunlap, 1, 2
Asheville Line, not a factor in rate making	McGovern, 686
Central Railroad of Georgia, competitor of	McGovern, 682, 683
Cincinnati, New Orleans and Texas Pacific Railroad Company, rela- tion to	Wilson, 693
Freight rates and profits	Davant, 6
Net earnings, increase in	Langley, 869
Southern Railway, Southwestern Investment Security Company, rela- tion to	Wilson, 693
Southern Railway and Steamship Association	Talcott, 628
Southern States:	
Freight rates, to cotton mills	Davant, 5-8
Increase discussed	Bacon, 73, 74, 75, 79-83; Langley, 863; Dunlap, 2-4
Trade, competition for	Markham, 439; Wilson, 687, 689
Division of, between railroads	Wilson, 687, 689
Western railways excluded from	Langley, 875
Southwestern Investment Security Company, relations to railroad com- panies	Wilson, 696

Speculation:	Page.
Business favored by Western Union Telegraph Company	Randall, 244
Grain, effects on prices	Teisberg, 372
By farmers	Teisberg, 372
Northern Pacific Railroad deal	Rice, 742; Schiff, 772
Stock gambling, effect on public	Parsons, 155, 156
Stocks discussed generally	Woodlock, 465, 466
Effect on value of securities	Woodlock, 465, 466
Listing of, on exchange, character of	Woodlock, 466
Spencer, Samuel, evidence before Industrial Commission, referred to	Fuller, 34
Spoils system, evils of, in municipal administrations (see also <i>Civil-service examination system</i>)	Bemis, 102
Spotters, railroad, practices criticised	Lindenberger, 333, 334

Number of brokers in United States	Lindenberger, 320
Railroads—	
Depend on support	Lindenberger, 351
Tickets bought from	Lindenberger, 326, 350, 355, 357
Reduction of rates by brokers' competition	Lindenberger, 336, 337
Short limit tickets	Lindenberger, 352
Wages, effect on	Faller, 71
Trade, balance of, with Canada	Howes, 714, 715
Trade centers, railroads, methods of building up	Markham, 498, 499
Trade holding, defined	Nicholson, 791
Traffic. (See <i>Freight traffic; Passenger traffic</i> .)	
Traffic associations, consolidation	Bacon, 74, 76

	Page.
Tramp steamers:	
Boston, absence of	Howes, 700, 701
New Orleans	Bryant, 398
Transcontinental discriminations, due to competition of Canadian Pacific	Wheeler, 748; Stubbs, 702
Transcontinental Freight Bureau, nature of organization and control of rates	Wheeler, 749
Transcontinental railroads:	
Classification in, basis	Stubbs, 763
Consolidation of through routes, advantage of	Wheeler, 717
Discrimination, alleged, against Denver	Griffith, 819, 854
Fruit traffic	Stubbs, 767
Geographical location	Schiff, 772
Middle West and Pacific Coast cities, case regarding	Wheeler, 743-748;
Oranges, routing of shipments of	Stubbs, 764
Rates, agreements regarding	Wheeler, 719; Stubbs, 764
Establishment of	Langley, 875, 876
Import, on Asiatic traffic	Stubbs, 761
Methods of fixing	Markham, 442
Ocean rates, effect of	Markham, 420, 442
Objections to, by Central cities	Langley, 875, 876
Reduction in	Stubbs, 765
Refrigerator cars	Wheeler, 754; Stubbs, 767, 769
Traffic, handling of	Nicholson, 721
Nature of	Nicholson, 727
Trunk lines not desirous of merging with	Schiff, 772
Transit-in-bond privilege, suspension of, an evil to certain shippers	Ripley, 299
Transportation, importance to industrial interests	Anderson, 637-639, 645, 646
Transportation, Department of, establishment advocated	Bacon, 77, 80
Travel. (<i>See Passenger traffic.</i>)	
Trimmer, vessel loading, defined	Barter, 310
Trunk-line commission, jurisdiction of	Nicholson, 725, 726
Trunk lines:	
Railroad, geographical location	Schiff, 772
Transcontinental lines, attitude toward	Schiff, 772
Trusts. (<i>See Combinations.</i>)	
Typographical Union, International:	
Government ownership, committee on	Randall, 241
Government ownership of telegraph, favored	Clark, 219;
Government ownership of	Randall, 242, 243, 250; Roberts, 266, 267, 268
Membership of	Roberts, 268
Underbilling:	
Criminal, when	McGovern, 673
Defined	McGovern, 672
Examples	McGovern, 672
Injustice	McGovern, 672
Legislation, adequate, to prevent	McGovern, 673
Penalties, suggested modification	McGovern, 673, 674
Railroad agents, practices with regard to	McGovern, 673
Southern freight classification committee, no power to prevent	McGovern, 673
Underclassification of goods:	
Discrimination by	Griswold, 623
Penalty against	Langley, 868
Railroads, practiced by	Ripley, 288
Shippers, practiced by	Ripley, 288
Temptation to practice	Langley, 868
Underground system of wires:	
Introduction	Hall, 817, 818, 821
Telegraph companies, desirous of	Chandler, 204
Uniform accounting:	
American commerce, effect on	Foots, 116
Defined	Foots, 106
Desirability	Nicholson, 727
Extent of, proper	Foots, 106
General interest in	Foots, 122, 123
Interstate Commerce Commission, advocated by	Nicholson, 727
Legislation suggested, respecting	Foots, 111, 123
Municipal expenditures, result on	Foots, 116

	Page.
Uniform accounting—Continued.	
Municipal government, relation to	Footo, 110
Municipal monopolies, necessity for	Footo, 113
Municipal ownership, relation to	Footo, 109, 110
Necessity of	Footo, 103-123
Opposition to, sources of	Footo, 106
Progress, relation to	Footo, 109
Public morals, effect on	Footo, 105
Public policy, relation to	Footo, 109, 121, 122
Taxation, relation to	Footo, 105, 109
Union Pacific Railroad:	
Bond issue	Schiff, 776
Reorganization	Schiff, 769
Southern Pacific, community of interests with	Woodlock, 462; Wheeler, 746; Stubbs, 764; Griffith, 855
United Fruit Company:	
New Orleans	Bryant, 397

Consolidated Gas Company of New York, relation to	Bemis, 87
Interests of	Bemis, 87
United Mine Workers of America:	
Demand of anthracite operators, 1901	McLeod, 576
Membership in anthracite coal field	Saward, 530
United States:	
Area	Clark, 207
Coal mines	Howes, 715, 717
Freight classification, division of	Langley, 860
Population per square mile	Clark, 207
Postal service	Clark, 208
Number of post-offices	Parsons, 886
Telegraph service and development compared with Great Britain	Parsons, 185, 886, 887
Extent of	Clark, 228, 229
Number of stations in	Parsons, 886
Trade relations with Canada	Howes, 713, 715, 716, 717, 718
United States Courts:	
No jurisdiction over larceny on State waters	Hayne, 414, 415, 421-425
United States Steel Corporation:	
Carnegie, Andrew, relation to formation of	Woodlock, p. 464
Pacific coast, results of formation of	Wheeler, 753
United States Telegraph Company, absorption by Western Union	
Telegraph Company	Roberts, 272
Valuation of railroads (see <i>Cost of construction; Capitalization</i>).	
Vanderbilt Railroad System:	
Community of interests with Pennsylvania system	Woodlock, p. 162
Fast freight lines of	Nicholson, 724
Traffic	Nicholson, 728
Vessels (see also <i>Water transportation</i>):	
Merchants' and Miners' Transportation Co., inspection of	Hayne, 417, 418
Vienna:	
Telephone system; service; rates	Bethell, 790-791
Virginia:	
Capitalization of street railways in	Bemis, 89
Wages:	
Agreements of employers and employees regarding	Fuller, 10
Anthracite coal miners	Childs, 499; Saward, 515, 519; McLeod, 567, 574; Stearns, 593, 591
Coastwise transportation	Penje, 412
Merchants and Miners' Transportation Company's employees	Hayne, 415-417
Old Dominion Steamship Company's employees	Guillaudeau, 448, 449
Comparison of, in different countries	Parsons, 138
Influences affecting	Fuller, 71
Labor organizations, advantage in maintaining	Fuller, 11
Effect on	Penje, 401
Lake Seamen's Union, influence by	Penje, 401
Longshoremen, Great Lakes	Barter, 810, 811
Uniform	Barter, 815
Michigan Alkali Company	Bacon, 72, 80

		Page.
Wages—Continued.		
Mississippi River boats, rates of	Bryant, 395-397	
Municipal monopolies, rate in	Bemis, 95	
Rate wars, effect upon	Fuller, 71	
Rates, relative, of different classes	Fuller, 11	
Railways, consolidation of, effect on	Fuller, 71	
Reduction by employers	Fuller, 11	
Sailors, foreign	Penje, 412	
Lake	Penje, 401-409	
Telegraph employees	Clark, 217, 223, 224; Roberts, 270, 271	
Average	Chandler, 200	
Compared with, Great Britain	Chandler, 205	
Effect of sex	Chandler, 206	
Range	Chandler, 200	
Relation of, to total expense of operation	Chandler, 205	
Uniformity	Chandler, 200	
Telephone employees, Amsterdam	Bethell, 795, 796	
Girls, wages of	Parsons, 883	
Ticket brokerage, effect on	Fuller, 71	
Wall Street, meaning of term	Schiff, 776	
Wanamaker, John:		
Views on telegraph	Parsons, 888	
Favors postal telegraph	Hitchcock, 891	
War Department, alleged discrimination in letting contracts for supplies	Wheeler, 756
